TO
His Royal Highneſs.

GREAT SIR,

I *Juſtly eſteem it a Peculiar Happineſs, that* You *were pleas'd to accept of the Patronage of this Work; for hereby you exempt me from that Hardſhip which attends moſt Dedicators, of inventing the Virtues they Celebrate.*

But tho' your Intrinſick Excellence and Real Worth takes away all Poſſibility of Flattery, yet being convinced that whatever I can ſay, falls ſhort of your Merit, I Bluſh as much at my Incapacity of giving You Your juſt Due, as I ſhould at aſcribing more than He deſerved to another.

Your Early Years, GREAT SIR, *ſhew'd Your* Skill *and* Conduct *in Arms, as well as the Greatneſs of Your Courage and Love for Glory; and 'twas an uncommon Happineſs your Bravery was more than once bleſt with, by Your own Perſonal Valour to Save Your Royal Brother, Rout the Enemies Troops, and Change the Fate of the Battle.*

After this, when Your Happy Alliance with Your Royal Conſort, *Our preſent Gracious and Moſt Excellent* QUEEN, *had made You* Ours, *tho' you were always ready to offer your Self to Command Our Armies or our Fleets, yet when we deny'd our Selves the Happineſs of your Conquering for us* Abroad, *you ſet your Self to ſhew us an Illuſtrious Example of Virtue and Goodneſs at* Home; *and prov'd you Self to be as much above* Pride *and* Revenge here, *as you would have been without* Fear *or* Surprize there.

The Epiſtle Dedicatory.

Great within Your Selves Alone, Your Royal Conſort *and* Your Self, *like the beſt of the Old* Roman *Generals and Conſuls, liv'd Retired indeed, but neither unactively nor unuſefully: Virtue and Piety You taught, by the beſt way of Recommending it, Your own Bright, Great, and Glorious Examples; And raiſed up the Conjugal Happineſs to ſuch a Degree of Perfection, as the World never knew before, and which could You have been* Unbeloved, *would have render'd you almoſt the Envy of every one.*

Then, MIGHTY SIR, *did You employ your Noble Mind in Studies of the greateſt Uſe and Benefit to Mankind here,* Mathematicks *and* Mechanicks; *and as Your Cloſet was always the Reſort of the uſefully Learned and Ingenious, ſo were you ſtill their Encourager and Patron.*

But when the Providence of GOD called Your Illuſtrious Princeſs to Empire, *and Your Self to Publick Buſineſs and Mighty Emptoyments, You ſoon* Both *ſhew'd You cou'd Command with as much Wiſdom and Conduct, as you could before Obey with Reſignation, and make our Nation Truly Happy by the Gracious and Excellent Adminiſtration of your Government.*

The Glorious Effects of which that we may long Enjoy, and that Our Gracious QUEEN, *and* Your ROYAL HIGHNESS, *may be Bleſſed with Iſſue to Inherit theſe* Great Dominions, *that I doubt not but GOD hath raiſed up* HER SACRED MAJESTY *to ſecure in laſting Peace and Happineſs to us, is,*

GREAT SIR,

The moſt Sincere and Conſtant Prayer

of Your ROYAL HIGHNESS'S

Moſt Obedient and Moſt Humble Servant

JOHN HARRIS.

THE PREFACE.

THE beſt Account I can give of the folloiwng Work, will be to lay before you in a ſhort View what it contains, wherein it differs from other Books which may ſeem to be of the ſame Nature, and from whence I have collected the Subſtance of it. That which I have aimed at, is to make it a Dictionary, not only of bare *Words* but *Things*; and that the Reader may not only find here an Explication of the *Technical* Words, or the Terms of Art made uſe of in all the *Liberal Sciences*, and ſuch as border nearly upon them, but alſo thoſe *Arts themſelves*; and eſpecially *ſuch*, and *ſuch* Parts of them, as are moſt Uſeful and Advantageous to Mankind. In this, which was the chief of my Deſign, I found much leſs Help from Dictionaries already publiſhed, than one would have expected from their *Titles*: *Chauvin*'s *Lexicon Rationale*, or *Theſaurus Philoſophicus*, is a well printed Book, and the Figures are finely Graved; but 'tis too much filled with the School Terms, to be uſefully inſtructive; and is as defective in the Modern Improvements of Mathematical and Phyſical Learning, as it abounds with a Cant which was once miſtaken for *Science*.

The *Grand Dictionaire Des Arts & Sciences, par Mrs. de l' Academie Francoiſe*, hath no Cuts nor Figures at all, and is only a bare Explication of Terms of Art; and it ſeems rather to have been deſign'd to improve and propagate the *French Language*, than to inform and inſtruct the Humane Mind in general. And, which I have often wonder'd at, 'tis filled every where with *Simple Terms*, ſo that you are told what a Dog, a Cat, a Horſe and a Sheep is; which, tho' it may be uſeful to ſome Perſons who did not know *that* before, and may ſhew very well, that ſuch Deſcriptions can be given in *French*; yet how the bare Names of Animals and Vegetables, of Metals and Mineral, can be reckoned as *Terms of Art*, and conſequently make the greateſt part of *a Dictionary of Arts and Sciences*, I confeſs I cannot ſee: And therefore, tho' this and Mr. *Furetiere*'s *Dictionary* may be Books very well done in their Way, and are certainly very uſeful for thoſe who would be perfectly acquainted with the *French* Tongue; yet I did not find much Aſſiſtance from them, with regard to my Deſign.

And much leſs Help was there to be had from a Book called, The *New World of Words, or an Univerſal* Engliſh *Dictionary*; for there I found the Compiler had the *Ill Luck* to Collect many *Foreign* Faults, and to underſtand little or nothing of the *Arts* and *Sciences* himſelf.

Mr. *Ozanam*'s *Dictionaire Mathematique*, is indeed as good a Book as *Vitalis*'s is a bad one; and had *Mathematicks* been a Science I was the leaſt acquainted with of any other, I ſhould have been generally as well ſupplied from *Ozanam*, as deceived by *Vitalis*; whoſe laſt Edition, in two Volumes at *Rome*, after ſo many Years time to conſider upon the Matter, is, I think, not better than the Firſt, becauſe it hath more Matter, and leſs to the Purpoſe.

The *Chymical* and *Phyſical Dictionaries* of *Johnſon*, *Caſtellus*, and *Blanchard*, have a great many Words and Terms that are not to be met with elſewhere: And the laſt hath had four Editions in our own Language; but tho' many things are well enough done in him, yet ſome can hardly be ſaid to be ſo; ſo that in many Places I have been obliged to put his Name to what my *Amanuenſis* or *Aſſiſtant* tranſcribed from him, leſt the Reader ſhou'd miſtake it for my own Words.

I write not this only to diſparage the Performances of others, or to build my ſelf a Reputation on their Ruins, but I think my ſelf obliged to acquaint the Reader with the plain Truth of Things, without Favour or Affection, that ſo he may be informed where to meet with Satisfaction in his Enquiries and Reading, an dwhere not; and perhaps if this were oftner done, both the Time and the Expence of gaining true Knowledge would be much ſhortned.

There are ſome other leſſer Dictionaries which are of good uſe, and which have been ſerviceable to me on Occaſion, which I ſhall mention below; but I muſt next acquaint the Reader, That *much the greater Part* of what he will find here is collected from *no Dictionaries*, but from the beſt Original Authors I could procure in all Arts and Sciences, and is the Reſult of ſome Years Labour and Conſideration.

I have been very Full and Particular in the *Mathematicks*, becauſe it is the only Solid Foundation on which a Uſeful Enquiry into Nature and all Phyſical Learning can poſſibly be built; and becauſe 'tis alſo of the greateſt Uſe and Advantage to Mankind in all Reſpects.

In *Geometry*, under the Name of each Figure you have the Eſſential Properties of it briefly and plainly demonſtrated, and the Application to the Practice ſhewed; ſo that by the Help of very eaſy References

References from one Place to another, you will find the Demonſtration of all ſuch uſeful and important Propoſitions in that Noble Science, as are uſually given by *Geometrick* Writers,

Under ſuch Words as *Parabola*, *Ellipſis*, *Hyperbola*, *&c.* in the *Conick Sections* you will find the Properties of each Figure or *Section* demonſtrated, with Methods for their Deſcription on a Plane; as alſo the Properties of the *Cycloid*, *Conchoid*, *Logarithmick-Line*, *Ciſſoid*, *Quadratrix* and *Spiral Lines*, *&c.* Some general Conſiderations of the Nature of *Aſymptotes*, the Nature and Properties of *Catacauſtick* and *Diacauſtick* Figures, of the *Involute* and *Evolute*, of the *Linea Celerrimi Deſcenſus*, *&c.* And under the Word *Conſtruction*, you have the Conſtruction of *Cubick* and *Biquadratick Equations* by the *Parabola*; together with the Inveſtigation of *Baker*'s *Central Rule*, and its Uſe and Application.

Under ſuch general Words as *Trigonometry*, *Surveying*, *Spherical Geometry*, *Projection*, *&c.* you will find Entire Treatiſes on theſe Heads; and which, if I miſtake not, are as ſhort and plain as any yet extant.

In *Algebra* you will meet, under the proper Heads, every thing that is uſually found in Treatiſes of this Nature, and perhaps ſomething more. And under *Fluxions* you have a ſuccinct Account of the *Nature* and *Algorithm* of them, and ſome Improvements which are not to be had elſewhere. And in ſeveral Places under the proper Words, you have an Account of what we now call the *New Methods, or Univerſal Ways of Inveſtigation*; as particularly, a Method of drawing of *Tangents* to all ſorts of *Curves*, a Method *de Maximis & Minimis*, *&c.* of finding the *Centers of Gravity and Oſillation*; of finding the *Unciæ*, *&c.* All the Parts alſo of *Common Arithmetick* are explained here, and its Application to *Anatociſm*, *Compound Intereſt*, and *Annuities*; together with the Doctrine of Surds, the Method of Extraction of Roots by *Converging Series*, and the entire Doctrine of Promotion; all kinds of Progreſſion, Fractions, Logarithms and Decimals: And I have alſo, from the beſt Authors I could get, collected an Account of the Ancient Weights and Meaſures of all Nations, and adjuſted them with our own; and have given you very large and uſeful Tables of the Values of all Modern or preſent Foreign Weights, Meaſures and Coins, compared with our own. I have inſerted alſo, from Dr. *Wallis*, a large Account of *Sexageſimal Fractions*. You will find here alſo the Deſcriptions and Uſes of both the Celeſtial and Terreſtial Globe; the Doctrine of the Sphere, according to the New and Old Hypotheſis; together with the Demonſtration and Practice of Spherick Projections *in Plano*; and moſt

of

of the uſeful things in *Aſtronomy*, as the *Phanomena*, *Paralaxes*, *Magnitudes*, *Motions* and *Diſtances* of the *Planets* and their *Satellites*; and in particular, the Incomparable Sir *Iſaac Newton*'s *Theory of the Moon*, and a very large Account of *Comets* from the ſame Author. You will have alſo the Ground and Practice of *Dialling*; the Nature and Uſe of *Opticks*; the taking all *Heights* and *Diſtances*; the *Menſuration* of *Surfaces*; *Gauging*; the *Art* of *Chronology*, *Geography*, *Coſmography*, *Muſick*, &c.

In *Gunnery* you have the Method of Shooting in Great Guns and Mortars, with Captain *Halley*'s and *Anderſon*'s Tables; and as to *Fortification*, I have conſulted the beſt Books and Drawings; and I believe the ſeveral Parts of a fortified Place are pretty well deſcribed, and the Plate belonging to this *Art*, at the End of the Book, comprehenſive, and done according to the beſt of the Modern Ways.

The Figures alſo of the Five Orders of Pillars in *Civil Architecture*, are, I hope, as inſtructive as they cou'd be of that Size; and as for the Terms of Art here, I took them from the beſt Author, as *Vitruvius*, *Vignola*, *Palladio*, and the *Parallel* by Mr. *Evelyn*.

Navigation is alſo largely treated of, and the whole *Art* taught under the Words *Plain* and *Mercator*'s *Sailing*, *and Traverſes*: And as to the *Variation of the Compaſs*, I have given you a very full and exact Account of it, from the Excellent Mathematician Capt. *Halley*, together with his Ingenious Hypotheſis for the Solution of its Variation; and Practical Rules to find the Variation of the Compaſs at Sea.

And as to a Ship, I have endeavoured to be very full and particular in deſcribing the ſeveral Parts of her, both in the *Dock*, when *Building*, and when *Rigg'd*, and *under Sail* at Sea: For I have conſulted the beſt *Draughts*, *Sections* and *Models* I could get a ſight of, have got what Helps I could from Captains and Maſters of Ships, and have often gone on Board my ſelf, to get the more ready Knowledge of this Affair; and I have compared it all with what we have already Printed of this Nature in Books and Deſcriptions of Ships; ſuch as *Manwaring*'s *Sea Dictionary*, *Boteler*'s *Sea-Dialogues*, *Philips*'s *Section of a Firſt Rate*, &c.

I have given alſo, from ſeveral Eminent Hands, and ſeveral Ways, the *Laws of Motion*: As from Dr. *Wallis*, Sir *Iſaac Newton*, Monſieur *Varignon*, Mr. *John Keil*, &c.

And the Doctrine of *Mechanicks*, *Nature* and *Properties* of *Staticks*, the Laws of *Pendulums*, and of *Projectiles*.

And

And I have been very large in that moſt Uſeful Science *Hydroſtaticks*, giving an Account of the Principles and Practice of the *Art*, both Mathematically and Experimentally: And under the Word *Specifick Gravity*, I have given you all that the Honourable Mr. *Boyle* hath advanced on that Subject, in his *Medicina Hydroſtatica*; to which a large Table of the *Specifick Gravities* of different Bodies is added; and all his *Hydroſtatical Paradoxes* are inſerted in their proper Place.

I have deſcribed alſo, chiefly from Mr. *Derham*, the way of *Calculation* of *Automata*, or Clock and Watch-work; and explained the Terms of *Art* uſed in *Painting* and *Sculpture*.

As to *Phyſick* and *Natural Philoſophy*, and thoſe admirable Helps to the underſtanding of Nature, which *Geometry*, applied to *Phyſical Enquiries*, hath of late afforded us, and to which indeed we are chiefly indebted to that Prodigious Mathematician Sir *Iſaac Newton*: I have endeavoured to give you every where the Marrow and Subſtance of it under proper Heads: And under the Term of Art, or Word, expreſſing any particular *Quality*, I have collected all I could meet with to explain it, and to clear up its Nature and Properties; as you will find at large under ſuch Words as *Electricity*, *Solidity*, *Elaſticity*, *Effluviums*, *Magnetiſm*, *Light and Colours*, &c. As to which laſt, I'm ſorry I had not time to take no more from Sir *Iſ. Newton*'s Excellent Book of *Opticks* lately publiſhed; what I could, I have inſerted, as I had before done the Subſtance of what he had publiſhed in the *Philoſophical Tranſactions* on that moſt Noble Subject; and which convinces us that we were all miſtaken in our Notions about it before, for want of proceeding in a right Method of Enquiry.

The *Phænomena* of the *Rain-bow*, or *Iris*, are here accounted for from the Learned and Ingenious Capt. *Halley*, now *Savilian Profeſſor* of Geometry in *Oxon.*

The Account of *Snow* I give you from Dr. *Grew*: And one of *Ice* from the *French.*

I have collected what I could meet with as to *Sound*; but I wiſh that Quality were a little better conſidered.

You have here a very full Account of all the *Phænomena* and *Properties* of the *Air* and *Atmoſphere*, as its *Gravity*, *Spring* or *Elaſticity*, &c. and a full Deſcription of, and the Uſe of ſuch Inſtruments as have been invented to enable us to judge of them; as the *Barometer*, *Thermometer*, *Hygrometer*, &c. all which is chiefly from the Honourable Mr. *Boyle* and the *Philoſophical Tranſactions.*

The Account of *Springs* and Fountains is from Capt. *Halley* and Dr. *Woodward*: And from the former of theſe Learned and Ingenious

nious Gentlemen I have given you a new Theory of *Tides*, or a Solution of the *Phænomena* of the Ebbing and Flowing of the *Sea*, which is very plain, certain and intelligible, and built on Sir *Is. Newton's* Principles.

In *Botany* I have been as large as I could be, without giving Deſcriptions of Plants, which is contrary to my Deſign: But you have here, from our Mr. *Ray*, *Morriſon*, and Monſieur *Tournefort*, I believe, a pretty exact *Botanick Lexicon*, which was what we *really* wanted before: Together with an Account of all the ſeveral *Kinds*, and *Subalternate Species* of *Plants*, and their *Specifick Differences*; in which I have followed Mr. *Ray*'s Method, as appearing to me to be the beſt and moſt Natural.

A Table of *Foſſils* I have given you from the Accurate Dr. *Woodward*, Profeſſor of Medicine in *Greſham*-College: And a Scheme of *Metals* and *Stones* from Biſhop *Wilkins*'s Real Character.

I have alſo given you a large Account of *Vegetation*, which is very curiouſly and exactly done from the Experiments and Obſervations of Dr. *Woodward*.

You have here alſo a good Account of the Nature and Property of the *Wind*, from Capt. *Halley*: And a Deſcription of Mr. *Papins*'s *Wind-Gun*, from Mr. *Boyle*.

From which laſt Excellent Gentleman I have alſo taken what I ſay about the Nature and Properties of *Cold*.

And likewiſe from Capt. *Halley* and Sir *Is. Newton*, is collected all that which you will find under the Word *Heat*.

In *Chymiſtry*, the Knowledge of which is one great help towards the Underſtanding of Nature, I have been large and particular; explaining the Chymical Principles, Veſſels, and Degrees of Fire; and have omitted no Proceſs nor Operation of Uſe, that I cõuld either meet with in Books, or get from my Friends; as the Reader will ſoon ſee, by conſulting the Book it ſelf, under ſuch Words as *Phoſphorus*, *Bolonian Stone*, *Sympathetick Inks*, *Tranſmutation*, &c.

In *Anatomy* I have been very large and full, deſcribing all the Parts of an Humane Body, both Internal and External: And tho' indeed the Figures for this Part are much leſs than I could have wiſhed them to be, (for the Book hath ſo much out-run the Expence the Undertakers at firſt propoſed, that they would not be brought to have larger Cuts;) yet I hope the Deſcriptions, in moſt Places, will prove tolerably Accurate and Inſtructive; eſpecially under ſuch general Words, as *Blood*, *Circulation*, *Bones*, *Heart*, *Ear*, *Eye*, *Viſion*, *Arteries*, *Veins*, *Bile*, *Lympha*, *Chyliſication*, &c. in all which I have conſulted the Beſt Authors.

In

The PREFACE.

In *Logick*, *Metaphyſicks*, *Ethicks*, *Grammar*, *Rhetorick*, &c. I have been deſignedly ſhort; giving uſually the bare Meaning only of the Words and Terms of Art, with one or two Inſtances to explain them, and illuſtrate them.

In *Hiſtory* and *Chronology*, you have what properly belongs to them as *Arts*; as an Account of the *Civil* Computation of Time; the Original and Reduction, one to another, of the ſeveral *Æra*'s, *Epocha*'s, *Periods*, &c.

In *Heraldry* I have given you the entire Art of *Blazoning* and *Marſhalling* a *Coat of Arms*; and explained all the *Ordinaries*, *Charges*, *Bearings*, &c. by Figures: But have ſaid nothing of Families (any further, than that ſuch a Coat belongs to ſuch a Name) my Deſign being only to explain the *Art* and its *Terms*.

As to the Deſcription of the *Mathematical* and *Philoſophical Inſtruments*; ſome of them (as the moſt uſeful) are largely done, but the others as briefly: For as it would have taken up a large Volume to have deſcribed them all; ſo for many of them, the Reader would not have been much the better. But the *Globes* and *Quadrants* are largely treated of, as are *Teleſcopes*, *Microſcopes*, *Baroſcopes*, *Hygroſcopes*, and the *Pneumatick-Engines*, or *Air-Pumps*; becauſe theſe are of vaſt Uſe and Benefit to Mankind, and have ſerved to improve and raiſe up the Knowledge of Nature to that good Height it is now arrived to, and I hope will carry it yet much further.

And as I have uſually taken particular Care to give all Authors their juſt Due, from whom I have taken any conſiderable Part of my Materials, without Partiality, ſo I have deſignedly done Juſtice to ſuch Ingenious and Induſtrious Artificers, as do truly deſerve the greateſt Encouragement for their Skill and Accuracy, in the making of thoſe Inſtruments: Such are Mr. *John Rowley*, *Mathematical Inſtrument-maker*, under St. *Dunſtan*'s-*Church* in *Fleet-ſtreet*: Mr. *Yarwell* late, and Mr. *Marſhal* now, *Perſpective-Makers* in *Ludgate-ſtreet*: Mr. *Hawkesbe*, who makes *Air-Pumps* and all *Pneumatick-Engines*, in *Wine-Office Court* in *Fleet-ſtreet*: And Mr. *John Patrick*, the *Torricellian Operator* in the *Old-Baily*, who makes all kinds of *Barometers* and *Thermometers*; as you will find I have done in the proper Places: And I can't here omit mentioning the Ingenious Mr. *Wilſon*, which I could not do in the Book, becauſe thoſe Sheets about the *Microſcope* were Printed off before I had ſeen Mr. *Wilſon* or his Glaſſes: But I muſt now do him that Juſtice to ſay, That of all the *Microſcopes* I have ever ſeen for Commodiouſneſs, various Uſes, Portability, and Cheapneſs, I never met with any thing like Mr. *Wilſon*'s Glaſſes. They are particularly deſcribed in the *Philoſophical Tranſactions*, *N.*

As

The PREFACE.

As to the *Law Part* of the Dictionary, I did my ſelf actually conſult the beſt Books and Dictionaries I could get recommended to me; and from thence I tranſcribed, abridgedly, all that ſeem'd neceſſary to be inſerted here; and ſince that, I have had it carefully examined and corrected by a Gentleman of known Ability in that Profeſſion.

And thus having given you a ſhort Account of what you may expect to find in this Work, and which may perhaps ſatisfy the Reader that it is a Book uſeful to be *read carefully over*, as well as to be conſulted like other Dictionaries occaſionally: I ſhall next fairly acquaint you wherein it is defective, and what Improvements may be made of it hereafter, in an additional Volume.

The Catalogue, Right-Aſcenſions, Declinations, *&c.* of the *Fixed-Stars*, is very imperfect; the Reaſon of which is, That Mr. *Flamſteed*, upon whom I thought I might depend, was pleaſed to refuſe me any Communication of that kind; elſe I would have given thoſe Things under the Name of each Star or Conſtellation.

There are alſo, I doubt, here and there ſome Words which my *Amanuenſis*, or *Aſſiſtant*, tranſcribed from other Dictionaries, which are not ſo well explained as they ſhould be, and which (among ſo many Thouſand Words as I had to range into Order) have eſcaped a Review; but I have corrected as many of them as I could in each Sheet as the Book was printing off.

I would have had alſo at the End of the Book, a particular *Alphabet* for each *Art* and *Science* by it ſelf; and ſome more and larger Copper-Plates in *Anatomy*, and of the *Outſide*, *Rigging*, and the *Section* of a *Ship*: But the Undertakers could not afford it at the Price propoſed, the Book having ſwelled ſo very much beyond the Expectation: But whatever Alterations, Amendments, Improvements and Additions ſhall be hereafter, as I queſtion not but many of the latter ſort Time will produce, if God pleaſe to Bleſs me with Health and Leiſure, theſe ſhall all be printed in a Volume by themſelves, and ſo by no Means be prejudicial to the firſt Impreſſion.

LEXICON TECHNICUM;

OR AN

UNIVERSAL *ENGLISH*

DICTIONARY

OF

Arts and Sciences.

ABACOT, the Cap of State, uſed in old time by our *Engliſh Kings*, wrought up in the Figure of two Crowns.

ABACTORS, the ſame with *Abigei*, ſuch as ſteal and drive away whole Flocks of Cattle, or the greateſt part of any Herd or Flock; in which the Lawyers diſtinguiſh them from *Fures*, who only ſteal a Sheep or two, *&c.*

ABACUS, ſometimes ſignifies the A, B, C, ſometimes a Table of Numbers for caſting up Accounts, which was anciently of Braſs, and called then, *The Table of* Pythagoras. It ſignifies alſo, ſometimes the Numeral Figures, which uſed to be drawn on a Table covered with ſmall Sand or Duſt, as *Perſius* hints in theſe Verſes.

Nec qui Abaco numeros & ſecto in pulvere notas
Scit reſiſſe vafer ——.

ABACUS, in Architecture, is the four ſquare Table that makes the Capital on the Top of a Column, eſpccially thoſe of the *Corinthian* Order: and is a Drip or *Corona* to the Capital. It ſupports the nether Face of the Architrave and whole Trabeation. In the *Corinthian* and *Compoſite* Orders, the Corners of it are called, the *Horns*, the middle part the *Sweep*, and the *Curvature* the *Arch*; which commonly has a *Roſe* carved in the middle. See Vol. 2.

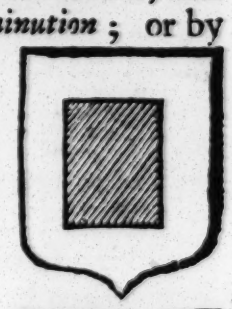
ABAFT, or *Aft*, a Sea Term, ſignifying always thoſe Parts which are towards the Stern of the Ship: So they ſay, Such a Maſt hangs *Aft* or *Abaft*, that is, towards the Stern. And becauſe the Maſter's or Captain's Cabbin is uſually in the hinder part of the Ship under the Quarter Deck, 'tis a common Complement to a Perſon come on Board a Ship, *Sir, will you pleaſe to walk Aft.*

ABALIENATION, a Term in the old *Roman* Law, ſignifying a ſimple Sale of the Goods of one Citizen to another: Theſe Goods were called, *Res mancupii*, or *mancipii*; and were Eſtates either in Slaves or Cattle, and ſometimes Land of Inheritance; but they muſt be in *Italy*.

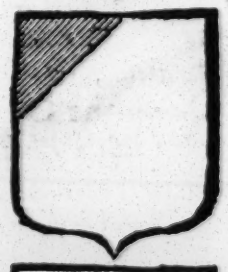
ABAPTISTON, or *Ana-baptiſton*, an Inſtrument uſed by Surgeons, the ſame with *Modiolus*, which ſee.

ABATE, *Abatement*, ſignifies in Law the taking Poſſeſſion of Land by a Perſon that hath no right to it, after the Death of the Anceſtor, and before the Entry of the right Heir. Alſo to *Abate a Writ*, ſignifies to deſtroy it for a time, thro' want of good Ground, or other Defect. So to *Abate a Nuſance*, is to deſtroy it, *&c.*

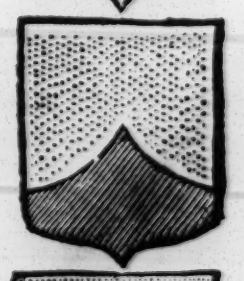
ABATEMENT *of Honour*, in Heraldry, is an accidental Mark annexed to a Coat of Arms, whereby its Dignity is abaſed by reaſon of ſome diſhonourable Quality or Stain in the Bearer, and 'tis either by adding a *Mark of Diminution*; or by *Reverſion* of the whole Eſcutchon. The *Marks of Diminution* are, 1. A *Delf Tenn*, which is a Square born in the middle of the Field, thus; and belongs to one that hath revoked his Challenge, or eaten his Words.



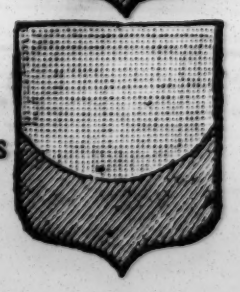
2. A *Point Dexter parted Tenn*: due to him that is a *Braggadocio*, or boaſts of more than he did, or can do.



3. A *Point in Point Sanguine*, thus; due to him that is Lazy and Sloathful in the Wars.



4. A *Point Champain Tenn*: which is due to him that kills his Priſoner after Quarter demanded and his Commander's Leave to give it; born thus.

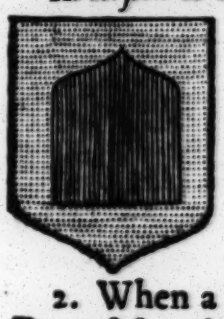


5. A *Plain Point Sanguine*, born thus; due to one that is a Lyar, and tells falſe Stories to his Sovereign.

6. A *Goar Siniſter Tenn*, born thus; and is due to him that is proved a Coward: But a *Goar Dexter* is not an Abatement.

7. A *Guſſet Sanguine*, born thus; where are two Guſſets one on each ſide. The Guſſet is an Abatement proper for an Effeminate Laſcivious Man; and is then born on the right ſide; but if he be given to too much Wine, the Guſſet is on the left ſide; if to both, he ſhould bear two Guſſets, as in this Example.

Reverſion is two fold, 1. When a Man bears in his own Eſcutcheon another Reverſed, as thus; which is due to a rude and uncivil Treater of Maid or Widow; or as ſome ſay, for Deflowering her only; and alſo, for one that runneth away from his Sovereign's Banner.



2. When a Man's own Eſcutcheon is entirely Reverſed, which is due to a Traitor.

N. B. Theſe Abatements are never charged with any thing; are always born ſingle, and their Colour is never of Metal, but always either *Murrey* or *Tawney*.

ABATOR, (in the common Law) is he that *abateth*, that is, intrudeth into a Houſe or Land void by the Death of the former Poſſeſſor, and not yet entered, or taken up by his Heir.

ABBROCHMENT, is the foreſtalling of a Market or Fair, by buying up the Wares before they are expoſed to Sale in ſuch Market or Fair, and then vending them again by Retail.

ABBUTTALLS, are the *Buttings* and *Boundings* of Lands any way, ſhewing how they lie in reſpect to other Places.

ABDICATION, a Term of the *Roman* Law, ſignifying ſeveral things; as the Abandoning of a Son, when he was expell'd his Father's Houſe and refuſed to be owned as his Child. *Abdicare Magiſtratum*, or *ſe Magiſtratu*, was to abandon or lay down the Office of a Magiſtrate. We meet there alſo with *Abdicare ſe ſtatu ſuo*; which ſignifies, a Man's renouncing his Condition to become a Slave, and to be degraded from the Priviledges of a *Roman* Citizen.

ABDICERE, ſignifies, to debar a Man from his Demands, or not to allow them: Thus *Abdicere vindicias* was in the *Roman* Law not to allow a Man the Poſſeſſion of thing in Controverſie, as *Addicere vindicias* is the very contrary.

Tho' the Word *Abdication* ſignifies ſtrictly an actual and voluntary Renouncing, yet in a larger Senſe, at common Law, it may be properly uſed where there is only an *Implicit Renounciation*; as when a Perſon does ſuch Actions which are inconſiſtent with the nature of his Truſt, he does in conſequence renounce it; and this was the late famous Caſe of a certain Prince, where this known and ancient Common-Law-Term was revived; tho' indeed 'tis more generally uſed among the Civilians.

ABDOMEN, the lowermoſt of the three *Venters* in an Human Body; properly the *Lower Belly*: It contains in its Region the Stomach, Guts, Liver, Spleen, Bladder, *&c.* within it is covered with a Membrane called the *Peritonæum*. The lower part of it is called the *Hypogaſtrium*. The foremoſt part is divided into the *Epigaſtrium*, the Right and Left *Hypocondria*'s, and the Navel. Tis bounded above by the *Cartilago Enſiformis* and the *Diaphragm*, ſideways by the ſhort or lower Ribs, and behind by the Vertebres of the Loins, the Bones of the *Coxendix*, *Pubis* and *Os Sacrum*. It hath ten Muſcles which both cover it and ſerve to excrete the *Fæces* and *Urine*, and to expel the *Fœtus* in Women: You will find them under their proper Names.

ABDUCTOR *Indicis*, is a Muſcle of the fore-Finger, which is not to be ſeen till the *Abductor Pollicis* is raiſed; by ſome it is reckoned amongſt the *Interoſſei*; it ariſes Fleſhly from the *Os Metacarpi* that ſuſtains the Fore-finger, and deſcending over the firſt Internode of the ſaid Finger becomes Tendinous, joyning with the Tendon of one of the Lumbrical Muſcles, and is inſerted with it together with the Tendon of the former Muſcle. Its Name intimates its Uſe, in drawing the Fore-finger from the reſt.

ABDUCTOR *Oculi*, a Muſcle of the Eye, ſo called from its Action in retracting or drawing off the Eye from the Noſe: It is alſo called *Indignabundus*, becauſe it is made uſe of in ſcornful Reſentments.

ABDUCTOR *minimi digiti*, is a Muſcle which appears in ſome Bodies divided into two or three Muſcles, having each a differing Series of Fibres; the firſt of which ſeems to be a *Flexor primi Internodii minimi digiti*; the ſecond an *Abductor* of the ſame; the third *Abductor Secundi & Tertii Internodii*; but this Diviſion is not conſtant. It ariſes fleſhly, firſt, from the *Ligamentum Tranſverſale* and fourth Bone of the *Carpus*; Secondly, from the third Bone of the *Carpus*; and then, Thirdly, from the ſuperior Parts of the ſubjacent *Os Metacarpi*: The two firſt continue fleſhy to their Inſertions; the former terminating at the ſuperior Part of the firſt Bone of the Little-Finger forwards; the latter ending at the ſame part of the ſaid Bone laterally; the Third becoming Tendinous like the *Interoſſei*, is inſerted like them with the Tendon of the *Extenſor Minimi Digiti* at the ſuperior part of the third Bone of the Little-Fingar. Its Uſe is to draw the Little-Finger from the others.

ABDUCTOR *Pollicis*, is a Muſcle of the Thumb, which ariſes broad and fleſhy from the internal part of the *Ligamentum Tranſverſale Carpi*, whence deſcending it leſſens it ſelf, and becomes Tendinous, at its Implantation to the ſuperior and external part of the ſecond Bone of the Thumb laterally. This draws the Thumb from the Fingers, from whence it derives its Name.

ABDUCTOR *Pollicis Pedis*, is a Muſcle which ariſeth fleſhy from the *Os Calcis* internally and laterally, in half its Ptogreſs becoming Tendinous, it joins with another fleſhy beginning, ſpringing from the *Os Cuneoforme Majus* that ſuſtains the *Os Metatarſi* of the Great Toe; both which making one Tendon are inſerted to the external part of the *Os Seſamoides* of the Great Toe laterally. This pulls the Great Toe from the reſt. ABDU-

ABDUCTOR *Minimi Digiti Pedis*, is a Muſcle which ariſeth outwardly Tendinous, but inwardly Fleſhly, from the external part of the *Os Calcis*, becoming Tendinous in half its progreſs on the outſide of the Foot; it joyns with the other fleſhy part of this Muſcle ariſing fleſhy from the outſide of the *Os Metatarſi* of the Little Toe, and making one Tendon as its Inſertion to the upper part of the firſt Bone of the Little Toe externally and laterally. Its Uſe is to draw off the Little Toe from the reſt.

ABDUCTORES, in the general are the ſame with *Abducent Muſcles*.

ABDUCENT *Muſcles*, are univerſally thoſe which ſerve to open or pull back divers parts of the Body, as the Arms, Legs, Eyes, Noſtrils, Lips, *&c.* Theſe are called alſo *Abductors*. Their Oppoſites are uſually called *Adductors* or *Adducent Muſcles*.

ABETTORS, is a common Law Term, and ſignifies thoſe that without Cauſe procure others to ſue out falſe Appeals of Murder, or Felony againſt Men, in order to render them infamous.

ABETTORS, in Murder, are thoſe which adviſe or procure a Murder to be committed; in the ſame ſenſe there are *Abettors* in Felony and Treaſon; in the laſt of which they are all *principals*, there being no Acceſſories in Treaſon.

ABELITION, the Licence given to a Criminal Accuſer, to deſiſt from further Proſecution.

ABEYANCE, in Law ſignifies a Thing's being *in Poſſe* only and not in *Actu*: Thus ſuppoſe a Leaſe made to *A.* for Term of Life, and the Remainder to the right Heir of *B.* who is living at the time of the Grant; in this caſe, tho' the Remainder paſs preſently from the Grantor, yet it veſts not preſently, or takes hold in the Grantee, that is the Heirs of *B.* but is Indeterminate, *in Potentia*, *in Nubibus*, in *Abeyance*, *viz.* in Conſideration of Law: So when the Parſon of a Church dies, and the Church is void; the Fee is in *Abeyance*, becauſe it is not determined who ſhall ſucceed him.

ABISHERISING, and in ſome Copies, *Miſherifing*, is (in Common-Law) being acquitted of *Amerceaments*, before whomſoever, of Tranſgreſſion prov'd.

ABJURATION, formerly was an Oath which a Perſon who had committed Felony, and who, to avoid the Law, had betaken himſelf to Sanctuary, took to depart the Kingdom for ever: It was a Law enacted by *Edward the Confeſſor*, but is ſince changed by the Statutes, 21 *H.* 8. *c.* 2. 22. *H.* 8. *c.* 14. 32. *H.* 8. *c.* 12. But the Senſe of the Word *Abjurate*, originally, in the *Roman* Language, as it is uſed by *Cicero* and other good Writers of that Age, was, *To deny a thing upon Oath*; to deny that a Man had *promiſed*, *committed*, *detained*, or *did owe* any thing, upon his Oath. Thus with him *Abjurare Creditum* was to forſwear a Debt, or to deny on Oath that he ow'd the Debt.

ABLACATION, the weaning of a Child that hath ſucked its full time. Alſo a kind of Grafting, when the Cyon remaineth on its own Stock, and the Stock you graft it on, together, till ſuch time as they are ſurely incorporated; then the Cyon is cut from its *own*, and lives only by the *other* Stock.

ABLAQUEATION, a laying open or baring the bottom of the Trunk, and Roots of Trees, that ſo being expoſed to the Air, the Sun, and the Rains, they may the better fructify, or bear fruit the enſuing Year.

ABLATIVE *Caſe*, is the laſt of the ſix Caſes of Nouns and Participles in Grammar, and is ſo called, becauſe it uſually takes away one thing from another. 'Tis called alſo the *Latin Caſe*, becauſe almoſt peculiar to the Latin Tongue, and is uſually connected with ſome Prepoſitions, which ſerve to determine it.

ABLUTION, the Preparation of a Medicine in any Liquor, to cleanſe it from its Impurities.

ABLUENT *Medicines* are the ſame with *Abſtergent*, which ſee.

ABNODATION, in Agriculture, ſignifies the pruning of Trees, and cutting off Knots and Knobs.

ABOLITION, in Metaphyſicks, is an utter Deſtruction of any Being.

ABOLITION of a Law, is the perfect repealing it, or the entire taking of it away, ſo that it ſhall never have Force again.

ABOMASUS, one of the Stomachs of *Ruminant* Animals or ſuch as chew the Cud; of which are reckoned four, the *Venter*, *Reticulum*, *Omaſus*, and *Abomaſus*.

ABORIGINES, are ſuch Nations as the *Italians*, who pretend antiently to be without Original or Derivation from any other Nation or People.

ABORTION, the bringing forth of a Child (or *Fœtus*) before its due time.

ABORTIVE, is ſpoken of a *Fœtus* brought forth before its time: Hence 'tis alſo an Epithet given to any Deſign or Purpoſe that miſcarries.

ABRENUNCIATION, is a renouncing or forſaking of any thing entirely.

ABREVIATIONS, are Contractions in Writing or otherwiſe, whereby any thing that is written or ſpoken, is contained in, or takes up much leſs Room, than it would do, if written or delivered at large.

ABRIC, with ſome Chymiſts the ſame with *Sulphur*.

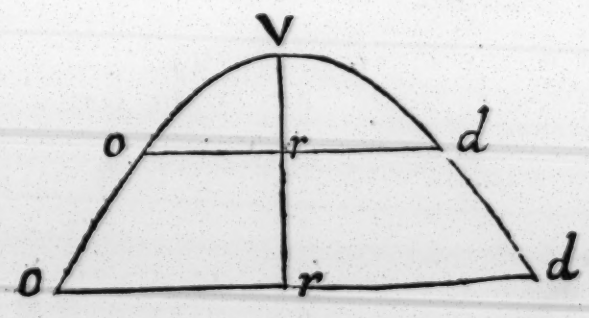
ABRIDGMENT of a Plaint, in Common-Law, is, when one Part of the Plaintiff's Demand is left out, and it is pray'd that the Defendant may anſwer to the other.

ABROGATE, ſignifies to diſanul or repeal; as to *Abrogate* a Law, is, to lay it aſide or to repeal it. So that the

ABROGATION of a Law, is the repealing it, or taking it quite away.

ABSCESSE, an Ulceration ariſing in any Part of the Body after a *Criſis*: The ſame with *Apoſtema*.

ABSCISSÆ, in Conick Section, or other Curvilineal Figure, are the Parts of the Axis cut off by the Ordinates, and accounted downwards from the Vertex of the Section. Thus *V r* or *V R* are the *Abſciſſæ* in this Figure. Theſe are called by ſome Writers, the *Intercepted Axes* or *Intercepted Diameters*.



ABSIS, the ſame with *Apſis*, which ſee.

ABSOLUTE: This Word (which ſignifies free from the Power of another) is variouſly uſed. Sometimes the Terms of a Propoſition are ſaid to be taken *Abſolutely*, that is, without relation to any thing elſe. A Prince is ſaid to be *Abſolute*, when

he makes his *Will* his Law, will in no reſpect be reſtrained or limited by the Laws of his Country. This is otherwiſe called Arbitrary Power; and ariſes from an Imperfection both in the Underſtanding of the Prince, and in the Spirits of the People. But God Almighty is *Abſolute* from the Perfection of his Nature, as containing in himſelf all poſſible Power, and lying under no Limitations nor Reſtraints from any one. *Abſolute* is ſometimes taken alſo in Oppoſition to Terms or Conditions; thus God doth not forgive Men their Sins *Abſolutely*, but on Condition of their Repentance and Amendment; and a Prieſt cannot abſolve Men from the Guilt of their Sins *Abſolutely*, but only declaratively and Miniſterially, on the Condition of the Perſon's Penitence and Reſolutions for Amendment. So (in Law) an *Abſolute* Eſtate is one free from all manner of Conditions.

ABSOLUTE *Number*, in an Equation in *Algebra*, is that which *Vieta* calls the *Homogeneum Comparationis*, and which always poſſeſſeth one entire part or ſide of the Equation, and is always a known Quantity; and the Rectangle or Solid, under the unknown Roots, in Quadraticks and Cubicks. Thus in this Equation $aa+16a=36$. The Abſolute Number is 36, which is equal to the Product of the two Roots or Values of *a*, multiplied one into another.

ABSOLUTE *Equation*, in Aſtronomy, is the Aggregate or Sum of the Eccentrick and Optick Equations. See *Equation*.

ABSORBENTS, are Medicines that temper and qualify the Acid Juices in the Body, by imbibing or drinking them up. Thus *Alkali*'s are ſaid by ſome to abſorb Acids.

ABSTENSION, in Law, is a with-holding an Heir from taking Poſſeſſion of his Land.

ABSTERGENT, or *Abſterſile* Medicines, are ſuch as are uſed to clear the Skin or Superficial Parts of the Body from any Filth, *&c.* obſtructing its Pores.

ABSTERSION, is the Effect produced by Abſterſive Medicines, or in general, any cleanſing or wiping away.

ABSTRACTION, is a Power peculiar to the Mind of Man, in Contradiſtinction to the Souls of Beaſts, and plainly diſtinguiſhes Him from Them; whereby he can make his Ideas, ariſing from particular Things, become general Repreſentatives of all of the ſame kind. Thus, if my Eye repreſents to me Whiteneſs in a Wall, I can *Abſtractedly* conſider that Quality of Whiteneſs, and find it attributable to many other things beſides, as to Snow, to Milk, or the like; and this Quality, whatever it be, thus conſidered apart from the *Concrete*, or the Subject in which it inheres, is ſaid to be taken in the *Abſtract*.

ABSTRACT, is frequently uſed alſo for a ſmall Draught or Epitome of any greater Work.

ABSTRACT *Numbers*, are thoſe which are conſidered as *Pure Numbers*, without being applied to any Subject; and ſo *Abſtracted Mathematicks*, is uſed in Oppoſition to *Mixt Mathematicks*; the former ſignifying pure *Geometry* or *Algebra*; and the latter Opticks, Dialling, Navigation, *&c.* where Phyſical Conſiderations are connected with the Mathematical.

ABSTRUSE, ſecret, dark, not eaſily intelligible.

ABUNDANT *Numbers*, are thoſe whoſe Parts added together, make more than the whole *Number* which they are Parts of; as *v. g.* Twelve, whoſe Parts being 1, 2, 3, 4, and 6, theſe all added together make Sixteen: Thus alſo the Parts of 20 make 22, *&c.*

ABUS, ſee *Apſis*.

ABYSS, is any vaſt deep Place, which either hath no Bottom, or elſe hath none diſcernable, or at leaſt is ſuppoſed to have none.

The Learned Dr. *Woodward*, in his *Natural Hiſtory of the Earth*, P. 117. tells us, That there is a mighty Collection of Waters incloſed in the Bowels of the Earth, conſtituting an huge Orb in the Interiour or Central Parts of it; and over the Surface of this Water, he ſuppoſes the Terreſtrial *Strata* to be expanded: This is what *Moſes* calls *the Great Deep*, and what many Authors call *the Abyſs*. And that there is ſuch a vaſt Collection of Waters lodged in the Bowels of the Earth, is confirmed by abundance of Obſervations.

The Water of this vaſt Abyſs the Dr. aſſerts, doth communicate with *that* of the Ocean by means of certain Holes, *Hiatus's* or *Chaſms* paſſing betwixt it and the Bottom of the Ocean: And this and the Abyſs he ſuppoſes to have one common Centre, around which the Water of both of them is placed; but ſo, that the ordinary Surface of the Abyſs is not level with that of the Ocean, nor at ſo great a diſtance from the Centre as that is, it being for the moſt part reſtrained and depreſſed by the *Strata* of Earth lying upon it; but wherever thoſe *Strata's* are broken, or ſo lax and poroſe that Water can pervade them, there the Water of the Abyſs doth aſcend, fills up all the Clefts or *Fiſſures* whereinto it can get Admittance or Entrance, and ſaturates all the Interſtices and Pores of the Earth, Stone, or other Matter all around the Globe, quite up to the Level of the Ocean.

ACADEMY, is a kind of higher School or Univerſity, where young Men are inſtructed in the Liberal Arts and Sciences. 'Twas ſo called at firſt from *Academia*, the Name of a Place near *Athens*, and built, ſay ſome, by *Cadmus* the *Phœnician*; others, by one *Academus*, whence it had its Name: 'Twas planted with Trees; and here *Plato* taught his Diſciples Philoſophy, who from hence are called *Academicks*. *Cicero* alſo call'd one of his Country Seats by this Name, where he had fine Groves, and pleaſant Walks for the Entertainment of his Philoſophical Friends; and here he wrote his Books, *D. Nat. Deorum* and *De Amicitia*, and his *Offices*, which therefore he called his *Academical Treatiſes*.

ACADEMICKS; ſo the Followers of *Plato* were anciently called, becauſe they ſtudied in the *Academia*. Afterward it became the Name of a Sect of Sceptical Philoſophers, who maintained, That all things were uncertain, and that Reaſon and Truth were changeable, ſo that Men ought to doubt of every thing, and believe nothing.

ACANTABOLUS, the ſame with *Volſella* (excepting that the *Volſella* is crooked) a Surgeon's Inſtrument to take out any thing that ſhall happen to ſtick in the *Oeſophagus* or Gullet; 'tis ſomething like a Pair of Plyers, and may be reckoned as a kind of *Forceps*.

ACANTHA, is with ſome Anatomiſts the moſt backward Protuberance of the Vertebres of the Back; and is otherwiſe called, *Spina Dorſi*.

ACARNAR, the ſame with *Acherner*.

ACATALECTICK *Verſe*, is one exactly perfect, where not ſo much as one Syllable is either redundant or deficient.

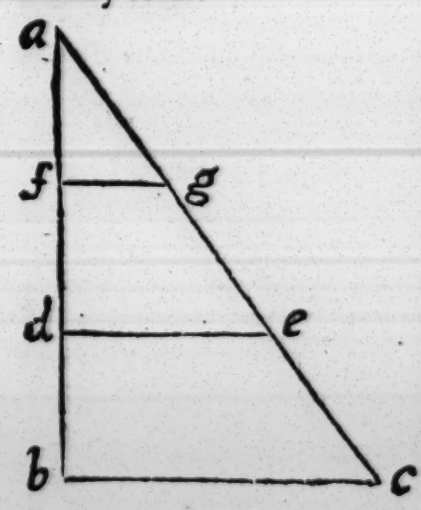
ACCEDAS *ad Curiam*; a Writ made out of the Chancery, and Returnable in the King's Bench or Common Pleas, and directed to the Sheriff, requiring him to go to the Court of ſome Lord, or Franchiſe, (where a Plaint is ſued for taking of Cattle as a Diſtreſs, or any falſe Judgment ſuppoſed to be made in any Suit in ſuch a Court, which is not a Court of Record) and there make a Record of the ſaid Suit, in preſence of the Suitors of the ſaid Court, and alſo of four other Knights of the ſame County; and to certify it unto the King's Court, at the Day limited in the Writ.

ACCEDAS *ad Vice Comitem*, is a Writ directed to the Coroner, requiring him to deliver a Writ to the Sheriff, who having a *Pone* delivered to him, ſuppreſſes it.

ACCELERATION of the Deſcent of heavy Bodies was firſt diſcovered by *Galilæus*: And if due Attention be given to our excellent Sir *Iſaac Newton*'s Second Law of Motion, *Axiom*, or *Law of Nature*, as it may be called, *viz. That the Mutation of Motion is always proportionable to the Force impreſſed, and always is according to that ſame Line of Direction*, the Reaſon of the Acceleration of the Deſcent of heavy Bodies, will be very clear and intelligible.

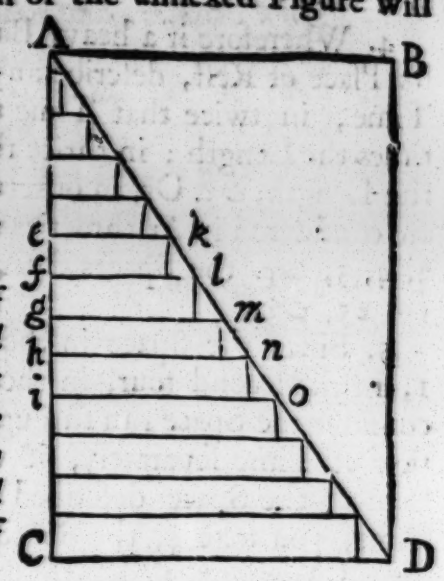
For, ſuppoſing Gravity (whatever it be) to act uniformly on all Bodies, at equal Diſtances from the Earth's Centre, and that the Time in which any heavy Body falls to the Earth, be divided into equal Parts infinitely ſmall: Let Gravity encline the Body towards the Earth's Centre, while it moves in the firſt infinitely ſmall Part of the Time of its Deſcent: If after this, the Action of Gravity be ſuppoſed to ceaſe, the Body would go towards the Earth's Centre equally, with a Velocity equal to the Force of that firſt Impreſſion, (by Sir *Iſaac*'s firſt Axiom.) But now ſince the Action of Gravity ſtill contiunes; in the ſecond Moment of Time the Body will receive a new Impulſe downward, and then its Velocity will be double of what it was in the firſt Moment: In the third Moment or Particle of Time, it will be Triple; in the fourth Quadruple, and ſo on continually. Wherefore ſince thoſe Particles of Time are ſuppoſed infinitely ſmall, and all equal to one another, the *Impetus* acquired by the Falling Body, will be every where as the Times from the Beginning of the Deſcent. And ſince the Quantity of Matter in the Body given, continues the ſame, the Velocity will be as the Time in which it is acquired (as you will find proved in the *Laws of Motion*.)

And after the ſame manner may it be proved, That the Motion of Aſcending Projectives ſhall be equably retarded; for ſince the Force of Gravity acts continually and equally againſt the Motion firſt begun, it muſt diminiſh or abate the Motion, according to the Time of the Aſcent, till at laſt it wholly ceaſe.



Let the Right Line *a b* expreſs the Time of any heavy Body's Deſcent, and let *b c* at right Angles to it, denote the Velocity acquired at the end of the Fall. Draw *a c*, and any where the two Parellels *f g*, *d e*, ſo they ſhall expreſs the Velocities acquired in the Times of Deſcent *a f* and *a d*. For becauſe of ſimilar Triangles, *ab. ad* : : *bc. de* : : and as *ad. af* : : *d e. fg*. wherefore 'tis plain, the Velocities are as the Times of Deſcent; that is, as the Lines or Elements of the Triangle *a b c*, drawn parallel to the Baſe *b c*.

The Conſideration of the annexed Figure will teach us, *That if an heavy Body be thus uniformly accelerated in its deſcent; the Space which it deſcribes from the beginning of the Time of its Motion, ſhall be juſt the half of that which it would have deſcribed, had it gone on for the ſame Time with a Velocity equal to what it had acquired in the end of its fall.*



Let (as before) *A C* repreſent the Time of the Deſcent, *D C* the Velocity at laſt acquired; and compleat the Triangle *A C D*. Let alſo the Time *A C* be diſtinguiſhed into an indefinite Number of ſmall Parts, as *e f*, *f g*, *g h*, *h i*, &c. and draw the Parallels *e k*, *f l*, *g m*, *h n*, *i o*, &c. to the Baſe *C D*. Then will *e k* be as the Velocity of the heavy Body, in the infinitely ſmall part of Time *e f*, and *f l* will be the Velocity in the ſmall Time *f g*, &c.

But now 'tis proved in the Laws of Motion, (ſee that Word) That the Space or Length deſcribed by any moving Body, in any given Time, and with a given Celerity; is *as the Rectangle under the Time and the Celerity*, wherefore the Space deſcribed in the Time *e f*, with the Celerity *e k*, will be as the Rectangle *f k*; and the Space deſcribed in the Time *f g*, with the Celerity *g m*, will be as the Rectangle *g l*, &c. wherefore the Space run thro' in the Sum of all theſe Times, will be as the Sum of all the Triangles; that is, as the Triangle *A C D*, which contains them all. Again, the Space run thro' by the deſcending Body in the Time, *A C*, with the uniform Celerity *D C* (*by the 7th Article of* Mr. Keil's *Laws of Motion above referred to*) will be as the Rectangle *A B C D*. Wherefore the Space run over by the deſcending Body in the given time, and uniformly Accelerated) is to the Space deſcribed by the ſame Body, in the ſame Time with an uniform Celerity equal to what it at laſt acquires : : as the Triangle *A D C*. is to the Rectangle *A B C D*. But the Triangle is one half of the Rectangle; wherefore the Space deſcribed by the Accelerated deſcending Body from the beginning to the end of its Motion, in a given Time, is juſt the half of the Space which would be deſcribed by the ſame Body if it had gone on, for the ſame Time, with a Velocity equal to what it had acquired in the end of its Fall. *Q. E. D.*

From whence it will follow, 1. That the Space run over with the Velocity *C D* in half the Time *A C*, will be equal to the Space deſcribed by the falling Accelerated Body, in the whole Time *A C*.

2. As the Triangle *A C D* repreſents the Space paſſed thro' in the Time *A C*, ſo the Triangle *A i o*, will repreſent the Space deſcribed by the falling Body in the Time *A i*; and the Triangle *A e k*, will repreſent that deſcribed in the Time *A e*, &c. Wherefore

3. Tis

3. 'Tis plain, the Spaces deſcrib'd, or the Diſtances run thro' in the Fall, will always be as the Squares of the Times: For the ſimilar Triangles *A C D*, *A i o*, *A e k*, &c. are to one another as the Squares of their Homologous Sides *A c*, *A i*, *A e*.

4. Wherefore if a heavy Body deſcending from its Place of Reſt, deſcribe any Length in a given Time, in twice that Time it will deſcribe four times the Length; in thrice the Time, nine times the Length, *&c.* Or, in other Words, if the Times are conſidered in Arithmetical Proportionals, 1, 2, 3, 4, 5, *&c.* the Spaces deſcribed will be 1, 4, 9, 16, 25, *&c.*

5. Since the Space in the firſt part of Time is 1, in the ſecond four, in the third 9, *&c.* if you conſider the Space run through in the ſecond Particle of Time ſeparately, it will be as 3; and if from 9, the Space deſcribed in the third part of Time, you take 4, the Space before deſcribed in the 2d Moment, there will remain 5, *&c.* wherefore ſuppoſing the Moments or Parts of Time equal, the Spaces deſcribed by the Deſcent of an heavy Body beginning from Reſt, in each Moment conſidered ſeparately, will be as the natural odd Numbers, 1, 3, 5, 7, 9, 11, 13, 15, 17, *&c.*

6. And ſince the Velocities acquired in falling, are as the Times, the Spaces run through will be alſo as the Squares of the Velocities; and both Times and Velocities will be in ſubduplicate *Ratio* of the Spaces deſcribed by any falling Body.

ACCELERATORES *Urinæ*, are a pair of Muſcles belonging to the *Penis*, whoſe uſe is to expedite the Urine and the *Genitura*: Our accurate Mr. *Cowper* ſaith, Authors have been miſtaken in aſſigning the Origination of theſe Muſcles, either to the *Sphincter Ani*, or to the Tubercles of the *Oſſa Iſchii*; for they ariſe Fleſhly from the ſuperior Part of the *Urethra*, as it paſſes under the *Oſſa Pubis*, encompaſſing the external Part of the Bulb of its cavernous Body; both theſe Muſcles meet on the inferior Part, and march on according to the Length of the Skin in the *Perinæum*, when parting from each other, they aſcend to their Inſertions on each ſide the *Corpora Cavernoſa Penis*. He thinks alſo, that they aſſiſt the *Erectores Penis*, by driving the Blood contained in the Bulb of the Cavernous Body of the *Urethra* towards the *Glands* in a greater Quantity, whereby it becomes diſtended: The Veins which carry off the Refluent Blood from the *Corpus Cavernoſum Urethræ*, being at that time compreſs'd by the ſwelling of theſe Muſcles.

ACCENSION, is the enkindling or ſetting any Body on Fire.

ACCENT *in Grammar*, is a Mark placed over a Syllable, to ſhew 'tis pronounced with a ſtronger or weaker Voice. The Greeks, who were the greateſt obſerver of Accents, diſtinguiſh them into the *Acute one* mark'd thus, (´), the *Grave* one thus, (`), and the *Circumflex* thus, (~). But of late one *Hennin*, a *Dutchman*, hath written a Book to prove the Accents were not ancient among the Greeks, and that that Language ought not to be pronounced according to them: He pretends no Accents are to be found in any MSS. above 800 Years old, and takes them to be an Invention of the *Arabs* about the time of *Mahomet*'s Death. He ſays, the *Maſſoretes* of *Tiberius* brought them into the Bible about the Sixth Century, and that they were perfected by *Rabbi Judah Ben David Ching*, born in *Fez*, about the Eleventh Century.

ACCENTS, in Grammar, ſhew how to judge of the Meaſure of Time; in which each Letter, Syllable, Word, or Expreſſion is pronounced; the Elevations and Depreſſions of the Voice, the Silence or Repoſe of the Voice at the End of Words or Sentences, *&c.* Theſe Accents may be very numerous: There are in the Hebrew Grammars more than thirty of them, and *Servius Honoratus* reckons eight in the Latin.

The *Acute Accent* ſhews when the Voice is to be raiſed, and is expreſſed thus (´).

The *Grave Accent* ſhews when the Voice is to be depreſſed, and is figured thus, (`).

The *Circumflex Accent* is compos'd of both the *Acute* and the *Grave*, and is expreſſed thus, (^).

The *Long Accent* ſhews that the Voice is to ſtop upon the Vowel that has that Mark, and it is expreſſed thus, (¯).

The *Short Accent* ſhews that the time of Pronunciation ought to be ſhort, and is marked thus. (˘).

Hyphen, is an *Accent* in Grammar, that implies two Words are to be joyned, as *male-ſanus*.

Diaſtole, is an *Accent* in Grammar, which ſhews that thoſe Words or Sentences to which it is adjoyned are to be ſeparated, its Mark is (,).

Apoſtrophe, is an *Accent* in Grammar, ſhewing there is a Vowel to be rejected, and is expreſſed thus, (') and placed over the Head of the Letter.

ACCENT *in Muſick*, is a Modulation of the Voice, to expreſs the Paſſions either Naturally or Artificially.

ACCEPTANCE, in Law, is an agreeing to ſome Act already done, which without ſuch Agreement, might have been undone or avoided; as if a Man and his Wife ſeized of Land in Right of his Wife, do joyn and make a Leaſe by Deed, reſerving Rent, and the Husband dying, the Wife *accepts* or receives the Rent: By this *Acceptance* in her, the Leaſe is made good, and ſhall bar her from bringing a *Cui in vita*.

ACCEPTILATION, in *Civil-Law*, is the ſame with *Acquittance* in *Common-Law*, being a Verbal Diſcharge from the Creditor to the Debtor.

ACCESS or *Acceſſion*, the Fit or *Paroxyſm* of a Diſeaſe.

ACCESSIBLE *Height*, is either that which may be mechanically meaſured by the Application of a Meaſure to it, or elſe an Height whoſe Baſe and Foot can be approached to; and from thence a Length meaſured on the Ground.

ACCESSORIUS *Williſſii*, is a Nerve which ariſes from the *Medulla Spinalis*, about the beginning of the ſixth Pair of the Neck; as it aſcends to the Head, it receives on each ſide a Twig from the firſt five Pair of Nerves of the Neck; as they riſe from the *Medulla Spinalis*; then it enters the Skull, and paſſes out of it again with the *Par Vagum*, and is wholly ſpent upon the *Muſculus Trapezius*.

ACCESSORY, in the Common-Law, is a Perſon adviſing or procuring before the Fact, or aiding and aſſiſting, receiving or protecting after it, one that hath committed Felony; who therefore ſhall have Judgment of Life and Member, as well as the Principal which did the Felony, but not till the Principal be firſt attainted, convict, or outlawed thereupon. A Man alſo may be Acceſſory to an Acceſſory, by aiding, receiving, *&c.* an Acceſſory to Felony. In the *Statute-Law* 'tis ſuch an one

as abetts, adviſes, aids or receives one that commits Felony, which is made ſo by Statute.

ACCIDENT: This Word is uſed by Logicians in three Senſes.

1. In Oppoſition to the *Eſſence* of any Thing, whatever doth not eſſentially belong to it may (tho' a Subſtance it ſelf) yet be an *Accident* or Adjunct to that Thing, or belong to it only accidentally, as the Cloths a Man hath on; the Money in his Purſe, *&c.* Theſe indeed are more properly called *Adjuncts*; and by the School-men are diſtinguiſhed by the Name of *Verbal Accidents*.

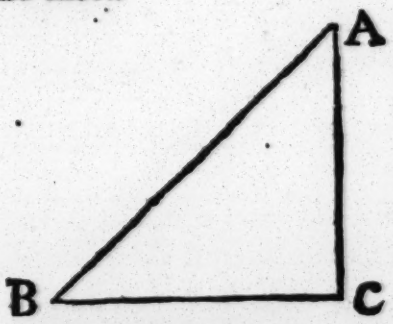
2. In Contradiſtinction to the *Eſſential Properties* of any Subject, many Qualities are called *Accidents*; becauſe they are there not *Eſſentially* but *Accidentally*. This in the Schools is called *Accidens Prædicabilis*, and implies a *Common Quality*, which may or may not be in any Subject, as any particular *Colour*, &c.

3. In Oppoſition to *Subſtance*, a Thing is called an Accident, when it is its Eſſence or Nature to *Inhere* or ſubſiſt in ſome Subſtance, and cannot be alone: And thus it is with all Qualities whatſoever. This is called *Accidens Prædicamentale*, and the nine laſt *Prædicaments* are in this Senſe Accidents.

In reference to its *Cauſe* alſo, or at leaſt as to our Knowledge of it, a Thing is frequently ſtiled an *Accident*, by which we mean an Effect either caſually produced, or which to us apppears to have been ſo.

ACCIDENTS (in Heraldry) are the *Points* and *Abatements* in an Eſcutcheon; which ſee.

ACCIDENTAL *Point*, in Perſpective is a Point in the *Horizontal Line*, where Lines parallel among themſelves, tho' not perpendicular to the Picture, do meet.



ACCLIVITY, is a Steepneſs reckoned upwards on a Slope Line, as *Declivis* is a ſteepneſs downwards. Thus *B A* is an *Acclivity*; *A B* a *Declivity*.

ACCOMODATE, ſignifies amongſt Geometers, to fit in a Line or Figure into a Circle, *&c.* ſo as the Conditions of the Propoſition or Problem require. See *Apply*.

ACCOMPT, a Writ in Law ſo called, lying againſt a Bailiff or Receiver, who will not give up his Accounts, or come to an Account for what he hath received. If the Auditors aſſigned him, find that he is in Arrears, they have Power by the Statutes of *Weſtm.* 2. *C.* 10. to award him to Priſon till he have made Satisfaction: But if they won't allow him reaſonable Charges, or if they charge him with more than he hath received, any Friend of his may ſue out a Writ *Ex Parte Talis*, from the Chancery, directed to the Sheriff, to take out four Main-Pernors, to bring his Body before the Barons of the Exchequer on a certain Day, and to warn his Lord or Maſter to appear there at the ſame time.

ACCORD, in Law, is an Agreement or Contract from one Man to another, to give him Satisfaction for ſome Treſpaſs or Damage done, which when executed and Performed, is a good Bar in Law againſt an Action of Treſpaſs for that Damage or Offence.

ACCRETION; nearly of the ſame Senſe with Augmentation, and is properly an Addition of Matter to any Body externally: This is uſually ſaid of the encreaſe of Bodies without Life, and is ſometimes called *Appoſition* or *Juxta Poſition*. But ſome will have the encreaſe of Living Bodies to be by *Introſumption* and *Aſſimilation* of the *Aliementary* or nouriſhing Particles.

Dr. *Havers* in his *Oſteologia* gives this Account of *Accretion*, that the Nutritious Particles being ſeparated by the Glandules placed every where on the ſides of the Arteries, are carried into thoſe ſmall Nervous Pipes, or Interſtices of the Fibres where the Spirits move, ſo that they fall in the way of the Spirit's Motion: Theſe Spirits he ſuppoſes to have a twofold Motion; one direct, the other *Rotatory* or turning round their *Axes*. While an Animal is capable of Accretion, and the Particles of which the ſolid Parts conſiſt are not entirely united at their Extremities, but are capable of receding one from another, both end-ways and laterally; the Spirits act upon the Nutritious Particles (which are of a Viſcous Nature) by their Rotary Motion, by which they carry them to the ſides of the Fibres and Bony Strings, driving ſome againſt the ſides of their Parts, and forcing them out laterally: Others they drive into the Interſtices between the Extremities, thereby lengthning every Series of them; where they are placed and fix'd, and thus the Parts of an Animal Body increaſe both in Thickneſs and Longitude. But after the Particles are united at their Extremities, and no longer capable of making Room to lode the Nutritious Parts out of the way of the Spirits direct Motion; then the Spirits come to act upon the Nutritious Matter by that Motion, and to drive it ſo through the Nervous Channels, that it has not the liberty of ſtopping and adhering; and ſo the Accretion of the Animal ceaſes.

ACETABULUM, is that Cavity in the Huckle Bone which is appointed to receive the Head of the Thigh Bone within it: Alſo certain Glandules in the *Chorion* are call'd *Acetabula*, concerning which (ſee *Cotyledones.*)

ACERB, is a Taſte betwen Sowre and Bitter, ſuch as moſt Fruits have before they are ripe.

ACETUM *Radicatum*, is the ſharpeſt part of Vinegar, when the Phlegm is drawn off.

ACETUM *Philoſophorum*; ſo ſome Chymiſts call that ſour Liquor which is made be diſſolving a little Butter or Icy Oyl of Antimony in a conſiderable Quantity of Water.

ACETUM *Alcaliſatum*, is diſtilled Vinegar ſalturated with ſome Alkalizate Salt.

ACHAMECH, with ſome Chymiſts ſignifies the Droſs of Silver.

ACHERNER, a bright fixed Star of the firſt Magnitude, in *Eridanus*, whoſe Longitude is 10. 31. of ♓, Latitude 59. 18.

ACHOLITE or *Acolite*, an inferior Church Servant, who, next under the Sub-Deacon, followed or waited on the Prieſts and Deacons, and performing the meaner Offices of lighting the Candles, and carrying the Bread and Wine, and paying other ſervile Attendance.

ACHOR, is a ſort of a cruſted Scab which makes an Iching and Stink on the Surface of the Head, and is occaſioned by a Serous, Salt and Sharp Matter: The difference betwixt an *Achor* and *Favus* conſiſts in this, that in *Achors* the Holes or Cavities are ſmall, and ſometimes not viſible; but

but in a *Fœtus* they are more large and conſpicuous.

ACHLYS, according to ſome, is a kind of Darkneſs in the Eyes, accounted one of the Species of *Amblyopia*, or Dimneſs of Sight.

ACHRONICAL, is uſed in Aſtronomy for the Riſing of a Star when the Sun ſets, or the Setting of a Star when the Sun riſes; in which Caſes the Star is ſaid either to riſe or ſet Achronically; which is one of the three *Poetical Riſings* or *Settings*.

ACIDITY, is the Taſt which Bodies that are *Acid* or Sharp affect the Mouth with: And thoſe Bodies are called

ACIDS, whoſe Particles are ſuppoſed to be longiſh, flexible, penetrating, and attenuating; and which have their Points ſharp and piercing. And theſe are either *Natural Acids*; which have a proper Acidity of their own, without the help of Art, as Juice of Limons, *&c.* or elſe *Artificial Acids*; which are made by Fire in Chymical Operations. So that *Acid Spirits* or *Stygian Liquors*, as the Chymiſts call them, from their Powers to deſtroy or diſſolve Bodies, ſeem to be nothing but an *Acid Salt* diſſolved, aud put into a violent Motion by the Fire: Theſe are called *Acid Menſtruums*. You may eaſily know whether any Liquor contain in it any *Acid Salt* or not, by dropping ſome of it on a little Syrup of Violets ſpread on white Paper; or in a Solution of Blue-bottle Flowers, *&c.* for then the Blue will be immediately turned into a Red or reddiſh purple Colour; whereas if it turn Green, 'tis a ſign the Liquors abounds with Salts of an Urinous or Lixiviate Nature; which how to diſtinguiſh, *ſee thoſe Words*. The Acidity of any Liquor may alſo be concluded by its being able to deſtroy the Blueneſs of a Tincture of *Lignum Nephriticum*: (See *Colours*, and the ways of producing ſudden Changes of them.)

ACIDULÆ, any Medicinal Waters that are not hot, like thoſe at the *Bath*, which are called *Thermæ*.

ACINUS, in Botanicks, doth not ſignify a Grape-ſtone, but the Fruit it ſelf of all ſuch Plants which bear it, in a manner reſembling Grapes: It is ſofter and more Juicy than a *Berry*, and therefore diſtingiſhable from it; as it is alſo becauſe the *Acini* grow in Bunches or Cluſters, and Berries often ſingle.

ACINIFORMIS *Tunica*, is the ſame with the *Uvea Tunica* of the Eye.

ACMASTICK *Fever*, with ſome, is the ſame as *Synochus*.

ACME, in general, ſignifies the Height or Top of any thing; the Word is more eſpecially uſed to denote the Height of a Diſtemper, many of which have four Periods. 1. The *Arche* or beginning. 2. The *Anabaſis*, or Growth and Increaſe. 3. The *Acme*, when the Morbifick Matter is at the Height. 4. The *Paracme*, or the *Declenſion* of the Diſtemper.

ACOLITE, ſee *Acholite*.

ACONTIAS, a ſort of Comets, ſhaped like a Dart or Javelin. Its Head is ſometimes round, and ſometimes oblong or compreſſed; and its Tail or Train is ſlender, but extended to a great Length.

ACOPUM, according to ſome Writers, is a Fomentation of warm and emollient things, to allay the Senſe of Wearineſs, occaſioned by too violent Labour or Exerciſe.

ACOSMY, is an in ill ſtate of Health accompanied with the Loſs of the natural florid Colour of the Face.

ACOUSTICKS, are Medicines or Inſtruments which help the Hearing; as to the latter of which, the uſe of *Otocouſtick* Trumpets is now very common; and no queſtion Inſtruments of this kind are capable of Improvement. Dr. *Hook* in his Preface to his Micrography, ſaith, 'tis not impoſſible to hear a Whiſper at a Furlong or $\frac{1}{5}$th part of a Mile's diſtance: That he knows a way by which 'tis eaſy to hear any one ſpeak thro' a Wall of a Yard thick: And that by help of a diſtended Wire, the Sound may be propagated to a very conſiderable Diſtance almoſt in an Inſtant.

ACQUIETANDIS *Plegiis*, is a *Juſticies*, that lies for a Surety againſt a Creditor, that refuſeth to acquit him after the Debt is paid.

ACQUIETANTIA *de Shiris & Hundredis*, to be free from Suit and Service in Shires and Hundreds.

ACQUITTAL, in Law, ſignifies the Diſcharge of a Tenant from any Entries or Moleſtations, for any manner of Service iſſuing out of the Land to any Lord; that is, above the Miſne. It ſignifies alſo, when two are indicted of Felony, the one as Principal, the other as Acceſſary; the Principal being diſcharged, the Acceſſary by conſequence is alſo acquitted.

ACQUITTANCE, ſignifieth a Releaſe or Diſcharge in writing of a Sum of Money, or other Duty, which ought to be paid or done.

ACRASY, is the Exceſs or Predominancy of one Quality above another, in the Conſtitution of a human Body.

ACRE of Land; its Quantity is four Square Roods; or 160 ſquare Poles; or 4840 ſquare Yards; or 43560 ſquare Feet. By a Statute of 31 of *Eliz.* 'tis ordained, That if any Man erect a new Cottage, he ſhall add 4 Acres of Land to it.

ACRIMONIOUS *Bodies*, are thoſe (in the General) whoſe Particles do eat, fret, deſtroy and diſſolve what comes in their way, or which have a great *Acrimony*.

ACRISY, is ſuch a State or Condition of a Diſeaſe, that no right Judgment can be made of the Patient whether he will recover or not.

ACROMION, is the upper Proceſs of the Shoulder-Blade, or the top of the Shoulder, where the Neck-Bones are joined with the Shoulder-Blades.

ACROMPHALUM, is the Middle of the Navel.

ACRONICAL, ſee *Achronical*.

ACRONYCHAL, is the ſame with *Achronical*, which ſee.

ACROS, with ſome Writers is the Height of a Diſeaſe; and with ſome Anatomiſts, the Tops, or Prominences of Bones, *&c.*

ACROSPIRE, the ſame with *Plume*, which ſee.

ACROSTICKS; are a certain Number of Verſes, whoſe initial Letters make up ſome Perſon's Name, Title, or ſome particular Motto.

ACROTERIA or *Acroters*, ſignify in Architecture thoſe ſharp Pinacles and ſpiry Battlements, which ſtand in Ranges about flat Buildings, with Rails and Balaſters: They ſignify alſo a ſort of *Pedeſtal* to ſupport Statues.

ACTINOBOLISM, is the ſame with the Diffuſion or Diradiation of Light or Sound, by which its carried or flows every way from its Centre.

ACTION *of a Writ*, is a Phraſe of Speech when one pleads ſome Matter, by which he ſhews, that the Plaintiff had no Cauſe to have the Writ which he brought; and yet it may be that he may have another *Writ* or *Action* for the ſame Matter.

ACTION *upon the Caſe*, is a *Writ* brought againſt one for an Offence done without Force, as for not performing Promiſe made by the Defendant to the Plaintiff, or for ſpeaking of Words whereby the Plaintiff is defamed, or for other Miſdemeanor or Deceit, *&c.*

ACTION *mix'd*; is when it is part *Real* and part *Perſonal*; and alſo is a Suit given by the Law to recover the thing demanded, and Damages for the Wrong done.

ACTION *upon the Statute*, is a *Writ* founded upon any Statute, whereby any Action is given to one in any Caſe whereby no Action was before.

ACTIONS *Perſonal*, are Actions whereby a Man claims Debt, or other Goods or Chattels, or Damage for them, or for Wrong done to his Perſon.

ACTION *Popular*, is an Action upon the Breach of ſome Penal Statute, which any Man that will may ſue for himſelf and the King, by Information or otherwiſe.

ACTIONS *Real*, are Actions whereby the Plaintiff claims Title to Lands, Tenements, Rents or Commons, in Fee, or for Term of Life.

ACTIVE PRINCIPLES, according to the Chymiſts, are the Spirit, Oyl and Salt, becauſe their Parts being briskly in Motion do cauſe Action in other Bodies.

ACTUARY, the Clerk that Regiſters the Acts and Conſtitutions of a Convocation.

ACUTE ANGLES: See *Angles*.

ACUTE ANGLED *Triangle*: See *Triangle*.

ACUTE DISEASE, is that which is over in a little time, but not without eminent Danger to the Patient.

ACUTE ACCENT, in Grammar, ſhews when the Voice is to be raiſed, and is expreſſed thus, (').

ACUTE *Angular Section of a Cone*, was the Term that the ancient Geometers uſed for the *Ellipſis*; but *Apollonius Pergæus* firſt demonſtrated, that the Section of any Cone thro' both it Sides, will produce the ſame Figure; whereas they conſider'd it only in that Cone whoſe Section by the Exis is a Triangle acute angled at the Vertex.

ADARIGE, with ſome Chymiſts ſignifies *Sal Armoniack*.

ADDITAMENTS, Things added a-new to the ordinary Ingredients of any Compoſition; or to a *Menſtruum*, to enable it the better to open, and diſſolve any Body.

ADDITION, in general, is the puttinig of two Things or Quantities together; and that Quantity which ariſes or reſults from thence, is call'd the *Sum* or *Aggregate* of thoſe Quantities.

ADDITION in *Algebra* or *Species*, is performed in general, by conjoyning the Quantities propoſed, preſerving their proper Signs. And the proper Mark or Sign of Addition is +, which is always ſuppoſed to belong to the Quantity which follows it.

Thus, if to $3a$ you add $2a$ } the Sum is $3a+2a$ or $5a$, and $A+2b$ when added to $c+bb$ makes $A+C+2b+bb$

Addition in *Algebra* may eaſily be learnt by obſerving the following particular Rules.

1. When *Simple* and *Like* Integers, having *Like* Signs are to be added, collect the Numbers (or Cœfficients) all into one Sum, and to that Sum annex the Letters by which any of the Quantities was expreſs'd; and laſtly, prefix the proper Sign;

Thus, $-b$
$-2b$ and $+bcd$
make $-13b$ $+2bcd$
$+4bcd$ and $-36de$
make $+7bcd$ $-4de$
make $-40de$.

2. *Rule.* When two ſimple and like Quantities have equal Numbers prefix'd, and unlike Signs, the Sum is 0;

Thus, $+3a$ and $-bb$ and $-7dce$
$-3a$ $+bb$ $+7dce$
00 00 00

N. B. The Reaſon of which is plain, if you conſider that all Quantities having Negative Signs, are in Nature directly contrary to ſuch as have Affirmative ones; and therefore will always deſtroy one another. Thus, if a Man have 10 Pounds in Caſh, and run in Debt 13 *l.* that is, if to his Caſh he add 10 *l.* (which is the proper way to expreſs a Debt) there will remains nothing; for the Debt, or -10 *l.* will quite deſtroy the Caſh, or $+10$ *l.* So alſo if a Man owe 10 *l.* and having nothing to pay it, then hath he a -10 *l.* or is 10 *l.* worſe than nothing: And if any Perſon give him 10 *l.* or add a $+10$ *l.* to his -10 *l.* the Sum will be nothing, but however the Man will, tho' worth nothing, be 10 *l.* better than he was before.

So that 'tis a general Rule in *Algebra*, that to add $-$ is the ſame as to take away $+$, and to take away $-$ is the ſame thing as to add $+$, and to take away $+$ is all one as to add $-$.

3. *Rule.* When two ſimple and like Quantities are given, having unlike Signs, and unequal Numbers prefix'd; ſubſtract the leſſer Number from the greater, and to the Remainder annex the Letters due, prefixing the Sign that belongs to the greater Quantity,

Thus, $+3a$ and $-8b$
$-a$ $+2b$
$+2a$ $-6b$

The Reaſon of which is clear from what was ſaid in the laſt Rule.

4. *Rule.* When three or more ſimple and like Quantities have unlike Signs, collect the Affirmative Quantities into one Sum, the Negative into another, then (by the 3d *Rule*) add theſe together, and the laſt Sum is the Sum ſought;

Thus, $-7a$ } $-10a$
$-3a$
$+5a$ } $+14a$
$+9a$
$+4a$ Sum.

5. *Rule.* When two or more ſimple and unlike Quantities are propoſed, write them down one after another without altering their Signs;

Thus, $+3a$
$+3b$
$+3a+4b$

From the due Apprehenſion of, and mature Conſideration on which *Rules*, the Addition of Compound Quantities may be eaſily perform'd;

Thus, $+3ee+7bb$
$-ee-2bb$
$+ff+3ff$
Sum $3ee+7bb-ee-2bb+ff+3ff$
Contracted $+2ee+5bb+4ff$

ADDITION of *Indexes* is performed after the ſame manner with that of Algebraical Quantities.

Thus, to 3 add 3, the Sum is 6, where both are the Indexes of Integer Numbers: But to 3 add $\frac{1}{2}$ the Sum will be 1: To $\frac{1}{3}$ add 3, the Sum will be $\frac{1}{3}$, *&c.*

ADDITION of *Integers*, in Common Arithmetick, is performed by this ſingle Rule:

Set the Numbers orderly one under another, *i. e.* Units under Units, Tens under Tens, Hundreds under Hundreds, *&c.*

Then collect each Column ſingly into one Sum, beginning at the Right Hand, at the place of Units; and if the Units in that Row are leſs than 10, ſet them down under the Line, but if they are more than 10, ſet down only the Overplus, and carry the Tens to the next Row, in which ſet down (under the Line) the odd Tens, and carry the Hundreds to the third Column, *&c.* as you will ſee in the following Examples.

16	34	756	5789	93256
72	68	382	3452	13700
		568	7898	78250
88	102		3257	97662
		1706		15628
			20396	
				297496

But if the Numbers be of different, or of ſeveral *Denominations*, then they muſt be added by ſumming up each Denomination by it ſelf, and ſeeing how many of them will make one of the next Denomination; and bearing ſo many Units forwards as thoſe will come to.

Thus, ſuppoſe the following Pounds, Shillings and Pence were to be collected into one Sum.

l.	*s.*	*d.*
135	17	08
95	11	02
3	05	09
234	14	07

Beginning with the Pence, I ſay 9 and 2 are 11, and 8 makes 19, which becauſe it is 7 above 12, or a Shilling, I ſet down the odd Seven Pence, and carry one Shilling to the next Rank. Say 1 that I carry and 5 is 6, and one is 7, and 7 is 14; I ſet down 4, and I find I have in all 3 Tens, therefore I ſet down one Ten on the Left Hand of the 4, and carry one Pound to the Column of Pounds; where I proceed, juſt as in *Addition of Integers*, and find the whole Sum to be 234*l.* 14*s.* 07*d.*

ADDITION *of Logarithms*: See *Logarithms*, N° 3.

ADDITION *of Vulgar Fractions*: See *Vulgar Fractions.*

ADDITION *of Decimal Fractions*: See *Decimal Fractions.*

ADDITION *in Law*, is that which is given to a Man beſides his proper Name and Sirname, to ſhew of what Eſtate, Degree or Myſtery he is, the place of his Birth or Habitation.

ADDUCENT MUSCLES, are thoſe that bring forward, cloſe, or draw together the Parts of the Body whereunto they are annexed.

ADDUCTORES, the ſame with *Adducent Muſcles.*

ADDUCTOR OCULI, is a Muſcle of the Eye, ſo call'd, becauſe it inclines its *Pupil* towards the Noſe; and alſo *Bibitorius*, it directing the Eye towards the Cup in drinking.

ADDUCTOR POLLICIS, is a Muſcle of the Thumb, which ariſes tendinous in common with the *Abductor Indicis*, and becoming fleſhly, aſcends bliquely to its broad Termination at the ſuperior part of the firſt Bone of the Thumb. This brings the Thumb nearer the Fore-Finger.

ADDUCTOR POLLICIS PEDIS, is a Muſcle of the Great-Toe, which ariſeth partly tendinous and partly fleſhy from the Inferior Parts of the *Os Cuneiforme Tertium*, and dilating its ſelf to a fleſh Belly, marcheth obliquely in the bottom of the Foot, and becomes leſs and tendinous as its Inſertion to the Internal Part of the *Oſſa Seſſamoidea* of the Great-Toe, laterally oppoſite to the Termination of the *Abductor Pollicis Pedis.* This brings the Great-Toe nearer the reſt.

ADEN, is the Term for a Glandule in an Animal Body, which is either *Conglobated*, as the Glands of the *Meſentary*, &c. With ſome alſo 'tis uſed for a Tumour in the Groin, the ſame with *Bubo.*

ADEPS *or* Pinguedo, *Fat*, is a ſimiliar Part of the Body: But *Adeps* and *Pinguedo* differ in this, that *Adeps* is a thicker, harder, and more earthy Subſtance than *Pinguedo*; the Fat which is particularly meant by *Adeps* flows from the Blood thro' peculiar Veſſels into Bags or Bladders appropriate thereunto, as is plain from the Obſervation of *Malpighius.*

ADEPTISTS, or *Adepts*, are ſuch Alchymiſts as pretend to have gain'd the Secret of the *Tranſmutation of Metals*, or to make the *Philoſopher's Stone*: Of theſe Myſtical Inviſible Gentlemen (they ſay) there are 12 always in being; which are kept ſupply'd by new ones when any of the Fraternity pleaſeth to die, or to tranſlate himſelf to ſome place where he can make uſe of his Gold, for in this wicked World it will not procure them Shirts.

ADEQUATE; a thing is ſaid to be adequate to, or adequately to agree with another, when 'tis every way equal to it in Extent, Capacity, Power, *&c.* and all other Properties; and neither exceeds it, nor falls ſhort of it in any reſpect. And thus when the Notions or Ideas that we have of any thing, take in all the Properties of that thing, and that we omit conceiving nothing which belongs to it, we then ſay we have *Adequate Ideas* of ſuch things.

ADEQUATE IDEAS, are thoſe Ideas which perfectly repreſent the Architypes or Images which the Mind ſuppoſes them to be taken from; which it intends them to ſtaed for, and to which it refers them.

ADJACENT *or Contiguous Angles*, ſee *Angles.*

ADIAPHORUS, or *Neutral*, i. e. indifferent; So Mr. *Boyle* calls a kind of Spirit which he diſtilled from *Tartar* and ſome other Vegetable Bodies; which was neither *Acid*, *Vinous*, nor *Urinous*. 'Tis made thus; Firſt, Shavings of Box, Guajacum, or any other ponderous Wood are diſtilled *per ſe* in a Retort; and then the ſowriſh Liquor is rectified to free it from the Phlegm: After this a Quantity of Powder of Coral, *&c.* was thrown into the ſowre Spirit, which it readily diſſolved; and the Acid Parts of the Menſtruum did ſo aſſociate themſelves with the Coral, as to leave a part of Liquor that was by no means of an Acid Nature, but which when gently drawn off the Coral, was of a ſtrong Smell, yet without any Acidity, and in many reſpects of a different Nature from almoſt any other common Spirit.

AD-

ADJECTIVES (in Grammar) are ſuch Words as deſcribe the manner only of the Being of a thing, and have no natural ſubſiſtence of their own, but do ſubſiſt by *Noun Subſtantives*, to which they are joyned.

AD INQUIRENDUM, a Writ in Law commanding an Enquiry to be made (for the better Execution of Juſtice) about the Merits of a Cauſe depending in the King's Court.

ADJOINING ANGLES, in Geometry: See *Angles*, or *Contiguous*.

ADJOURNMENT, is the putting off of any Court or Meeting, and appointing it to be kept at another Place or Time.

ADIPOSA MEMBRANA, is the Baſis of the *Cellulæ Adipoſæ*, is double, and may be divided into two Parts; the one is External throughout which there are a number of little Cells, full of Fat; the other is Internal, which Anatomiſts have miſtaken for the *Membrana Carnoſa*, becauſe it has a greater Number of Blood Veſſels.

ADIPOSA VENA, or *Renalis*, a Vein ariſing from the deſcending Trunk of the *Cava*; which ſpreads its ſelf on the Coat, and Fat, that covers the Kidneys.

ADIPOSI DUCTUS, call'd alſo *Sacculi*, *Veſiculæ Adipoſæ* or *Lobuli*, are Veſſels which convey the Adeps or Fat into the Interſtices of the Muſcles, or to the Parts between the Fleſh and the Skin.

ADIT, is the *Shaft*, or Entrance into any Mine.

ADJUDGE, when a determinate Sentence is paſt in the behalf of another, the Caſe is ſaid to be Adjudged for him.

ADJUNCT: Whatever comes to any Being from without, is called an *Adjunct* to that Being; as being not naturally and eſſentially belonging to it, but adjoyned or ſuperadded to it.

AD JURA REGIS, is a Writ that lies for the *King*'s Clerk againſt him that ſought to eject him, to the Prejudice of the *King*'s *Title* in Right of his Crown.

ADJUTANT, an Officer in the Army, the ſame with an *Aide-Major*, which ſee.

ADMEASUREMENT *of Dower*, is a Writ that lies where a Woman is endowed by an Infant, or by a Guardian, of more than ſhe ought to have.

ADMEASUREMENT *of Paſture*, is a Writ that lies againſt ſuch, as having Common of Paſture appendant to their Free-holds, do ſurcharge it with more Cattle than they ought to do.

ADMINISTRATION, (in Law) is the diſpoſing of a Man's Goods or Eſtate that died inteſtate, or without any *Will*, with an Intent to give an Account thereof.

ADMINISTRATOR, he that has the Goods of a Man dying inteſtate, committed to his Charge by the Ordinary, and is accountable for the ſame. If the Perſon be a Woman, ſhe is called an *Adminiſtratix*.

ADMITTENDO CLERICO, is a Writ granted to him that hath recovered his Right of Preſentation againſt the Biſhop, in the *Common Bench*.

ADMITTENDO *in Socium*, is a Writ for the Aſſociation of certain Perſons to Juſtices of Aſſize before appointed.

ADNATA TUNICA, is the common Membrane of the Eye, called *Conjunctive*, it ſprings from the Skull, grows to the Exterior Part of the *Tunica Cornea*; and that the viſible Species may paſs there, leaves a round Cavity forward, to which is annexed another Tunic, without any particular Name, made up of the Tendons of thoſe Muſcles which move the Eye; by reaſon of its Whiteneſs, 'tis called *Albuginea*.

AD OCTO, among ſome of the Antient Philoſophers, is a Term ſignifying the Higheſt or Superlative Degree; becauſe they reckoned no Degree above the Eighth, in their way of diſtinguiſhing of Qualities.

ADONICK, a ſort of a ſhort Verſe, conſiſting of a *Daſtyle* and a *Spondee*; as *Rara juventus*; 'tis uſually placed at the end of each Stanza of Saphick Verſes. So called from *Adonis*, in whoſe Praiſe they were firſt made.

AD QUOD DAMNUM, is a Writ which ought to be ſued before the King grant certain Liberties, as a Fair, Market, *&c.* to the Prejudice of others.

There is alſo another Writ of *Ad quod Damnum*, if any one will turn a Common High-way, and lay out another as beneficial.

ADRAMIRE: See *Arraign*.

AD TERMINUM *qui præteriit*, is a Writ of Entry that lies where a Man having leaſed Lands or Tenements for Life or Years, and after the Term expired, is held from them by the Tenant, or other Stranger that occupieth the ſame, and deforceth the Leſſor: In ſuch Caſe this Writ lieth for the Leſſor and his Heirs.

ADVANCE DITCH, in Fortification, is a Ditch dugg all along the *Glacis* beyond the *Counterſcarp*, and uſually filled with Water.

ADVANCE GUARD, is the firſt Line or Diviſion of an Army, ranged or marching in Battle-aray; or that Part which is next to the Enemy, or which marches firſt towards them. The whole Body of an Army conſiſts of the *Advance Guard*, the *Arriere Guard*, and the *Main Body*.

Sometime alſo a Party of 15 or 20 Horſe commanded by a Lieutenant beyond, but within ſight of the *Main Guard*, is called an *Advance Guard*, and is deſigned for the greater Security of the Camp.

ADVENT, in the Sacred Calender, is the Time from the *Sunday* that falls either upon St. *Andrew*'s Day, or next to it, till *Chriſtmas*; which Time was wont anciently to be ſpent in a pious Preparation for the Advent, or coming on of the Feaſt of our Saviour's Nativity.

ADVENTITIA BONA, were anciently ſuch as came to a Man unexpectedly *Windfalls*, as we call them now: Hence the Word *Adventitious* comes to be uſed by Philoſophick Writers, and to ſignify ſuch Matter as doth not properly belong to any mix'd Body, but comes to it from ſome other Place. Thus, 'tis a Queſtion, whether in the Freezing of Water, there do not enter in ſome *Frigorifick Particles*, which are *Adventitious* to the Water, from the Air, or Freezing Mixture.

AD VENTREM INSPICIENDUM, is a Writ mentioned in the Statute of Eſſoignes: See *Ventre Inſpiciendo*.

ADVERB, in Grammar, is a Part of Speech undeclined, and without Conjugation; and is uſually joyned with a Verb to expreſs the manner of Action. They are diſtinguiſhed into Adverbs of *Time*, *Place*, &c.

ADULTERATION of any Thing, ſuch as Wine, Medicinal Druggs, Chymical Preparations, *&c.* is a mixing ſome baſer Matter with it, which hinders it from being truly Good and Genuine in its kind.

ADVOCATES, in the Eccleſiaſtical Court, were either *Advocate* of the Cauſes and Intereſt of the Church, retain'd as a Counſeller and Pleader, to maintain the Properties and Rights: Or, *Advocate* or Patron of the Preſentation and Advowſon. Both theſe Offices did formerly belong to the ſame Founder of a Church or Covent, and his Heirs, who were bound to protect and defend the Church, as well as to nominate or preſent to it. But when the Patrons grew negligent, or were Men of no Intereſt or Ability in the Courts of Juſtice, then the Religious began to retain a *Law Advocate*, to ſollicite and proſecute their Controverſial Cauſes. See *Spelman*.

ADVOWSON, in our Common Law, ſignifies a Right to preſent a Benefice, and is as much as *Jus Patronatus* in the Canon Law; the Reaſon why 'tis termed Advowſon (*Advocatio*) is, becauſe anciently thoſe who had a Right to preſent to a Church, were Maintainers of it, or great Benefactors to it: Theſe were ſometimes called *Patroni*, and ſometimes *Advocati*. Now in the General, an Advowſon is where a Biſhop, Dean or Chapter, and their Succeſſors, or any Lay Patron, have a Right to preſent whom they pleaſe, to any Spiritual Benefice, when it becomes void. *Advowſon* is of two ſorts; Firſt, *Advowſon in Groſs*, that is, ſole or principal, not belonging to any Mannor, as a Parcel of its Right: Secondly, *Advowſon Appendant*, which depends upon a Mannor, as appurtenant to it; and this may be ſold by it ſelf, and then it is in *Groſs*: And while it is dependant to the Mannor, 'tis by *Kitchen* called an *Incident*.

ADUST, burnt or parched; the Blood is ſaid to be *Aduſt*, when by reaſon of extraordinary Heat, the thinner Parts are ſteem'd forth, and the thicker remain dreggy and black, as if they were burnt.

ÆGYLOPS, *Angilops* and *Anchylops*, is a Tumour or Swelling in the great Corner of the Eye by the Root of the Noſe, either with or without an Inflammation.

ÆGYTIACUM, ſc. *Unguentum*, in Pharmacy, is a kind of Deterſive Ointment, deſcribed by *Meſue*; and is ſo called from its black Colour, like the Hue of an *Egyptian*.

ÆNIGMA: See *Enigma*.

ÆOLIPILE, is a round hollow empty Ball made of Iron, Braſs, Copper, *&c.* and furniſhed with a Neck, in which there is a very ſlender Pipe opening to the Ball. Sometimes the Neck is made to ſcrew into the Ball, which is the beſt way, becauſe then the Cavity may the more readily be filled with Water. But if there be no Screw, you muſt fill it with Water, thus; Heat the Ball red hot, and then throw it into a Veſſel of Water; the Water will run in at the ſmall Hole, and fill about $\frac{2}{3}$ of the Cavity. And if after this the *Æolipile* be laid on or before the Fire, ſo that the Water and Veſſel become very much heated, the Vaporous Air will be forced out with very great Noiſe and Violence; but it will be by fits, and not with a conſtant and uniform Blaſt. Perhaps they may be ſometimes of uſe to blow the Fire, where a very quick and ſtrong Blaſt is required. And they may ſerve to ſcent or perfume a Room, by filling them with perfum'd inſtead of common Water.

ÆQUATOR: See *Equator*.

ÆQUILATERAL: See *Equilateral*.

ÆQUILIBRIUM, is when either equal Weights at equal Diſtances, or unequal ones at reciprocally proportionable Diſtances from the Centre, make the Arms of any Libra or Balance to hang even; ſo that they do Equiponderate and not out-weigh one another: In ſuch a Caſe we ſay the Balance is *in Æquilibrio*.

ÆQUIVOCAL: See *Equivocal*.

ÆRA: *Lucilus* and ſome others ſay, that *Æra* did originally ſignify a Number ſtamp'd on Money to determine its current Value; and in this Senſe it comes from *Æs* Braſs, from the Plural of which *Æra*, came this femine ſingular *Æra*; and that either becauſe they put the Word *Æra* to each particular of an Account, as we now do *Item*: Or elſe becauſe the Number of Years was anciently among the *Romans* mark'd down in Tables with little Braſs Nails. In reference to which latter Cuſtom, the Word *Æra* came to ſignify the ſame with *Epocha*, *viz.* a certain Time or Date from whence to begin the new Year; or ſome particular way of reckoning Time and Years. And in this Signification the Word is thought to riſe from theſe Initial Letters, *A. E. R. A.* which, among the *Spaniards*, who began their *Æra* from the Reign of *Auguſtus*, ſtood for *Annus erat Regni Auguſti*. The moſt eminent *Æra's* among Chronologers, are the *Æra* of the World's Creation, which, according to the *Julian* Account of Time, began in the Month of *October*, and on the 24th Day. Some place this 3950 Years before Chriſt's Birth, whom *Gaſſandus* ſaith, come neareſt to Truth, and that this *Æra* is confirmed by the *French Aſtronomers*; others account 3983 Years before the Birth, of our Saviour, and with theſe *Petavius* joins. *Kepler* make them 3993; and there are ſome who will have it, that the true Number is 5199.

The *Jewiſh Æra* or *Period*, invented by *Hillel* about the Year of Chriſt 344. This is by no means *Hiſtorical*, but Artificial and Aſtronomical, and is ſuted to the *Jews* falſe Account of the New Moons, Feaſts, Holydays, *&c.* and is of far later ſtanding than the beginning of the World, tho' they uſe it as the Date of the Creation; it begins in *Autumn*.

The *Æra* from the *Deſtruction of Troy*, begins *June* 16. as *Scaliger* proves out of *Ephorus*: 'tis very common in Profane Authors.

The *Æra* of *Nabonaſſar*, begins the 26th of *February* (747 Years before Chriſt) but it varieth in 1461 Years thro' the whole 365 Days; for ſo many he accounts, neglecting the odd Hours, which makes a great *Intercalation*.

The *Æra* of the *Olympiads* begins from the New Moon in the *Summer Solſtice* 777 Years before Chriſt, and the *Æra* of *Iphitus* is only a Collection of the Olympick Years: Theſe two are the *Æra's* chiefly uſed by Greek Hiſtorians.

The *Roman Æra*, from the building of the City, begins *April* 21. and is 752 Years before Chriſt.

The *Chriſtian Æra* from the birth of Chriſt begins *December* 25.

The *Turkiſh Æra* or the *Hegira*, begins the 16th Day of *July*; they account it from *Mahomet's* Flight, *A. D.* 622.

The *Æra* of the Death of *Alexander the Great* is the 12th of *November*, 324 Years before Chriſt: See *Epocha*.

ÆSUSTUM, or calcin'd Copper is made by Stratifying Plates of Copper with Powder of Sulphur

phur in a Crucible, whose Cover or Lid hath a Hole in it to give the Vapours vent, while the Matter is calcining in a strong Fire, till no more Fumes will arise; the Plates must lie separated while hot. In this Stratification the first and last Beds or Layers must be of Sulphur.

ÆSCHYNOMENOUS PLANTS, the same as *Sensitive*, which see.

ÆSTIVAL SOLSTICE, or *Summer Solstice*: See *Solstice*.

ÆTATE PROBANDA, is a Writ of Office, and it lies for the Heir of the Tenant that held of the King in chief, to prove that he is of full Age, directed to the Sheriff to enquire of his Age; and then he shall become Tenant to the King by the same Services that his Ancestors made to the King.

ÆTHER: Dr. *Hook Microgr.* p. 13. calls the Æther that Medium or Fluid Body in which all other Bodies do as it were swim and move. But this seems to me to favour the *Cartesian Doctrine* of an Absolute *Plenum*, which, by many infallible Reasons and Experiments, is proved to be impossible. As therefore we call the *Medium* in which we breath and live, the Air, by which we understand an Elastical Fluid Body, either having its very large Interstices devoid of all Matter, or else filled in part with a Fluid, which is very easily moved out of them by Compression, and which readily returns into them again, when that Compression is taken off: So we agree to call that finer Fluid-Body, if it be a Body, which is extended round our Air and Atmosphere, above it and beyond it, up to the Planets, or to an indefinite Distance; this, I say, we call the *Æther*, tho' what we mean by that Word, we scarce well understand. For that there can be no Fluid whose Parts do resist the Motions of Bodies thro' them (as our Air doth) in the Planetary Regions, we are certain almost to a Demonstration; because the Motion of the Heavenly Bodies is by no means impeded or altered by any such Resistance, but they move as freely as if they were in an absolute Void. But that which is often meant by the Word *Æther* or Æthereal Matter, is a very fine thin Diaphonous Fluid, which some will have to surround the Earth up to as far as the Interstellary World, and which easily penetrates and runs thro' all things, and lets all things run as easily thro' it.

ÆTHIOPS MINERAL, is a Medicine usually made by incorporating well together equal Parts of running Mercury and Flower of Sulphur, and then deflagrating the Mixture.

But 'tis much the best way only to mix them well together in a Glass Mortar, and never to enkindle the Matter at all; the Mercury will perfectly disappear, and the Powder in a little time will turn black.

ÆTIOLOGY, signifies an Account of the Causes and Reasons of Diseases, and of their various Symptoms, in order to their Cure: Wherefore it is by some called *Parthology*.

AFFEERORS, a Term in Law, signifies such as are appointed in Court-leets, *&c.* upon Oath to mulct those who have committed any Fault which is arbitrably punishable, and for which no express Penalty is prescribed by Statute.

To *Affere* an *Amercement*, is properly to lessen and mitigate the Rigour of it.

AFFIANCE (in Law) is the plighting of Troth between a Man and a Woman, upon an Agreement of Marriage to be had between them.

AFFIDAVIT, in Law, signifies an Oath: As to make *Affidavit*, is to testify a thing upon Oath.

AFFORCIAMENT, a Fortress or strong Hold, or other Fortification.

AFFOREST, (a Term in the *Forest Law*) signifies to lay waste a Piece of Ground, and turn it into *Forest*.

AFFRAY, or *Affraiment*, in the Common-Law, is an Affrightment put upon one or more Persons; and this may be wrought, they say, without a Word spoken or Blow given: As if a Man should shew himself in Armour, or furnished with Weapons not usually worn, it may strike a Fear into others that are unarmed; which therefore is a common Wrong, and is inquirable in a *Court-leet*, wherein it differs from an *Assault*, which is always a *Particular Injury*.

AFFRETAMENTUM, the Freight of a Ship from the *French Fret*, which signifies the Tuns.

AFTER-SAILS, in a Ship: See *Sails*.

AGE PRIER (a Term in Common-Law) is when an Action is brought in against an Infant for Land which he hath by descent, for then he is to shew the Matter to the Court, and shall pray that the Action may be stay'd till his full Age of 21 Years, and so by Award of the Court, the Suit shall surcease.

AGENT and PATIENT (in Common-Law) is, when a Man is the Doer of a thing, and the Party to whom it is done; as where a Woman endows her self of the fairest Possession of her Husband.

AGGREGATE, is much the same as the *Sum*, arising from the Addition, Connexion or Collection of several things together.

AGGRESSES, or *Ogresses*, the same with *Pellets*. A Term in Heraldry: See *Balls*.

AGGRESSOR, is he that makes the first Assault, Attack, or that first begins any Quarrel, Encounter or Difference.

AGILD, in Law, signifies free from Penalty, not subject to the customary Fine or Imposition.

AGIST (a Term in Law) signifies to take in, and feed the Cattle of Strangers in the King's Forest, and to gather Money due for the same to the King's use. The Officers doing it are called,

AGISTERS; and their Office is called,

AGISTMENT.

AGITATION, in general, signifies Motion or Action; but 'tis mostly used in a Philosophical Sense for the brisk Intestine Motion of the small Corpuscles of any Natural Body. Thus Fire or Heat agitates the small Particles of all Bodies, and puts them into a rapid Motion.

AGNATION, in the Civil Law, is the Term for that Line of Consanguinity which is between Males descended from the same Father; as *Cognation* is the Line of Parentage between Males and Females, both descended from the same Father. The Use of both these Words is derived from the old *Roman* Law.

AGRICULTURE, is the Art of Tilling, Manuring, and Cultivating the Earth, in order to render it fertile, and to make it bear Plants, Trees and Fruits.

AGRYPNIA, is a kind of *Coma Vigil*, a Watching or Dreaming Slumber, proceeding from some Disorder in the Brain.

AGRYPNOCOMA, the same with *Coma Vigil*.

AIDE DE CAMP, in an Army, is an Officer always following one of the Generals, i. e. the General, Lieutenant General, or Major General, to receive and carry their Orders as Occaſion requires. When the King is in the Field, he uſually appoints young Gentlemen of Note to carry his Orders, and they are called, the *King's Aides de Camp*.

AIDE MAJOR, or *Adjutant*, is an Officer whoſe Buſineſs it is to eaſe the Major of part of his Duty, and to perform it all in his Abſence. Some Majors have ſeveral *Aides Majors*; each Troop of Guards hath but one Major, who hath two *Aides Majors* under him, according to the greatneſs of the Buſineſs: Every Regiment of Foot hath as many *Aides Majors* as it contains Battallions. When the Battallion is drawn up, the *Aide Major*'s Poſt is on the Left beyond all the Captains, and behind the Lieutenant Colonel.

AILE, is a Writ which lies where Land deſcends from the Grandfather to the Son or Daughter of his Son, the Father being dead before the entry by him, and one abates, the Heir ſhall have this Writ againſt the Abator.

AMIABLE NUMBERS; Mr. *Ozanam* calls ſuch as are mutually equal to the whole Sum of one another's Aliquot Parts: As are theſe two Numbers 284 and 220. For 284 is equal to the Sum of all the Aliquot Parts of the ſecond Number 220, which are 1, 2, 4, 5, 10, 11, 20, 22, 44, 55, 110. and the latter Number 220 is equal to all the Aliquot Parts of 284, *viz.* 1, 2, 4, 71 142.

AIR. *The Atmoſpherical Air* in which we breath is a Diaphanous, Compreſſible and Dilatable Fluid Body, covering the Earth and Sea to a great Height above the higheſt Mountains; and differs from the Æther (among other things) in this, that it refracts the Rays of the Moon and other remoter Luminaries. This Air ſeems to conſiſt of three differing Kinds of *Corpuſcles*, or ſmall Bodies.

1. Such as are carried up into it in the Form of *Exhalations* or *Vapours* from the Earth, Sea, and all Animal, Vegetable and Mineral Bodies, by means of the Sun's, or the Subterraneal Heat.

2. There are yet a more ſubtle ſort of Particles in the Air, which we may reckon emitted into it from the Heavenly Bodies; and alſo the Magnetick Streams of this Globe of Earth and Water. But

3. There is alſo a Third kind of Particles, which perhaps do moſt properly merit the Name of *Aereal*, as being the proper and diſtinguiſhing Parts of *Air* taken in the ſtricteſt Senſe; and theſe are Corpuſcles which are conſtantly *Elaſtical* or *Springy*. For *Elaſticity* is an Eſſential Property of Air, and 'tis thought no other Fluid hath any thing of it, but only ſo far as it participates of Air, or hath Air contained in its Pores. So that our Air probably doth either conſiſt of, or abound with Parts of ſuch a Nature, that in caſe they be bent or compreſſed by the Weight of the incumbent part of the Atmoſphere, or of any other Body, they do endeavour to free themſelves from that preſſure, by bearing againſt the Bodies that kept them bent; and as ſoon as theſe Bodies are removed to give them way, they unbend themſelves, either quite, or ſo far forth as the Bodies that reſiſt them will permit, and thereby expand the whole parcel of Air, theſe Elaſtical Bodies compoſe.

Dr. *Hook*, in his *Micrograph.* p. 13. ſeems to think the Air to be nothing elſe but a kind of Tinc[illegible] [illegible] [illegible] [

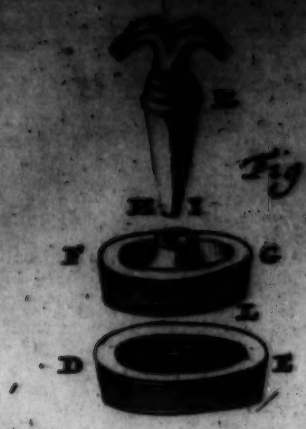

Fig. 1.

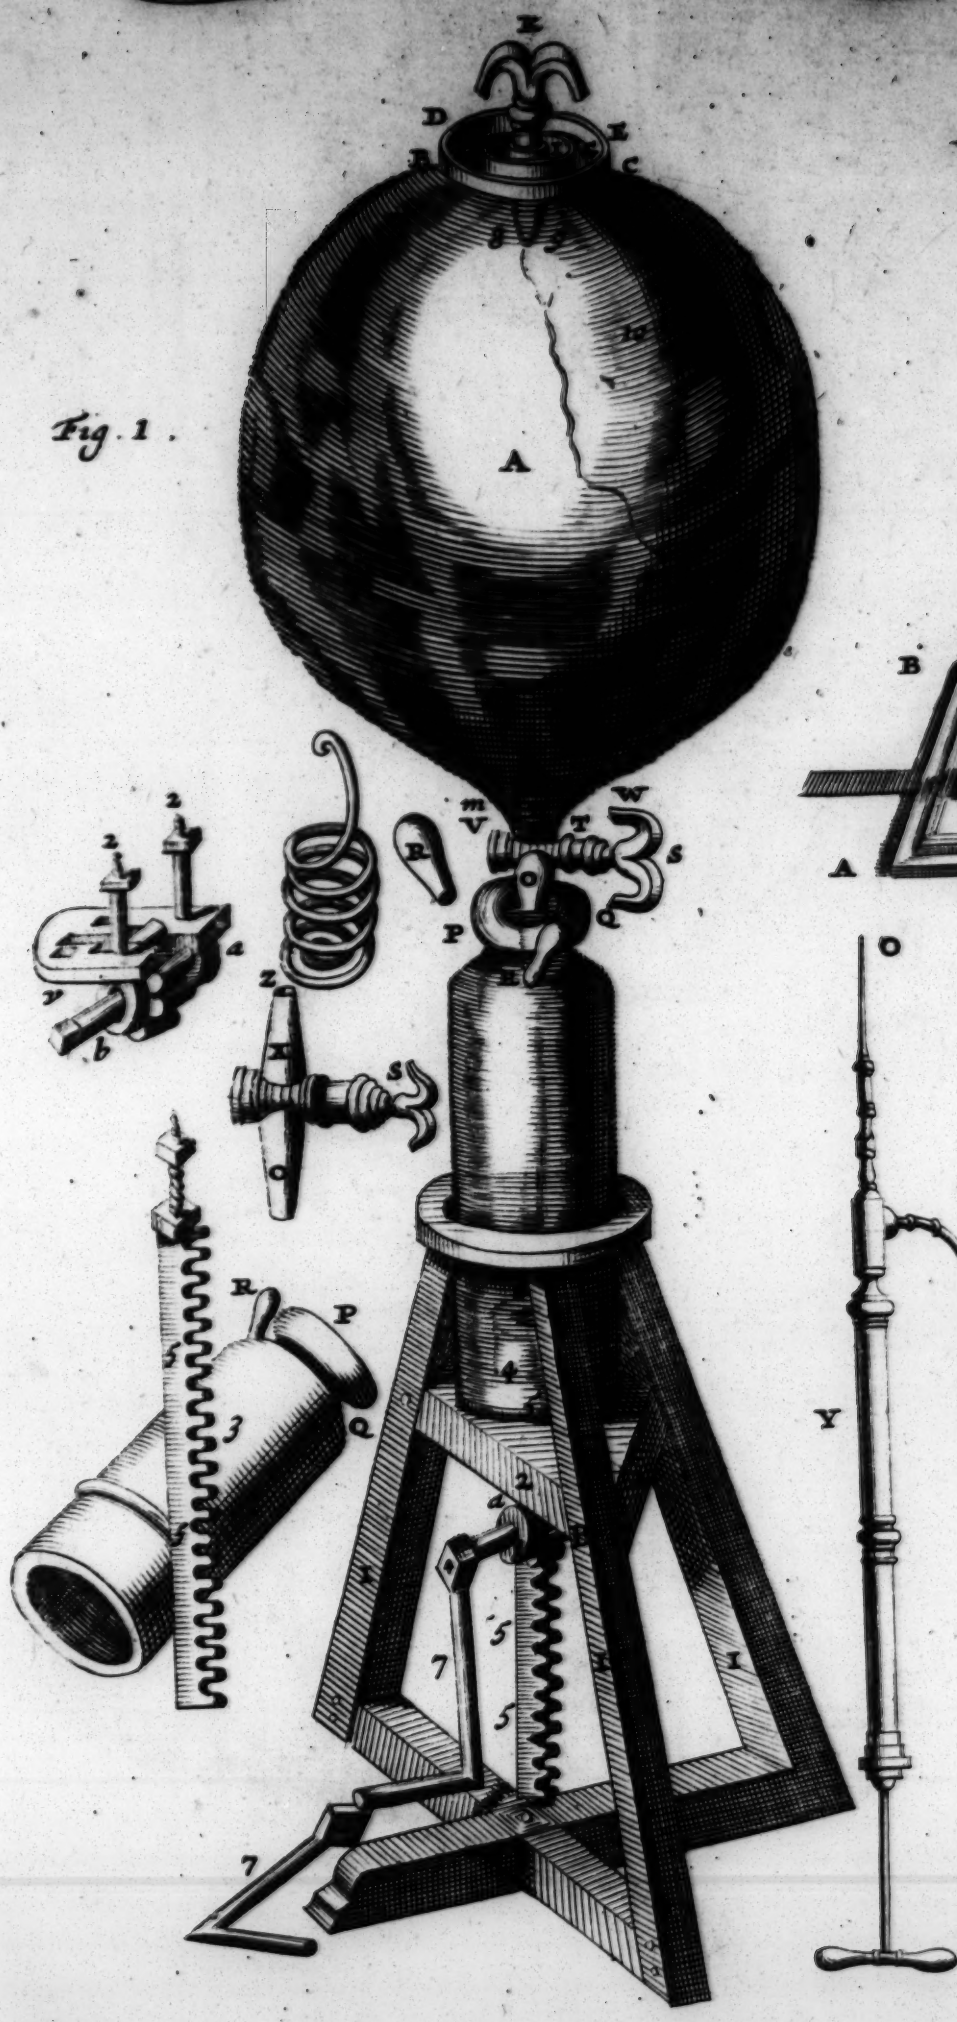
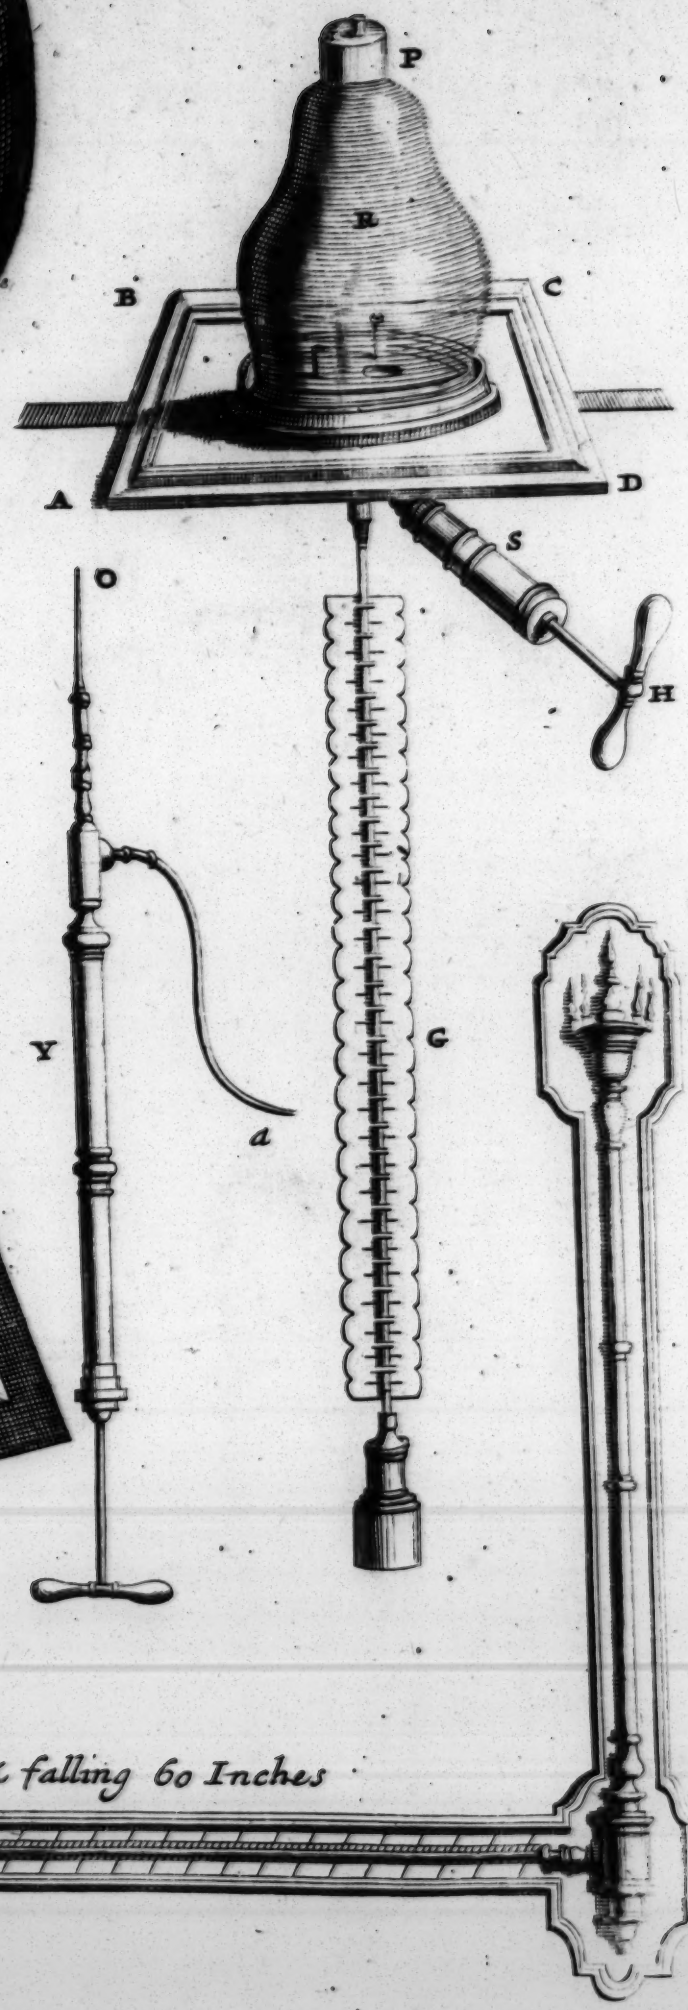




M.r Hawksbee's Barometer, rising & falling 60 Inches

an infinite Page which would not do in this Case; and therefore happily fell on thinking of the Counter-Balance of the Air's Weight, which *Torricellius* afterwards purſued and improved, with like Sagacity; inventing, as a farther Proof of the Notion of the Gravity of the Air, that which we call the *Torricellian Experiment*.

Mr. *Boyle* found a Lamb's Bladder containing about $\frac{3}{4}$ of a Pint, and blown up, and well dried to loſe about a Grain and $\frac{1}{4}$ when it was prick'd, and the Air let out.

Alſo, that a Lamb's Bladder being counterpoiſed in a nice Pair of Scales in the Reciever, on the Air's being drawn out, did manifeſtly preponderate; but when the External Air was let in again, the Scale's returned to their former Equilibrium.

An Æolopile well heated, and then having its little Hole ſtop'd, was cooled, and weighed; after which the Hole being opened, the Air was heard plainly to ruſh in with a whiſtling Noiſe, and then the Æolopile being weigh'd again, it was manifeſtly heavier than it was before.

The *Magdburgick* Engine being weighed when full of Air, and afterwards being again weighed when 'twas well exhauſted, was found to weigh an entire Ounce and $\frac{1}{10}$ leſs than it did before.

And Mr. *Boyle* found by accurate Experiments, that a ſmall Receiver weigh'd 35 Grains more when full of Air, than after it was exhauſted. He found alſo that

A Glaſs Bubble as big as a Hen's Egg, having as much Air as could be driven out by Heat, had then its Stem nimbly ſealed up, and then being left leiſurely to cool (for there is great Danger of its breaking) was put into a nice Balance, and then the Scales were equipoized: After, the ſealed End being warily broken off, the Air was heard to ruſh in with a whiſtling Noiſe, and then the Scale in which the Bubble was, did manifeſtly preponderate by near $\frac{1}{4}$ of a Grain. And after this, filling it with Water, it was found to hold 906 Grains of that Liquor; ſo that allowing for $\frac{1}{4}$ of the Cavity of the Bubble's being filled with Air, which perhaps might weigh about a Grain, the Proportion of Water to Air appears in Weight to be about 905 to one, and roundly it may be ſuppoſed as 1000 to one, becauſe 'tis not poſſible but that ſome Air muſt remain in the Bubble more than is now accounted for.

Mr. *Boyle* found by repeated Experiments, that the weight of Air to Water is as 1000 to 1.

Mr. *Halley*, *in Philoſ. Tranſ.* N°. 181. ſays, That the Specifick Gravity of Air, near the Earth's Surface to that of Water, at ſeveral Trials, was as 1 to 840, as 1 to 852, and as 1 to 860; the *Mercury* ſtanding at all thoſe times about $29\frac{3}{4}$; but becauſe 'twas Summer Weather, and conſequently the *Air* rarefied when all theſe were try'd, it may, without ſenſible Error in round Numbers, be ſaid, that the *Barometer* ſtanding at 30 Inches, and in a mean Eſtate of Heat and Cold, the Specifick Gravity of the *Air* to Water, is as 1 to 800: Wherefore, ſince Mercury to Water is as $13\frac{1}{2}$ to 1, Mercury will be to Air as 10800 to 1, and a Cylinder of Air of 10800 Inches, or 900 Feet, is equal to an Inch of Mercury; wherefore if the Air were throughout of an equal Definity, the Height of the Atmoſphere would be no more than 5 Miles, and one Tenth of a Mile, and in the Aſcent of every 900 Feet from the Earth's Surface, the Mercury in the Barometer would fall an Inch. But ſince the Expanſion of Air increaſes, as the Weight of the incumbent Atmoſphere decreaſes, or as the Mercury ſinks in the Barometer; the upper Parts of the Air muſt be much more rarefied than the lower, and conſequently the Height of the Atmoſphere much greater than 5 Miles. *See Vol.* 2.

AIR PUMP, an Inſtrument to exhauſt the Air out of proper Veſſels. Mr. *Boyle* owns he had the firſt hint of it from *Schottus*, who had publiſhed to the World, (but Mr. *Boyle* had not ſeen the Book) that one *Otto Gerick*, *Conſul* of *Magdeburgh*, had found out a way of evacuating Glaſs Veſſels, by ſucking out the Air at the Mouth of the Veſſel, plunged under Water. But this Engine was defective in two reſpects: 1. That in order to evacuate the Veſſel, there was required the continual Labour of two ſtrong Men for two Hours. 2. The Receiver and Engine being all of one Piece, there was no way to get things in and out of it, in order to try any Experiment upon them. To remedy which, and to ſupply thoſe Imperfections which Mr. *Boyle* had heard the *Otto Gerick Engine* laboured under, he directed one Mr. *G.* and Dr. *Hook* to contrive a newer and better *Air Pump*; which Dr. *Hook* effected in the following Form, which I will deſcribe, becauſe it was the firſt of the kind made here.

This *Air Pump* conſiſts of two Parts; a Glaſs Veſſel; and a Pump to draw the Air out of it.

The Glaſs is expreſſed by the Fig. 1. *A*. having a Hole at the Top with a Cover fitted to it, and alſo a ſtop Cock faſtened to the Extremity of its Neck below; its Cavity being large enough to contain about 60 lb. of Water. The Diameter (*B C*) of the Hole at the Top of the Veſſel (*A*) is about four Inches, the Orifice whereof is encompaſſed with a Lip of about an Inch in Height, whoſe uſe is for the Cover to reſt on; which Cover is deſcribed in the Second Figure, where (*D E*) denotes a Brazen Ring, which is to cover, and to be cloſely cemented on the Lip (*B C*) of the firſt Figure. To the internal tapering Orifice of this Ring, is fitted a Braſs Stopple (*F G*) ſo exact, as to prevent any conſiderable acceſs of External Air: In the midſt of this Cover there is a Hole (*H I*) of about half an Inch Diameter, encompaſs'd with a Ring or Socket of Braſs, to which is likewiſe fitted a Stopple (*K*) of the ſame Metal, ſo exquiſitely adapted to it, that it may be turned round, without admitting in the leaſt Air, and yet may be put in or taken out at pleaſure: Through the lower End of it there is a little Hole (8) made for Paſſage of a String, (8, 9, 10) which is likewiſe to paſs through a ſmall Brazen Ring (*L*) fixed to the Bottom of the Stopple (*F G*); the uſe of which String is to move what is contained in the exhauſted Veſſel, without unſtopping it. That the Stop Cock (*S*) (in the firſt Figure) might be better faſtened to the Neck of the Receiver, and cemented on with Pitch, Roſin and Wood-aſhes well incorporated together, and poured hot into the Cavity of the Plate; and to prevent the Cement from running into the Orifice (*Z*) of the Shank (*X*) it was ſtopp'd with a Cork, having a String fixed to it, that it might be drawn out at the upper Orifice of the Receiver, and then the Glaſs Neck of the Receiver being well warmed, and thruſt into the Cement, it filled the Interſtices betwixt the Tin Plate and the Receiver, as alſo between the internal Superficies of the Receiver, and the Shank of the Cock.

The

The lower Part is the *Sucking Pump* or *Air Pump*, ſupported by a Frame of Wood, with three Legs, (III) ſo contrived, for the freer Motion of the Hand, that one ſide of it may ſtand perpendicular; acroſs the Midſt of the Frame is nailed a Board (222) to which the *Pump* is faſtened.

The *Pump* is made up of four Parts, *viz.* An exact and ſtrong Cylinder of Braſs of about fourteen Inches in length, with a Cavity of about three Inchers Diameter; to which is fixed a Sucker made up of two Parts; the one (44) ſomewhat leſs in Diameter than the Cavity of the Cylinder, on which a thick Piece of tann'd Leather is nailed, whereby it cloſes ſo exactly to the Cylinder, that the Air cannot inſinuate it ſelf between them: The other Part being a thick and narrow Plate of Iron (55) is firmly joined to the Middle of the former Part (44) it is ſomewhat longer than the Cylinder; one Edge of it being ſmooth, but the other indented (as in the Figure) with a Row of Teeth; to the Interſtices of which are fitted the Teeth of a ſmall Iron Nut *(L B)* which is faſtened by two Staples (22) to the under ſide of the croſs Board (222) on which the Cylinder reſts, and is turned to and fro by the *Manubrium* or Handle (7).

The laſt part of the Pump is the Valve *(R)* being a Hole at the Top of the Cylinder, a little taper towards the Cavity; to this Hole is fitted a Braſs Pegg, to be put in or taken out upon Occaſion.

Having thus deſcribed the Engine, it will be requiſite for the better Excluſion of the outward Air, and the more eaſy moving of the Sucker, Stop-cock and Key *S*, as alſo the Valve, that they ſhould be well oyled with Sallad Oyl; but ſometimes Oyl and Water together prove more effectual: Alſo, that the Ingreſs of Air betwixt the Braſs Cover and the Ring may be likewiſe prevented, the Edges of both muſt with the former Cement, be carefully plaiſtered, and ſpread on with a hot Iron, that it may run the better, and fill the little Cavities.

Things being thus fitted, and the lower Shank (*O*) of the Stop-cock being put into the upper Orifice of the Cylinder, then the Handle being turned till the Sucker riſes to the Top of it, and ſhutting the Valve with the Plug, and turning the other way, the Sucker is drawn down to the Bottom; by which means the Air is driven out of the Cylinder, and a Succeſſion from without being prevented, the Cavity of the Cylinder muſt be emptied of Air; then if the Turn-cock be turned, ſo as to afford a Paſſage betwixt the Receiver and Cylinder, part of the Air contained in the Receiver, will deſcend into the Cylinder, and by turning back the Key, that may be prevented from flying back into the Receiver, and may alſo, by opening the Valve, and winding up the Sucker, be forced into the open Air; and ſo by reiterated Exſuctions of the Air out of the Receiver, and Expulſions of it again out of the Cylinder, it may be exhauſted, as the Nature of the Experiment requires.

When this Engine is ſet on work, theſe *Phænomenas* are obſerv'd (1) That the Sucker being wound up, and upon ſtopping the Valve, and turning the Key, drawn down again; the Air in both Veſſels will be brought to an equal Meaſure of Dilation; and upon returning the Key, and opening the Valve, near a Cylinder full of Air will be expelled; but the Receiver by reiterated Exſuctions, being more and more exhauſted, leſs proportionably is forced out; ſo that at laſt, before you need to open the Valve, the Sucker may be forced up almoſt to the Top of the Cylinder; and if, when it is ſo exhauſted, you let go the Pump, the Valve being ſtopped, the Sucker meerly by the Protruſion of the External Air, overpowering that more rarified Air within, will be forced up to the Top of the Cylinder; whereby 'tis obſerved, That as the Sucker is preſs'd higher by the external Air, it ſhews the Receiver to be more or leſs exhauſted; the Air in the Cylinder being accordingly more or leſs able to reſiſt the external, as it varies in Quantity. 'Tis alſo obſerved, That whilſt the Receiver retains any conſiderable Quantity of Air, there is a briſk Noiſe immediately produced upon the turning of the Key.

2. Alſo, that when the Receiver is well exhauſted, the Braſs Key (that is a Stopple to the Braſs Cover) cannot be lifted up without ſome Difficulty, for it feels as if ſome great Weight were faſtened to the Bottom of it: The Cauſe of this *Phænomenon* ſeems to be, That the Air in the Receiver being very much dilated, its Spring muſt be proportionably weakened, and conſequently the lower end of the Stopple is accordingly preſs'd up, whereas the Spring of the external Air is not at all weakened; ſo that a Strength to lift up the Stopple, muſt ſupport a Preſſure equal to the Diſproportion betwixt the Force of the internal expanded Air, and that of the *Atmoſphere* incumbent upon the upper part of the Stopple: But if the Air be let into the Receiver by Degrees, the Weight that is ſuppoſed to keep the Stopple down, may be felt to decreaſe more and more, the internal Air by this Recruit apporoaching more to an *Æquilibrium* with the external, till at laſt the Receiver being fill'd with Air again, the Stopple may be eaſily lifted up.

Mr. *Boyle*, after ſome Years Experience, found it convenient to alter a little the Form of his firſt *Air Pump* into that which the annexed Figures repreſent: And the advantagious Differences between this and the former Engine, are as followeth.

(Vid. Plate I.)

1. The Cylinder is contrived to be placed within a Frame of Wood which is filled with Water, ſo that the Cylinder is always kept quite covered with it; by which means the Sucker is always kept Turgid and Plump, and the Water alſo fills up all the little Intervals or Spaces between the Sucker and the Barrel, and by that means the Air is much more exactly excluded than in the former Engine. But here great Care muſt be taken in turning the Stop-cock, or elſe the Water will get into the Receiver, and ſpoil the Experiment.

2. Becauſe in this Engine the Sucker is to be always under Water. There is a Perforation *P Q* *(See Plate* II.*)* which paſſes perpendicularly thro' it, and together with the Stick *R S*, ſerves for a Valve, and is to be ſtop'd at the Bottom of the Cylinder *N O*, when it is full of Water; wherefore the Stick *R S* muſt be of a conſiderable Length, as of 2 or 3 Foot.

3. The chief thing in this reformed Engine is, that the Pipe *A B (Plate* II.*)* whoſe End *B* turns upwards, is made to lie in a Groove or Gutter hollowed purpoſely for it in the Board *C D E F*, on which the Receivers are to reſt. This Board was covered

covered with good Cement, and then on it was applied a ſtrong Plate of Iron of the bigneſs of the Board, having only a Hole in the Middle for the Mouth of the Pipe *B* to paſs through; and this Plate he added, becauſe he found that the Weight of the Atmoſphere would ſometimes force the Air to penetrate thro' a thick Board, tho' its Pores were alſo deſignedly filled with Oyl. The Edges of this Plate ſhould be a little turned upward, to hold a little Water, which now and then will be apt to get into the Receiver.

The Stop-cock, *GHIK*, tho' it may be ſodered into the Cylinder at *I*, yet had better go on with a Screw; for then it may be more eaſily mended if it ſhould not prove right or ſtanch, and alſo will not be ſo apt to break off. 'Tis convenient alſo to have a little Cover of Tin, *&c.* to put over the Noſe of the Pipe *B*, to hinder things from falling into it, or injuring it, and to keep the Cement out of it, when very ſmall Receivers are uſed.

There is this conſiderable Advantage in this flat Board on which the Receiver is placed; that the Receiver needs no Stop-cock of its own, but is uſually one entire piece of Glaſs in the form of a Bell, or Cucurbit, *&c.* which will much better keep out the Air than if it were perforated, tho' the Stop-cock ſhould be never ſo good.

Care muſt be taken to get a good Cement to faſten the Receivers to the Plate: That which the Honourable Mr. *Boyle* uſed was a well wrought mixture of equal parts of Bees-wax and Turpentine; tho' in the Winter he found it beſt to uſe a little more of the Turpentine, and in the Summer a greater portion of Bees-wax.

The Deſcription of Mr. *Papin*'s Engine for exhauſting the Air from Mr. *Boyle*'s continuation of the *Phyſico Mechantical Experiments*, Part 2. *Iconiſmus primus*, Figure 1, 2.

AA, are two Pumps made of Braſs.

BB, are two Pluggs hollow within and open below.

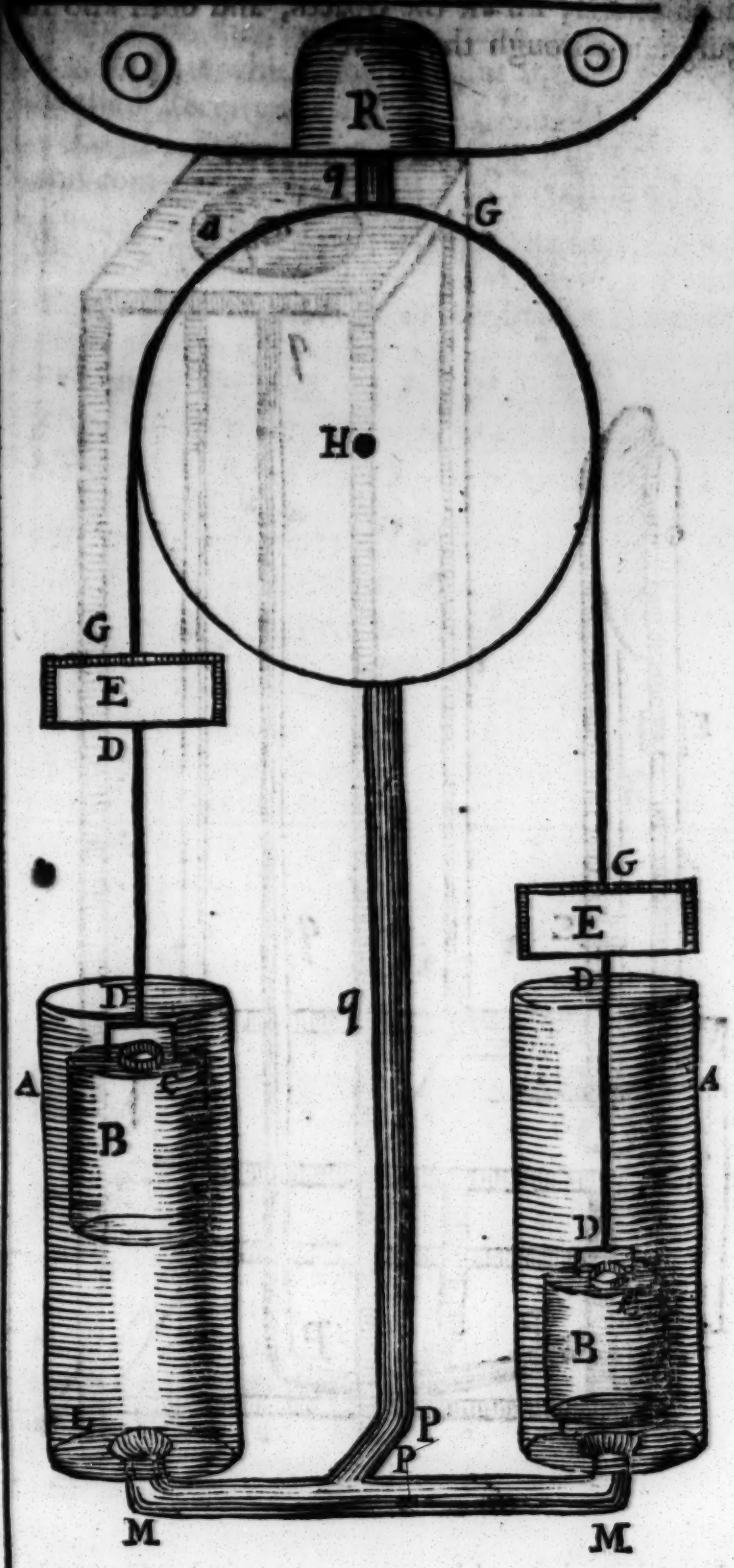
CC, are two Holes in the upper part of the Pluggs, with Valves opening inwardly, that they may afford paſſage to the Air to go out, and hinder it from coming in.

DDDD, are Iron Rods ſerving to move the Pluggs, and annexed to them, by means of the Gnomons *FF*.

EE, are two flat Iron Stirrups at the top of the Rods *DD*, on which the Operator muſt ſtand to ſet a-work the Engine.

GGG, is a Cord joyned to the two Stirrups, and compaſſing the Pulley *H*.

LL, are two Valves at the Bottom of the Pumps, opening inwardly, for the admiſſion of the Air out of the Tube *MM*.

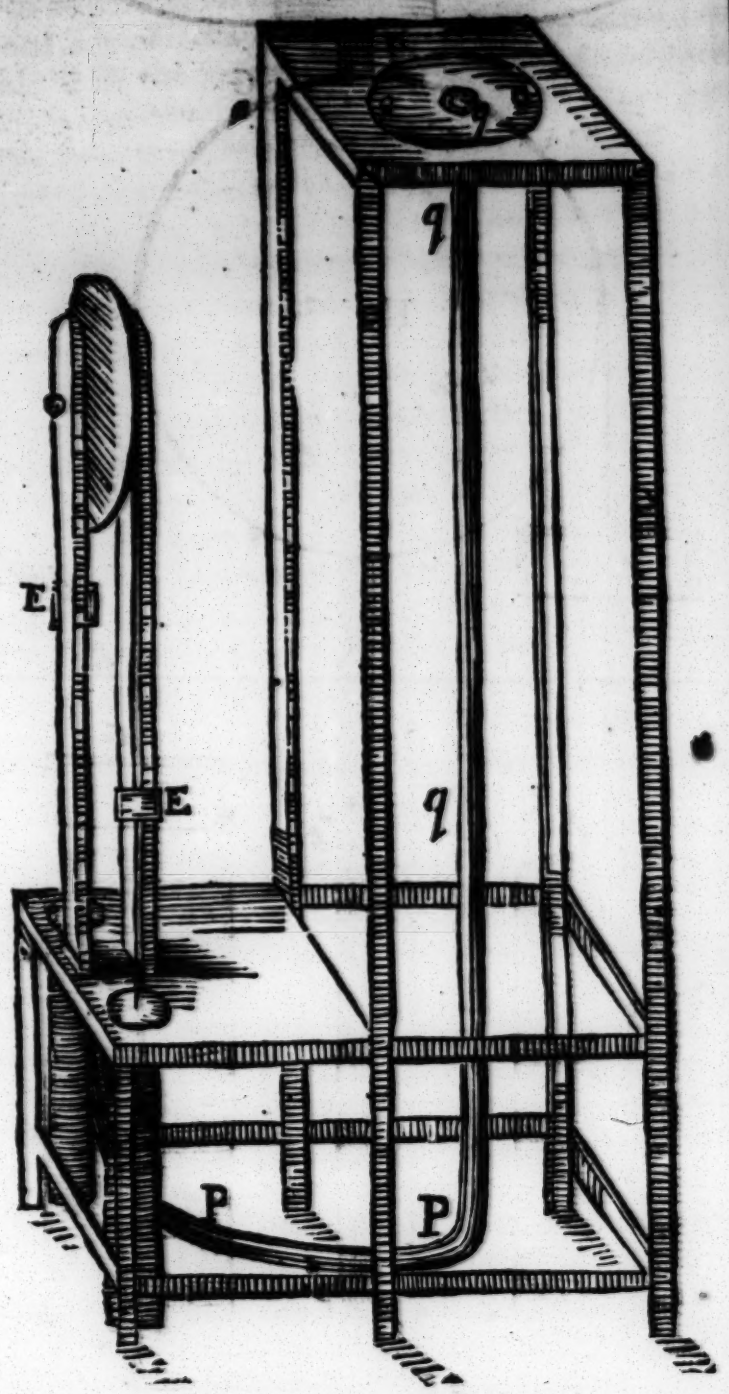


MM, is a Tube reaching from both Pumps to the *Plate OO*, by means of the Curvature *PP QQ*; which Curvature ought to be ſo long, that the Tube *PQQ* may not hinder the Exerciſer of the Pumps, but that he may conveniently ſtand on the Stirrups *EE*.

OO, is a Plate bored in the middle, on which the Receivers to be evacuated, are to be put; as *R* for Example.

This Engine is to be put into a Frame of Wood to ſupport it before it can be uſed, ſuch as is ſhewed in the ſecond Scheme. And as much Water is to be pour'd into the Pumps thro' the Hole *Q* in the *Plate OO*, as is ſufficient to fill the Cavities of the Pluggs, and a little more; and then ſome Body muſt ſtand on the two Iron Stirrups *EE*, and muſt alternately depreſs and elevate them: For by this means the Pluggs following the Motion of the Stirrups, in their aſcent will leave the Space in the Bottom of the Pump empty; and ſeeing all other Paſſage is intercluded from the Air, that Air alone which is contained in the Receiver *R*, is conveyed into the aforeſaid Pumps by the Tube *QQPPM*, and opens the Valve *L*, which being ſhut again, hinders the ſame Air from making a Regreſs; wherefore the Plugg afterwards deſcending, compreſſeth that Air, whence, of neceſſity, the Valve *C* muſt be open'd, and all the Air muſt paſs out of it,

becauſe the Water in the Bottom of the Pumps doth exactly fill all the Spaces, and doth alſo regurgitate through the Valve C.



Here 'tis obſervable, That this *double Engine* is upon many Occaſions to be preferr'd before a *ſingle one* (that's mov'd with the Foot) for it doth not only produce a double Effect, but performs it much more eaſily; for in theſe Engines, which are furniſhed but with one Tube, whilſt the Plugg is drawn out to evacuate the Pump, the whole Pillar of the Air, incumbent on the Plugg, is to be elevated by Force; and again, when the Plugg returns back, it is alſo by Force to be reſtrained, leſt it ſhould be too ſwiftly impell'd by the Air, and ſo break the Bottom of the Engine; but in theſe *double Engines*, the Plyer of them is in a manner wholly free from that Toil. For the Pluggs are eaſily lifted up, in the firſt Suction; becauſe the Air, immediately derived from the Receiver *R* into the Pumps, preſſes the Pluggs downwards, almoſt as ſtrongly as the external Air incumbent on the oppoſite Parts; and when the Quantity of the internal Air is diminiſh'd, it comes to paſs, that the Plugg to be depreſs'd, tends downward with ſo much the greater Force, and ſo by means of the Cord *GGG* compaſſing the Pulley, draws the other Plugg upwards, and at the ſame time hinders it from too much Velocity of Deſcent; ſo that by this means both Pluggs at one and the ſame time will be helpful to him that exerciſeth the Pumps.

This Engine is of great uſe in order to thoſe Experiments which cannot be very well made but with Velocity and Speed, ſeeing the Pluggs make but a ſmall Reſiſtance, a Man may eaſily judge, that the two Pumps of this Engine may be plyed with greater Eaſe and more Speed, than one Pump in a ſingle Engine can.

The Ingenious Mr. *Hawkesbee* now makes *Air-Pumps* of a much ſimpler and eaſier Form than theſe Engines, above deſcribed, and in which are many Conveniences which they had not: The Form of which is as follows.

1. There is a ſquare Board, as *ABCD*, which, by the Help of two Screws, is faſtened readily in any Window, or on any Table; in the middle of this Board is a Hollow, which contains a Braſs Plate, on which the Recipient *R* is placed, and faſtened to it without any Cement, by means of a thin Piece of wet Leather: In this Braſs Plate are two Holes, into one of which is an Elbow fitted, which hath the End of the *Air Pump* ſcrew'd on it, and on that Screw is a Valve made by a piece of Bladder, and anſwers alternately to another in the Sucker, opening when that ſhuts, and cloſing when that opens reciprocally: The other Hole hath faſtened into it a ſmall Braſs Pipe, on which is ſcrewed the upper Part of the Mercurial Gage, whoſe uſe is by the riſing of the Mercury from the Ciſtern below in the *Torricellian* Tube, to ſhew to what Degree the Recipient is exhauſted. This Gage is repreſented by the Letter *G*. *S* expreſſes the Body of the *Syphon* or *Air Pump*, which is work'd Horizontally by means of the Handle of the *Piſton b*: By which means the Recipient is very eaſily exhauſted, the Valves much better ſupplying the Uſe of the Stock-cock in other Engines of this Nature.

And when the Experiment is over, and you would let the external Air return again into the Receiver, in order to take it off the Engine, you need only unſcrew a little the Elbow above-mentioned, by turning the *Air Pump* about from the Left Hand towards the Right, as far as Liberty allows, and then the Air will eaſily inſinuate it ſelf between the Joints of the Screw: Or you may let the Air in alſo, by unſcrewing the Cap at *P*.

R. 2. is another Receiver, through whoſe Cap *P* (which contains a Box, in which are ſeveral Collars of Cork and Leather) paſſes a Braſs Wire as *W*, moveable up and down in the Cap, without letting in any Air into the Receiver, and on whoſe Hook *K*, may any thing be ſuſpended or faſtened in an Experiment.

F is a ſmall Air Pump applicable to a Cupping-Glaſs, by which 'tis eaſily affixed to any part of the Body, without Fire.

Y is a Syphon or Syringe for Injection in Anatomical Experiments; having ſeveral ſmall Pipes, as *C*, of differing Bores, to ſcrew on upon it; and receiving a conſtant Supply of the Liquor by means of the crooked Pipe *a*.

In the *Memoires de Mathematique & de Phyſique* for *December* 1693, you have this general Theorem (from Mr. *Varignon*) about the Proportion of the remaining Air in the (partly) exhauſted Receiver, to that which was in the Receiver before you began to pump, viz.

The Quantity of the Natural Air contained in the Receiver before you begin to pump any out, is always to the Quantity of what remains, after any Number of Pumps: As the Capacity of the Receiver, and the Cavity of the Pump together (which Cavity is made by the drawing up of the Sucker) *raiſed to a Power which ſhall have the Number of the Stroaks*

of

of the Pump for its Index; is to a like Power of the Capacity of the Receiver alone.

Demonstration.

Let a be the Natural Air, v that which remains after any number of Stroaks of the Pump, r the Capacity of the Receiver, s the Capacity of the Receiver, and the Cavity of the Pump together, n the number of the Stroaks of the Pump (here supposed all equal in force and effect to one another). Then says Mr. *Varignon*.

| $a.$ *is to* v :: *as* $s^n . r^n$. | which is the Theorem above delivered, *in species*. To shew the Truth of which, 'tis enough (saith he) to consider, That each time the *Piston* or Sucker of the Pump is drawn back, the Air in the Receiver must expand it self so as in some measure to fill up the Cavity of the Pump left vacant by the *Piston*, as well as the Receiver it self. (*N.B.* He seems to build on the *Cartesian* Notion of a *Plenum*, but it matters not, the Calculation is just) wherefore, as now, so after each Stroak of the Pump, the remaining Air in the Receiver and Pump, will be to what was in the Receiver just before, as the Capacity of the Receiver alone, is to that of the Receiver and Pump taken together; that is, as r to s.

Let us make then a, b, c, d, e, f, &c. and at last t and v to denote the different Quantities of Air found successively in the Receiver after each Stroak of the Pump: That is, let a be the Air in its Natural State when you begin first to Pump; b the Quantity of Air there after the first Stroak; c the Quantity of Air after the second Stroak, and so on till you come to the last Stroak, where v represents the Quantity of Air remaining in the Receiver and Cavity of the Pump after any Number of Stroaks; and that Number will be n.

Then will it ever be

$a. b :: s. r.$
$b. c :: s. r.$
$c. d :: s. r.$
$d. e :: s. r.$
$e. f :: s. r.$

and in one Word,

$t. v :: s. r.$

wherefore $a. v :: s^n . r^n$. *Q. E. D.*

From whence, by way of Corollary, he gives us this Rule.

Let $b. k. l. m.$ represent the Logarithms of the Quantities before-mentioned, a, v, s and r; then will $b. k :: ln. mn.$ that is, those four Terms will be Arithmetically Proportional: Wherefore $b + mn = k + ln$: or $b - k = ln - mn$. Which is the *Rule* to be used, as follows in the *Problems*.

Problem 1. *The Capacity of the Receiver, and of the Cavity of the Pump being given, or the Ratio between them; together with the Number of the Stroaks of the Pump in the Evacuation of the Receiver; To find the Ratio between the Natural Air, and that now in the Receiver.*

The *Rule* is, keeping to the last mentioned Notation, $b - k = ln - mn$.

Where $ln - mn$ is the Logarithm of the Ratio sought; that is, in Words, The Logarithm of the Ratio of the Natural Air to that in the (nearly suppose) exhausted Receiver is always equal to the Product of the Number of the Stroaks of the Pump, multiply'd by the Logarithm of the Ratio between the Capacity of the Pump and Receiver together, and the Receiver alone.

So that these things being given, as in the Supposition of the *Problem*, the *Ratio* of the Natural Air, to that which now remains in the nearly exhausted Receiver, is found. *Q. E. I.*

Let this *Ratio* be as p to q; then will $a. v :: p. q.$ and consequently $aq = pv$; and dividing all by q, the Natural Air will be thus expresst, $\frac{pv}{q} = a$, if you have the remaining Air in the Receiver; and that remaining Air will be expresst thus, $\frac{aq}{p}$ if you have the Natural Air. And supposing both Natural and Remaining Air to be each $= 1$, they will be thus expresst: The Natural Air $= \frac{p}{q}$ and the remaining rarify'd Air $= \frac{q}{p}$

As for *Example*, Suppose the Cavity of the Receiver to be 10 times as great as that of the Cavity of the Pump left by drawing up the *Piston*; and that the Number of the Stroaks of the Pump be 30: I demand what Proportion the Air in the (partly) exhausted Receiver bears to the common Air. The Answer is, That there is about the 18th part of the Air which was in the Receiver when you began to Pump.

For in this Case the Logarithm $l - m =$ to the Ratio between the Capacity of Receiver and Pump together, to Receiver alone, will be 4139275 which, multiply'd by $30 = n$, gives 12417810 for the Logarithm of $ln - mn$, the Ratio of the Natural Air to the remaining Air. Let the Natural Air in the Receiver, before the Pump was set on work, be $= 1$; then will -12417810 be the Logarithm of that small Quantity of Air which shall at last remain after the 30 Pumps, which will be the Logarithm of $\frac{1}{18}$ *fere*; that is, it may be expresst thus, $\frac{a}{18}$. And therefore, to find the Weight of all the Natural Air ($= a$) in the Receiver, we may say, that the re-entred Air at last let in is $= a - \frac{a}{18}$; and then taking a for its proper Weight, (as supposing the Weights of Bodies to be proportionable to their Bulks) let p be the Difference between the Weights of the Receiver when full and when exhausted; we shall find that $a - \frac{a}{18} - p$, which Æquation will produce $a - p + \frac{a}{17}$, for the Weight of all the Natural Air in the Receiver. In general, if g be put for the Number of which $ln - nm$ is the Logarithm, the remaining Air at last will always be precisely $= \frac{a}{g}$, its Weight $= \frac{p}{g - 1}$: And the Weight of the Natural Air $= \frac{gp}{g - 1}$.

Problem 2. *The Ratio between the Natural Remaining Air being given with the Number of Stroaks of the Pump, to find the Ratio of the Receiver, to the Cavity of the Pump.*

The Rule will be $b - k = ln - mn$, and consequently $\frac{b - k}{g} = l - m$; then will $\frac{b - k}{n}$ be the Logarithm of the Ratio of the Capacity of

the Receiver alone; which Ratio being alſo known, viz. as p to q, then will $s.r :: p.q$, and $s-r.r :: p-q.q$; that is, the Logarithm of the Ratio of the natural Air to the remaining Air, being divided by the Number of the Strokes of the Pump, will always give for the Quotient the Logarithm of a Ratio, whoſe Antecedent leſs the Conſequent, will be to the Conſequent, as the Pump is to the Receiver; and therefore this Quotient being known, the Ratio between the Pump and the Receiver will alſo be known. *Q.E.I.*

From hence, if the Capacity of the Receiver be known, the Capacity of the Pump will be found to be $\frac{rp-rq}{q}$; and if the Capacity of the Pump be known, viz. $s-r=e$, then that of the Receiver will be $\frac{eq}{p-q}$.

Problem 3. *The Ratio between the Pump and Receiver being given, together with that of the natural Air to the remaining Air; To find what Number of Strokes of the Pump, are neceſſary to bring the natural and remaining Air to the given Ratio: Or, in other Words, To rareſie the Air in a given Ratio, with an Engine whoſe Receiver and Pump are given in Capacity.*

The *Rule* being $b-k=ln-nm$, and conſequently $\frac{b-k}{l-m}=n$, it will be, as the Logarithm of the Ratio of Receiver and Pump together, to Receiver alone, is to the Logarithm of the Ratio between the natural and remaining Air: So is Unity to the Number of Stroakes of the Pump required: Or, in other Words, the Quotient of the Second of theſe Logarithms divided by the Firſt, is always equal to the Number of Stroakes ſought.

AIRY METEORS: See *Meteors.*

AISTETERIUM, the common Senſory, which *Cartes* would have placed in the *Glandula Pinealis*, but is now generally ſuppoſed to be about the beginning of the *Medulla Oblongata* in the *Corpus Striatum.*

AJUTAGE, is the Spout for a *Jets d'eau* in any Fountain: Mr. *Marriott* aſſerts, That an even poliſhed round Hole in the End of the Pipe, will give an higher *Jet* than either a Cylindrical or a Conick *Adjutage*; but of thoſe the latter is the beſt.

ALA, in *Botany*, ſignifies the Angle (which generally is acute, and never greater than a Right one on the *Foot Stalks* of Plants, and is always tending upwards) that either the Leaves or the Foot Stalks of Leaves make with the Stalk, or with any Branch of the Plant. Sometimes alſo 'tis taken for a little Branch, making an Angle after that manner with the Stalk.

ALABASTRA, in a Plant, are thoſe little green Leaves which compaſs in the Bottom of the Flower.

ALBA FIRMA, in Land, is an Annual Rent in Money, payable to the Chief or Lord of any Hundred; and *Spelman* ſaith, 'Tis called *Alba* becauſe it is not paid according to the Cuſtom of old Times in Corn (which was call'd *Blackmail*) but in Silver, or as they ſay now in ſome Parts of *England*, in *White Money.* There are Tenures of this Nature in *Weſtmorland*, 2 *Part Inſtitut. Fol.* 10.

ALBAPITUITA, the ſame with *Leuco-Phlegmatia.*

ALBUGINEA OCULI, is a very thin white Coat or Tunic of the Eye, adhering to the *Cornea*, extending it ſelf beyond the *Sclerotick*, even to the Circle of the *Iris*, but leaves a Hole forward for the opening of the Apple of the Eye. See *Tunica Adnata*: 'Tis by ſome Writers call'd *Tunica Conjunctiva.*

ALBUGINEA TESTIS, is the White Membrane immediately involving the *Teſtes* or *Teſticles.*

ALBUGO, the *Pin* and *Web*, is a white Speck in the Honey Tunicle of the Eye, which hinders the Sight, and uſually follows an Inflamation, Wound or Ulcer of that Part. Sometimes it's taken for the *Album Oculi*, or White of the Eye; being that part where the *Tunica Adnata* or *Albuginea* adheres to the *Sclerotica.*

ALBUM OCULI, ſometimes is taken for the ſame with *Albugo*: But by *Galen* and *Hippocrates* is uſed for that Tunick of the Eye which is uſually call'd, the *Tunica Adnata*; and by ſome Writers *Albuginea Oculi*: Which ſee under thoſe Words.

ALCHAICKS, are a ſort of Verſes conſiſting of two *Dactyls* and two *Trochees*, as ſome will have it; but *Fabricius* ſaith, they conſiſt of 5 Feet, of which the firſt is a *Spondee* or *Iambick*, the ſecond an *Iambick*, the third a long Syllable, the fourth a *Dactyle*, the fifth a *Dactyle* or *Amphimacer*; as theſe of *Horace.*

Vides ut alta ſtat nive candidum
Soracte, nec jam ſuſtineant onus.

ALCHYMIST, is one that ſtudies *Alchymy*; that is, that Sublimer Part of *Chymiſtry* which teaches the Tranſmutation of Metals and the Philoſoper's Stone; according to the Cant of the *Adeptiſts*, who amuſe the Ignorant and Unthinking with hard Words and Non-ſenſe: For were it not for the *Arabick* Particle *Al*, which they will needs have to be of wonderful vertue here, the Word would ſignifie no more than *Chymiſtry.* Whoſe Derivation ſee under that Word. This Study of *Alchymy* hath been rightly defined to be, *Ars ſine Arte, cujus principium eſt mentire, medium laborare, & finis mendicare*: That is, an Art without an Art, which begins with Lying, is continued with Toil and Labour, and at laſt end in Beggery. And ſo poor *Penotus* found it, who after he had ſpent his whole Life and Fortune in this vain Study, died at laſt in an Alms-Houſe at *Yverdon* in *Switzerland*; and uſed to ſay, he would recommend the Study of *Alchymy* to a mortal Enemy, whom he did not dare openly to attack.

ALCOHOL, a Term uſed by the *Chymiſts* both for a very fine or impalpable Powder; and alſo for a very pure Spirit well rectify'd or dephlegmated. Thus the higheſt rectify'd Spirit of Wine is called *Alcohol Vini.* Hence to *Alcoholize* any thing, with them ſignifies to ſubtilize; as when any thing is beaten to a very fine Powder, *&c.*

How to make a tolerable true Alcohol or pure Spirit of Wine, ſee in *Alcalizate Spirit of Wine.*

ALCOVE, in Architecture is a part of a Chamber ſeparated by an *Eſtrade* or Parition made by Columns and other correſponding Ornaments, in which is placed a Bed of State, or ſometimes Seats to entertain Company.

ALDEBARAN, an *Arabian* Name for a fix'd Star of the firſt Magnitude, ſituate in the Head of the Conſtellation called the *Bull*, and therefore is uſually named the *Bull's-Eye.*

ALE-

ALE-TASTER, is an Officer appointed and ſworn in every Court-Leet, to look that there be a due Size and Goodneſs of Bread, Ale and Beer ſold within the Juriſdiction of the Leet.

ALEMBICK, is a Chymical Inſtrument uſed in Diſtilling; it has the ſhape of an Helment Concave within, and Convex without; and towards the Bottom is placed a Beek or Noſe about a Foot and a half long, by which the Vapours deſcend; ſometimes they are made without a Noſe, but then they are rather Circulatory Veſſels, and the Head is called a *Blind-Head*: They are made uſually of Copper tinn'd within-ſide; and often of Glaſs.

ALEOPHANGINÆ *(Pillulæ)* are purging Pills compoſed of Aloes and ſeveral Spices.

ALERSANS JOUR, (a Law Term) ſignifying to be finally diſmiſs'd the Court, becauſe there is no further Day aſſign'd for Appearance.

ALEXIPHARMICK MEDICINES, are ſuch as are uſed as Antidotes againſt Poiſon, or any Infectious Diſeaſe; or to raiſe or ſtrengthen the decayed or drooping Spirits in malignant Diſtempers.

ALEXITERICAL, } the ſame with *Alexipharmick*.
ALEXITERICK, }

ALGAROT, In Chymiſtry, ſignifies a ſtrong Emetick and Cathartick Powder, the ſame as *Mercurius Vitæ*, being made of Butter of *Antimony* precipitated into a white Powder, by being waſhed or diluted in a large Quantity of warm Water.

ALGEBRA; the wonderful *Analytick Art*, or the Art of Equation. In *Arabick* is called *Al-giabr W'al-mokabala*, from the former of which Words we call it *Algebra*; and it may be render'd, either the *Art of Reſtitution and Compariſon*, or the *Art of Reſolution and Equation*. *Lucas de Burgo*, the moſt Ancient *European* Writer of *Algebra* we have, defines it *Reſtaurationis & Oppoſitionis Regula*.

The *Italians* gave it the Name of *Regula Rei & Cenſus*; that is, *the Rule of the Root and the Square*, becauſe they call the Root *Res*, and the Square *Cenſus*; and from *Coſa* in the *Italian* Language, for *Res* or the Root, comes the Word *Coſſick*: For ſome Writers call the *Powers* of Numbers, as the *Root*, the *Square*, *Cube*, &c. *Coſſick Numbers*.

Cardan calls it, and that very juſtly, *Ars magna*, *The great Art*; following therein *Lucas de Burgo*, who ſtiles it in *Italian*, *L'Arte Maggiore*.

It was certainly of Old in uſe amongſt the *Grecians*, but purpoſely concealed as a very great Secret. We have ſome Examples of it in *Euclide*, or at leaſt in *Theon* upon *Euclide*, who tells us, it was firſt communicated by *Plato*: There are alſo Inſtances of this Art in *Pappus*; and we find the Effects of it plainly in *Archimedes*, *Apollonius*, and ſome others, tho' ſtudiouſly covered and diſguiſed. The firſt Books among the *Greeks*, and, I believe, the only one that treats profeſſedly of *Algebra*, is that of *Diophantus*: Publiſhed at firſt in *Latin* by *Xylander*, afterwards in *Greek* and *Latin* by *Bachet*, with ſome things added of his own; and ſince him by Mr. *Fermat*, with ſome Additions of his likewiſe. But it certainly was in uſe among the *Arabs* more anciently than among the *Greeks*; and they are ſuppoſed to have had it from the *Perſians*, and the *Perſians* from the *Indians*. Thence, that is, from the *Arabs*, the *Moors* and *Saracens* brought it into *Spain*, from whence it came into *England*; and that before we knew any thing of *Diophantus*. The Uſe of the Numeral Figures, Mathematick Learning and all our old Aſtronomy, came to us likewiſe the ſame way from the ſame Original, and about the ſame time.

The firſt *European* Writer of *Algebra* (as was hinted above) is *Lucas Pacciolus* or *Lucas de Burgo* a Minorite Frier: His Book is in *Italian*, printed at *Venice* 1494. He makes mention of one *Leonardus Piſanus*, and ſeveral others, from whom he learn'd it, but we have none of their Writings. He ſays, this Art came Originally to us from the *Arabs*, and makes no mention of *Diophantus*, who therefore 'tis probable was not yet known here. His *Algebra* goes no farther than Quadratick Equations.

Next came out *Stiphelius*, a good Author, but he alſo went on beyond Quadraticks.

But *Scipio Ferreus*, *Cardan*, *Tartalea*, and ſome others, proceeded to give a Solution of ſome Cubick Equations.

After this *Bombelli* went a little farther, and ſhewed how to reſolve a Biquadratick Equation into two Quadratick ones, by the means of a Cubick.

Then, in the laſt Century, appear'd *Nonnius (Nunnez* in *Spaniſh) Ramus*, *Schonerus*, *Saliguacus*, *Clavius*, &c. who wrote on this Subject in various ways, but generally went no farther than Quadratick Equations.

About this time out came *Diophantus*, whoſe Method differs much from that of the *Arabs*, which others had hitherto followed.

All this while, the known Quantities in any Equation, were deſigned only by the Numerical Letters, and there were no Symbols nor Marks but for thoſe that were unknown or ſought.

But then came *Vieta*, *A. D.* 1590, and introduced what he called his *Specious Arithmetick*; which is a way of giving Marks or Symbols to all the Quantities, both known and unknown; whereby a very ſhort and conſpicuous way of *Notation* was gained, the whole Operation expoſed always to the Eye in a ſhort *Synopſis*, and many Diſcoveries were made in *Algebra*, not before taken notice of.

Vieta alſo introduced the *Numeral Exegeſis* of affected Equations, ſhewing how to extract their Roots in Numbers. And in the Denomination of the Powers of Numbers, he follows *Diophantus*, and not the *Arabian* manner uſed by others.

The Incomparable Mr. *Oughtred* followed, and mightily improved the Specious *Algebra* of *Vieta*, in his *Clavis Mathematica*, firſt publiſhed 1631: He alſo affecting Brevity, (which indeed he was a perfect Maſter of, being ſhort, but not obſcure) invented many *Compendious Characters* or *Ligatures* to note the *Sums*, *Differences*, *Rectangles*, *Squares*, *Cubes*, and their *Sum*, *Difference*, &c. by which means his little Book contains more excellent and uſeful Geometry, than many other large Volumes. *Oughtred* in his *Clavis* uſually contents himſelf with the Solution of Quadraticks, rarely proceeding to thoſe of higher Powers, becauſe he deſigned it as an *Introduction* to *Algebra* only.

The Famous Mr. *Harriott* was Contemporary with *Oughtred*, but died before him; he left many good things behind him, of which nothing is yet publiſhed but his *Analytice* or *Algebra*, which Mr. *Warner* printed *A. D.* 1631. From this great Man did *Des Cartes* borrow, not to ſay ſteal, all the famous things in his *Geometry*, which are purely Algebraical, as any one may ſee, that will compare their Methods together: For 'tis impoſſible but one muſt be Copied after the other: But the *Geometry* of *Des Cartes* was not publiſhed in *French* till the

the Year 1637, and not in *Latin* till the Year 1649: Therefore he muſt have ſeen and copied *Harriott*'s Book.

Mr. *Harriott* did wonderfully improve (in this Treatiſe) that which is purely *Algebra*, in the following Reſpects, and many others which I might mention.

1. He brought in ſmall Letters inſtead of the Capitals uſed by *Vieta* and *Oughtred*.

2. He waved the uncouth Terms of *Quadrato-Cube*, *Surſolid*, &c. explaining the Power plainly to the Eye, by only repeating the Root as often as the Index of the Power.

3. He ſhewed the true Original and Conſtitution of all Equations, by putting all the Equation over to one ſide; and thereby making the whole equal to nothing; whereby alſo he determined the Number of Roots, which he ſhews are in Number, ſuch as the Index of the higheſt Powers in the Equation.

4. He diſcovers the true Conſtruction of the abſolute Number (the *Homogeneum Comparationis*) in a Quadratick or Superior Equation; ſhewing it to be the Product of the continual Multiplication of all the Roots.

5. The ſame he doth alſo by the Co-efficients.

6 He ſhews the way to multiply the unknown Roots of an Equation according to any Proportion aſſigned, thereby freeing the Co-efficients from Fractions and Surds.

7. He ſhews how to reduce the adrected Quadraticks, to ſimple Equations, and all adfected Cubicks to a Form eaſily ſovable, by the means of deſtroying the ſecond Term in ſuch Equations.

8. He ſhews the Method (and a very good one 'tis) of ſolving all adfected Quadraticks by compleating the Square.

9. He mightily alſo improves the *Exegeſis Numeroſa*, invented by *Vieta*.

All theſe vaſt Improvements, and many more (which, to avoid Prolixity, I omit) did *Des Cartes* take from *Harriott*, without ever ſo much as naming him, and publiſh them as his own. 'Tis true, in his *Geometry* there are abundance of excellent Things about the Accomodation of *Algebra* to *Geometrical Propoſitions*, and many very fine *Geometrical Effections* and *Conſtructions*; but this was not *Harriott*'s Buſineſs, who kept himſelf up pure *Algebra* only. As to which *Des Cartes* hath added but one ſingle Rule (and even that is plainly deducible from *Harriott*'s Principles) over and above what is in *Harriott*; and that is, the Method of diſſolving a Biquadratick Equation, whoſe ſecond Term is wanting, into two Quadraticks, by means of a Cubick Equation of a plain Root; and this, after all, both *Bombell* and *Vieta* had done before him. And thus leaving the *French* Plagiary, I come next to another of *Our* Countrey Algebraiſts, Dr. *Pell*, who reviſed and altered a Piece of *Algebra* firſt publiſhed in *High Dutch*, *A. D.* 1659, at *Zurich*; and after tranſlated into *Engliſh* by Mr. *Thomas Francher*, and printed, *A. D.* 1688, and called, *An Introduction to Algebra*: In which Dr. *Pell* gives us a peculiar Method of his own for applying *Algebra* to *Problems* of divers Sorts; and introduces a way of keeping a *Regiſter* of the whole Proceſs in the Margin. He ſhews alſo there how to judge whether a *Problem* be fully determined or not; which is by this Rule (as Dr. *Wallis* interprets him). *If the Number of the* Data, *or Things given in any Queſtion, be (independent of each other) fewer than the things ſought, the Queſtion is not fully determined, but is capable of innumerable Anſwers or Solutions.*

But if the Number of both Data *and* Quæſita *be the ſame, the Queſtion is then determined to either to ſome one, or to ſome certain Number of Solutions.*

And when the *Data* are more in Number than the *Quæſita*, ſo many as exceed are always ſuperfluous, and ſometimes, it may be, are contrary to, or inconſiſtent with others, and conſequently render the thing impoſſible.

Dr. *Pell* alſo, beſides the former Characters, introduced this Mark & for *Involution*, and this *vv* for *Evolution*, as he calls it, *i. e.* for *Squaring*, *Cubing*, &c. of any Quantity, and for *Extracting the Square*, *Cube*, &c. Roots out of any Quantity. He makes alſo the Mark :- to ſtand for *Diviſion*, and Regiſters the ſeveral Steps of the whole Proceſs by Numeral Figures in their Order in the little Column in the middle; keeping an Account alſo in Symbols of the ſeveral Operations in the Column towards the Left Hand, that ſo you may ſee how any Quantity or Equation in the large Column towards the Right Hand is produced. In which very good Method he is follow'd by Mr. *Ward*, in his ſmall Treatiſe of *Algebra*.

Algebra is well enough divided into

1. *Numeral* or *Vulgar*; which was that of the Ancients, and ſerved only to find the Solution of Arithmetical Problems, without any Demonſtration; ſuch as thoſe given us by *Diophantus*, &c.

2. *Specious* or *New*, called ſometimes *Logiſtica Specioſa*, and often *Species* alone; which ſince *Vieta* hath been perform'd by Letters of the Alphabet. And this way of Notation is very pleaſing to the Mind, aſſiſting to the Imagination, and eaſy to the Memory. This alſo is no ways limited, like the former *Algebra* to any one certain kind of Problems, but ſerves equally for the Inveſtigation and Demonſtration of all Theorems; eſpecially if to thoſe two you add the new Methods of

3. *Fluxions*; a large Account of which you will have under that Word.

And the ſeveral Operations of *Algebra*, ſuch as *Addition*, *Subſtraction*, *Multiplication*, *Diviſion*, *Extraction of Roots*, *Fractions*, *Equations*, &c. you will find Directions how to perform under thoſe ſeveral Words.

ALGENEB, a fix'd Star of the ſecond Magnitude in the right ſide of *Perſeus*, whoſe *Longitude* is 57 *Deg.* 17 *Min.* *Latitude* 30. 5. Right Aſcenſion 44 *Deg.* 15. *Min.*

ALGOL, or *Meduſa's Head*, a fix'd Star of the third Magnitude, in the Conſtellation *Perſeus*, whoſe Longitude is 51. 27. Latitude 22. 22. and Declination 39. 39.

ALGORITHM, ſometimes call'd *Logiſtica Numeralis*, is the Sum of the principal Rules of Numeral Computation; of which they commonly reckon Five, *Numeration*, *Addition*, *Subſtraction*, *Multiplication* and *Diviſion*; to which may be added *Extraction of Roots*.

ALGORISM, is the Practical Operation in the ſeveral Parts of *Specious Arithmetick*, or *Algebra*; and ſometimes the Word is uſed for the Practice of Common Arithmetick by the ten Numeral Figures.

ALIDADA, the Label or Ruler which is moveable on the Centre of an Aſtrolabe, Quadrant, *&c.* which carries the Sight. It is ſo called by the *Arabian* Writers of Mathematicks, from whom we took and retain ſeveral *Arabick* Terms, as *Azimuth*, *Zenith*, *Nadir*, *Almacanter*, &c.

ALIEN,

ALIEN, a Subject born in a Foreign Countrey, who (by our Common Law) is not capable to inherit Lands in *England*, till Naturaliz'd by Act of Parliament.

ALIENATION, is (in Law) making a thing another Man's, or to alter or put the Poſſeſſion of Lands, or other things, from one Man to another; and in ſome Caſes a Man hath Power in himſelf to do ſo, without the Aſſent or Licence of any other, and in ſome not.

ALIFORMES MUSCULI, *Alares*, *Pterygoides*, are Muſcles ariſing from the Pterygoide Bones (the Proceſs of the *Os Cuneiforme*, partly with a Nervous Beginning, and partly Fleſhy; and ending in the Neck of the lower Jaw, and towards the internal Seat of the Head.

ALIFORMES PROCESSUS, are the Prominences of the *Os Cuneiforme*, from the fore Part; the ſame with the *Pterygoides*.

ALIMENT, is whatever ſerves to nouriſh, ſupply the Decays of, and to recruit an Animal or Vegetable Body.

ALIMONY, formerly ſignified Nouriſhment or Maintenance; but in a Modern Legal Senſe, it is that Portion or Allowance which a married Woman ſues for upon any Occaſional Separation from her Husband, wherein ſhe is not charged with *Elopement* or *Adultery*. This was recoverable in the Spiritual Court, but now only in Chancery.

ALIQUOT PART of a Number, is ſuch an one as will exactly meaſure it without any Remainder. But an

ALIQUANT PART, is that which cannot meaſure any Number exactly, but that ſome Remainder will be left. Thus 3 is an Aliquot Part of 12, becauſe being taken 4 times it will juſt meaſure it; but 5 is an Aliquant Part of 12, for being taken twice it falls ſhort, and when taken 3 times it exceeds 12.

ALKAHEST; one of the canting Terms of the *Alchymiſts*, by which they intend an Univerſal *Menſtruum* that will diſſolve all manner of Bodies; and by which they pretend to extract the Sulphur of Metals. Some Chymiſts have given this mighty Name to the *Tincture*, or *Liquor* of *Flints*,, which is a Solution of them made (after Calcination) by the means of Salt of Tartar; and others to the *Liquor of Fixt Nitre*, which is Nitre calcined and fixed, by burning powder'd Coals with it, and at laſt run into a *Deliquium*, by being ſet in a cool Cellar, as Oyl of *Tartar per Deliquium* is made. *Van Helmont* calls this Liquor ſometimes *Ignis Gehennæ*: He pretends to be Maſter of it himſelf, and Mr. *Boyle* is inclined to believe him. *Helmont* ſaith, it would diſſolve all Bodies, without leaving any *Caput Mortuum*, and was as fit for a new Operation after it had diſſolved one kind of Body as at firſt; it would diſſolve Metals, Marchaſites, Stones, and even Glaſs it ſelf when finely powdered.

'Tis found, that the common *Menſtruums*, ſuch as *Aqua Fortis*, *Spirit of Nitre*, &c. when they have once diſſolved any Metal, are render'd uncapable by it of any futher Service, having the Points or Edges of their *Acids* ſo broken, that they can hardly diſſolve any more of the ſame, or any other Metal. Therefore this immortal *Alkaeſt* had, in this reſpect, a wonderful Preheminence, if what they relate of it be true. And to ſhew that ſomething of this Nature is poſſible, Mr. *Boyle* ſays, That he diſtill'd a Spirit from Verdigreaſe, which would ſerve more than once as a *Menſtruum* to diſſolve Bodies. or to draw Tinctures, and being drawn off, was ready for the ſame Operation anew.

ALKALISATE SPIRIT OF WINE; So Mr. *Boyle* calls a Spirit of that Liquor diſtill'd from Salt of Tartar, or Tartar calcined to Whiteneſs: And by ſo drawing off Spirit of Wine from that Salt, you may get eaſily a pure and rich dephlegmated Spirit (*viz.* one that ſhall burn all away, and fire Gunpowder) after this manner;

Put about an Inch thick of Tartar calcined white, into a Glaſs as long and ſlender as you can procure, and then put upon it Spirit of Wine that hath been once rectified, to a Finger's Height above the Tartar; and fitting on a Head, draw the Spirit off in a very gentle Heat; or at leaſt, ſo much of it as you conclude, or find will come pure, and it will anſwer your Expectation at the firſt Diſtillation. The Tartar being dried and new calcined will ſerve again for a new Operation. If you cannot procure Tartar, Quick-lime, or the Salt of Pot-Aſhes will do tolerably well. *Eſſay of Unſucceſsfulneſs of Experiments.*

ALKALI, a Chymical Word ſignifying the *fixt Salt* of any Plant; and is ſo call'd, becauſe the Herb called *Kali* which is a kind of a *Sea-blite*, *Glaſs-wort*, or *Salt-wort*, yields ſuch a Salt in a great Quantity. This fix'd Salt of Plants (which is made by burning the Plant, making a *Lixivium* or Lee of its Aſhes; and after filtrating the Lee, evaporating the Moiſture over a gentle Heat, that the fix'd Salt may remain at the Bottom of the Veſſel) being render'd very Porous by the Fire's paſſing ſo often thro' it in its Calcination, and it may be fixing there ſome of its Eſſential Salt: And becauſe very many of the fiery Particles do alſo ſtick in thoſe Pores, it makes a very great Ebullition or Efferveſcenſe when any *Acid Liquor* is mingled with it, and from thence, all Bodies that do, or are ſuppoſed to ferment with *Acids*, are now always call'd *Alkalies*, or *Alkaliſate Bodies*; not becauſe they muſt always contain any *Hidden Alkali* in them; which ſome Chymiſts aſſert as neceſſary to the Cauſe of Fermentation; but becauſe they are of the Nature of *Alkalies* themſelves, and have their Pores naturally ſo form'd, in ſuch a Proportion, as that they are fitted to be penetrated and put into a violent Motion by the Points of the *Acid* poured upon them. Theſe fix'd Salts of Plants are called *Fix'd Alkalies*: but the Volatile Salts of Vegetables, becauſe they will ferment with *Acids*, are called *Volatile Alkalies*.

ALKERMES, in Pharmacy, is a Confection deſcribed in the *Diſpenſatory*, and ſold in the Shops, and ſo called from the *Arabick* Particle *Al* and *Kermes*, which are *Red* or *Scarlet Grains*, the chief Ingredient in the Confection.

ALLANTOIS *or* ALLANTOIDES, is the Urinary Tunic placed betwixt the *Amnion* and the *Chorion*, which by the Navel and *Urachus* (or Paſſage by which the Urine is convey'd from the Infant in the Womb) receives the Urine that comes out of the Bladder: It's called likewiſe *Farciminalis*, becauſe that in many Brutes it's of the Shape of a Gut-pudding, but in Man, and ſome other few Animals it is round, and like the thin ſoft Skin which wrappeth the Child in the Womb.

The Ingenious and Accurate Dr. *Richard Hale*, of *Trin. Coll.* in *Oxford*, *in Phil. Tranſact.* N. 271 hath obliged the World with a more perfect Diſcovery of the Human *Allantois*; and aſſign'd the Reaſons why thoſe who believed its Exiſtence had not before

fore fully found it out; giving alſo an Anſwer to the Objections of thoſe, who even ſtill, deny its Reality.

ALLEGATION, is the Citation or Quotation of any Authority, Book, &c. to make good any Point or Aſſertion.

ALLEGORY, is a Figure in Rhetorick, conſiſting of one continued Metaphor, carried on thro' the whole Diſcourſe.

ALLEGIANTIA, is the natural and ſworn Allegiance or Legal Obedience which every Subject bears to his Prince.

ALLEGIARE, is to juſtifie and clear himſelf by courſe of Law, of the Crime objected to him.

ALLEMANDE, is a kind of grave ſolemn Muſick, where the Meaſure is full and the Movement ſlow.

ALLIANCE, properly is a Connection of two Perſons or two Families together by Marriage; but it is often extended in a larger Senſe, ſignifie the Leagues, Unions and Treaties made between Princes, &c.

ALLIGATION, is a Rule in Arithmetick (ſo called from the Numbers being bound or connected together by Circular Lines) relating to the mixture of Merchandizes; as Corn, Wine, Metals, Medicines, &c. one with another; and to the Proportion of the Ingredients in any Quantity of, and the Price of ſuch a Mixture. 'Tis diſtinguiſh'd into two kinds, *viz.* *Alligation*, *Medial* and *Alternate*.

Alligation Medial teaches how to find a Mean in the Price, Quantity or Quality between the Extreams; and all Caſes in it may be ſolved by theſe Propoſitions and Rules.

1. Having the Quantity of the Ingredients, and the particular Prices, to find the Price or Value of ſome part of the Mixture.

Rule; Multiply the Ingredients ſeverally by their own Prices, and Divide the Sum of thoſe Products by the Sum of the Ingredients, and the Quotient anſwers the Queſtion.

2. Having the particular Prices of the Ingredients, and the Sum paid or received for a Mixture bought or ſold; to find what Quantity of each was bought or ſold.

Rule; Divide the Sum paid or received for the Mixture bought or ſold, by the Sum of the particular Prices, the Quotient gives what was required.

3. Knowing the Ingredients of a Mixture, to augment or diminiſh the Mixture proportionally.

Rule; Sum up the Ingredients; then ſay, As that Sum is to the Augmentation or Diminution, ſo is the Quantity of each Parcel of the Mixture to the Quantity of the Mixture deſired.

4. Knowing the Nature, Quality, or Fineneſs of the ſeveral Ingredients of a Mixture, to find the reſulting Temperament or Fineneſs of the whole.

Rule; Place the ſeveral Quantities of the Mixture in Rows, againſt which place orderly their ſeveral Qualities of Fineneſs, and multiply each Quantity by its own Quality or Degree of Fineneſs, then as the Sum of all the Quantities is to the Products of all the Quantities, ſo is Unity to the Quality or Fineneſs of Mixture.

Example; There are melted and mixed together two kinds of Silver, one worth 5 *s.* and the other worth 4 *s.* an Ounce, and there were 4 Ounces of the former, and 8 of the latter; what is the value of an Ounce of the Mixture?

	Oun.	*s.*		*s. d.*
Silver	4 + 5 = 20		12 : 52 :: 1 : $\frac{52}{12}$	(= 4. 4
	8 + 4 = 32			
	12	52		

5. Knowing the Quantities of a Mixture, to find the particular Qantities of any Ingredient in any part of the Mixture.

If the Mixture be compounded of but two things, then ſay, As the Total of the Ingredients in the Compoſition, is to the part of the Mixture propoſed: So is the Quantity of the Ingredient propoſed in the whole Compoſition, to the Quantity of the Ingredient in the Part deſired.

But if the Mixture be decompounded, then you muſt repeat your Work upon every Mixture.

6. Knowing the Total of a Mixture, with the Total Value, and the Values of the ſeveral Ingredients mixed, to find the ſeveral Quantities mixed, tho' unequally.

Rule. Multiply the Total of the Mixture by the leaſt Value; ſubſtract the Product from the Total Value, and the Remainder is the firſt Dividend: Then take the ſaid leaſt Value from the greateſt valued Ingredient, and the Remainder is the firſt Diviſor. The Quotient of this Diviſion ſhews the Quantity of the higheſt Priz'd Ingredient, the other is the Complement to the Whole: And when more Ingredients than two are in the Compoſition, the Diviſors are the ſeveral Remains of the leaſt Value taken from the other. The Dividends are the Remains left upon the Diviſions, till 0 remain there; which will be one ſort of the Number of Ingredients, and this defective Ingredient is to be ſupplied as a Complement; and in Diviſion no more muſt be taken in every Quotient, than that there may remain enough for the other Diviſors, and the laſt to leave nothing remaining.

II. *Alligation Alternate*, ſhews the due proportion of every Ingredient entring the Mixture, and counter-changes the Places of ſuch Exceſſes or Differences as fall out between the Mean Price and the Extreams, aſcribing it to the greater Extream which proceeds from the Leſſer, and the contrary.

Rule 1. Let every greater Extream be linked with one Leſſer.

2. When either of the Extreams be ſingle, and the other Extreams be plural, the ſingle Extream muſt be linked to all the reſt.

3. If both greater and leſſer Extreams are not ſingle, then they may be linked ſo diverſly, that ſundry Differences may be taken, and Diverſities of Anſwers to the Queſtion, yet all true: But if one of the Extreams be ſingle, there can be but one Anſwer.

4. The Numbers being linked, take the Difference of each Number from the Mean or common Price, and place this Difference againſt the Number it is linked to alternately.

5. Every Number linked with more than one, muſt have all the Differences of the Numbers it is linked to ſet againſt it.

6. Thoſe Differences reſolve the Queſtion, when the Price of every of the Ingredients is given without their Quantities, and the Demand be to mix them ſo as to ſell a certain Quantity at a mean rate.

7. But when the Quantity of one, with the Price of all the Ingredients is given, and the Demand

mand is to know the Quantities of the other Ingredients, then the *Rule of Three* is to be uſed.

8. And when the Price of every Ingredient is given, without any of their Quantities, and the Demand be to make up a certain Quantity to be ſold at a mean Rate, then all the Differences added together, ſhall be the firſt Number in the *Rule of Three*; the whole Quantity to be mixed ſhall be the ſecond Number; and each Difference apart the ſeveral third Numbers: And ſo many ſorts mix'd, ſo many Operations of the *Rule of Three*.

9. A Queſtion may be ſo propounded, as both Sorts of *Alligation* is needful to the Reſolution.

Example.

Suppoſe a Mixture of Wine of 119 *Quarts be required, that muſt be made up of theſe ſeveral Prices,* 7 d, 8 d, 14 d *and* 15 d, *ſo as the whole may be afforded at* 12 d. per *Quart.*

Having link'd 8 to 14, and 7 to 15, and counterchanged their Difference from the common Price 12 *d*, I find the Sum of their Differences to be 14, by which dividing 119, the Quotient is $8\frac{7}{14}$ or $8\frac{1}{2}$, or for conveniency in Operation $\overline{1}7\frac{7}{2}$.

		Quarts.
8 } 2	$17\frac{7}{2} + 2 = 19\frac{4}{2}$	$= 17$
14 } 3	$17\frac{7}{2} + 4 = 23\frac{8}{2}$	$= 34$
7 } 4	$17\frac{7}{2} + 3 = 20\frac{1}{2}$	$= 25\frac{1}{3}$
15 } 5	$17\frac{7}{2} + 5 = 24\frac{5}{2}$	$= 42\frac{1}{2}$
14		119

ALLIOTH, the Name of a Star in the Tail of the *great Bear*, whoſe Obſervation is much uſed at Sea. The *Elevation of the Pole* or the *Latitude* may thus be eaſily found by this Star.

Obſerve when *Allioth* comes to the *Meridian* under the *Pole*, then take the Height of the *Pole-Star* with a Quadrant, and out of that ſubſtract 2°. 25. the Diſtance of the *Pole-Star* from the *Pole*, the Remainder is the *Pole*'s Height, or the Latitude.

ALLITERATION, (a Figure in Rhetorick) is a repeating and playing on the ſame Letter.

ALLOCATIONE FACIENDA, is a Writ directed to the Lord Treaſurer and Barons of the *Exchequer*, upon complaint of ſome Accountant, commanding them to allow him ſuch Sums as he hath by vertue of his Office lawfully and reaſonably expended.

ALLOCATION, in Law, is an Allowance made upon an Accompt.

ALLODIAL *Lands* are thoſe, for which no Rents, Fines, nor Services are due. Such as *Free-Land*.

ALLODIUM, a Law-term, ſignifying, every Man's own Land, *&c.* which he poſſeſſeth meerly in his own Right, without acknowledgment of any Services, or payment of any Rent to another, which is a property in the higheſt degree.

ALLOETICKS, are Medicines conſiſting chiefly of *Aloes*.

ALLOGOTROPHY, with ſome Writers, is a Diſproportionate Nutrition of the Body; when one part (as in the Rickets) is nouriſhed more than the other.

ALLOY, is the Proportion of a Baſer Metal mingled with a Finer or Purer; as the Quantity of Copper that is mingled with Gold to make it of a due hardneſs to be Coined into Money, is called its *Alloy*: And Gold that hath more of this than it ought to have, is ſaid to be of a Courſer or Greater *Alloy*. The Proportion of *Alloy* for Gold uſed in our Mints is about a 12th part.

ALMACANTERS, an *Arabick* Word ſignifying the ſame with *Parallels of Altitude on the Globe*: Which ſee. Some write it *Almicanterahs*, and others *Almacanterahs*.

ALMACANTERS STAFF, is an Inſtrument uſually made of *Pear-Tree* or *Box*, with an Arch only of 15 degrees, to take Obſervations of the Sun, about the times of its Riſing and Setting, in order to find the *Amplitude*, and conſequently the Variation of the Compaſs.

ALMONDS *of the Throat* or the *Tonſillæ*; a Glandulous Subſtance repreſenting two Kernels placed on each ſide of the *Uvula*, at the Root of the Tongue. They are covered with the common Tunick of the Mouth, and have Veins and Arteries from the *Carotides* and *Jugulars*: They are of a lax and ſpongy Subſtance, having ſeveral *Sinus*'s within them, in which they contain the Liquor of the *Saliva*, which they receive from the Brain, and by diſperſing it to the *Larynx*, *Jaws*, *Tongue*, and *Oeſopagus*, do moiſten and lubricate thoſe Parts. When theſe are ſwelled and inflamed by a Cold, *&c.* they very much ſtraiten the Paſſage of the Throat, and render Swallowing painful and difficult, and help to make what we call a *ſore Throat*, and as the Country People ſay, the coming down of the Almonds of the Ears.

ALMUCANTERHS, the ſame with *Almacanters*: Which ſee.

ALOPECY, is a ſhedding of the Hair, occaſioned by the Pox, or otherwiſe: So called from a Fox ἀλώπηξ, whoſe, Urine is ſaid to make places bald, and barren for a Year, as the Scholiaſt on *Callimachus* obſerves; or from a Diſeaſe peculiar to a Fox. It is called likewiſe ὀφίασις, from the Figure, becauſe that the parts ſmooth and deſtitute of Hair, look winding like a Serpent, in Greek ὄφις. It's common to both theſe Diſtempers that the Hair fall of *Areatim*, *i. e.* by ſhedding, whence in general this Diſeaſe is called *Area*. *Blanchard*.

ALPHETA, the Name of a Star: See *Lucina Corona*.

ALPHUS, is a Cuteaneous Diſtemper, in which the Skin is rough, and looks here and there as if there were Drops of a white Colour upon it: Some call it *Morphew*; it differs from the *Leuce*, in that it penetrates not ſo deep as the *Leuce* doth.

ALRAMECH, a Star's *Arabick* Name, which is the ſame with *Arcturus*.

ALTERAGE, or ALTARAGIUM, is a Word which includes not only the Offerings made upon the Altar, but alſo the Profit that ariſes to the Prieſt by reaſon of the Altar.

ALTERATION, is, in a Phyſical Senſe, that Motion by which a Body is varied or changed in ſome Circumſtances from what it really was before, tho' as to Senſe, its Nature and Bulk appear to continue ſtill the ſame; ſo that it conſiſts in the Body's acquiring or loſing ſuch Qualities, as whether preſent or abſent, do not *eſſentially* change the Subject: And herein it differs from *Generation* and *Corruption*, which Terms expreſs the Acquiſition or Loſs of the Eſſential Qualities of any Body. Or otherwiſe.

ALTERATION, is an *Accidental* and *Partial Change* made in any Body, without proceeding ſo far as to make the Subject be quite unknown, or to take a new Name or Denomination upon it: Or it may be called the *Acquiſition* or *Loſs* of ſuch Qualities as are not Eſſential to the Form of any Body.

ALTERING REMEDIES; ſuch Medicines as ſerve to purifie and reſtore the due Mixture of Blood, and other circulating Humours.

ALTERNATE PROPORTION: See the Word *Proportion*, N°. 8.

ALTERNATE ALLIGATION: See *Alligation Alternate.*

ALTERNATE ANGLES: See *Angles.*

ALTERN BASE, a Term in *Trigonometry*, diſtinguiſhed from the *True Baſe*, thus; In Oblique Triangles the *True Baſe* is always either the Sum of the Sides, (and then the Difference of the Sides is called the *Altern Baſe*) or the *True Baſe* is the Difference, and then the Sum of the Sides is called the *Altern Baſe.*

ALTERNATION, is a Word uſed by Dr. *Wallis*, and others for the different Changes or Alterations of Order in any Number of things propoſed. Of this that learned Mathematician hath a peculiar Diſcourſe at the end of his *Algebra.* This Alternation is eaſily found, by only continual Multiplication of all the Numbers beginning at Unity. Thus, if it were required to know how many Changes can be rung on ſix Bells, you need only write down 1, 2, 3, 4, 5, 6, and then multiply all thoſe Numbers continually one into another, and the laſt Product gives the Number of Changes, which is 720 Changes.

ALTIMETRY, the Art of taking and meaſuring of *Heights*, whether *Acceſſible* or *Inacceſſible*: See *Altitudes* or *Heights.*

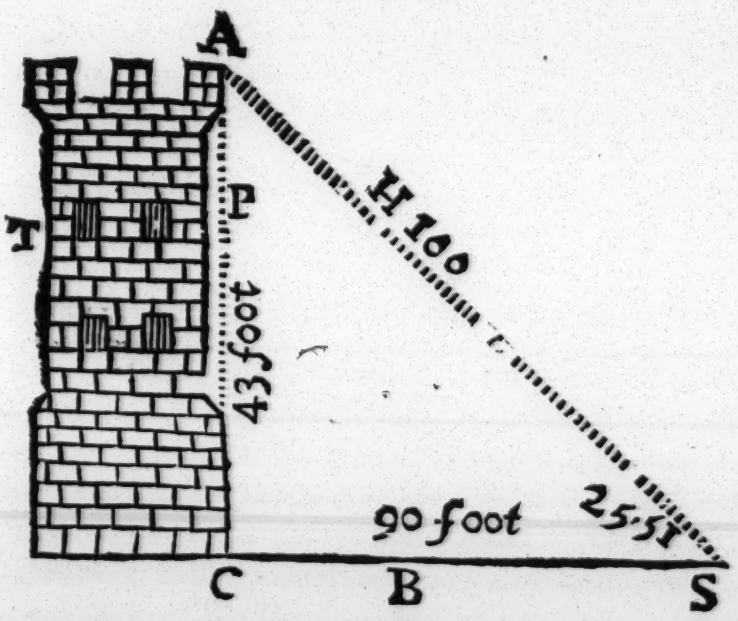
ALTITUDE *of the Pole*: See *Elevation of the Pole.*

ALTITUDE of MOTION, is a Term uſed by Dr. *Wallis* in his Mechanicks, for the Meaſure of any Motion, eſtimated according to the Line of Direction of the moving Force.

ALTITUDES, or *Heights of Places* perpendicularly above the *Horizon*, are thus found, whether *Acceſſible* or *Inacceſſible*, *i. e.* whether they are ſuch whoſe Foot or Bottom you can have acceſs to, or ſuch as you cannot come near.

1. *To take an Acceſſive Altitude at one Station.*

Let *T* be a Tower ſtanding upon a level Ground, whoſe Height is required, your Station being at *S*, 90 Foot diſtant from the Baſis of the Tower.



Firſt, with a *Quadrant*, *Theodolite*, or ſome other graduated Inſtrument for that purpoſe, from your Station *S*, take the *Angle of Altitude ASC*, 25 *Deg.* 1 *Min.* Now, you ſee that the Perpendicular Height of the Tower *AC*, the Baſe *CS*, and the *Viſual Line SA*, do conſtitute a Right Angled Triangle, wherein there is given the Baſe *B* 90 Foot, the Angle at *C* a Right one, and the *Angle of Altitude* taken by Obſervation 25°. 51′. and therefore the Angle *SAC*, its Complement to 90 *Deg.* = 64°. 60′. and the Altitude *P* is required.

Wherefore, by *Caſe* 1. of *Right Angled Plain Triangles*, the Proportion is,

As the Radius, is to the Baſe; ſo is the Tangent of the Angle of Altitude, to the Height of the Tower. That is, *R* : *B* :: *T*, *S* : *P.*

And the Operation is performed thus:

To the Logarithm of *B*, 90 *F.*	1,954242
Add the *Tang.* of the Angle *S*, 25°. 51′.	9,685290
The *Sum* will be	11,639532
From which Subſtract the Radius,	10,000000
The *Remainder* is the Log. of 43 Feet,	1,639532

Which is the Perpendicular Height of the Tower.

N. B. Here, and in all ſuch Caſes of this kind, Allowance muſt be made for the Height of the Eye, or Inſtrument above the Ground.

You may alſo, having the former Requiſites, *viz.* the Baſe and Angles, eaſily find the Hypothenuſe *H*, or how far it is from the Top of the Tower to the Station, by the ſecond Caſe of Rectangle Triangles; and this will be uſeful in many Caſes.

On the *Common Quadrant* you have a Line called the *Quadrat*, which hath two Sides, divided each into 100 equal Parts, and that on the Left-hand is called *Right Shadow*, and that on the Right-hand *Contrary Shadow.*

By which means 'tis very eaſie to take any Acceſſible Altitude at one Station by the Quadrant; for, if the Angle *S* be juſt 45, the Diſtance to the Foot of the Tower from the Station is always equal to the Altitude: But if the Angle be leſs than that, the String will fall on *Right Shadow* in the *Quadrat.* Then ſay, as 100: Is to the Number of Parts of the *Right Shadow*, cut by the String :: So is the Diſtance: To the Altitude. So that if the String cut 25, 75, or 50, *&c.* the Height is accordingly $\frac{1}{4}$, $\frac{3}{4}$, or half the Diſtance.

But when the String falls towards the Right-hand, and the Angle *S* be above 45°. then ſay, As the Parts cut by the Thread in the Quadrant: Are to 100 :: So is the Diſtance: To the Height. Wherefore, if the Thread cut 50 here, the Height is double to the Diſtance; if it cut 25, 'tis 4 times as great as the Diſtance, *&c.*

N. B. By applying what is here ſaid of Diſtances to the Shadow of any Objects; the taking their Height by the Length of their Shadows, will be eaſily underſtood.

2. *How to take an Inacceſſible Altitude at two Stations.*

Let *AB* (*ſee the following Figure*) be a *Church*, *Steeple*, &c. whoſe Height is required; your Station being at *D*, between which and the Baſis of the *Steeple*, there is a River, ſo that it is inacceſſible, that is, you cannot come to the Foot at *B.*

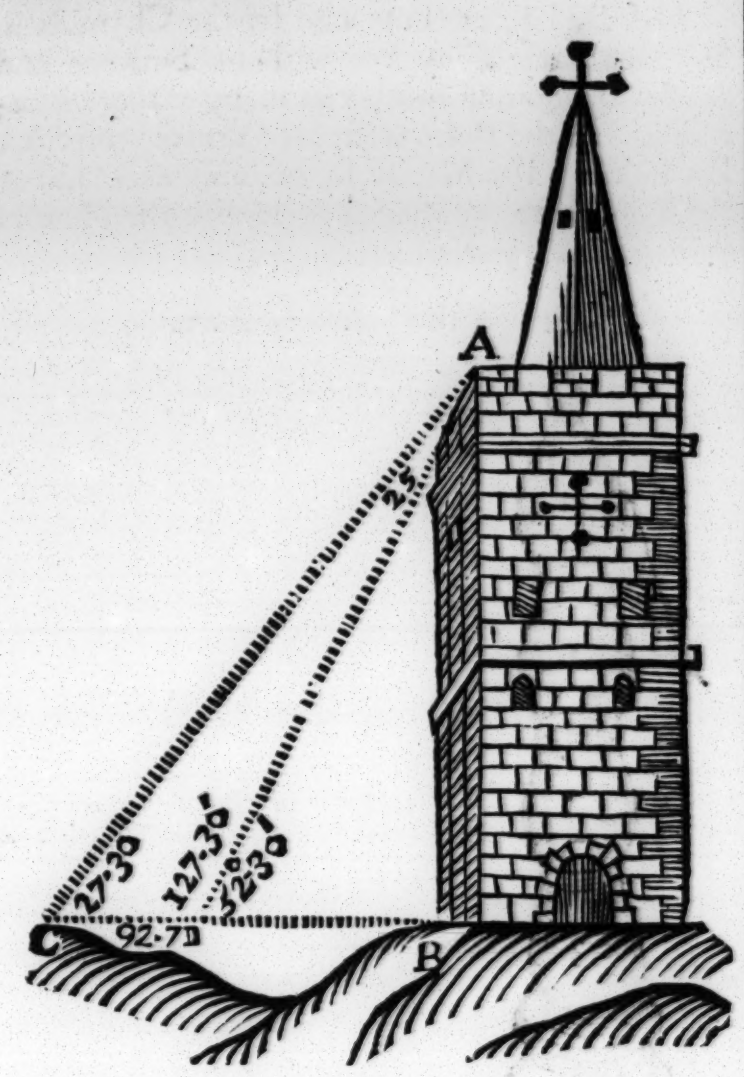
Firſt, from *D* with your Quadrant (or the like Inſtrument) take the *Angle of Altitude ADB*, which ſuppoſe 52 *Deg.* 30 *Min.*

2. Remove your Inſtrument to another *Station*, as to *C*; where take alſo the Angle of Altitude *ACB*, 27 *Deg.* 30 *Min.*

3. Meaſure the Diſtance between the two Stations *D*, *C*, which let be 92,7 Foot.

Now, the two viſual Lines *DA*, *CA*, together with the Diſtance *DC*, do make the *Oblique Angled*

gled *Triangled A D C*, wherein there is given the Angle *A C B*, 27°. 30′; and by the Angle *A D B*, 52 *Deg.* 30 *Min.* you have the *Angle A D C*, 127 *Deg.* 30 *Min.* its Complement to 180; and conſequently you have the *Angle C A D* 25 *Degrees*, alſo the Side *D C* 92,7 Feet.



So that having the three Angles and one Side given, the Side *A D* may be found, by *Caſe* 3d of *Oblique Angled Triangles*; for the *Analogy* is,

As { *S*, *DAC* : *D C* :: *S*, *ACD* : *AD*
{ *S*, 25,00 : 92,7 :: *S*, 27, 30 : 101. 3

By which means you gain *A D*, they Hypothenuſe of the right angled Triangle *ADB*; then in the *Right angled Triangle A D B*, there being given *A D*, the Hypothenuſe, 101, 3, and the Angle *A D B* 52°. 30′, 'tis eaſy to find the Perpendicular *A B*.

By *Caſe* 6. of *Right angled plain Triangles*, for the *Proportion* or *Canon* is,

As { *Rad.* : *AD* :: *S*, *ADB* : *AA*
{ *S*, 90, : 101,3 :: *S*, 52°. 30′ : 80,3 Feet.

3, *To take the Altitude of a Tower Steeple*, &c. *or the like, which ſtandeth upon a Hill.*

Let *H K* (*ſee the following Figure*) be a *Tower* ſtanding upon a Hill, and you ſtanding at *L*, deſire to know the Height thereof above the Hill.

Firſt, take the Angle *H L M* 40 *Degrees*; as alſo, the Angle *K L M* 22 *Degrees*, 3 *Minutes*.

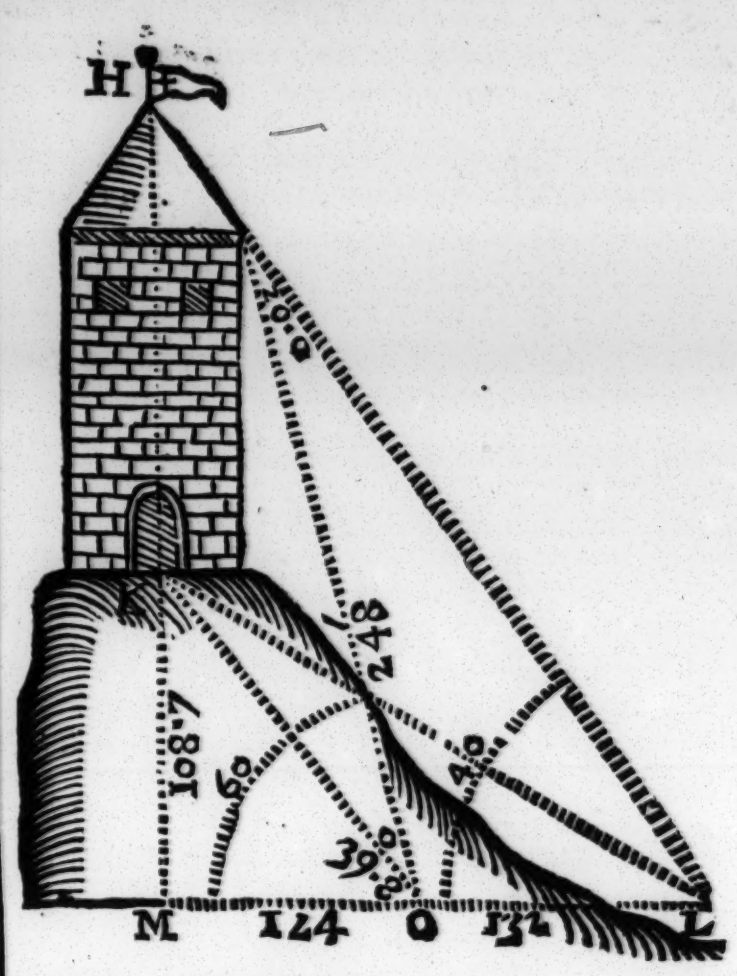
Secondly, remove your Inſtrument to *O*, and take the Angle *H O M* 60 *Degrees*; as alſo the Angle *K O M* 39 *Deg.* 54 *Min.*

Thirdly, meaſure the Diſtance *O L* = 132 Feet.

Now, in the Triangle *H O L*, you have given the Angle *H L O* 40 *Deg.* the Angle *H O L* 120 *Deg.* and the Diſtance *L O* 132 Foot. Then, by *Caſe* 3. of *Oblique angled Triangles*,

As { *S*, *L HO* : *O L* :: *S*, *H L O* : *HO*
{ *S*, 20°. : 132 :: *S*, 40°. : 218.

Then, by *Caſe* 1. of *Right angled Triangles*, *HM* is found to be 214 Foot.



Now, in the Triangle *H M O*, you have given the Angle *H O M* 60 *Degrees*, and *H O* 248, or the Perpendicular *H M* 214 Foot, required, the Baſe *M O*; 'twill be, As *Rad* : *H O* : : *S*, *H O M* : *M O* 124 Foot.

Alſo in the Triangle *K M O*, there is given *MO* 124, and the Angle *K O M* 39 *Deg.* 54 *Min.* required *K M*, which, by *Axiom* 2. *Plain Triangles*, is found to be 108,7 Foot, which being ſubducted from *H M* 214, leaves 1053 Foot for the Height of the Tower.

ALTITUDE, in *Aſtronomy*, is of the *Sun*, *Stars*, or any Planet or Point of the Heavens, an Arch of an *Azimuth Circle*, contained between the *Horizon* and any *Parallel* of *Altitude*, or between the *Star*, *Planet*, or aſſigned Point in the *Heavens* and the *Horizon*.

To find the *Sun's Altitude* at any time by the *Globe*, *rectify* your *Globe*, and fit the *Quadrant of the Altitude*; then turn the *Globe* about till the Hour Index ſhew the Time of the Day, and ſtay it there; after which bring the *Quadrant* to cut the Sun's Place in the Ecliptick, and then that Place ſhall ſhew the *Altitude* on the *Quadrant*.

To find the Sun's *Altitude* and *Hour of the Day*, when he is due, *Eaſt* or *Weſt*, and above our *Horizon*, by the *Globe*.

Having *rectified* the Globe, and fitted the Quadrant, bring it to cut the true Eaſt Point, and then turn the Globe till the Sun's Place in the Ecliptick cut the graduated Edge of the Quadrant, for then that Place will ſhew the *Altitude*, and the Index the *Hour*.

To find the Sun's *Altitude* on any *Azimuth* by the Globe.

Set the Quadrant to the *Azimuth* given, and then turn the Globe till his Place in the Ecliptick touch the Graduated Edge of the Quadrant, ſo ſhall that Place give the Altitude on the Quadrant.

By *Trigonometrical Calculation*.

1. To find the Sun's *Altitude* when it is due *Eaſt* or *Weſt*.

Having the Latitude of the Place, and the Sun's Declination given,

Say, *As the Sine of the Latitude : Is to the Radius :: So is the Sine of the Sun's Declination : To the Sine of the Sun's Altitude required.*

Example, Suppoſe the Latitude be	51°. 30′.	
And the Sun's Declination	11 31	
Then to the Ar.co. of the Sine of	51°.30′.	0,106455
Add the Sine of	11 31	9,300275
Sum the Sine of	14, 49.	9,406730

Which is the *Sun's Altitude* that Day when due *Eaſt* or *Weſt*.

2. To find the *Sun's Altitude* on any Hour in the *Equinoctial*.

Say, *As the Radius is the Co-ſine of the Latitude, ſo is the Co-Sine of the Sun's Diſtance from the Meridian (or Hour from Noon) to the Sine of the Altitude required.*

3. To find the *Sun's Altitude* at Six.

Say, *As the Radius is to the Sine of the Latitude, ſo is the Sine of the Declination to the Sine of the Altitude at Six.*

4. To find the *Sun's Altitude* on any *Azimuth*.

Say, *As the Radius is the Co-Sine of the* Azimuth, *ſo is the Co-Tangent of the Latitude to the Tangent of the* Altitude.

To find the *Sun's Altitude* at any time, having the Latitude and Declination given;

Say, *As the Radius is to the Sine of the Sun's Diſtance from Six, ſo is the Co-Tangent of the Latitude to the Tangent of the fourth Ark.*

Which 4th Ark, for Hours between 6 and 6 muſt be ſubſtracted from, or for Hours, before or after Six, muſt be added to the Sun's Diſtance from the Pole, and the *Sum* or *Difference* ſhall be a Fifth Ark.

Then as the Co-Sine of the 4th Ark, is to the Sine of the Latitude, ſo is the Co-Sine of the 5th Ark to the Sine of the *Sun's Altitude*.

Sir *Jonas Moore* gives an eaſier Method for theſe *Problems*; of which this is his *Example* for the Hour of the Day.

There is given the Complement of the Sun's Height, his Complement of the Declination, and the Complement of the Latitude of the Place: Required the Angle of the Sun's Diſtance from the Meridian, or the Hour from Noon.

Write all theſe down thus;

Complement of the Latitude	38°.30′.	*Sine Comp. Arith.*	0.205850
Complement of Declination	76. 53.	*Sine Comp. Arith.*	0.011481
Their Difference is	38. 23		
To which add Comp. of the *Al.*	60. 00		
The Sum is	98 23		
And their Difference is	21. 37		
Then take the ½ Sum which is	49. 11	*Sine* =	9.878984
And the half difference, which is	10. 48	*Sine* =	9.272726
Then add the two Arith. Compl. and theſe two Sines all into one Sum, and it will make			19.369041
The Half of which will be			9.684520

Which laſt Quantity is the Sine of 28°. 56′. Double thoſe Degrees and they make 57°. 12′. which Sum converted into Time make 3 Hours 51 Minutes; which is the Time that the *Sun* wants of being at the *Meridian*, or it is the Hour of 8 a Clock 9 Minutes before Noon; or 3 a Clock and 51 Minutes after Noon.

ALTO & BASSO, (or *in Alto, & in Baſſo*) in Law ſignifies the abſolute Submiſſion of all Differences, ſmall and great, high and low, to a Judge or Arbitrator.

ALUDELS, are Pots uſed by the Chymiſts in Sublimations: They are without Bottoms and are fitted into one another as many as there is occaſion: At the Bottom (in the Furnace) there is a Pot holding the Matter to be ſublimed; and at the Top there is a Head to receive the Flowers that ſublime up thither.

This is the Figure of them.

a The Head

1, 2, 3, Three *Aludels*.

e The Pot holding the Matter to be ſublimed.

f The Fire-place.

b The Stopple of the Fire-place.

ALVEARIUM, is the Cavity of the inward Ear, near the Paſſage which conveys the Sound, where that yellow and bitter excrementitious Stuff is bred, call'd *Ear-Wax*.

AMAIN; a Word uſed at Sea when a Man of War giveth Defiance to another Ship, or biddeth her *ſtrike* her Topſails or yield; for to bid a Ship *Strike Amain*, is to order her to let fall her Topſails.

AMALGAMATE, a Chymical Term ſignifying the mixing Quickſilver with ſome melted Metal: The Deſign of which is either to render the Metal fit to be extended on ſome Works, as in Gilding, *&c.* or elſe to reduce the Metal into a very ſubtile Powder.

The *Amalgama* of Gold is thus made; Take a Dram of the Regule of Gold, beat it into very thin little Plates, which heat in a Crucible Red hot in a ſtrong Fire, then pour on it an Ounce of pure Quickſilver; ſtir the Matter with an Iron Rod, and when you find it beginning to raiſe a Fume, which will ſoon happen, caſt it into an Earthen Pan filled with Water; it will co-agulate and become tractable. Waſh it often to take away its Blackneſs, and preſſing from it with your Fingers and in a Linen Cloth, that *Mercury* that remains ununited with the Gold. The Gold will retain about thrice its weight of the *Mercury*. If you would reduce the Gold into Powder, put this *Amalgam* into a Crucible over a gentle Fire, and the *Mercu-*

ry

ry will evaporate into the Air, and leave the Gold at the bottom in an inpalpable Powder, which you may melt into its Form again; and if it ſhould retain any Blackneſs from the *Mercury*, *Oil of Tartar per Deliquium* will fetch it off.

For Experiment ſake, you may make a *Luminous Amalgama* after this manner.

Put into a long Vial 10 Grains of the *Phoſphorus* made from Urine, and pour on it two Drachms of Oyl of *Aſpike*: The Glaſs muſt be large enough for two Thirds at leaſt to remain empty. Heat it a little with a Candle, and the *Phoſphorus* will diſſolve with an Ebullition: Whilſt this Diſſolution is making, pour into it half a Drachm of pure Quickſilver, ſhaking the Glaſs that the Matter may be ſtir'd and mix'd. You will have an *Amalgama* which will appear all of a Fire in the Dark; but it muſt, like the *Phoſphorus*, be kept cloſe ſtop'd from Air, elſe it will ſoon be ſpoiled.

If the *Amalgam* of Gold be deſign'd to be ſo hard, as to be fit to be powder'd, you muſt uſe 3 parts of the Metal, and 2 of *Mercury*; but if you would have it ſo ſoft as to ſpread, you muſt uſe 3 parts of *Mercury* to one of the other Metal.

AMANSES, a barbarous factitious Word which ſome of the canting Chymiſts uſe for counterfeit Gems, and precious Stones.

AMAUROSIS, is a dimneſs of Sight, whether the Object be placed near or at diſtance; but ſo that no external Fault appear in the Eye, if you inſpect it never ſo narrowly; the Defect conſiſts in the Obſtruction of the Optic Nerve: It is called alſo *Gutta Serena*. *Blanchard*.

AMBAGES, an idle Circumlocution, or vain connecting together of far fetch'd Words or Sayings, remote from the true purpoſe of the Speaker.

AMBE, is a ſuperficial jutting out of the Bones: Alſo a Chyrurgeon's Inſtrument, with which diſjointed Bones are ſet again.

AMBIDEXTER (in Law) ſignifies that Juror or Embraceor that takes Moneys of both Parties for giving of his Verdict, for which he forfeits ten times as much as he taketh.

And ordinarily, *Ambidexter* denotes that Man that can equally uſe both his Hands.

AMBIENT, encompaſſing round about: Thus the Bodies which happen to be placed round any other Body are called the *Ambient*, and often the *Circum-Ambient* Bodies; and the whole Body of the Air, becauſe it encompaſſes all things on the Face of the Earth, is often by Phyſical Writers called, by way of Eminence, *The Ambient*.

AMBIT, of any Figure in Geometry, is the Perimeter, Circumference or Sum of all the Bounding or Encompaſſing Lines that include it.

AMBLIGONIAL, in Geometry, ſignifies *Obtuſangular*, or that the Sides of any Plane Figure make an Obtuſe Angle one with another. Thus an *Ambligonial Triangle* is that which hath one Obtuſe Angle.

AMBLIOPIA, is a dulneſs or dimneſs of Sight when the Object is not clearly diſcern'd at what diſtance ſoever placed, and proceeds from an imperfect Obſtruction of the Obtick Nerves, a light Suffuſion, want of Spirits, or groſsneſs of the ſame, *&c.* Some reckon 4 kinds of *Ambliopia*, viz. *Myopia*, *Presbytia*, *Nyctalopia*, and *Amauroſis*: Which ſee under thoſe Words. *Blanchard*.

AMBLOTICK *Medicines*, are ſuch as Cauſe Abortion.

AMBUSCADE, a Place where Soldiers hide themſelves to ſurpriſe the Enemy.

AMENDMENT (a Common-Law Term) ſignifying the Correction of an Error committed in a Proceſs, and eſpied before Judgment, but may be amended by the Juſtices after Judgment; and if there be Error in giving Judgment, they may not amend it, but the Party is to put in his Writ of Error.

AMERCEMENT, (a Term in Law) is a Penalty aſſeſs'd by the Peers, or Equals of the Party amerced, for an Offence done.

AMERCEMENT ROYAL, is when a Sheriff, Coroner, or other ſuch Officer of the King is amerced by the Juſtices for Abuſe in his Office.

Blunt makes this Difference between *Amercements* and *Fines*; that the *latter*, as taken for Puniſhments, are Puniſhments certain, which grow expreſly from ſome Statute; and *Amercements* are arbitrarily, impoſed by *Aſſeerors*.

AMETHIST, in *Heraldry*, is the Term for the Purple Colour in the Coat of a Nobleman; which in all Gentlemen's Eſcutcheons below that Degree is called *Purpure*, and in thoſe of Sovereign Princes *Mercury*.

AMITERE LEGEM TERRÆ, a Law Term, ſignifying to loſe the Liberty of ſwearing in any Court, to become Infamous; the Puniſhment of a Champion overcome or yielding in a Fight, or in Battel, and the Jurors found Guilty in a Writ of *Ataint*, and of a Perſon outlawed.

AMNESTY, is an Act of Oblivion; ſuch as was granted at King *Charles*'s Reſtauration.

AMNION or AMNIOS, is the innermoſt Membrane with which the *Fœtus* in the Womb is moſt immediately covered, and with which the reſt of the *Secundines*, the *Chorion*, and *Allantois* is ejected after the Birth; it is whiter and thinner than the *Chorion*. It contains not only the *Fœtus*, but the Nutritious Humour, whence the *Fœtus* by the Mouth and Throat ſucks its Nouriſhment. It is outwardly cloathed with the Urinary Membrane and the *Chorion*, which ſometimes ſtick ſo cloſe to one another, that they can ſcarce be ſeparated: Tho' it is not knit to the *Chorion* in any Place, ſave where the Umbilical Veſſels paſs thro' them both into the *Placenta*. It hath Veſſels from the ſame Origin as the *Chorion*.

Before the *Ovum* is impregnated, this Membrane contains a Limpid Liquor, out of which, after Impregnation, the Embryo is formed. In it (ſays *Gibſon*) reſides the Plaſtick Power, and the Matters alſo out of which the firſt Lineaments of the *Embryo* are drawn; but becauſe its Liquor is ſo very little, there Tranſudes thro' this Membrane the *Amnion*, a part of the Nutritious Albugineous Humour which is contained in the *Chorion*, which it had imbibed out of the *Uterus*, and by the *Juxta*-Poſition or Addition of its Humour to undiſcernible Rudiments of the *Embryo*, it receives its Encreaſe. But tho' the *Amnion* have its additional Nutritious Liquor at firſt only by Tranſudation, yet when the *Umbilical Veſſels* and the *Placenta* are formed, it receives it after another manner; for then its Liquor at firſt being ſeparated from the Mother's Arteries by the *Placenta*, and imbibed by the Umbilical Vein of the *Fœtus*, it paſſes directly to its Heart, from whence, being driven out by the *Aorta*, it is ſent forth again, in good part, by the Umbilical Arteries, out of whoſe Cavities, being plentifully diſperſed thro' the *Amnion*, it iſſues

ſues into its Cavity: juſt as the Juices, which are far more groſs and viſcid than this, do ſometimes critically, and often on taking a Purge, ouze into the Inteſtines out of the ſmall Mouths of the Arteries: Indeed, here the Intervention of the Glands aſſiſt this Matter; but 'tis hoped, ſome curious Perſon one time or other will diſcover, that there are ſuch alſo in the *Amnion*.

AMORTISE (a Term in Law) is to alien Land or Tenements to any Corporation, Guild or Fraternity, and their Succeſſors, which cannot be done without Licence of the King, and the Lord of the Mannor.

AMOUSES, counterfeit Gems, or Precious Stones.

AMPELITE (in Agiculture) is a kind of Black or Bituminous Earth, uſed about Vines, to make them thrive the better.

AMPHIBOLOGY, a Grammatical Figure, when our Expreſſions ſeem to look one way, and are intended another.

AMPHIBLESTROIDES, or the *Tunica Retina* or *Retiformis* of the Eye, is a ſoft, white and ſlimy Subſtance; which is ſo named, becauſe that being thrown in the Water it reſembles a Net; it ſhoots from the very Centre of the Optick Nerve, and conſiſts of the Medullar Subſtance of it, and expanding it ſelf over the *Vitreous Humour*, is extended as far as the *Ligamentum Ciliare*, or the Ligaments of the Eye-lids: This Tunic, in that it is whitiſh and of a marrowy Subſtance, ſeems to proceed from the very marrowy and fibrous Subſtance of the Optick Nerve; ſo that it is, as it were, an Expanſion of Nervous Fibres, which are there gathered into one Bundle, into a Contexture made like a Net; and indeed if the whole Eye were taken for a Flower, growing, as it were, to the Brain by the Stalk of the Optick Nerve, the *Tunica Retina* would be the very Flower it ſelf, and the two other Tunicles, the *Sclerotica* and *Choroides*, be only in the Nature of a Stem. This Tunic ſeems to be the principal Organ of Sight, and receives the viſible Species within the Bed of the Eye much after the ſame manner as a whited Wall, or a piece of a white Paper in a darkned Chamber, receives and repreſents the viſible Species which are intromitted thro' a little Hole: See *Camera Obſcura*.

AMPHIBRACHYS, is the Foot of a Latin Verſe conſiſting of three Syllables, where the two Extreams are ſhort, and the Middle long, as *Amare*.

AMPHIBRANCHIA, are Places about the *Glandules* in the Jaws, which moiſten the *Aſpera Arteria* and *Stomach*.

AMPHIBIOUS, is uſed for an Animal that lives both on Land and in the Water, as an *Otter*, *Beaver*, &c.

AMPHIMACER, is the Foot of a Latin Verſe, conſiſting of three Syllables; the two Extreams long, and the Middle ſhort; as *Caſtitas*.

AMPHIDÆUM, with ſome Writers is the Summit or Top of the Mouth of the Womb. *Blanchard*.

AMPHIPROSTYLE, a Term in Architecture for a kind of Temple of the Ancients, which had four Columns in the Front, and as many in the Face behind.

AMPHISCII; ſo the Inhabitants of the *Torid Zone* are called in reſpect of their Shadows; becauſe their Shadows fall both ways, *viz.* to the South (as ours always do to the Northward) when the Sun is beyond them in Northern Signs, and to the North when the Sun is to the Southward of them in Southern Signs.

AMPHISMELA, is an Anatomical Inſtrument uſed in the Diſſection of Bones.

AMPHITHEATRE, is a Place built for Acting and ſeeing of Publick Spectacles and Stage-Plays: The common Theatre was but ſemicircular, but this was built entirely round, or in a Form of a perfect Circle.

AMPLIATION (in Law) ſignifies a deffering of Judgment till the Cauſe be further examined.

AMPLITUDE of the *Sun* and *Stars*, is an Ark of the *Horizon* intercepted between the true *Eaſt* and *Weſt* Point of it, and the Center of the *Sun* or *Stars* at their Riſing or Setting; and ſo is either *North* and *South*, or *Ortive* and *Occaſive*.

To find the *Sun*'s *Amplitude*, either Riſing or Setting by the Globe, bring the *Sun*'s Place to the *Horizon* either on the *Eaſt* or *Weſt* ſide, and the Degrees from the *Eaſt* Point either *North* or *South*, are the *Amplitude* required.

To find the *Sun*'s *Amplitude* Trigonometrically: having the Latitude and *Sun*'s Declination given.

Say, *As the Co-ſine of the Latitude is to the Radius, ſo is the Sine of the preſent Declination to the Sine of the Amplitude.*

Example, Suppoſe the Latitude to be 51 *deg.* 30 *min.* and the Declination of the ſame 11 *deg.* 50 *min.*

Then, to the Ar. co. of the Co-ſine of	50°. 30'. 0,	2058503
Add the Sine of -----	9,	3118926
Sum is the Sine of -------	9,	5177429

Which is the *Amplitude* required.

AMPLITUDE MAGNETICAL: See *Magnetical Amplitude*.

AMPLIFICATION (in Rhetorick) is a Figurative Speech aggravating a Crime, enlarging in Praiſe of another, inſiſting upon a Relation, *&c.*

AMPUTATION, is the Surgeon's Term for the cutting off any Member of the Body.

AMULET, any thing that is hung about the Neck or any Part of the Body, ſuppoſed to be good againſt Witchcraft or Diſeaſes. Theſe were called anciently *Præbia*, *Apotropæa*, *Phylacteria*, *Amynteria*, *Alexiteria*, and *Alexipharmaca*.

AMUNITION, in the general, is all Sorts of Warlike Stores and Proviſions; eſpecially Powder and Ball.

AMMUNITION-BREAD, in an Army, is that which is provided for and diſtributed to the Soldiers.

AMY (is a Law Term) ſignifying the next to be truſted for an Orphan or Infant.

AMYGDALATE, in Pharmacy, is an Artificial Milk, or Emulſion made of blanch'd Almonds, *&c.*

AMYGDALÆ: See *Tonſillæ*.

ANA, a kind of barbarous Word uſed amongſt the Writers of Pharmacy, and ſignifies that an equal Quantity of thoſe Ingredients with which it is connected, is taken for the Compoſition of any Medicine.

ANABIBAZON, the *Dragon's Head*, or the Northern Node of the *Moon*, where ſhe paſſes the Ecliptick from *South* to *North Latitude*., is ſometimes ſo called.

ANABROCHISMUS, is a way of drawing out the inverted pricking Hairs of the Eye-lids, by means of a Thred of a fine Silk in the Eye of a Needle

Needle, which when you have doubled, you put the Hair thro', and ſo draw it out.

ANABROSIS, is a conſuming or waſting of any Part of the Body by ſharp Humours.

ANACAMPTICK, ſignifies Reflecting; 'tis frequently uſed in reference to Ecchoes, which are Sounds produced *Anacamptically*, or by Reflection: And therefore *Anacampticks* is by ſome taken for *Catoptricks*.

ANACATHARSIS, is a Medicine that diſcharges Nature by ſome of the upper Parts; as a thing that provokes to Vomit, to Sneezing, to Salivation, *&c.* in which laſt Senſe *Hippocrates* uſed the Word, as *Galen* ſaith.

ANACATHARTICK MEDICINES, are ſuch as cauſe Vomiting.

ANACEPHALEOSIS, is a brief Summary or Recapitulation of the Heads of any Matter ſpoken or delivered in Writing.

ANACHRONISM, an Error in *Chronology*, an undue Connexion of Time, or a falſe Chronicling.

ANACLATICKS, a part of *Opticks* which treats of all ſorts of *Refractions*, and is the ſame with *Dioptricks*.

ANACOLLEMA, is a kind of Linement or dry Medicine, to be apply'd to the Forehead or Noſe, in Diſeaſes of the Eyes, or to ſtop Bleeding; alſo a Medicine which will breed Fleſh and conglutinate the Parts.

ANACREONTICK VERSE, is a kind of Verſe conſiſting of ſeven Syllables, without being tied to any certain Law of Quantity; ſo call'd from its Author *Anacreon*, a *Lyrick* Poet.

ANADIPLOSIS (a Figure in *Rhetorick*) when one Verſe begins with the ſame Word the laſt ended with. 'Tis alſo ſometimes uſed in Medicine, for the Redublication of the Paroxyſms or Fits of Feavers; and in this Senſe 'tis call'd by ſome Writers *Epanadiploſis*.

ANADOSIS, is ſometimes uſed for whatever tends upwards in the Body, as a Vomit, *&c.* but moſt uſually for the Diſtribution of the *Chyle* thro' the proper Veſſels.

ANAGLYPHICK ART, is the Art of Carving, Engraving, or Emboſſing.

ANAGOGICAL, the ſame with Myſterious, or which hath an elevated, raiſed, uncommon Signification, or which raiſes the Mind up to Divine Contemplations.

ANAGRAM, is the Tranſpoſition of the Letters of any one's Name, Title, &c. in order to make out from thence ſomething to the Honour of the Perſon. Thus *Galen* by Tranſpoſition is *Angel*, &c.

ANA LEMMA, is a Projection of the Sphere on the Plane of the *Meridian*, *Orthographically* made by ſtrait Lines and *Ellipſes*, the Eye being ſuppoſed to be at an infinite Diſtance, and in the *Eaſt* or *Weſt* Points of the *Horizon*.

To deſcribe the Annalemma.

With 60 Degrees of —— the Line of Chords, deſcribe the *Meridian* $ZHNb$, which is the Primitive Circle.

Then draw the Diameters ZN and Hh at Right Angles one to another: Then will

Hh be the *Horizon*;

P the *North Pole*, elevated above the *Horizon* 51°. 30'.

p The *South Pole*.

Pp The *Axis* of the World.

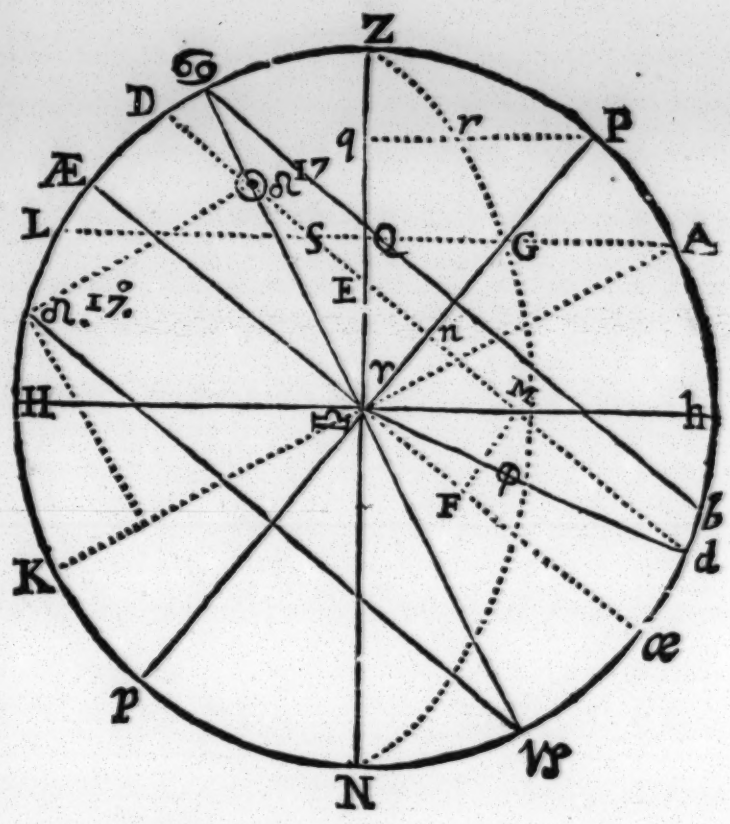
$Æ\ æ$ The *Equinoctial* at Right Angles with Pp.

Z The *Zenith*.

N The *Nadir*.

ZN The *Axis* of the *Horizon*, the *Prime Vertical Circle*, or *Eaſt* and *Weſt Azimuth*.

The *Analemma* for the *Lat.* 50°. 30'. *North*.



At the Diſtance of 23 *Deg.* 30 *Min.* (on the Limb) each way from $Æ$ and $æ$ draw,

$69\ b$ The *Tropick* of *Cancer*.

$♑\ o$ The *Tropick* of *Capricorn*; draw alſo

$69\ ♑$ The *Ecliptick*, and at Right Angles to it

$A\ K$ The *Axis* of the *Ecliptick*.

Let $D\ d$ drawn any where parallel to the *Æquator*, and repreſenting a Parallel of the *Sun*'s *Declination*, or the *Sun*'s *Diurnal Ark* for that Day.

M } the Point of { Riſing or Setting.
D } the *Sun*'s { *Culminating*, or being on the *Meridian*.

Then will $\gamma\ M$ repreſent the *Sun*'s *Amplitude*, and the parts of the Parallel.

$D\ M$ } the *Sun*'s *Semi-* { *Diurnal* / *Nocturnal* } *Ark*.
$d\ M$ }

$n\ ☉$ The like Sine of the *Sun*'s Right Aſcenſion.

$M\ n$ The like *Ark* of his *Aſcentional Difference*.

$H\ D$ The *Sun*'s *Meridian Altitude*.

$L\ A$ A Parallel of Altitude or *Almacanter*.

$\gamma\ Q$ or $\gamma\ q$, the Sine of the *Sun*'s *Meridian Altitude* when he is at L and at D.

To find the Arches of Leſſer Circles, which Mr. *Oughtred* calls *Like Arks*; Say,

As the *Semi-Diameter* of any Parallel is to the like Diſtance in that Parallel, ſo is the Radius of the Primitive Circle to the Sine of the *true Diſtance* from the Center.

So that if by this Method, you will find $n\ M$, the like Sine of the Aſcentional Difference.

To the end of the Parallel $D\ d$, draw the Radius $\gamma\ d$, and from the Point M, draw $E\ \varphi$ parallel to Pp; that Parallel will cut the Legs of the Triangle $\gamma\ d\ n$ proportionably; ſo that

$n\ d : n\ M :: \gamma\ d : \gamma\ \varphi\ (= \gamma\ F)$ the Sine of the Aſcenſional Difference.

If the Sum be in the 17th *deg.* of *Leo*; then he muſt be 47 *deg.* diſtant from the firſt *degree* of *Cancer*.

Wherefore

Wherefore ſet 47 *deg.* on the Limb, from ♋ to ♌ 17, and from thence take the neareſt Diſtance to *k* ♈, the Axis of the Ecliptick, and ſet it from ♈ to ☉ on the Ecliptick, ſo ſhall it be the Sine of the Ark ♌ 17 *k*, 43 *Deg.* or the Sine of the *Sun*'s Diſtance from the next Equinoctial Point.

To deſcribe the *Azimuths*, *Meridians* or *Hour Circles*, which in the *Analemma* are *Ellipſes*.

As ſuppoſe, to draw an *Azimuth* through the Points *Z M N*.

Draw as many Parallels as you will to the *Horizon*, 'twill always be, as

♈ *b* : ♈ *M* : : ♌ λ : ♌ *G* : : *P q* : *q r*, &c.

By this means you may find as many Points as you pleaſe, as *r*, *G*, to deſcribe the *Ellipſes*.

To bring which to practice, ſet the Sector to the Radius of the Parallel, and then from it take the Sine of the *Azimuth*'s Meridian or *Hour Circle*'s Diſtance from the Prime Verticle *Z N*, and ſet it from ♌ to *G*, or from *q* to *r*, &c. which will find you as many Points as you pleaſe, through which the *Ellipſis* muſt paſs.

ANALEPTICKS, are Medicines which cheriſh and renew the Strength; it ſignifies alſo a part of *Hygieina*, or the Art of preſerving Health, whereby weak Perſons are recovered.

ANALOGY, in Mathematicks, is the Compariſon of ſeveral *Ratio's* together, much the ſame with *Proportion*, which ſee. And 'tis frequently uſed in common Diſcourſe for the Word *Proportion*.

ANALOGISM (in Logick) a forcible Argument from the Cauſe to the Effect, implying an unanſwerable Neceſſity.

ANALYSIS, a Reſolution of any thing into its component Principles: Thus a Chymiſt is ſaid to *Analyze* Bodies, when he diſſolves them by the Fire, and endeavours to find out their Conſtituent Parts: And *Algebra* is ſometimes called the *Analytick Art*, becauſe it teaches us to ſolve Queſtions, and to demonſtrate Theorems, by enquiring into the Bottom, into the Fundamental Conſtitution and Nature of the Thing, which is, as it were, reſolved into its Parts taken all to Pieces, and then put together again, that ſo we may ſee into the Reaſon and Nature of it. And in this Senſe *Analytical* Demonſtrations are oppoſed to *Synthetical* ones, which ſee. The Ancients had ſome Knowledge of this Art, but kept it concealed; whoſe Invention *Theo* aſcribes to *Plato*, and he defined it (according as *Vieta* renders it) *Aſſumpti Quæſiti tanquam conceſſi, per conſequentia ad verum conceſſum*; a taking of that as granted, or confeſſed which is enquired after, and thence going back by Conſequences to what is confeſſedly true.

ANALYTICK, in Logick, is a part of that Science teaching to decline and conſtrue Reaſon, as Grammar doth Words. Our famous *Butler* makes his Impertinent Heroe and Scholar *Hudibras*, to be *profoundly skill'd in* Analytick.

ANAPÆST, is a Latin Verſe, whoſe Feet conſiſt of three Syllables, the laſt long and the two firſt ſhort. Such Verſes are called.

ANAPÆSTICK VERSES; they are commonly uſed in *Tragedies*, where are three Feet which are uſed in all Parts of the Verſe indifferently; as,

Caſtos ſequitur mala paupertas,
Titioque potens regnat Adulter.

ANAPHORA, (a Figure in Rhetorick) is the Repetition of the ſame ſound in the beginning of ſeveral Sentences or Verſes.

ANAPLEROTICK MEDICINES, are ſuch as help to fill Ulcers with Fleſh.

ANARCHY, want of all Government in a Nation where there is no Supreme Authority lodged in either Prince or Rulers; but the People live without any Rule or Government at all, and all things are in the utmoſt Confuſion.

ANASARCHA, is a white, ſoft, yielding Tumour of the whole outward Body, or of ſome of its Parts, which dents in by compreſſing the Fleſh; it is cauſed by the Blood upon a double account; firſt, when it doth not rightly ſanguifie or aſſimilate the Chyle; and again, when it is not rightly accended in the Lungs; the Blood thus perverted, pours forth the *Serum* at the Extremities of the Arteries in greater Quantities than it can receive and reduce by the Veins and Lympheducts, or expel by the Veins and Pores, and other Paſſages that ſend it forth. If the Humours be too viſcous, it is called *Leucophlegmatia*. *Blanchard*.

ANASTOMATIQUE, *(Medicines)* are ſuch as open and dilate the Orifices of the Veſſels, and by that means help to make the Blood circulate freely, and paſs eaſily out of the Arteries into the Veins.

ANASTOMOSIS, is an Effluxion of the Blood, the Lympha or Chyle, at the meeting of Veſſels that cloſe not narrowly: It is alſo taken for the mutual opening of Veins and Arteries into one another.

ANATOCISM, is the annual Increaſe or *Intereſt* of Money, whether *Simple* or *Compound*. And under it, they alſo comprehend the Valuation of Annuities. See *Intereſt*.

ANATOMY, is an artificial Diſſection of an Animal, eſpecially Man, whereby the Parts are ſeverally diſcovered and explained, for the uſe of Phyſick and Natural Philoſophy; and he that is skilful in this Art, is called an *Anatomiſt*.

ANCHILE, is the back part of the Knee; alſo the Contraction of a Joint, eſpecially of the *Ham*.

ANCHOR of a Ship, is a thing as well known as the Ship it ſelf, and alſo its uſe; but the Terms of Art uſed at Sea about its ſeveral *Parts*, *Kinds* and *Uſes*, are as followeth.

The Parts of an Anchor are, (1.) The *Ring*, into which the *Cable* is faſtened. (2.) The *Beam* or *Shank*, which is the longeſt Part of the Anchor. (3.) The *Arm*, which is that which runs down into the Ground; at the End of which is, (4.) The *Flouk* or *Fluke*, by ſome called the *Palm*, being that broad and pecked Part, with its Barbs like an Arrow-head, which faſtens into the Ground. (5.) The *Stock*, a Piece of Wood faſtened unto the Beam near the Ring, ſerving to guide the *Fluke*, ſo that it may fall right, and fix in the Ground. There are three kinds of Anchors, the *Kedger*, the *Grapnel*, and the *Stream Anchor*, *(which ſee under thoſe Words)*. The Anchors aboard a Man of War, are, the *Firſt*, *Second* and *Third Anchors*; and two of which being always carried at the *Bow* of the Ship, are therefore called the *Firſt* and *Second Bowyer*: The other, which is the largeſt of all, is called the *Sheet Anchor*, and is their utmoſt Refuge when in a great Streſs of Weather they are forced to ride on a *Lee-Shore*.

When

When the Cable is perpendicular between the *Hawſe* and the *Anchor*, the Anchor is then ſaid to be *a-peek*. When the Anchor hangs right up and down by the Ship's Side, it's ſaid to be a *Cock-Bell* upon the Ship's coming to an Anchor. To put an Anchor down into the Sea, in order to make the Ship *ride*, is called *letting fall or dropping* the Anchor. They ſay an Anchor is *foul*, when by the turning about of the Ship, the Cable is hitched about the *Fluke*. An Anchor is ſaid to *come home*, when it cannot hold the Ship, but that ſhe drives away by the Violence of the Wind or Tide. To *Shooe an Anchor*, is, to put Boards fitted and formed for that purpoſe on upon the *Flukes*, that the Anchor may the better hold in ſoft Ground.

The Shank of an Anchor is to be 3 times the Length of one of its *Flukes*; and a Ship of 500 Tun hath her Sheet Anchor of 2000 Weight; and ſo proportionably for others ſmaller or greater.

ANCHORING, or *Anchorage*, is Ground fitting to hold a Ship's Anchor, that ſo ſhe may ride it out ſafely: The beſt Anchoring Ground is ſtiff Clay or hard Sand; and the beſt riding at an Anchor, is when a Ship is *Landlockt*, and out of the Tide.

ANCHORAGE, (in Law) is a Duty taken of Ships for the *Pool* of the *Haven* where they caſt Anchor; for no Man can let any Anchor fall on the King's Ground in any Port, without paying for it to the King's Officer appointed by Patent.

ANCHYLOPS, the ſame with *Ægylops*: Which ſee.

ANCIENT, is the Flag or Streamer in the Stern of a Ship.

ANCON, is the Top or Point of the Elbow, and is taken alſo ſometimes for the backward and larger ſhooting forth of the *Ulna*.

ANCONÆUS, a Muſcle of the *Cubit*, called ſo by *Riolanus* from its Scituation. It ariſeth Fleſhy from the inferior and back Part of the *Os Humeri*, growing larger as it marcheth between the ſuperior Ends of the *Ulna* and *Radius*, and is inſerted Fleſhy to the lateral Part of the *Brachiæus Externus*, a Thumb's length below the *Olecranum*: It helps to extend the Cubit.

ANCYLOBLEPHARUM, is the growing of the Eye-lids to the *Tunica Cornea*, or to the *Albuginea*, ſo that ſometimes both the Eye-lids grow together.

ANCYLOGLOSSUM, is when the little String under the Tongue is too ſtraitly tied, ſo that there is a Difficulty of uttering the Words.

ANCYROIDES, the ſhooting forth of the Shoulder-Bones in the form of a Beak; which is called *Coracoides*, *Anchoralis* and *Cornicularis*.

ANDRATOMY, is a Diſſection of Human Bodies, as *Zootomy* is of thoſe of Beaſts.

ANDROMEDA, a Northern Conſtellation conſiſting of 27 Stars.

ANDROGYNE, an Hermophradite, which is of both Sexes, or both Male and Female: The ſame with.

ANDROGYNUS, an Hermophradite, or one who is Caſtrate and Effeminate.

ANGLICISM, is the *Engliſh* Idiom, or form of Expreſſion, or manner of Speech which is peculiar to *England*.

ANEMOSCOPE, a Machine invented to foreſhew the Change of the Air or Wind: I have obſerved, that Hygroſcopes made of Cat's-gut (according to the Directions which you will find under that Word) are very nice *Anemoſcopes*, and never fail hardly by their turning the Index about to foretel the ſhifting Wind. But, as *Vitruvius* deſcribes an *Anemoſcope*, it ſhews, that the Ancients rather deſigned it to ſhew which way the Wind blew, than to foretel to what Quarter it would ſhift or change.

AN-JOUR and WAST, is a Forfeiture when a Man has committed petit Treaſon or Felony, and has Lands held of ſome common Perſon, which ſhall be ſeized for the King, and remain in his Hands a Year and a Day next after the Attaindure; and then the Trees ſhall be pulled up, the Houſes razed and pulled down, and the Paſtorage and Meadows plowed up; unleſs he to whom the Lands ſhould come by Eſcheat or Forfeiture, redeem it of the King.

ANEURISM, is a Diſeaſe which is a kind of Dilatation or burſting of the Arteries, always beating, and ſwelling ſometimes to the bigneſs of an Egg, which yields if you compreſs it, but recoils preſently.

The moſt Accurate and Learned Dr. *Tyſon* found in his *Anatomy of the Tajacu* or *Aper Mexicanus*, ſeveral *Aneuriſmata* in the *Aorta* or great Artery, which it ſeems were natural, and which he never ſaw before in the Arteries of any other Animal: Tho' *Malpighius*, as he obſerves, took notice of ſuch in the *Aorta* of Silk-worms.

ANGARIA, a Term in Law, ſignifying any troubleſome or vexatious Duty or Service paid by the Tenant to the Lord.

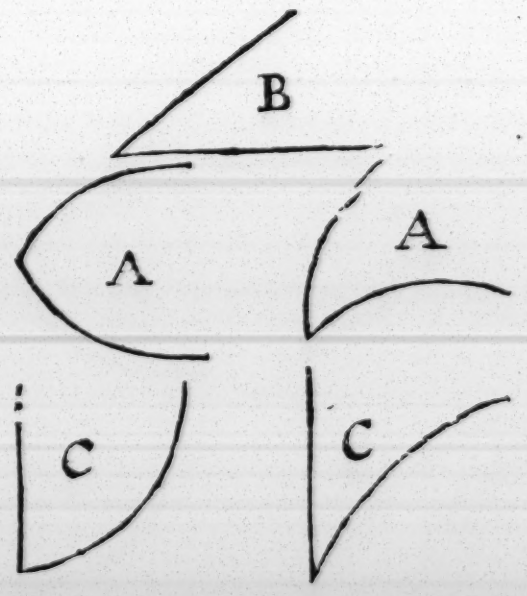
ANGLID, the bare ſingle Valuation or Compenſation of a Man or Thing, according to the legal Eſtimate, from the *Saxon*, *An* one, and *gild* Payment, Mulct, or Fine; ſo *Twigild* was the double Fine, *Trigild* the treble Fine, according to the rated Ability of the Perſon.

ANGIGLOSSUS, one that ſtuttereth, or hath a Difficulty in his Speech of pronouncing *L*, *R*, or *K*.

ANGINA, a *Quinſy* or *Squinancy*, is an Inflammation of the *Jaws* or *Throat*, attended with a continual Fever and Difficulty of Reſpiration and Swallowing; and it is two-fold, either *Spuria* or *Exquiſita*, a baſtard or a true *Squinſie*: The latter is again four-fold, *Synanche*, *Paraſynanche*, *Chynanche* and *Parachynanche*, of all which in their proper Places. *Blanchard*.

ANGLE, in *Geometry*, is either *Plane* or *Solid*.

A *Plane Angle* is the Inclination, Aperture or Diſtance between two Lines meeting in a Point,

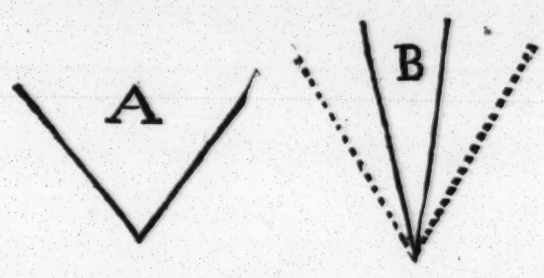


and which, when the Lines forming it (which are

called its *Legs)* are *Right* or *Strait ones*, is called a *Right Lined* or *Rectilineal Angle*, as *B*; but when the Legs are crooked Lines, 'tis called a *Curvilineal Angle*, as *A*; and when one Leg is ſtrait and the other crooked, 'tis called a *Mixt Angle*, as *C*.

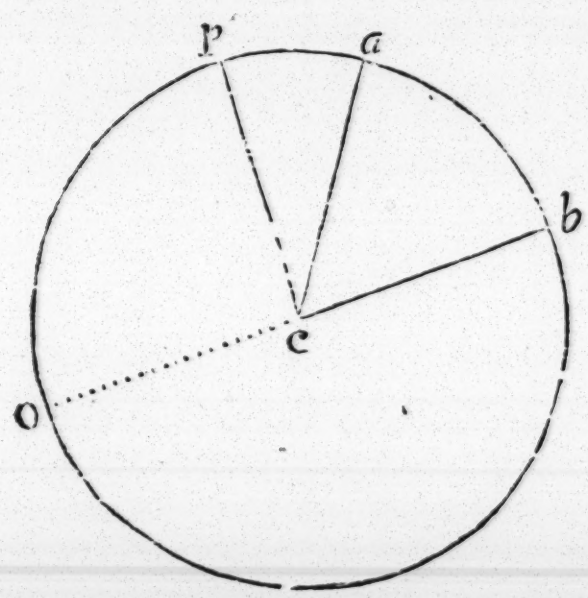
An *Angle* is uſually marked with 3 Letters (eſpecially if there be more *Angles* than one at the ſame Point) wherefore the middle Letter, which is always placed at the Angular Point where the Lines meet, denotes the Angle.

The *Quantity*, *i.e.* the *Greatneſs* or *Smallneſs* of an *Angle*, is by no means meaſured by the Length of its Legs, but by their Diſtance from, or Inclination to each other. Thus the Angle *B* is leſs than *A*, tho' the Legs of *B* are much longer than thoſe of *A*, but then thoſe of *B* are more inclined to each other, than the Legs of the Angle *A*. Which, to conceive the better, imagine



the Angle *A* to be laid upon *B*, as the prick'd Lines about *B* do repreſent; then 'tis plain, the Angle *B* will eaſily be contained within *A*; and therefore is *leſs* than *A*, becauſe its Legs come nearer, or are more inclined towards each other, than thoſe of *A*; and conſequently *A* will be a *greater* Angle than *B*, becauſe its Legs are farther diſtant from each other than the Legs of *B*. If you imagine the Legs to open and ſhut like thoſe of a Joint Rule, or a Pair of Compaſſes, the thing will be very plain.

The Quantity of any Angle is meaſured by the Number of Degrees of the Ark of a Circle intercepted between the Legs of the Angle, whoſe



Center is the Angular Point. Thus the Ark *a b* is the Meaſure of the Angle *a c b*; and if that Ark contain 30 Degrees, the Angle is ſaid to be an Angle of 30 Degrees.

A RECTILINEAL ANGLE is of 3 ſorts.

1. *Right*, when one Leg of the Angle ſtands exactly upright, or perpendicularly on the other, as *p c* doth on *c b*; and inclines no more one way than it doth another. And ſuch a *Right Angle* is ſaid to be an Angle of 90 Degrees, becauſe 'tis meaſured by an Ark that is the 4th part of a Circle (as you ſee in the laſt Figure) and every Circle being ſuppoſed to have its whole Circumference divided into 360 Parts (which are called *Degrees*) the 4th Part of that is 90 Degr. and therefore a Right Angle contains 90 Degr.

2. An *Obtuſe Angle*, as *a c o*, which exceeds or is bigger than a Right one, and is called *Obtuſe*, becauſe its Angular Point is blunt.

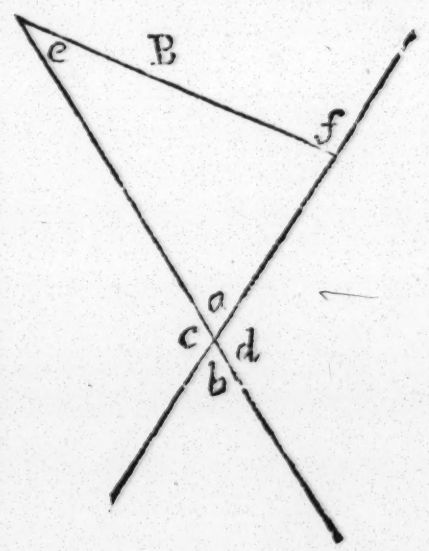
3. An *Acute Angle*, as *a c b*, which is leſs than a *Right one*, and is called *Acute*, becauſe its Angular Point is ſharp. No Angle can contain fully 180 Degrees, for then one Leg falls into the ſame Right Line with the other, and they make the *Diameter* of the Circle *o b*.

Angles alſo receive ſeveral other Denominations according to their ſeveral Poſitions, their Relation to the ſeveral Figures they are in, and the Lines that form them. Some are called

1. *Contiguous*, or *Adjacent Angles*, as *a* and *c*, *c* and *b*, *a* and *d*, &c. which have one Leg common to both Angles, and are both taken together, always equal to two Right ones; for if they are equal, the Obtuſe one will be as much bigger than a Right one, as the Acute one is leſs; and therefore in the whole muſt make juſt two Right. 13 *e* 1 *Euclid.*

Cor. And from hence 'tis plain, that all the Angles that can be made about any Point, are equal but to four Right ones.

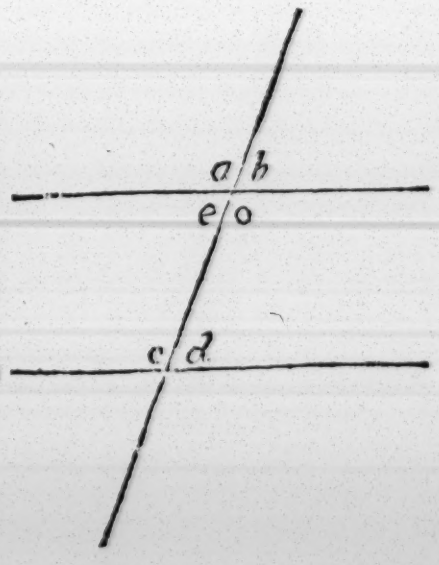
2. *Oppoſite* or *vertical Angles*, as, 1. Thoſe that are made by two Right Lines croſſing each other, and which touch only in their Angular Point. Thus the Angles *a* and *b*, or *c* and *d*, are called *Oppoſite* or *Vertical Angles*, becauſe they are oppoſed *ad Verticem*, or at the Head; and therefore in ſome Books are called *Head Angles*. Theſe are always equal one to another, becauſe each, with the *Contiguous one*, makes two Right Angles.



An Angle alſo in any Triangle is ſaid to be *Oppoſite* to the Side that *ſubtends* it; as the Angle *a* is to the Side *B*. *(Fig. preced.)*

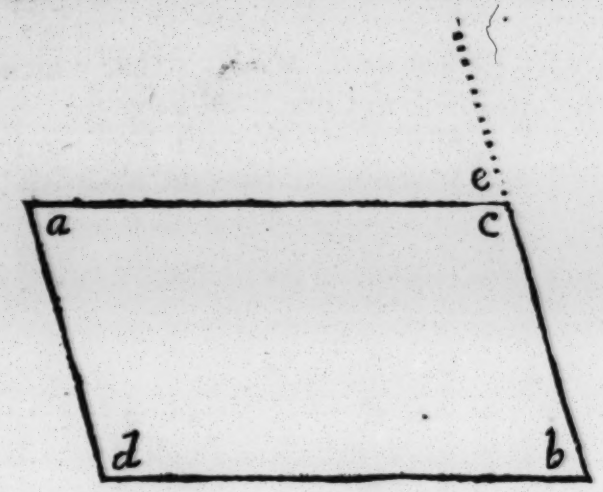
4. In any Triangle, as *a e f* *(ſee the ſame Figure)* the Angle *e* and *a* are called *Internal* and *Oppoſite*, in reſpect of the *External Angle f*, which is equal to them both.

5. If a Line cut two others that are Parallel, the Angles *c* and *d* are called *Internal* and *Oppoſite* alſo in reference to the External one *a* and *b*, to which they are ſeverally equal.



6. The

6. The *Angles a* and *b*, as alſo *c* and *d* in every *Rectangle* or *Parallelogram*, are called the *Oppoſite Angles*; and are always equal to one another,



for the Angle *a* is equal to the Alternate one *e*, and *e* is equal to the Internal and Oppoſite one on the ſame Side *b*, wherefore *a* is equal to *b*; and after the ſame manner may *d* and *c* be proved equal to each other.

ANGLE *of Right Aſcenſion*, is the Angle which the Circle of the Star's *Right Aſcenſion* maketh with the Meridian at the Pole of the World.

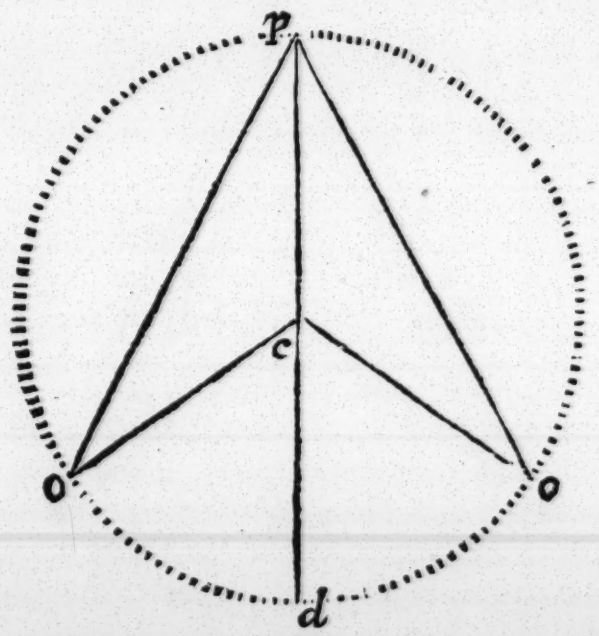
ANGLE *at the Centre of a Circle*, is an Angle made there by two *Radius*'s which meet in the Centre.

Propoſition.

If ſtanding or inſiſting on the ſame Chord, or being in the ſame Segment, two Angles are formed, as *o c d*, *o p d*, one at the Center, and the other at the Circumference: The Angle at the Center is always double of that at the Circumference. Of this there are three Varieties.

1. When one Leg of the Angle is the Diameter of the Circle, then 'tis plain the Angle at the Center *o c d* being external to the Triangle *o c p*, will be equal to *o* + *p* (by 16 *e* 1. *Eucl.*) but *o* = *p*, becauſe the Triangle is an *Iſoſceles* (5 *e.* 1.) wherefore *c* = 2*p*. *Q. E. D.*

Caſe 2.

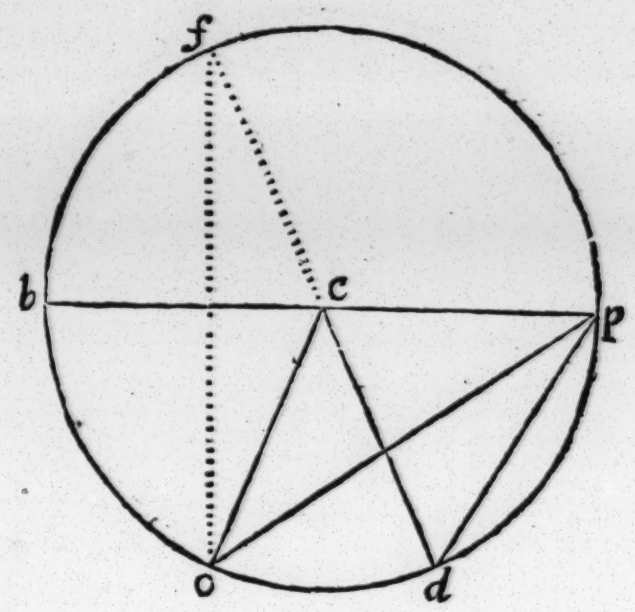


2. When the Diameter divides the two Angles, then 'tis plain, the whole Angle at the Center *o c o* muſt be double to the whole Angle *o p o* at the Circumference, becauſe its Parts are ſeverally double of the Parts of *P* (by the 1*ſt Caſe.*)

Caſe 3. When the Angles fall both on the ſame Side of the Diameter, then 'tis plain the whole External Angle *b c d* is = 2 *c p d*, and the Part *b c o* = 2 *c p o*; wherefore the remaining part *o c d*, the Angle at the Center, muſt be double to *o p d*, the Angle at the Circumference. *Q. E. D.*

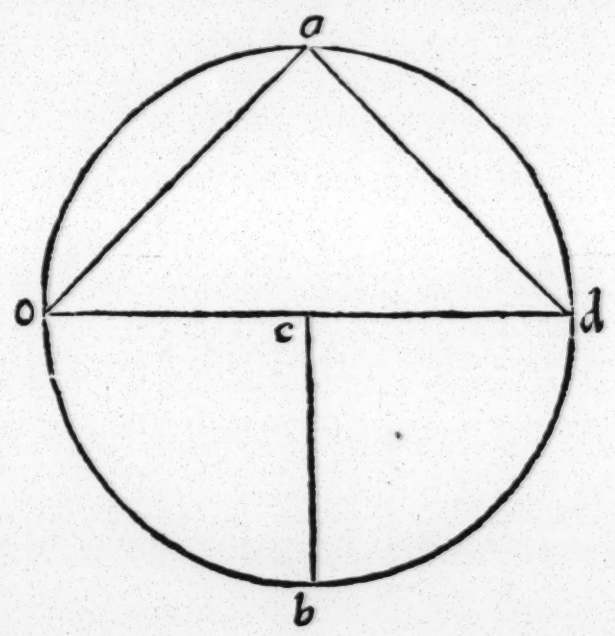
And hence are deducible the following *Corollaries.*

1. All Angles *o f d* and *o p d* ſtanding on the ſame Ark, or being in the ſame Segment, are e-



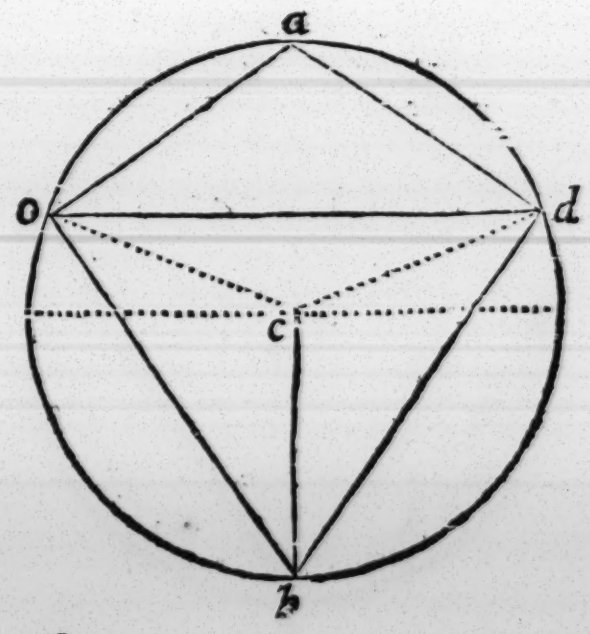
qual, becauſe they are juſt the Halves of the Angle *o c d* at the Center.

2. Hence any Angle at the Center *c* ſtanding on half the Ark *o b* muſt be equal to one at the Circumference *a*, which ſhall ſtand on *o d* the whole Ark, or on the double of the former Ark.



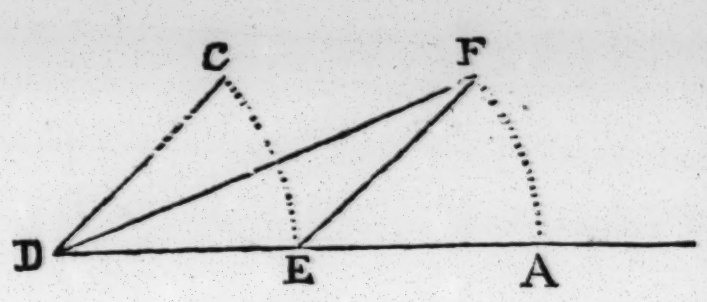
3. And from hence 'tis plain, that every Angle in a Semi-circle, as *a*, muſt be a Right one, becauſe 'tis equal to *c* at the Center, which ſtands on a Quadrant, and is a Right Angle.

4. Wherefore an Angle, as *a*, made in a Segment leſs than a Semi-circle, muſt be *Obtuſe*, becauſe 'tis equal to *o c b*, which is bigger than a Right one.



5. And consequently the Angle *b* made in the Segment *o b d*, which is greater than a Semi-circle, is *Acute*; for the Angle *a* of the Quadrilateral Figure *o a d b* inscribed in a Circle, being *Obtuse*, *b* must needs be an *Acute* one, since the Sum of both is but 2∟s, (by 22 *e* 3 *Euclid.*)

Hence may be drawn this *Problem* for the Bisfection of any Angle or Ark of a *Circle*; as suppose the Angle *CDE*, or the Ark *CE*.



Taking *EA* = *DE*, on the Center *E*, make the Ark *FA* = *CE*, and the Angle *FEA* = *CDE*, then draw *DF*, and that shall bisfect the Ark *CE*, or the Angle *CDE*: For the Angle *FEA* (= *CDE*) is double (because an Angle at the Center) to *FDA* an Angle at the Circumference.

ANGLE *of or at the Center*, in Fortification, is that which is made by the Concourse of two Lines drawn from the Angles of the Figure.

ANGLE *at the Circumference of a Circle*, is an Angle made by any two Chords which meet there in a Point.

ANGLE *of the Circumference*, in *Fortification*, is the mix'd Angle made by the Arch which is drawn from one Gorge to another.

ANGLE *of the Counterscarp*, is made by the two Sides of the Counterscarp meeting before the Middle of the Curtain.

ANGLE *of the Curtain*, or *Angle of the Flank*, is that which is made by or contained between the Curtain and the Flank in any Piece of Fortification.

ANGLE *of the Compliment of the Line of Defence*, is the *Angle* proceeding from the Intersection of the two Complements one with another.

ANGLE DIMINISHED, in Fortification, is that which is made by the meeting of the outermost Sides of the *Polygon*, and the *Face* of the *Bastion*.

ANGLE *of the Ecliptick with the Vertical Circle*, or, as some call it, *Parallactick Angle*, is thus found; As the Tangent of ☉'s distance from *Aries*: Is to *Rad* :: So is the Tangent of his Declination: To the Co-sine of the *Parallactick Angle*.

ANGLE *of Evection*: See *Evection*.

ANGLE *of the Exterior Figure*, or *The Angle of the Polygon*, is that which is formed at the Point of the *Bastion*, by the meeting of the two outermost Sides or Bases of the *Polygon*.

ANGLE *of the Interior Figure*, in Fortification, is that which is made in the Center of the *Bastion* by the meeting of the innermost Sides of the Figure.

ANGLE FLANKING, is that which is made by the meeting of the two *Rasant* Lines of Defence, *viz.* the two Faces of the *Bastion* prolonged.

ANGLE *flanking inward*, is the Angle made by the Flanking-Line and the Curtain.

ANGLE FLANK'D, by some called the *Angle of the Bastion*, in Fortification, is that which is made by the two *Faces*, being the utmost part of the *Bastion* most exposed to the Enemy's Batteries, and therefore by some is called *the Point of the Bastion*.

ANGLE *forming the Flank*, is that which consists of one *Flank* and one *Demi-Gorge*.

ANGLE *forming the Face*, in Fortification, is that which is composed by one *Flank* and one *Face*.

ANGLE *of Incidence*: See *Incidence*.

ANGLE *of Inclination in Opticks*: See *Inclination*.

ANGLE *of Inclination* of the *Axis* of the Earth to the *Axis* of the Ecliptick is 23°. 30, and remains inviolably the same in all Points of the Earth's Annual Orbit.

Mr. *Keil* in his Examination of *Burnet's Theory of the Earth*, hath shewn the great Wisdom of God in thus placing the *Axis* of the Earth Obliquely to the Plane of the Ecliptick; for by that means all those who live beyond 45°. of Latitude, have more of the *Sun's* Heat, take all the Year round; and those who live within 45°. have less than if the Earth moved always in the Equinoctial, *P.* 69, *&c.* And besides, 'tis the Oblique Position that causes all our Diversities of Seasons, and different Degrees of Heat and Cold.

ANGLE *of Longitude*, is the Angle which the Circle of a Star's *Longitude* maketh with the Meridian at the Pole of the Ecliptick.

ANGLE *of the Meridian and Ecliptick*, is found thus; As *Rad*: *T*, of the *Sun's* greatest Declination :: So is the Co-sine of his Longitude or Distance from *Aries*: To the Co-Tangent of the Angle sought.

ANGLE *of the Meridian with the Horizon*, is thus found; As the Co-sine of ☉'s Declination is to *Rad* :: So is the Co-sine of the Elevation of the Equinoctial: To the Sine of the Angle required.

ANGLE *of the Moat*, in Fortification, is that which is made before the *Curtain*, where it is intersected.

ANGLE *of the Parallax*: See *Parallax*.

ANGLE *of the Interval of two Places*, is the *Angle* made by the Lines directed from the Eye to those Places.

ANGLE *of the Sun's Position*, is the *Angle* made by the Intersection of the Ark of the Meridian Line, with an Ark of an *Azimuth*, or any other great Circle cutting thro' the Body of the *Sun*.

ANGLE *of Reflection*: See *Reflection*.

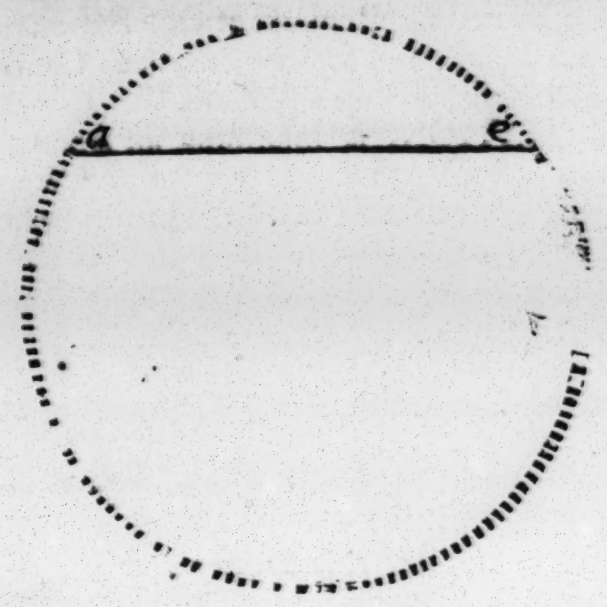
ANGLE *of Reflection*: See also *Incidence*.

ANGLE *of Refraction*: See *Refraction*.

ANGLE *Refracted*, in *Opticks*, is the *Angle* between the Refracted Ray and the Perpendicular.

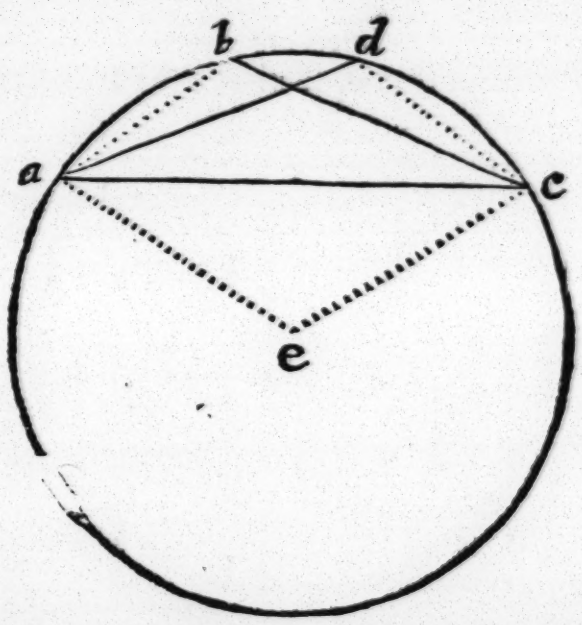
ANGLE RE-ENTRING, or *Re-entrant Angle*, in Fortification, is that which retires inward toward the Place.

ANGLE *of a Segment*, is an Angle made by the Circumference, and a Right Line cutting it:



Thus here the two mix'd Angles, *a* and *e*, made by the Chord, and the Ark, are called *Angles of a Segment*.

ANGLE *in a Segment*, is an Angle made by two Right Lines riſing from the Angles of the *Segment*, and meeting in the Circumference: Thus



the Angle *a b c inſiſting* or ſtanding on the Chord *a e*, and having its Vertex in the Circumference of the Circle, is called *an Angle in the Segment a b c*.

Propoſition.

All Angles in the ſame Segment, or ſtanding on the ſame or equal Arches or Chords, are equal, becauſe they are juſt the Halves of the Angles at the Center ſtanding on the ſame Ark. See *Angles of the Center*.

ANGLE SAILANT, is that which advances its Point towards the *Field*. This is called *Sortant* or *Viff*.

ANGLE *of the Sun's apparent Semi-Diameter in his neareſt Diſtance to the Earth*; *Bullialdus* found it by two Obſervations to be 16 *min.* 45 *ſec.* And the Semi-diameter of the *Moon* he found to be 16 *min.* 54 *ſec.* And the Semi-diameter of the *Earth's Shadow* he found in an Eclipſe of the *Moon* to be 44 *min.* 9 *ſec.*

ANGLE SPHERICAL, is made on the Surface of the Globe or Sphere by the Interſection of two Arks of *great Circles*.

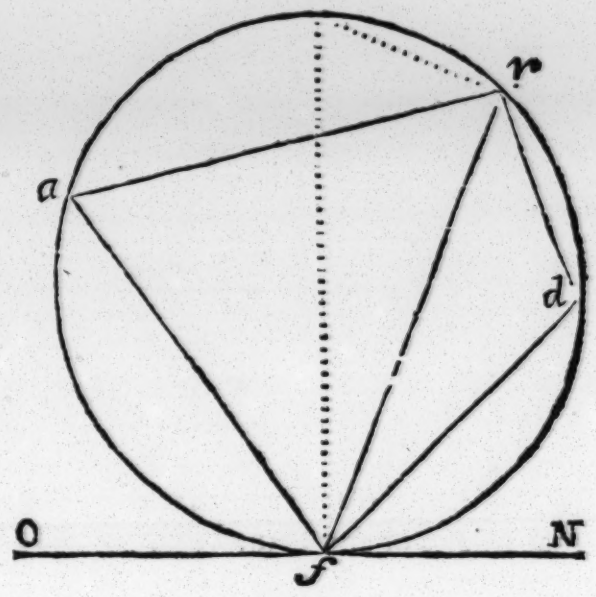
ANGLE *of the Shoulder*, in Fortification, is that which is conſtituted by the Lines of the *Face* and *Flank*.

ANGLE SOLID: See *Solid Angle*.

ANGLE made by a Tangent to a Circle and any Chord drawn from the ſame Point of Contract, is equal to any Angle that can be made in the oppoſite Segment, 32. *e.* 3. *Euclid.*

I ſay, ∟ *r f n* = ∟ *a*.

Draw the Diameter *b f*, and alſo the Line *b r*.



Demonſtration.

Becauſe *f b* is a Diameter, the Angle *b r f* is a Right Angle; wherefore the Angles *b* and *b f r* together muſt be equal to a Right Angle.

Alſo, *b f r* and *r f n* = ∟, becauſe *f n* is a Tangent; therefore take away *b f r* which is common to both, and ⌟ *b* = *r f n*.

But the ⌟ *b* = ⌟ *a*, becauſe in the ſame Segment, wherefore ∟ *a* = ∟ *r f n*. *Q. E. D.*

Alſo, I ſay, ⌟ *o f r* = ⌟ *d*.

Demonſtration.

The ⌟ *o f r* + *r f n* = 2 ∟

And ⌟ *d* + ⌟ *r f d* + ⌟ *f r d* = 2 □

But ⌟ *r f n* = *r f d* + *f r d*.

Therefore taking away *r f n* from both, the ⌟ *d*, will remain equal to the ⌟ *o f r*. *Q. E. D.*

Corollary.

Hence 'tis plain, That the oppoſite Angels (*d* and *a*) of any Quadrilateral Figure inſcribed in a Circle, are equal to two Right Angles.

For *d* + *a* = *o f r* + *r f n* = 2 ∟s.

ANGLE *of the Tenaille*, or the outward *Flanking Angle*, called alſo *Angle Mort* or the *Dead Angle*, *Angle Rentrant* or *Angle Inwards*; is made by the two Lines *Fiſchant*, in the Faces of the two Baſtions extended till they meet in an Angle towards the Curtain; and is that which always carries its Point in towards the Work.

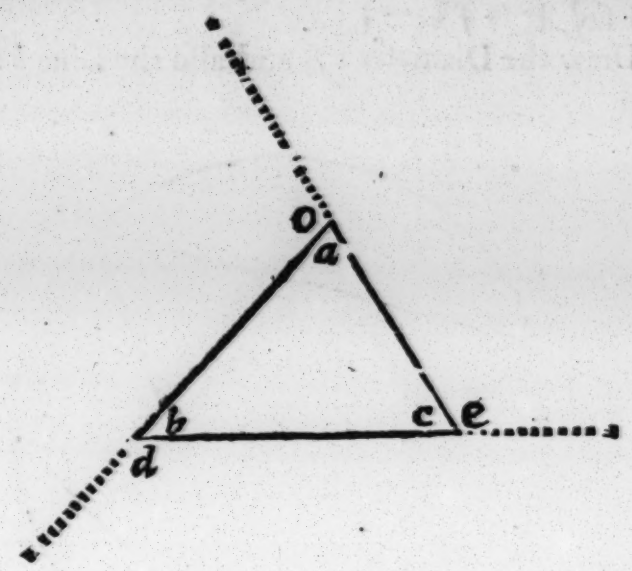
ANGLE *of the Triangle*, in Fortification, is half of the *Angle of a Polygon*.

ANGLES ALTERNATE, are *o* and *c*, as alſo *e* and *d* in Figure, *N.* 5. and are always equal to one another. *See* 3 *Pages back.*

ANGLES *of a Battalion*, are made by the laſt Men at the ends of the Ranks and Files: And two laſt Men of the Front and Rear Ranks, are called { *Front* and *Rear* } *Angles*.

ANGLES EXTERNAL, are the Angles of any Right Lined Figure without it, when all the Sides are ſeverally produced; and they are all taken together, equal to 4 Right Angles: And, in particular, of a Triangle the External Angle *e* is equal

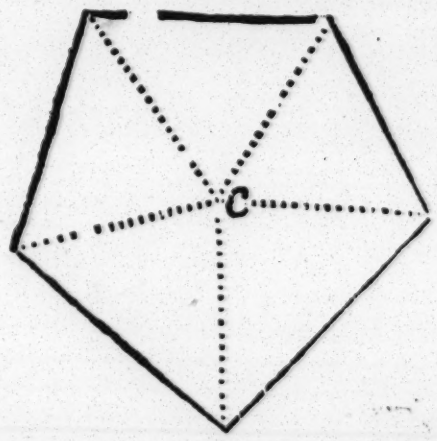
equal to both the Internal and Oppoſite ones *a* and *b*. *See the Demonſtration of which under* Triangle.



And as to the former part, that the Sum of the External Angles of any Plane Figure is = to 4∟s, is plain from hence; that the Sum of all the Angles of any Right-lined Figure both Internal and External, muſt be = to twice as many ∟s as the Figure hath Sides, (by 13. *e.* 1. *Euclid.*) But the *Internal ones* are = to twice as many ∟s as the Figure hath Sides, except 4. (by *Theor.* 1. *Prop.* 32. *e.* 1. *Barrow's Euclid.*) wherefore the External Angles all together muſt be equal to thoſe 4 Right ones.

ANGLES INTERNAL, in general, are all Angles made by the Sides of any Right-lined Figure within. Alſo the two Angles between the Parallel Lines on each Side the croſſing Line, as *o* and *d*, *e* and *c* (in *Fig.* 5.) are called the two *Internal Angles*; and are always equal to two *Right ones*. The *Angles c* and *d* (ſee *Fig.* 5.) are alſo called *Internal* and *Oppoſite Angles* in reſpect of *a* and *b*, as hath been lately ſaid.

The Sum of all the *Internal Angles* of any Right-lined Figure, is equal to twice as many Right Angles as the Figure hath Sides, except 4. For ſince every ſuch Figure from a Point taken within it, can be divided into as many Triangles as it hath Sides, and ſince the Sum of the Angles of each Triangle is equal to 2∟s (32. *e.* 1. *Eucl.*) That will make twice as many ∟s as the Figure hath Sides; from which Sum you muſt take away all thoſe Angles which are about the Point *c*, which (by 13. *e* 1. *Euclid.*) are equal to 4∟s; wherefore the remaining Sum of all the *Internal Angles* is equal to twice as many *Right Angles* as the Figure hath Sides, except 4. *Q. E. D.*



ANGLES OBLIQUE, are ſuch as are either *Obtuſe* or *Acute*, in oppoſition to *Right Angles*.

ANGULAR, is that which relates to or hath *Angles*.

ANHELATION, a Difficulty in fetching one's Breath.

ANHELOTE, a Term in Law, ſignifying that every one ſhould pay according to the Cuſtom of the Country, his reſpective Part and Share.

ANIENTE, a Law Term, ſignifies fruſtrated or made void.

ANIMADVERSION, ſometimes ſignifies Correction, ſometimes Remarks or Obſervations made on a Book, *&c.* and ſometimes ſerious Conſideration and Reflection on any Point.

ANIMATION, is informing an Animal Body with a Soul; thus the *Fœtus* in the Womb is ſaid to come to its *Animation*, when it begins to act like a true Animal; or after the Female that bears it is *Quick*, as the common way of Expreſſion is.

ANIMA HEPATIS, is *Vitriolum* or *Sal Martis*, Vitriol or Salt of Steel, according to ſome Chymiſts.

ANIMA SATURNI, ſignifies (with ſome Chymiſts) the Extract of Lead.

ANIMALS, are ſuch Beings, which, beſides the Power of growing, encreaſing and producing their Like, as Plants and Vegetables have, are endowed alſo with Senſation and Spontaneous Motion.

For the more eaſie and clear Comprehenſion and Diſtinction of the ſeveral kinds of *Animals*, Mr. *Ray* gives two *Schemes* or *Tables* of them: The firſt a general one of all *Animals*; the ſecond a particular one of *Quadrupeds*.

Animals are either
- *Sanguineous*, that is, ſuch as have Blood, which breath either by
  - *Lungs*, having either
    - *Two Ventricles in their Heart*, and thoſe either
      - *Viviparous*.
        - *Aquatick*, as the Whale-kind.
        - *Terreſtrial*, as Quadrupeds.
      - *Oviparous*, as Birds.
    - *But one Ventricli in the Heart*, as Frogs, Tortoiſes and Serpents.
  - *Gills*, as all Sanguineous Fiſhes except the Whale-kind.
- *Exanguineous*, or without Blood, which may be divided into
  - *Greater*, and thoſe either,
    - *Naked*
      - *Terreſtrial*, as naked Snails,
      - *Aquatick*, as the Poulp, Cuttle-Fiſh, *&c.*
    - *Covered* with a Tegument, either,
      - *Cruſtaceous*, as Lobſters and Crab-fiſh.
      - *Teſtaceous*, either,
        - *Univalve*, as Limpets.
        - *Bivalve*, as Oyſters, Muſcles, Cockles.
        - *Turbinate*, as Periwinkles, Snails, *&c.*
  - *Leſſer*, as Inſects of all ſorts.

Viviparous Hairy Animals or *Quadrupeds*, are either
- *Hoof'd*, which are either,
  - *Whole-footed* or Hoof'd, as the Horſe and Aſs.
  - *Cloven-footed*, having the Hoof divided into
    - *Two principal Parts*, called *Biſcula*, either
      - *Such as chew not the Cud*, as Swine.
      - *Ruminant*, or *ſuch as chew the Cud*, divided into
        - *Such as have perpetual and hollow Horns*,
          - *Beef-kind*,
          - *Sheep-kind*,
          - *Goat-kind*,
        - *Such as have ſolid, branched, and deciduous Horns*, as the *Deer-kind*.
    - *Four parts*, or *Quadriſulca*, as the *Rhinoceros* and *Hippopotamus*.
- *Claw'd* or *Digitate*, having the Foot divided into

- *Two Parts* or Toes, having two Nails, as the *Camel-kind.*
- *Many Toes* or *Claws*; either
  - *Undivided*, as the *Elephant.*
  - *Divided*, which have either
    - *Broad Nails*, and an *Human Shape*, as *Apes.*
    - *Narrower, and more pointed Nails*, which in reſpect of their Teeth, are divided into ſuch as have
      - *many Fore-teeth or Cutters in each Jaw*;
        - The *Greater*, which have
          - *A ſhorter Snout and rounder Head*, as the *Cat-kind*;
          - *A longer Snout and Head*, as the *Dog-kind.*
        - The *Leſſer*, the *Vermin* or *Weazle-kind.*
      - *Only two large and remarkable Fore-teeth*, all which are *Phytivorous*, and are called the *Hare-kind.*

ANIMALCULA, are very ſmall Animals, ſuch as by the Microſcope have been diſcovered in moſt Fluids, of which there are prodigious Numbers in Black-Pepper Water, and as I have often ſeen alſo in Water wherein Barley, Oats, and eſpeciall Wheat, hath been ſteeped for about 4 or 5 Days.

ANIMATED MERCURY; ſo Mr. *Boyle* calls a Mercury, which by being impregnated with ſome Subtile, Agile and Spirituous Particles, is rendered capable of growing hot when mingled with Gold; and ſuch alſo he calls *Incaleſcent Mercuries.*

ANIMATED NEEDLE, is one touch'd with a Load-ſtone.

ANI SCALPTORIS MUSCULIPAR, is the Muſcle called alſo *Latiſſimus Dorſi*, from its largeneſs; its Uſe is to draw the Arm backward and downward, and therefore is called *Ani Scalptor*, becauſe it helps to *ſcratch the Breech.*

ANKRED, ſo the Heralds call one of their Croſſes in a Coat of Arms, whoſe Figure is this.

ANNALS, are a Chronological Account of the Remarkable Events of a State, yearly, as the Annals of *Tacitus:* they differ from *Hiſtory*, becauſe this deſcants upon thoſe Events, and on the Cauſes that produced them. The Writer of ſuch an Hiſtory is called an *Annaliſt.*

ANNATES, (a Law Term) ſignifying the ſame with *Firſt-Fruits:* The Reaſon of the Name is, becauſe the Rate of *Firſt-Fruits* paid to Spiritual Livings, is after the Value of *one Year*'s Profit.

ANNIENTED, a Term in Law, ſignifying as much as fruſtrated or brought to nought.

ANNIHILATION, is the deſtroying utterly, or turning of any created Being into nothing.

ANNUA PENSIONE, is a Writ whereby the King having due unto him an Annual Penſion from an Abbot or Prior, for any of his Chaplains (whom he ſhould think for to nominate, being as yet unprovided of ſufficient Liberty) did demand the ſame of the Abbot or Prior; and alſo willed him, for his Chaplain's better Aſſurance, to give him his Letters Patent for the ſame.

ANNUAL EQUATION, or mean Motion of the Luminaries: See *Equation.*

ANNUALIA, formerly a Yearly Stipend aſſign'd to a Prieſt, for keeping the Anniverſary, or otherwiſe for ſaying continued *Maſſes* one Year, for the Soul of the deceaſed Perſon.

ANNUATES MUSCULI, a pair of Muſcles at the Root of the Tranſverſe Vertebra of the Back, deſcribed by Mr. *Cowper*, and called by him *Recti Interni Minores*, becauſe they lie under the *Recti Majores*; and he thinks they may very properly have this Name of *Annuates*, becauſe they ſerve to nod the Head directly forward.

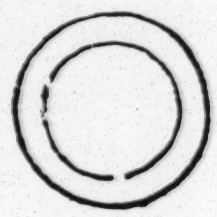
ANNUITY, is a Yearly Rent to be paid for Term of Life, or Years, or in Fee: In Common-Law, the Difference between a Rent and an Annuity is this, That Rent is payable out of Land, Annuity charges only the Perſon of the Grantor. For the Valuation of *Annuities*: See *Intereſt.*

An Annuity cannot be taken for *Aſſets*, becauſe 'tis no Freehold in Law; nor can it be put in Execution on a Statute Merchant, Statute Staple, or Elegit, as a Rent may.

ANNULAR CARTILAGE, the ſecond Griſtle of the *Larynx*, which is encompaſſed by it, as it were with a Ring.

ANNULARIS PROCESSUS, is a Protuberance made by the meeting of the Proceſſes of the *Medulla Oblongata*, under the Side thereof.

ANNULET, a little Ring, which in Heraldry is the Mark of Diſtinction which the Fifth Brother of any Family ought to bear in his Coat of Arms. *Anulets* are alſo part of the Coat-Armour of ſeveral good Families.

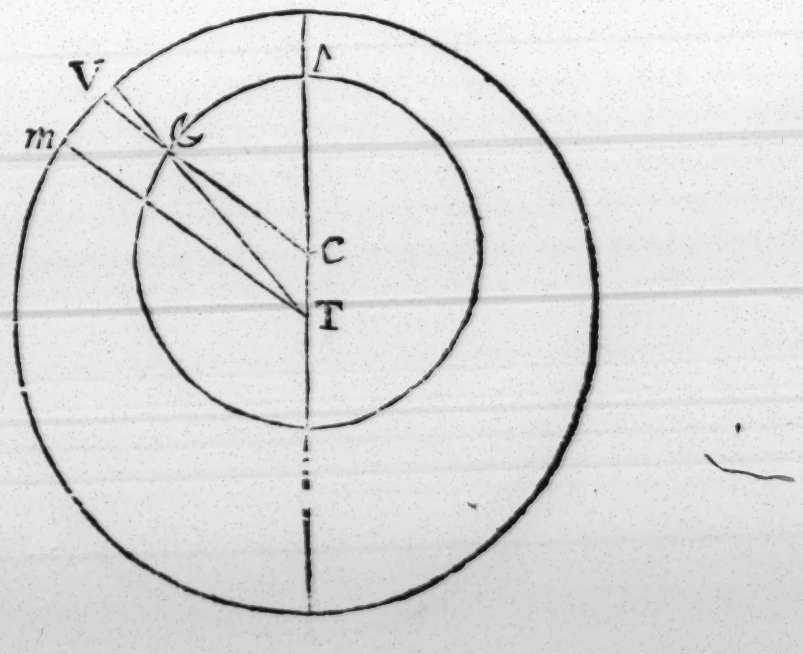


ANNULETS, in Architecture, are ſmall ſquare Parts turned about in the *Corinthian Capital*, under the *Echinus* or Quarter-round.

ANNULAR PROTUBERANCE, is with the Anatomiſts a certain part of an Human Brain lying between the *Cerebellum* and the two backward *Prominences.* The ſame with the *Annularis Proceſſus.*

ANODYNES, (in Medicine) are ſuch Remedies as alleviate or quite take away Pain. They are ſometimes alſo called *Paragoricks*, from the Comfort and Quiet that they procure to the Patient: If they are of ſuch a Nature as to produce Sleep, they are called *Hypnoticks*; if they ſtupify and take away the Senſe of Pain, they are called *Narcoticks.*

ANOMALY, is an Inequality or Irregularity in the Motion of the Planets. In *Phil. Tranſ.* N. 57. you have a way to find it Geometrically



by

by Mr. *Caſſini*. The Word *Anomaly* is ſometimes uſed to ſignify the *Argument* of the Irregularity, and the *Equation* which ſhould adjuſt it. This Irregularity is moſt conſiderable in the *Moon*'s Motion, and it muſt be adjuſted before the exact time of her Conjunction with the Sun can be found, and conſequently an Eclipſe truly calculated.

The *Angle A C ☾*, or its equal *A T M*, is the *Argument* or the *Mean Anomaly* of the *Moon*; and the *Angle A T ☾* is the *True* or *Co-adequated Anomaly*: See *Mercator*'s *Aſtronomy*, P. 69.

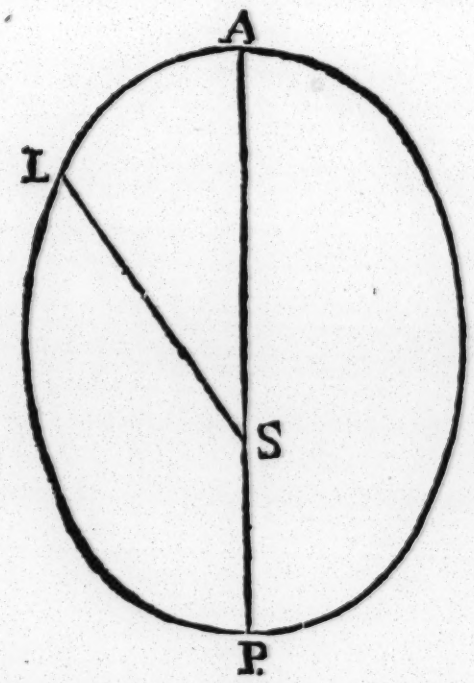
ANOMALY *of the Orbit*, is the Arch or Diſtance of a Planet from its *Aphelion*. The *Mean*

ANOMALY *of the Center*, in the *Ptolemaick Theory* of the Planets, is an Ark of the *Zodiack* of the *Primum Mobile* terminated by the *Linea Apſidum*, and by the Line of the *Mean Motion of the Center*. The *True*

ANOMALY *of the Center*, is the ſame Ark of the *Zodiack* terminated by the Lines of the *Apſes*, and by the Line of the *True Motion of the Center*.

ANOMALY *(true or equal)* of a Planet, is an Ark of the Eccentrick comprehended between the true Place and the *Apogee*.

ANOMALY, *Mean* or *Equable* of a Planet in the *New* or *Elliptical Aſtronomy*, is the *Area* contained under the Line *S L* drawn from the *Sun* to the *Planet*, under *S A* and *L A*, computed from *S A*, in *Conſequentia*, or according to the Natural Order of the Signs. They call it the *Equable*, *Mean* or *Middle Anomaly*, becauſe this *Area* increaſes equably, or in Proportion to the Time of the Planets Revolution round the *Sun* in the *Focus S*.



The *Angle A S L* under the Line of the *Apſes A P*, and the Line *L S*, which is that of the Planets Motion, is called the *Anomaly Co-æquated*, or *True*, in this *Aſtronomy*.

ANOMALY, *(Mean)* of the *Sun* or other Planet, in the old *Aſtronomy*, is an Ark of the Ecliptick between its mean Place and Apogee. This is call'd the *Argument*.

ANOMALY, is alſo uſed by the Grammarians, and is apply'd to ſuch Words as do not in their Formation or Variation, agree with a common Rule; as *do*, *dedi*, *datum*, where the *Imperfect Tenſe* and the *Participle* are both *Anomalous*, that is, *Irregular*.

They reckon 4 kinds of *Anomalous Nouns*, *Hetrogeneous*, *Heteroclites*, *Deficients*, and *Redundants* or *Abundants*, which ſee.

ANOMALOUS, is the ſame with *Irregular*, and is ſpoken of a Motion in the Planets that is Unequal or Irregular.

ANONYMOUS, *Nameleſs*, to which no Name is affixed. Mr. *Boyle* finding by Experiment, that a Spirit was ſeparable from *Tartar*, and ſeveral *Woods*, which in many Qualities differed both from the *Vinous*, *Acids*, and *Urinous ones*, and having not fully diſcovered its Nature, he called it by this Name *Anonymous*, and ſometimes the *Neutral* or *Adiaphorous* Spirit of *Tartar*, *Wood*, &c.

ANOPSY, is want of Sight, or Blindneſs.

ANOREXY, is a loathing of Meat, ariſing from an ill Diſpoſition of the Stomach.

ANOYSANCE, the ſame with *Nuſance*.

ANSES or ANSÆ, the ſame with the *Ring of Saturn*; ſo called, becauſe they ſometimes appear like Handles to the Body of the Planet. See *Ring*.

Anno 1668, *Auguſt* 17*th*, 11 *h*. 13*m*. *P. M.* Mr. *Hugens* and Mr. *Picart*, by the Help of a 21 Foot *Teleſcope*, found the Inclination of the great *Diameter* of the *Ring of Saturn*, with the *Equator*, to be about 9 *Degrees*; whence they inferred, the *Angle* of the Plane of the Ring, with that of the *Ecliptick*, muſt be about 31 *Deg*. See *Saturn*.

ANTAGONIST, he that in Diſputation, or Arguing oppoſes another.

ANTAGONISTA, is a Muſcle placed oppoſitely to another; as may be ſeen betwixt the *Adductor* and *Abductor*, that which contracts, and that which expands the Arm.

ANTANACLASIS, a Figure in Rhetorick, where the ſame Word in appearance is repeated in a various Signification.

ANTAPHRODITICK MEDICINES, are ſuch as are uſed for the *French Pox*.

ANTARES, the *Scorpion's Heart*, a fix'd Star of the firſt Magnitude in the Conſtellation *Scorpio*; its Longitude is 245. 13′. Latitude 4°. 27.

ANTARTICK POLE, is the *Southern Pole*, or End of the Earth's *Axis*; 'tis ſo called becauſe oppoſite to the *Arctick* or *North Pole*.

ANTARTICK CIRCLES: See *Polar Circles*.

ANTARTHRITICK MEDICINES, are ſuch as are uſed againſt the Gout.

ANTASTHMATICK MEDICINES, are ſuch as are uſed againſt the *Aſthma*.

ANTECEDENCE IN, or *in Antecedentia*: The Aſtronomers ſay, a Planet is in *Antecedence*, when it appears to move contrary to the uſual Courſe or Order of the Signs of the *Zodiack*, as when it moves from *Taurus* towards *Aries*, &c. but if it go from *Aries* to *Taurus*, and thence to *Gemini*, &c. they ſay, it goes *in Conſequentia*, or *in Conſequence*.

ANTECEDENT, (in Logick) is the firſt of the two Propoſitions in an *Enthymema*, as the latter is called the *Conſequent*.

ANTECEDENT, in Mathematicks, is the former of two Terms in Proportion, or that which is compared with the other; thus, if the Proportion were of *A* to *B*, *A* is ſaid to be the *Antecedent*.

ANTEMETICKS, are Medicines given againſt Vomiting.

ANTES, in Architecture, are ſquare Pilaſters which the Ancients uſed to place at the Corners of the Walls of their Temples.

ANTESTATURE, is a ſmall Retrenchment made of *Palliſadoes*, or Sacks of Earth ſet up in haſte to diſpute with the Enemy the remainder of a

Piece

piece of Ground, part whereof hath been already gained.

ANTHELIX, is the Protuberance of the Ear, or the inward Brink of the outward Ear, being a Semicircle within the *Helix*, and almoſt parallel to it.

ANTHELMINTICKS, are ſuch Medicines as deſtroy Worms.

ANTHERÆ, are thoſe little Tops or Knobs which grow on the Tops of the *Stamina* of Flowers, and are oftner called *Apices*: which ſee. Mr. *Ray* Engliſhes them *Chives*.

ANTHOLOGY, is a Diſcourſe or a Treatiſe of Flowers, or the Art of a true Floriſt.

ANTHRACOSIS OCULI, is a corroſive ſcaly Ulcer in the Eye, attended with a general Tumour, eſpecially of the Parts about the Eye.

ANTHRAX, *Carbo*, *Pruna*, or *Carbunculus*, is defined to be a Tumour that ariſes in ſeveral places ſurrounded with hot, fiery, and moſt ſharp Pimples, accompanied with acute Pains, but without ever being ſeparated; and when it ſpreads it ſelf farther, it burns the Fleſh, throws off Lobes when it is rotten, and leaves an Ulcer behind it, as if it had been burnt in with an Iron. *Blanchard*.

ANTIAS, in the plural *Antiades*, are the Glands called the *Tonſills* or the Almonds of the Ears.

ANTIAPHRODITICKS, are Medicines that lay Luſt.

ANTIARTHRITICKS, are Medicines againſt the Gout.

ANTIASMATICKS, Remedies againſt ſhortneſs of Breath.

ANTIBACHIUS, is a Latin Verſe whoſe Feet conſiſts of three Syllables, the two firſt long, and the laſt ſhort.

ANTICARDIUM, the ſame with *Scrobiculus Cordis*.

ANTICTHONES, the ſame with *Antipodes*.

ANTICKS, in Architecture, are certain carved Works repreſenting divers odd Shapes of Men, Beaſts, Birds, Fiſhes, Flowers, *&c.* which being rudely determin'd and form'd one out of another, ſerve as an Ornament to the whole Fabrick, and afford a grateful Variety to the Eye of the Beholder.

ANTIDILUVIAN, is whatever was before *Noah*'s Flood: Thus thoſe Generations from *Adam* which were before the Flood, are called the *Antidiluvians*, as thoſe ſince deſcended from *Noah* are called the *Poſt Diluvians*. The Earth that then was before it was deſtroyed by the Flood, and which the ingenious and learned Dr. *Tho. Burnet* conceives to have been very different from ours in Form, Conſtitution, Figure and Situation, is called the *Antidiluvian Earth*.

But Dr. *Woodward* in his *Natural Hiſtory of the Earth*, undertakes to prove from a Series of Obſervations carefully made,

1. That the Face of the Earth before the Deluge was not as the Theoriſt imagines, *Smooth*, *Even*, and *Uniform*, but as it is now, Unequal, diſtinguiſhed into Mountains, Valleys and Plains, as alſo having a Sea, Lakes and Rivers.

2. That this Sea was *Salt* as ours is, *agitated by Tides repleniſhed* with *Fiſhes* of all kinds, and that the Ocean then was nearly of the ſame Extent, and poſſeſs'd an equal ſhare of the Globe with the preſent one.

3. That the *Antidiluvian Earth* was ſtock'd with Vegetables and Animals on all ſides and in all Parts of it quite round the Globe; had both Metals and Minerals in it; had the ſame Poſition in reſpect of the *Sun* which ours now hath, its *Axis* being not parallel, but inclin'd as at preſent, to the Plane of the Ecliptick; and conſequently there were then the ſame Succeſſion of Heat and Cold, Wet and Dry, and the ſame Viciſſitudes of Seaſons, *Spring*, *Summer*, *Autumn* and *Winter*, as there are now.

ANTIDOTE, a Medicine againſt deadly Poiſon.

ANTIEPILEPTICKS, are Remedies againſt the Falling ſickneſs.

ANTIEMETICKS, Remedies that ſtop Vomiting.

ANTI-HECTICUM POTERII, or *Jupiter*'s *Diaphoretick*, is a *Chymical* Medicine made by the Mixture of *Tin*, the Martial Regulus of *Antimony*, and fixed by *Salt-Petre*. See the Operation in *Lemmery*'s *Chymiſtry*, laſt Edit. p. 117.

ANTIHYPNOTICKS, Medicines that drive away Sleep.

ANTI-HYPOCHONDRIACKS, are Medicines uſed againſt the *Hypochondriack Melancholly*.

ANTI-LOGARITHM, the Complement of the Logarithm of any *Sine*, *Tangent*, or *Secunt* to 90. *De*.

ANTI-LOGY, is a Contradiction between any Words or Paſſages in any Author.

ANTI-METRICAL, is whatever is contrary to the Nature and Order of Metre or Verſe.

ANTIMONIUM DIAPHORETICUM, is made of one part of *Antimony* and 3 of *Salt-Petre*, powdered and mixed together, and thrown Spoonful by Spoonful into a red hot Crucible, a Detonation will follow each Spoonful; when all is put in, continue a great Fire about the Crucible for about two Hours; then throw the white Matter into an Earthen Veſſel of fair Water, and leave it ſteeping warm for about two Hours, that all the *Salt-Petre* may be diſſolved; then pour off the Liquor gently, and waſh ſeveral time the white Powder at the Bottom; which is the *Calx of Antimony*, or *Antimonium Diaphoreticum*. Some uſe it as a *Diaphoretick*; but *Lemmery* ſaith, he could never find it would raiſe a Sweat.

ANTIMONIUM MEDICAMENTOSUM, is a Preparation conſiſting of 5 Ounces of *Antimony*, 1 Ounce of *Salt of Tartar*, and 4 Ounces of *Salt-Petre* fluxed together into a *Regulus*, which is aftewards powdered and waſh'd.

ANTIMONIUM RESUSCITATUM, is made of equal parts of *Antimony* and *Sal Armoniack* ſublimed together three times; then the Sublimate is waſh'd with diſtill'd Vienegar warm to get out the Salts.

ANTINEPHRITICK, is a Medicine good againſt the Stone.

ANTINOMASY, is a Figure in Grammar, or rather Rhetorick, whereby an Appellative is uſed inſtead of a proper Name; as the *Philoſopher* inſtead of *Ariſtotle*, &c. and whatever is thus delivered or ſpoken, is ſaid to be ſo delivered or ſpoken *Antonomaſtically*.

ANTINOMY, is a Contradiction between two Laws.

ANTIÆCI, are ſuch Inhabitants of the Earth as dwell one againſt another in the ſame Semicircle of the ſame Meridian, and in the ſame De-

gree of Latitude, but one *North*, the other *South*. These have Noon and Midnight at the ſame time, but the Seaſons of the Year are contrary; as when the *Northern Antiæci* have their *Summer*, the *Southern* have *Winter*, &c. In one Word, they live under the ſame Meridian, but oppoſite Parallels.

ANTIPAGMENTS, (in *Architecture*) are the Garniſhing of Poſts or Pillars.

ANTIPASIS, the ſame with the *Revulſion* of a Diſeaſe, when the Humours flowing into ſome one Part, are turned back again, and forced to take ſome other Courſe.

ANTIPERISTASIS, according to the Peripateticks, is a certain Invigoration of the Internal Heat of any Body, by its being invironed all round with Cold. They inſtance in Lime growing hot on the Effuſion of cold Water, *&c.*

ANTIPERISTALTICK, is a Motion by which the Excrements of the Guts are carried upwards inſtead of downwards, which is the uſual and natural *Periſtaltick Motion*. See that Word.

ANTIPHARMACUM, the ſame with *Antidote*, is a Medicine that expels Poiſon.

ANTIPHRASIS, a figurative Speech, having a contrary Meaning to what it carries in Appearence.

ANTIPILEPTICKS, are Medicines againſt the Falling-Sickneſs.

ANTIPODES, are ſuch Inhabitants of the Earth as live diametrically oppoſite to one another, that is, in Parallels of Latitude equally diſtant from the Equator, but one *North*, the other *South*; and under the ſame Meridian, though 180°. or juſt half of that Meridian diſtant from one another.

ANTIPRÆDICAMENTS, in Logick, are ſuch Notions as are previouſly neceſſary to underſtand the Doctrine of the Prœdicaments; ſuch as the Definitions of Univocal, Equivocal, and Denominative Terms, *&c.*

ANTIPTOSIS, a Figure in Grammar, wherein in one Caſe is put for another.

ANTISCII, is a Term in Geography, ſignifying ſuch Inhabitants of the Earth as live in two Places oppoſite to one another, one on the *North*, the other on the *South* Side of the *Æquator*; ſo that their Shadows at Noon fall different ways, one directly oppoſite to the other.

ANTISCORBUTICK, are Medicines againſt the *Scurvy*.

ANTISTROPHE, is a Figure in Grammar, whereby two Terms of Things which are mutually independant one upon another, or reciprocally converted; as if one ſhould ſay, the Maſter of the Servant, and the Servant of the Maſter.

ANTISPASMODICKS, are Remedies againſt Convulſions.

ANTITHENAR, one of the Muſcles that extends the Thumb.

ANTITHESIS, in Rhetorick, is a ſetting two things by way of Oppoſition one againſt anothet, that ſo the Excellence of one, and the Evil and the Folly of the other may the better appear.

ANTITRAGUS, a little Prominence at the lower end of the *Antihelix*, ſeated oppoſite to the *Tragus*, whence it has its Name.

ANTÆCI, the ſame with *Antiæci*, which ſee.

ANTONOMASIA, (a Trope in Rhetorick) is when the proper Name of one thing is applied to ſeveral others; or on the contrary, the Name of ſeveral things to one.

By this *Trope* we call any voluptuous Perſon a *Sardanapalus*, and any cruel Perſon a *Nero*, for the one was a voluptuous King, and the other a cruel Emperor,: Or when we ſay, the *Philoſopher* has prov'd it in his *Metaphyſicks*; The *Orator* gives this Precept in his *Rhetorick*; we mean *Ariſtotle* and *Cicero*.

ANUS, is the Extrimity of the *Inteſtinum Rectum*; it conſiſts of three Muſcles, two called the *Levatores*, which diſtend and open the *Anus* in order to diſcharge the Excrements; and one called the *Sphincter*, which ſhuts it and keeps it ſo. There is alſo a Cavity in the Brain called *Anus*, which ariſes from the four Trunks of the *Spinal Marrow*; and by ſome the Skin which goes over the Navel, in aged Perſons becoming wrinkled, is called *Anus*.

AORTA, or *great Artery*, ſo called becauſe it is the greateſt Artery in the whole Body, from which all others (except the *Pulmonary*) are deriv'd: It riſes immediately out of the left Ventricle of the Heart, and at its riſe hath three *Valves*, which have the ſame Uſe and Figure as the *Semilunares* in the *Arteria Pulmonaria*. As ſoon as the *Aorta* comes out of the Heart, it aſcends a little upwards, and then turns downwards to form the deſcending Trunk, becauſe the Blood might offend the Brain, if it ran with that impetuoſity with which it's thrown out of the Heart; and from the upper ſide of this turning, the *Cervical* and *Auxillary* Veſſels do ariſe: By this Artifice, as the Blood collides againſt the ſides of the *Aorta*, its force is broken, part of it is taken in by the Mouth of the aſcending Branches, but its greateſt part is directed downwards. At the riſe of the *Coronariæ* out of the *Aorta*, there is a *Valve* placed that permits the Blood to flow out of the great Artery into them, but hinders its reflux. When it has pierced the *Pericardium* and bended a little Arch-ways backwards, it is divided into two Trunks, whereof the one is called *Truncus Aſcendens*, the other *Deſcendens*.

The *Aorta* hath four *Tunicks*, a *Nervous*, a *Glandulous*, a *Muſcular*, and a *Membranous* one, which is the *Internal*. See *Arteries*.

APAGOGICAL DEMONSTRATIONS, are ſuch as do not prove the thing directly; but ſhew the impoſſibility and abſurdity which ariſes from denying it; and therefore 'tis uſually called *Reductio ad impoſſibile, vel ad Abſurdum*.

APATHY, is an utter want of Paſſion.

APEPSIE, bad Digeſtion or rawneſs of Stomach, when there is no good Concoction of the Aliments.

APERIENS PALPEBRAM RECTUS, is a Muſcle ſo called from its ſtreight Progreſs and Uſe. It ariſes ſharp and fleſhy from the profoundeſt Part of the *Orbit*, near the Place where the Optick Nerve is tranſmitted, paſſing directly over the *Muſculus Attollens*, it becomes Tendinous as it marches over the Bulb of the Eye, whence growing ſtill broader and thinner, till it is inſerted to the whole ſuperiour part of the upper Eyelid.

APERITIVE MEDICINES, or ſuch as open the obſtructed Paſſages in the ſmall Veſſels, *Glands* or *Pores*, and by that means promote a due Circulation of the contained Juices.

APERTURA FEUDI, a Term in the Civil-Law, ſignifying the loſs of a *Feudal Tenure* by Default

Default of Iſſue of him to whom the *Feud* was firſt granted or given.

APERTURE, in ſome Writers of Geometry is the Inclination of one Right Line to another, which meet in a Point and form an Angle. And 'tis ſo called, becauſe the Angle is the *opening* of the Legs of the Angle, like thoſe of a Joint Rule.

APERTURE, in Opticks, is the Hole next to the Object Glaſs of a Teleſcope or Microſcope, thro' which the Light and Image of the Object comes into the Tube, and thence is carried to the Eye. Mr. *Auzout* ſaith, he found that the *Apertures* of Teleſcopes, ought to be nearly in a Subduplicate Proportion of their Lengths.

The viſible *Area* of an Object, is not encreaſed or diminiſhed by the greater or leſſer *Aperture* of the Object Glaſs; all that is effected thereby, is the admittance of more or leſs Rays, and conſequently the more bright or obſcure appearance of the Object. When you look at *Venus* thro' a Teleſcope, you muſt uſe a much leſs *Aperture* than for the *Moon*, *Jupiter* or *Saturn*, becauſe her Light is ſo vivid and glaring.

APETALOUS *Flowers* or *Plants*, are by the Botaniſts accounted ſuch as want the fine coloured Leaves of Flowers which they call *Petala*: Theſe Flowers are otherwiſe called *Stamineous*, and are juſtly reckoned *Imperfect*.

APEX, is the top, point, uppermoſt or ſharpeſt part of any thing.

APHÆRESIS, in Grammar, is that Figure which takes away a Letter or a Syllable from the beginning of a Word.

In Surgery, is that part which teaches to take away Superfluities.

APHELIUM, or *Aphelion*, or *Auge* in the *Copernican Hypotheſis*, is that point of the Earth's or any other Planet's Orbit, in which it is the fartheſt diſtant from the *Sun* that it can ever be; and when 'tis at its neareſt diſtance, it is ſaid to be in its *Perihelion*.

Sir *Iſaac Newton* proves the *Aphelia* of the Planets as well as the Nodes to be at reſt, *Prop.* 14. *Book* 3.

In Philoſ. Tranſ. N. 128. is a ſtrict Geometrical Method for finding the *Aphelia* of the Planets by Mr. *Halley*.

APHORISM, is in a general Rule, or eminent but ſhort Obſervation, experienced for a Truth in any Art, or relating to Practice.

APHTHÆ, are Wheals, Ulcers or Pimples about the Internal Parts of the Mouth; as alſo about the Ventricle and Guts, which when they come to be ripe, fall off by piece-meal, and are often accompanied with a Fever in thoſe of riper Years. Infants are often ſubject to the *Aphthæ*, they begin in the Gums, and by degrees ſpread over the whole Palate and Mouth; if they ſeize the Epiglottis and the upper parts of the Throat, the Child ſeldom recovers. Theſe are called *Aphthæ* of *Celſus*.

APICES, of a Flower, are thoſe little Knobs that grow on the Tops of the *Stamina*, in the middle of the Flower: They are commonly of a dark purpliſh Colour. By the Microſcope they have been diſcovered to be, as it were, a ſort of *Capſulæ Seminales* or *Seed Veſſels*; containing in them ſmall Globular, and often Oval Particles, of various Colours, and exquiſitely formed, as I have often with Admiration obſerved my ſelf: In the Plant called *Germanium Robertianum* or *Herb Robert*, theſe *Apices* are of a deep purple Colour, and the Pulviſcular Matter within of a glorious Yellow; they are exquiſitely Spherical, and afford a very pleaſant Proſpect in the Glaſs.

What the Uſe of theſe ſo finely elaborated Particles is, is not yet, that I know of, diſcovered: Some have gueſſed it to be a kind of *Male-Sperm*, which falling down into the Flower, they will have to help, fœcundate and ripen the Seed; but this I take to be a meer Fancy.

APNOEA, a Depravation and Diminution, or an entire Suppreſſion of Breathing, at leaſt to Senſe, as it happens in Swoonings, Fits of the Mother, and Strong Apoplexies.

APOCHYLISMA, is any Juice boiled and thickened with Honey or Sugar into a kind of hard Conſiſtence. This is called alſo *Rob. Rubab*, and *Succago*.

APOCOPE, a Figure in Grammar, wherein the laſt Letter of a Word or Syllable is cut off.

APOCROUSTICKS, are (according to ſome Phyſicians) ſuch Medicines as hinder the Influx of the Humours to any particular part of the Body, and reject thoſe which are beginning to flow thither.

APODICTICAL *Argument* or *Syllogiſm*, ſignifies a plain Proof or Demonſtration of a thing.

APODICTICK, the ſame with *Apodictical*.

APODIOXIS, a Figure in Rhetorick, wherein any Argument or Objection is with Indignation rejected as abſurd.

APOGEE or APOGÆUM, in Aſtronomy, is the fartheſt diſtance that any Planet can be at from the Earth in its whole Revolution; as *Perigæum* is its neareſt diſtance.

How to find both *Apogæum* and *Perigæum*, ſee the Geometrical Method of *Caſſini*, with ſome Conſiderations upon it by Mr. *Mercator*, in *Philoſ. Tranſ. N.* 57.

APOGEE of the *Equant*, is the fartheſt diſtance of it from the Earth, or that Point where the Circumference of the *Equant* is interſected by the *Linea Apſidum* in the remoteſt part of the Diameter; as the *Perigee of the Equant* is the oppoſite Point of the neareſt part of the Diameter. The *Mean*.

APOGEE of the *Epicicle*, is a Point where the *Epicicle* is cut above by a Right Line drawn from its Center to the Center of the *Equant*, or the Point of the *Epicicle* moſt remote from the Earth.

APOLOGETICAL, is what is ſaid or written by way of Excuſe or Apology for any Action.

APOLOGUE, is an inſtructive Fable, like thoſe of *Æſop*.

APOMECOMETRIE, is an Art teaching the Practiſer how to meaſure things at a Diſtance, *viz.* how far they are off from him.

APONEUROSIS, is (with Anatomiſts) the ſpreading or extenſion of a *Nerve* or a *Tendon* out in Breadth, in the manner of a *Membrane*: Alſo the *cutting off* a *Nerve* or *Tendon* is ſo called.

APORE, in Mathematicks, is a Problem which tho' it be not impoſſible, yet it is very difficult to be reſolved; and hath not yet actually been ſo: Thus the *Quadrature* of the Circle may be called an *Apore*, becauſe there is yet no *Way* or *Path* diſcovered to lead us into it.

APORIME: See *Porime*.

APOPHLEGMATICAL *Medicines*, are ſuch as are endowed with the Faculty of drawing cold

pituitous Humours from the Head, and discharging them by the Nose or Mouth.

APOPHYGE, in Architecture, signifies that part of a Column where it seems to fly out of its Base, like the Process of a Bone in a Man's Leg, and begins to shoot upward. But this *Apophyge* is really no more than the Rings or Ferrils heretofore fastened at the Extremities of wooden Pillars to keep them from splitting, and afterward imitated in Stone Work.

APOPHYSIS, is a Protuberance made by the Fibres of a Bone, produced above its Superficies, and is ordinarily upon the Extremity of the Bones.

APOPLEXY, *Attonitus Stupor*, *Syderatio*, and *Morbus attonitus*, is a profound Sleep, wherein the Patient being either vehemently shaken, tossed or pricked, yet perceives nothing, nor affords any Sign of Action, accompanied with a Difficulty of Respiration for the most part, and sometimes with none at all. *Blanchard.*

APORRHEÆ, are Vapours and Sulphureous *Effluviums* which exhale through the Pores of the Body.

APORRHEAS, a Word used by Mr. *Boyle* for *Effluviums*; of the same Sense with the former.

APOSIOPESIS, (a Figure in Rhetorick) is, when on a sudden, a Person changes his Passion, cutting off his Discourse, so that the Hearer cannot easily imagine what it is he intends: As it is very common upon Occasion of threatning, to say, *If I* — &c. *But*, &c. —

APOSTARE LEGES, and *Apostatare Leges*, signifies, wilfully to break or transgress the Laws.

APOSTATA CAPIENDO, is a Writ directed to the Sheriff, for to take the Body of one, who having enter'd into, and professed some Order of Religion, leaves it and departs from his House, and wanders about the Countrey.

APOSTEM, the same with *Apostbume*.

APOSTROPHE, is a Figure in Rhetorick, when the Speaker is in an extraordinary Commotion, turns himself on all Sides, and addresses himself to all Beings, whether sensible or insensible; whom he, for the present, supposes to be *equally* capable of hearing his Complaint, and of returning an Answer to his Demands.

APOSTROPHE, also is an *Accent* in Grammar, shewing there is a Vowel to be rejected, and is expressed thus (') and placed over the Head of the Letter. *Vossius* writes it *Apostrophus*.

APOTHEGM, is a short pithy instructive Sentence spoken by some grave and considerable Man; or else made in Imitation of such. As the *Apothegms* of *Plutarch*, or those of the Ancients collected by *Lycosthenes*.

APOTOME, in Mathematicks, is an Irrational Remainder, or Residual Root; when from a *Rational Line*, as suppose *a*, you cut off a part as *b*, which is only *commensurable in Power* to the whole Line. Then 'tis expresst thus $a - \sqrt{b}$, and is called *Aporome*, because it signifies a Remainder left by *cutting off b*.

APOTOME, in Musick, is the Differenee between the greater and the lesser Semitone.

APOZEME, is a Decoction of Roots, Woods, Barks Herbs, Flowers, Fruits, Seeds, *&c.* which is boyled down commonly to Twelve, Fifteen or Twenty Ounces. It is either Purging, Loosening, Altering or Drying, *Cephalick*, *Stomachick*, *Diuretick*, *Splenetick* or *Hepatick*, according as the Indications of the Disease direct.

APPARENT CONJUNCTION: See *Conjunction Apparent.*

APPARENT HORIZON: See *Horizon.*

APPARENT *Place of a Star*, is a Point determined by a Line drawn from the Eye through the Center of the Star; whereas the *True* or Real Place is determined by a Line drawn from the Center of the Earth to the Star or Planet.

APPARENT PLACE *of any Object in Opticks*, is that (different from the real one) in which it appears when seen through one or more Glasses. For when by Refraction through Glasses, that parcel of Rays which fall on the Pupil of the Eye from each Point of any near Object, is made to flow as close together as that which comes from a distant one; or when by the same way, the Rays coming from distant Objects are made to *Diverge* as much as if they flowed from nigh ones, then the Eye must necessarily see the Place of the Object changed; which Change is its *apparent Place.*

If an Object be placed nearer to a Convex Glass than is the Distance of its Focus, its Apparent Place may be determined; as Mr. *Molyneux in Dioptr.* p. 116. shews.

But if the Object be in the *Focus* of the Glass, the *Locus Apparens* of the Object cannot be determined; only, as Dr. *Barrow* saith, it will appear vastly remote.

Nor can the *Locus Apparens* be determined, if the Object be beyond the *Focus* of a Convex Glass. But if an Object be more distant from a Convex Glass, then its *Focus* and the Eye lie beyond the *distinct Base*, the *apparent Place* of the Object will be in the *distinct Base.*

APPEAL of *Mayhem*, (in Law) is an accusing of one that hath maimed another: But that being no Felony, the Appeal is but a kind of Action of *Trespass*, because there is nothing recoverd but Damages.

APPEAL, (in Law) is a removing of a Cause from an Inferior Judge to a Superior: Also a private Accusation of a Murtherer, by one who had Interest in the murthered Party; or of any Felon, by one of his Complices in the Fact.

APPEAL *of wrong Imprisonment*, a Term in Law, is by some used for an Action of *wrong Imprisonment.*

APPELLANT, is he that brings an Appeal.

APPELLATIVE, a Term in Grammar, signifying a Name in Opposition to Proper, and which belongs to a whole Species or Kind, as *Man*, *Chymist*, &c.

APPELLOR or *Appellant*, the same with *Approver.*

APPENDANT and *Apurtenant* (in Law) are things that by time of Prescription have belonged, appertained, and are joyned to another principal thing, by which they pass and go as accessary to the same special thing, as Lands, Commons, *&c.* to a Mannor; Courts, Ways, *&c.* to a House, Office, or such others.

APPENDICULA VERMIFORMIS, so some Anatomists call the *Intestinum Cæcum*, or Blind Gut, from its Figure and manner of Scituation, which in some Animals hangs pendulous like a Worm, and is not filled with Excrement, as it is in others.

APPEN-

APPENDIX, the ſame with *Epiphyſis*.

APPENSA, the ſame with *Periapta*, ſuch things as are hung about the Necks of diſeaſed Perſons, to free them from ſome Diſtempers which they labour under; ſuch as a dried Toad to ſtop Bleeding, Peony Roots for Convulſions, *&c.*

APPERTINANCES, ſignify, in the Common-Law, Things both Corporeal, belonging to another thing, as the more principal; as Hamlets to a chief Mannor, Common of Paſture, Turpary, Piſcary, and ſuch like; and Incorporeal, as Liberties and Services of Tenants.

APPLICATE, in Geometry, is a Right Line, otherwiſe called the *Ordinate* or *Semi-ordinate* in a *Conick Section*: See the Word *Ordinate*, or any Treatiſe of *Conick Sections*.

APPLICATION, is ſometimes the Geometrical Term for Diviſion, the Reaſon of which ſee in *Geometrical Diviſion*. But *Application* alſo ſignifies the fitting or applying one Quantity to another, whoſe Area's, but not Figures, are the ſame. *Thus*, Euclid, Book 6. Prop. 28. *teaches how to a Right Line given, to apply a Parallelogram equal to a Rectilineal Figure given.*

APPLICATE ORDINATE, (a Term in Geometry) ſee *Ordinate*. It ſignifies a Right-line applied at Right-angles to the Axis of any Conick Section, and terminated by the Curve.

APPLY, a Term uſed by Geometricians in in three Senſes.

1. It ſignifies to transfer a Line given into a Circle (moſt uſually) or into any other Figure, ſo that it ſhall be there fitted or *Accomodated*, (which is alſo another Word they uſe for the ſame thing) according to its proper length.

2. Tis alſo uſed to expreſs Diviſion in Geometry, eſpecially by the Latin Writers, who, as they ſay, *Duc* 8 *in* 9, when they would have 9 multiply'd by 8; ſo they ſay, *Applica* 4 *ad* 12, when they would have 12 divided by 4: See *Diviſion Geometrical*, or in Lines, where the Reaſon of this way of ſpeaking is explained.

3. It ſignifies alſo to fit Quantities whoſe Area's are equal, hut Figures different, ſo that they ſhall conform to one another; as when *Euclid* in his ſixth Book, teaches how, *on a Line given, to apply a Parallelogram equal to a Rectilineal Figure given.*

APPORTIONMENT, is a dividing into Parts a Rent which is dividable, and not entire or whole; and foraſmuch as the thing out of which it was to be paid is ſeparated and divided, the Rent alſo ſhall be divided, having Reſpect to the Parts.

APPORTUM, in Law, ſignifies Revenu, Gain or Profit, which a thing brings to its Owner.

APPOSALE *of Sheriffs*, is the charging them with Money received upon their Account in the *Exchequer*.

APPOSITION, in Grammar, is the putting of two or more Subſtantives together in the ſame Caſe.

APPRENDRE, in Law, ſignifies a Fee or Profit to be taken or received.

APPREHENSION, is the ſimple Contemplation of things that preſent themſelves to the Mind, as when we conſider the Sun, the Earth, a Tree, Rotundity, a Square, Cogitation, Entity, pronouncing nothing expreſly concerning them; and the Forms under which they are conſidered are called *Ideas*.

APPROACHES, in Fortification, are Works caſt up on both ſides; ſo called becauſe the Beſiegers by that Means may draw near a Fortreſs without fear of being diſcovered by the Enemy. Or *Approaches* are all ſorts of Advantages by the Help of which an Advancement may be made toward a place beſieged.

APPROPRIARE COMMUNAM, to diſcommon, that is, to ſeparate and encloſe any parcel of Land that was before open Common.

APPROPRIATION, is when the Advowſon of a Parſonage is given, or belongs to any Biſhoprick, Religious Houſe, College, *&c.* And to their Succeſſors, ſo that the Houſe or Body is both Patron or Parſon, and ſome one of the Members officiates as Vicar. 'Tis called *Appropriation*, becauſe the Profits of the Living are appropriate to the uſe of the Patrons.

APPROPRIATE *ad* HONOREM, a Term in Law, ſignifying to bring a Man not within the Extent or Liberty of ſuch an Honour.

APPROVEMENT, is where a Man hath Common within the Lord's waſte Ground, and the Lord encloſes part of the Waſte for himſelf, having nevertheleſs ſufficient Common, with Egreſs and Regreſs for the Commoners. This Incloſing is called *Approvement*.

APPROVER, (in Law) is he who hath committed ſome Felony, which he confeſſes; and to ſave himſelf, impeaches his Accomplice or Accomplices; and he is ſo called, becauſe he muſt *Prove* that which he hath alledged in his Appeal.

APPROVERS *of the King*, are thoſe that have the letting of the King's Demeans in ſmall Mannors for the King's greater Advantage.

APPROXIMATION, in *Arithmetick*, or *Algebra*, is a continually coming ſtill nearer and nearer to the *Root* or *Quantity* ſought, without expecting to have it exactly. Of theſe Methods of *Approximations*, Dr. *Wallis* gives ſeveral Specimens in his Hiſtory of *Algebra*, P. 317. and ſome have been invented ſince: They are all nothing but a *Series infinitely converging* or approaching ſtill nearer to the Quantity required, according to the nature of the *Series*.

In Philoſoph. Tranſ. N. 215. That excellent Mathematician hath a Diſcourſe about the Methods of *Approximation* in the Extraction of *Surd Roots*, in which he deſignedly ſhews the Grounds and Reaſons of the whole Buſineſs, and which therefore is very well worth the Reader's peruſal: The Subſtance of what the Doctor delivers, is as followeth.

To begin with the *Square Root*.

From any non-quadrate Number or Quantity propoſed (ſuppoſe n) ſubſtract (in the uſual manner) the greateſt Square in Integers therein contained (ſuppoſe $a\,a$) the Remainder (ſuppoſe $b = 2a\,e + e\,e$) is to be the Numerator of a Fraction, for deſigning the near Value of e the remaining part of the Root ſought ($a + e = \sqrt{n}$) whoſe Denominator or Diviſor is to be $2a$ (the double Root of the ſubſtracted Square) or $2a + 1$ (that double Root increaſed by one) the true Value falling between theſe two; ſometime the one, ſometime the other, being neareſt to the true Value. But (for avoiding negative Numbers) the latter is commonly directed.

The true Ground of the Rule is this; $a\,a$ being (by Conſtruction) the greateſt Integer Square contained in n, 'tis evident that e muſt be leſs than 1, (otherwiſe not $a\,a$, but the Square of $a + 1$,

or

or ſome greater than it, would be the greateſt Integer Square contained in n.) Now if the remainder $b = 2a + ee$ be divided by $2a$, the reſult will be too great for e, (the Diviſor being too little, for it ſhould be $2a + e$ to make the Quotient e) But if (to rectify this) we diminiſh the Quotient by increaſing the Diviſor, adding 1 to it, it becomes too little, becauſe the Diviſor is now too big. For (e being leſs than 1) $2a + 1$ is more than $2a + e$, and therefore too big.

As for Inſtance; If the Non-quadrat propoſed be $n = 5$, the greateſt Integer Square therein contained is $aa = 4$ (the Square of $a = 2$) which being ſubſtracted, leaves $n - aa = 5 - 4 = 1 = b = 2ae + ee$; which being divided by $2a = 4$, gives $\frac{1}{4}$; but divided by $2a + 1 = 4 + 1 = 5$, gives $\frac{1}{5}$: That too great, and this too little for e. And therefore the true Root ($a + e = \sqrt{n}$) is leſs than $2\frac{1}{4} = 2{,}25$, but greater than $2\frac{1}{5} = 2{,}2$: And this was anciently thought an *Approach* near enough.

If this *Approach* be not now thought near enough, the ſame Proceſs may be again repeated; and that as oft as is thought neceſſary.

Take now for a, $2\frac{1}{5} = 2{,}2$, whoſe Square is $4{,}84 = aa$ (now conſidered as an Integer in the ſecond place of Decimal Parts) this ſubtracted from 5,00 (or, which is the ſame 0,84, the exceſs of this Square above the former, from 1, which was then the remainder) leaves a new remainder $b = 0{,}16$; which, divided by $2a = 4{,}4$, gives $\frac{16}{440} = \frac{2}{55} = 0{,}03636 +$, too much: But divided by $2a + 1 = 4{,}5$, it gives $\frac{16}{450} = \frac{8}{225} = 0{,}3555 +$, too little. The true value (between theſe two) being 2,236 *proxime*, whoſe Square is 4,999696.

If this be not thought near enough, ſubſtract this Square from 5,000000: The remainder $b = 0{,}000304$, divided by $2a = 4{,}472$, or by $2a + 1 = 4{,}473$, gives (either way) $0{,}000068 -$; which added to $a = 2{,}236$, makes $2{,}236068 -$, ſomewhat too big; but $2{,}236067 +$, would be much more too little.

Which gives us the Square Root of 5, adjuſted to the ſixth Place of Decimal Parts, at three ſteps. And by the ſame method, if it be thought needful, we may proceed further.

It were eaſie to compound the Proceſs of two or more Steps into one, and give (for the Rule) the Reſult of ſuch Compoſition, which would make it ſeem more intricate and myſterious, to amuſe the Reader.

In the *Cubick Root* (conſonant to the Quadratick) the Rule is this:

From the *Non-Cubick* propoſed (ſuppoſe n) ſubſtract the greateſt Cube in Integers therein contained (ſuppoſe aaa) the Remainder (ſuppoſe $b = 3a\,ae + 3a\,ee + eee$) is to be the Numera. of a Fraction for deſigning the value of e, (the remaining part of the Root ſought, $a + e = \sqrt{n}$). To this Numerator, if (for the Denominator or Diviſor) we ſubjoin $3aa$, the Reſult will certainly be too great for e, becauſe the Diviſor is too little: (For it ſhould be $3a\,a + 3a\,e + e\,e$, to give the true value of e). If for the Diviſor we take $3a\,a + 3a + 1$, it will certainly be two little, becauſe the Diviſor is too great. (For e by conſtruction is leſs than 1.) It muſt therefore (between theſe Limits) be more than this latter; and therefore this latter Reſult being added to a, will give a Root whoſe Cube may be ſubſtracted from the Non-Cubick propoſed in order to another ſtep.

But if for the Diviſor, we take $3a\,a + 3a$ (or even leſs than ſo) the Reſult may be too great; or (in caſe b be ſmall) it may be too little, and oft is ſo.)

Which comes to paſs from hence, becauſe e (by Conſtruction) is leſs than 1; and therefore $3a\,e$ leſs than $3a$; and perhaps ſo much, as that the Addition of $e\,e$ will not redreſs it. And when it ſo happens $3a\,a + 3a$ is a better Diviſor than $3a\,a + 3a + 1$, (or even ſomewhat leſs than either). But becauſe it doth not always ſo happen (tho' for the moſt part it doth) the Rule doth rather direct the other; as which doth certainly give a Root leſs than the true value, whoſe Cube may always be ſubſtracted from the Non-Cubick propoſed. The Deſign being to have ſuch a Cube, as (being ſubſtracted) may leave another b to be ordered in like manner for a new Approach. But for the moſt part $3a\,a$ may be ſafely taken for the Diviſor: For tho' the Reſult will then be ſomewhat too big, yet the exceſs may be ſo ſmall as to be neglected; or at leaſt we may thence eaſily judge what Number (ſomewhat leſs than it) may be ſafely taken; and if we chance to take it ſomewhat too big, the Inconvenience will be but this, that b for the next ſtep will be a Negative; of which Caſe we ſhall ſpeak anon.

Thus for Inſtance; if the *Non Cube* propoſed be $9 - n$, the greateſt Integer *Cube* therein contained is $8 = a\,aa$ (whoſe Cubick Root is $a = 2$) which Cube ſubſtracted, leaves $9 - 8 = 1 = b = 3a\,ae + 3a\,ee + eee$. This divided by $3a\,a = 12$, gives $\frac{1}{12} = 0{,}08333 +$, too big for e; but the ſame divided by $3a\,a + 3\,a + 1 = 12 + 6 + 1 = 19$, gives $\frac{1}{19} = 0{,}05263 +$, too little; or if but by $3a\,a + 3a = 2 + 6 = 8$, it gives $\frac{1}{18} = \frac{5}{90} = 0{,}05555 +$, yet two little. For the Cube of $a + 0{,}06 = 2{,}06$, is but $8{,}742 -$, which is ſhort of 9: And ſo much ſhort of it, that we may ſafely take 2,07 as not too big; or perhaps 2,08 (which, if it chance to be too big) it will not be much too big (as ſhall be farther ſhewn:) And upon tryal it will be found not too big; for the Cube of 2,08, is 8,998912.

If this Step be not near enough, this *Cube* ſubſtracted from 9,000000 leaves anew $b = 0{,}001085$, which divided by $3aa = 12{,}9796$, gives $0{,}000084 -$, which will be ſomewhat too big, but not too much (for e is now ſo ſmall) as that $3a\,e$ may be ſafely neglected (and ee much more) ſo that if to 2,08 we add $0{,}000084 -$, the Reſult 2,080084 will be too big, but 2,080083 will be more too little; (as will appear if we take the Cube of each) ſo that either of them at the ſecond Step, gives the true Root within an Unite in the fixth place of Decimal Parts.

He ſays, (*taking the Cube of each*; which he does) that the thing may be more clearly apprehended, but it is not neceſſary that we trouble our ſelves with the whole Cube: For $a\,a\,a$ being already ſubſtracted, for finding $b = 3a\,ae + 3a\,ee + eee$, we have no more to try, but whether $3a\,ae + 3a\,ee + eee$ be greater or leſs than b, according as we take 0,000084, or 0,0000083, for e.

Which may be conveniently done in this manner: Take $3a + e$ and multiply this by e (or e by it) ſo have we $3ae + ee$; to this add $3\,a\,a$, and multiply the whole by e (ſo have we $3\,a\,ae + 3aee$

$3aae + eee$) to see whether this be greater or less than b.

That is, in the present Case, if we take $e = 0{,}000084$, and add to this $3a = 6{,}24$, then is $6{,}240084 = 3a + e$: This multiply'd by $e = 0{,}000084$, is $3ae + ee = 0{,}000524 +$; to which, if we add $3a\,a = 12{,}9792$, it is $3a\,a + 3ae + ee = 12{,}979724$, which multiply'd again by $e = 0{,}000084$, is $0{,}0010902 +$, $= 3a\,a\,e + 3a\,e\,e + e\,e\,e$, which is more than $b = 0{,}001088$.

But if we take $e = 0{,}000083$, and proceed as before, we shall have $3a\,ae + 3a\,ee + eee = 0{,}001077 +$, which is less than b, and therefore (if we substract that from this) the Remainder 0,000011, will be another b for the next Step, if please to proceed further.

Hitherto we have pursued the Method most affected by the Ancients, in seeking a Square or Cube (and the like of other Powers) always less than the just Value, that it might be substracted from the Number proposed, leaving b a positive Remainder, thereby avoiding Negative Numbers.

But since the Arithmetick of Negatives is so well understood, it may in this (and other Operations of like nature) be advisable to take the next greater (in case that be nearer to the true value) rather than the next lesser.

According to this Notion for the Square Root of 5, I would say, it is $(2 +)$ somewhat more than 2, and enquire, how much more? But for the Square Root of 8, I would say, it is $(3 -)$ somewhat less than 3, and enquire, how much less? Taking in both Cases that which is nearest to the just Value.

Thus, in the Cubick Root before us, I take for e (in the last Enquiry) 0,000084 (where, for the near Step, we have $b = -\ 0{,}000002$) rather than $0{,}000083 +$ (where, for the next Step, we should have $b = +\ 0{,}000011$). In this latter Case we are to divide $b = +\ 0{,}000011$, by $3a\,a = 12{,}980236 -$, to find (by the Quotient) how much is to be added to 0,000083. In the other Case, we are to divide $b = +\ 0{,}00002$, by $3a\,a = 12{,}980248$, to find (by the Quotient) what is to be abated of 0,000084, so have we $\frac{0\ 0000011}{12\,98043\,6} = 0{,}00000085 +$, to be added to 6,240083: Or $\frac{0\ 0000002}{12\,98024\,8} = 0{,}00000015 +$ to be abated of 6,240084: (Or it may suffice in either, to divide by $12{,}98 +$, or even by $13 -$, without being incumbred with a long Divisor) either of which gives us, for the Root sought, 2,08008385 *proxime*. True (at the third Step) to the eighth place of Decimal Parts. And if this be not near enough, the Cube of this compared with the Number proposed, will give us another b, for the next Step, and so onwards as far as we please.

Now, what is said of the Cube, is easily applicable to the higher Powers.

That of the Biquadrate may be omitted, because here perhaps it may be thought most advisable to extract the Square Root of the Number proposed; and then the Square Root of that Root.

But if we would do it at once, we are from n (the Number proposed, being not a Biquadrate) to substract a^4 (the greatest Biquadrate contained in it) to find the Remainder $b = 4a^3 e + 6a^2e^2 + 4ae^3 + e^4$, which Remainder, if we divide by $4a^3$, the Quotient will certainly be too big for e (tho' perhaps not much).

If by $4a^3 + 6a^2 + 4a + 1$, it will certainly be too little (for Reasons before mentioned.) And we are to use our Discretion in taking some intermediate Number. And if we thence chance not to hit on the nearest, the Inconvenience will be but this, that our leap will not be so great as otherwise it might be, which will be rectify'd by another b at the next Step.

For the *Surfolid* (of the five Dimensions) we are from n (the Number proposed, being not a perfect *Surfolid*) to substract a^5 (the greatest *Surfolid* therein contained) to find the Remainder.

$$b = 5a^4e + 10a^3e^2 + 10a^2e^3 + 5ae^4 + e^5.$$

which (as before) if we divide by $5a^4$, the Result will be somewhat too big (because the Divisor is too little).

If by $5a^4 + 10a^3 + 10a^2 + 5a + 1$, the Result will certainly be less than the true e. The just Value of e being somewhat between these two, where we are to use our Discretion, what intermediate Number to take; which according as it proves too great or too little, is to be rectify'd at the next Step.

If to direct us in the choice of such intermediate Numbers, we should multiply Rules of Precepts for such choice, the trouble of observing them would be more than the advantage to be gained by it. And for the most part it would be safe enough (and least trouble) to divide by $5a^4$, which gives a Quotient somewhat too big; which we may either rectify at Discretion (by taking a Number somewhat less) or proceed to another b (affirmative or negative as the Case shall require) and so onward to what exactness we please (which is, for substance, in a manner coincident with Mr. *Raphson*'s Method, even for affected Equations.

Thus, in the present Case; if the Number proposed be $n = 33$, then is $a^5 = 32$, and $b = 33 - 32 = 1 = 5a^4e + 10a^3e^2 + 10a^2e^3 + 5ae^4 + e^5$, which if we divide by $5a^4 = 5 \times 16 = 80$, the Result $\frac{1}{80} = 0{,}0125$ is somewhat too big for e, but not much. And if we examine it, by taking the *Surfolid* of 2,0125, or of $2\frac{1}{80}$, we shall find a Negative b (for the next Step) but not very considerable. Or if we think it considerable, we may proceed further to another Step, or more than so.

The like Method may be apply'd (with more advantage) in the higher Powers, according as the Composition of each Power requires. And the same Method may be of use (with good Advantage) in long Numbers (if duely applied) even before we come to the place of Units, for the same will equally hold there also.

APPURTENANCES, in the Common Law, are the same with *Appendante*: Which see.

APSIS, in Astronomy is used as well for the *highest part* of an Orbit, to which when a Planet comes, it is at the greatest distance from the Earth, and is called the *Apogæum*; as the *lowest part* of that Orbit, when the Planet is in his nearest distance to the Earth, which is called the *Perigæum* of that Planet.

APTITUDE, is the natural Disposition that any thing hath to be fitting for such or such a Pur-

Purpoſe. Thus Oil hath an Aptitude to burn; and Water to extinguiſh Fire.

APTOTE, (in Grammar) is a Noun Indeclinable, or which is without the variation of *Caſe*.

APYREXY, is an Intermiſſion, cooling, or abating of a Fever; the Cauſe of it is, that all the Morbifick Matter is ſpent in one Fit, and ſo it intermits till new come, and begins to ſwell and ferments as the other. *Blanchard.*

AQUÆ DUCTUS, (in Anatomy) is the Bony Paſſage of the *Tympanum* of the Ear, reaching into the Palate of the Mouth.

AQUA FORTIS, is made by diſtilling in a cloſe Reverberatory Furnace a Mixture of equal Parts of *Puriſied Nitre*, *Vitriol calcined white*, and Potter's Earth or Clay dried and powdered. A ſmall Fire is uſed at firſt to warm the *Retort*, and to draw off the *Phlegm*; but as ſoon as the Spirits begin to appear in the Receiver in Red Clouds, the Fire is raiſed to the moſt intenſe Degree, and kept ſo till White Fumes begin to come forth; then unlute the Veſſels, and you have the *Aqua Fortis* in the Receiver. 'Tis uſed to diſſolve Metals.

AQUALICULUS, the loweſt part of the Belly, being the ſame with *Hypogaſtrium*.

AQUARIUS, a Conſtellation in the Heavens, being the Eleventh Sign in the *Zodiac*; it is commonly marked with this Character ♒, and conſiſts of 33 Stars.

AQUATICK or AQUATILE, is that which belongs to, or lives moſtly in in the Water: Thus thoſe Animals or Plants that live or grow uſually in Water, are called *Aquatick Animals* and *Plants*.

AQUEDUCT, is the Term in Architecture for a Conduit or Work to convey Water (without Force of Engines) to any Place.

AQUEOUS HUMOUR, or the watry Humour of the Eye, is the utmoſt being traſparent, and of no Colour; it fills up the Space which lie between the *Cornea* Tunicle and the *Chryſtalline* Humour.

AQUILA ALBA, or *the white Eagle*, the ſame with *Mercurius Dulcis*, which ſee.

AQUILA, or *Vultar Volans*, a Conſtellation in the Northern Hemiſphere, conſiſting of 32 Stars.

ARA, the *Altar*, a Southern Conſtellation, containing 8 Stars.

ARACNOIDES, is the *Chryſtalline Tunic* of the Eye; by ſome called alſo

ARANEA TUNICA, or *Chryſtallina*; and is that which ſurrounds and contains the *Chryſtalline Humour*; by reaſon of its light thin *Contexture*, like that of the Web of a Spider, it has the Name of *Aranea*. This Coat, by means of the *Ciliary Proceſſes*, helps to move the Chryſtalline Humour of the Eye nearer to, or farther from the *Retina*, and perhaps alſo to render its Figure more or leſs *Convex*.

ARÆOSTYLE, in Architecture, is a ſort of Edifice where the Pillars are ſet at a great Diſtance one from another.

ARBITRATOR, is an extraordinary Judge in one or more Cauſes between Party and Party, choſen by their mutual Conſents. The *Civilians* diſtinguiſh between *Arbiter*, who is to proceed and judge according to Law and Equity mingled, and *Arbitrator*, who is permitted wholly to uſe his own Diſcretion, without Solemnity of Proceſs, or Courſe of Judgment, to hear and determine the Controverſy committed unto him.

ARBITREMENT, is a Power given by two or more contending Parties, to ſome Perſon or Perſons to determine the Matter in Diſpute between them; and to pronounce the ſame, to which they bind themſelves under a Penalty to ſtand: And the Determination thus made is called an *Award*; or the Reſult of an *Arbitration*.

ABOR DIANÆ: See *Diana's Tree*.

ARBOR MARIS, a Name by ſome Chymiſts given unto *Coral*, becauſe it grows like a Tree or Plant under the Water of the Sea.

ARBOREOUS, is by the Botaniſts uſed for ſuch *Fungi* or *Muſci* which grow upon Trees, whereas others grow on the Ground. Thus *Agaric* is a *Fungus Arboreus*, becauſe it always grows on the *Larix*. But the *Fungus Pulverulentus* is *Terreſtrial*, always growing on the Ground.

ARBORIST, is one that hath good Skill in the ſeveral Kinds and Natures of Trees; and knows how to propagate and preſerve them well for their ſeveral Uſes.

ARCANUM CORALINUM, is the Red Precipitate of Mercury, on which hath been burnt ſix times, well rectify'd Spirit of Wine, in order to burn off ſome of the Acids, and to ſweeten the Precipitate ſo as that it may be fit to be taken inwardly.

ARCANUM DUPLUM, is a kind of a Salt gain'd by waſhing the *Caput Mortuum* remaining after the Diſtillation of double *Aqua Fortis* with warm Water; which Water is aftewards filtrated and evaporated, and the Salt remains at the Bottom of the Glaſs.

ARCANUM JOVIS, is an *Amalgama* made of equal Parts of Tin and Mercury, powder'd and digeſted with good Spirit of Nitre; and from it the Spirit being drawn in a Retort, the dry Maſs is powdered again, and then digeſted with Spirit of Wine till the Powder be inſipid.

ARCH or ARC, in Geometry is any part of the Circumference of a Circle.

ARCHAISMS, are obſolete Expreſſions now out of uſe, and to be found only in ancient Authors.

ARCHES, (or the Court of the *Arches*) is the chief and moſt ancient Conſiſtory belonging to the Archbiſhop of *Canterbury*, and it is ſo called from the Arches of the Church where the Court is kept namely, *Bow-Church* in *London*.

ARCHÆUS, with the *Paracelſians*, is the Principle of Life, Health and Vigour in any Animal Body.

ARCHIPELAGUS, in Geography, is a part of the Sea containing many ſmall Iſlands one near another, and conſequently ſeveral little Seas denominated from thoſe Iſlands; as the Grecian *Archipelago* or *Ægean Sea*.

ARCHITECTONICK, is that which builds a Thing up regularly according to the Nature and Properties of it. Thus that plaſtick Nature, Power, Spirit, or whatever it be called, which hatches the *Ova* of Females into living Creatures of the ſame Species, is by ſome called the *Architectonick Spirit*.

ARCHITECTURE, is the Art or Science of Building, and is uſually divded into *Civil* and *Military*; *Civil Architecture* teaches how to make any kinds of Buildings, Palaces, Churches or private Houſes. *Military Architecture* inſtructs us in the

the beſt way to fortify Cities, Camps, Sea-Ports, or any other Places of Strength.

The Ancients at ſeveral Times, and on ſeveral Occaſions, eſtabliſh'd 5 *Orders of Architecture*, that is, 5 ſorts of Pillars, *viz.* the *Tuſcan*, the *Dorick*, the *Ionick*, the *Corinthian*, and the *Compoſite* or *Roman Order*, *(which ſee under thoſe Words.)* The Difference between which *Orders* conſiſts in the *Column*, with its *Baſe* and *Capital*, and the *Entablature*, that is, the *Architrave*, *Friſe* and *Cornice*; for theſe are the Parts which conſtitute the *Order*, and each one hath its proper and peculiar Meaſures.

Beſides theſe five Ancient Orders, ſome Authors mention two more, as that of the *Caryatides* and the *Perſick*, (which ſee.)

The Rules of *Architecture* require, That in a well-built Fabrick there ſhould be *Solidity*, *Convenience* and *Beauty*; to which ſome Writers add, *Order*, *Diſpoſition*, *Proportion*, *Decorum* and *Oeconomy*: And theſe Eight, they ſay, make the neceſſary Parts of *Architecture*. *Solidity*, implies the Choice of a good Foundation, and good ſound Materials to work with. *Convenience* conſiſts in ſo ordering and diſpoſing the Parts of an Edifice, that they may not hinder or embaraſs one another. *Beauty* is that agreeable Form and pleaſing Appearance which it exhibits to the Eye of the Spectator. *Order* (they ſay) gives each Part of the Building a convenient Bigneſs, whether we conſider them apart, or with Relation to the Whole. And *Diſpoſition* they make the due Ranging and agreeable Union of all the Parts.

Proportion, is the Relation that all the Work hath to its Parts, and which every one ſeparately hath to the *Idea* of the Whole: For among Works that are perfect, from any particular Part we may make a certain Judgment of the Greatneſs of the whole Work: *v. gr.* the *Diameter of a Pillar*, or the Length of a *Triglyph*, gives us a right Idea of the Whole to which they belong. And to expreſs the Relation that many things have to one another, as to their Greatneſs, and the different number of their Parts, *Vitruvius* indifferently uſes thoſe three Words; *Proportion*, *Eurithmy* and *Symmetry*; the two laſt of which are of much the ſame Senſe with the firſt.

Decorum or *Decency* comes next to be conſidered, which conſiſts in making the whole Aſpect of the Fabrick ſo *correct*, that nothing ſhall appear but what is founded upon, and approved by ſome Authority: And they ſay, *Decorum* teaches you to have a Regard to theſe three things, *Deſign*, *Cuſtom* and *Nature*. The Regard to *Deſign* makes us chooſe (for Inſtance) other Diſpoſitions and Proportions for a Palace than a Church. The Reſpect we pay to *Cuſtom*, makes us adorn the Porches and Entries into ſuch Houſes as are within Rich and Magnificent. And the Regard we have to the *Nature* of the Places, makes us pitch upon different Proſpects for different Parts of a Building: As for Example, we expoſe Bed-Chambers and Libraries to the Morning Sun: Winter Apartments to the *Weſt*, and Cloſets of Pictures, *&c.* to the *North*, becauſe they require an equal Light.

Oeconomy teaches the Architect (they ſay) to have regard to the Expences that are to be made, and the Quality of the Materials, near the Places where he builds, and to take his Meaſures rightly for the Order and Diſpoſition, *viz.* to give the Fabrick a convenient *Form* and *Magnitude*.

ARCHITRAVE, is the chief Beam in any Building, and the firſt Member of that which is called the *Entablature*, *viz.* that part of a Stone Pillar which is above the *Capital*, and below the *Frize*. And 'tis called the *Reaſon-Piece* or *Maſter-Beam* in Timber Buildings; but in Chimneys it is called the *Mantle-Piece*, and over the Jambs of Doors or Lintels of Windows *Hyperthyron*. The *Greeks* called it the *Epiſtyle*.

ARCTICK CIRCLE, is a Leſſer Circle of the Sphere drawn on the Globe, parallel to the Equator, and at 23°. 30′. diſtant from the North Pole of the World, from whence it takes its Name. This, and its oppoſite the *Antarctick*, are called the *two Polar Circles*. They may be conceived to be deſcrib'd by the Motion of the Poles of the Ecliptick round the Poles of the Equator, or of the World.

ARCTOPHYLAX, ſee *Bootes*.

ARCTOSMINOR, the ſame with *Urſa Minor*.

ARCTURUS, a fixed Star of the firſt Magnitude placed in the Skirt of *Arctophylax*: Its *Longitude* is 199°. 39′. *Latitude* 31°. 2′. *Right Aſcenſion* 210°. 13′. and *Declination* 20°. 58′.

ARDENT SPIRITS, in Chymiſtry, are ſuch Spirits as being diſtilled from fermented Vegetable, will take fire and burn, as Spirit of Wine, Brandy, Aqua Vitæ, *&c.* They are uſually diſtilled in an Alembick, or in a Copper Body with its Moor's Head and Refrigeratory.

ARDOR VENTRICULI, is the Diſeaſe commonly called the *Heart-burning*.

ARDOR URINÆ, is the ſame with *Dyſuria*.

AREA, of any Figure in Geometry, is its Internal Capacity or Superficial Content reckoned in the Square Parts of any Meaſure; as if a Field be in the Form of a Square, and its Side be 40 Yards in length, its *Area* or Superficial Content will be 1600 ſquare Yards: Or will contain 1600 little Squares, each of which is a Yard every way.

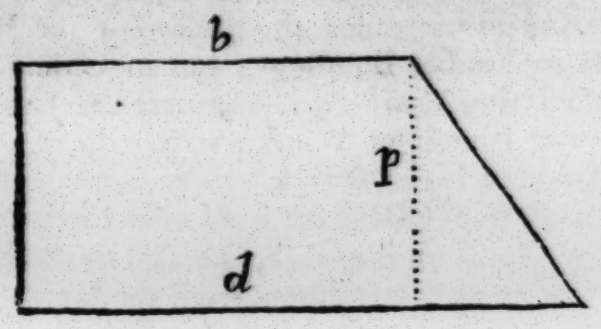
Problems. To find the *Area* of all ſorts of *Plane Figures.*

1. For a *Square* or *Rectangle*, multiply one Side found in any known Meaſure by another: The Product is the true *Area*. The Reaſon of which you have under *Multiplication in Geometry*: which ſee.

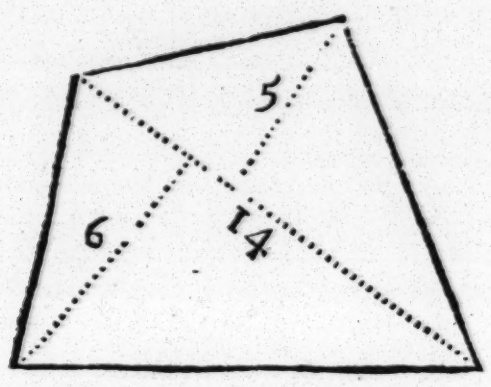
2. *For all Parallelograms*, multiply the Perpendicular let fall from any ſide, by the ſide it falls upon; and the Product is the *Area*. Becauſe all ſuch Figures are equal to Rectangles of the ſame or equal Baſe and Altitude.

3. *For all Plane Triangles*, multiply half the Perpendicular let fall from an Angle, by the oppoſite ſide, or half that ſide by the Perpendicular, and the Product is the true *Area*; becauſe Triangles are the Halves of Parallelograms of the ſame or equal Baſes and Altitudes.

4. *For a Trapezium*, where two Sides are Parallel, multiply the Sum of the Parallel Sides (*b* and *d*) by half (*p*) the Perpendicular.



5. *For any other Trapezium, or any Multangular Plane Figure*, resolve it Diagonally into Triangles; and add the *Area's* of those Triangles (found by the 3d *Problem*) into one Sum; which will be the true *Area* of the whole. Thus, suppose a *Trapezium* whose Sides are not parallel, divide it into two Triangles by a Diagonal, and let fall a Perpendicular from the other Angles thereto; then multiply the whole Base by half the Sum (or half the Base by the whole Sum) of the Perpendiculars, the Product is the *Area*.



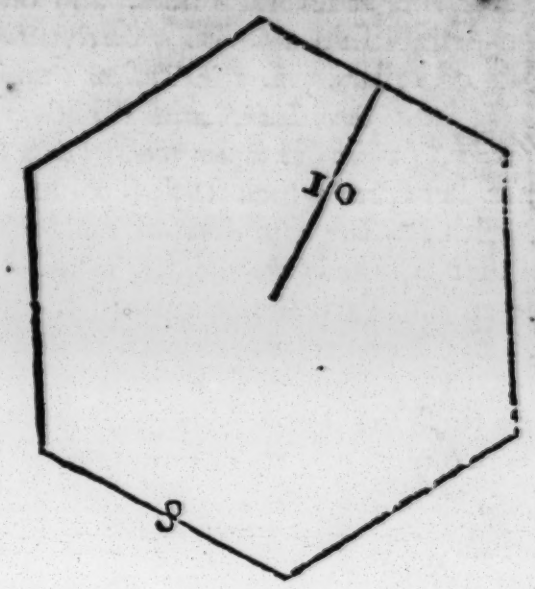
Base 14, its half 7
Sum of the Perpend. 11, its half 5,5.

14		11	
5,5		7	
70		77	*Area* 77.
70			
77			

6. *For all Regular Figures or Polygons*, multiply the half Sum of all the Sides by the length of a Line drawn from the Center to the Middle of any one Side, the Product gives the *Area*.

Because that Line will be equal to the height of each Triangle in the *Polygon*, and their Bases will be also equal, because they are Sides of a *Regular Polygon*.

Thus in a *Hexagon*, whose Side is 8 Yards,



and the Distance from the Center to the Middle of any of the Sides 10 Yards.

The Sum of the Sides is $6 \times 8 = 48$, whose half is 24, which multiplied by 10, produces 240 Yards, the *Area* of the *Hexagon*.

7. *For all Circles*, multiply half the Circumference by the *Radius*, because every Circle is equal to a Rectangle △, one of whose Legs is the *Periphery*, and the other the *Radius*, as *Archimedes* hath demonstrated. For Practice, measure the Semidiameter, then say, As 1000 : 3141 :: So is the Semi-diameter : To the Circumference : which found, multiply by half the Diameter (or Radius) the Product is the *Area*.

8. *For a Sector of a Circle*, multiply the *Radius*, or one of its Legs by half the Arch (or half the *Radius* by the whole Arch) the Product gives the Content.

9. *For all Segments of Circles*, find the *Area* of the *Sector* insisting on the *Ark*, and also the *Area* of the *Triangle*, and substract that of the *Triangle* from that of the *Sector*, the Remainder is the *Area* of the *Segment*.

10. *For an Ellipsis*, multiply the longest Diameter by the shortest, and extract the Square Root of the Product, it gives the Diameter of a Circle, whose *Area* is equal to the *Area* of the *Ellipsis*; because the Diameter of such a Circle is a mean Proportional between the Diameters of the *Ellipsis*.

11. *For a Parabola*, multiply the entire Ordinate by the Abscissa or intercepted Ax; then double that Product, and divide the whole by 3; the Quotient is the *Area*.

AREOLA PAPILARIS, a darkish coloured Circle about the Nipple.

AREOMETER, is an Inſtrument to meaſure the Gravity of Liquor. 'Tis uſually made of a thin fine Glaſs of this Figure, and ſealed at the Top, there being firſt as much running Mercury put into it, as will ſerve to keep it ſwimming in an erect Poſition. The Stem is divided into Degrees, and by the Depth of its Deſcent into any Liquor, its Lightneſs is concluded; for that Fluid or Liquor in which it ſinks leaſt, muſt be heavieſt, and that in which it ſink loweſt, will be lighteſt.

AREOSTYLE, in Architecture, is a Building where the Columns ſtand a little too thick, as ſome ſay; or as the *French Dictionary of Arts and Sciences* expreſſes it, *Loin a loin*, that is, at a convenient Diſtance.

AREOTECTONICKS, is that part of Fortification and Military Architecture which teaches how to attack ſafely, and to fight an Enemy advantageouſly.

AREOTICK MEDICINES, are ſuch as open the Pores of the Skin, and render them large enough for the Morbifick Matter to be carried off by Sweat, or inſenſible Tranſpiration. *Blanchard.*

ARGEMA, a little Ulcer of the Eye in the Circle of the *Iris*, having its Seat in a part of the White, and alſo ſome part of the Black of the Eye. *Blanchard.*

ARGENT, the Name in Heraldry of the white Colours which is uſed for Gentlemen, Knights and Baronets: But Barons, and all Nobles, have the white Colour called *Pearl*, as all Sovereign Princes have it called *Luna*; Without either this or *Or*, the Heralds ſay, there can be no good Armory. This is expreſſed in Engraving, by the Parts being left plain without any Strokes from the Graver.

ARCO NAVIS, a Southern Conſtellation conſiſting of 42 Stars.

ARGUMENT, in Aſtronomy, is an Ark by which we ſeek another Ark unknown, and proportional to the firſt; as the

ARGUMENT of INCLINATION, is an Ark of the Orbit intercepted between the *Node* aſcending, and the Place of the Planet from the Sun, being numbred according to the Succeſſion of the Signs.

ARGUMENT *of the Moon's* Latitude, is her Diſtance from the *Dragon's Head* and *Tail*, *viz.* where the Orbit of the *Moon* in two Points Diametrically oppoſite, is interſected by the Ecliptick, whereby we find out the Quantity of the real Obſcuration in *Eclipſes*, or how many Digits are darkened.

ARGYROCOMUS, according to ſome Writers, is a Silver-coloured Comet differing very little from the *Solar Comet*, except that it is of a brighter Silver Colour, and ſhines with ſo great a Luſtre that it dazles the Eyes of the Beholders.

ARIES, a Conſtellation of Stars drawn on the Globes in the Figure of a Ram: 'Tis the firſt of the 12 Signs of the *Zodiack*, and is mark'd thus ♈, and conſiſts of 19 Stars.

ARISTA, in Botany, ſignifies that long ſlender Needle-like *Beard* which grows out from the Husk of Corn or Graſs: By ſome 'tis called the *Awn*.

ARITHMETICK, is the Art of numbring truly; or, as ſome define it, the Science of diſcrete Quantity: 'Tis divided into two general Branches; *Common Arithmetick*, and *Algebra*.

ARITHMETICAL COMPLEMENT, of a Logarithm, is what that Logarithm wants of 10.0000000. That the Arithmet. Complement of 7.1079054 is 2.8920946, where each Figure but the laſt is taken from 9, and that from 10.

ARITHMETICAL PROGRESSION, or *Proportion*, ſee the Word *Progreſſion*.

ARK, the ſame with *Arch*, which ſee.

ARK of DIRECTION or *Progreſſion*, in *Aſtronomy*, is that Ark of the *Zodiack* which a Planet appears to deſcribe when its Motion is forward according to the Order of the Signs.

It is alſo in the *Ptolemaick* Syſtem, the *Ark of the Epicicle*, which a Planet deſcribes when it is Progreſſive according to the Order of the Signs.

ARK of RETROGRADATION, is that which a Planet deſcribes when it is *Retrograde*, or moves contrary to the Order of the *Signs*.

ARK *of the Firſt and Second Station*, is the *Ark* which a Planet deſcribes in the former or the latter Semi-circumference of his *Epicicle* when it appears *Stationary*.

ARMARIUM UNGUENTUM, the ſame with the *Hyplo*, *Chryſma*, *Magnes Microcoſmicus*; or a Weapon Salve, whereby *Wounds*, as they pretend, may be cured at any diſtance, by dreſſing the Weapon only. They preſcribe it to be made of the Fleſh of a Man hanged, or which died ſome ſuch violent Death, at the Increaſe of the *Moon*, and in a good Sign, *&c.* according to the fooliſh and wicked Superſtition of Aſtrologers. See a good Refutation of this Impoſture, and of the Arguments brought for it, by the Author of *Philoſophiæ Moſaicæ*, *in Athan. Kircher de magnete*, *Lib.* 3. *pars* vii.

ARMED, is ſaid at Sea of a Man of War fitted out and provided in all reſpects. Alſo a *Croſs-Barr-Shot* is ſaid to be *Armed*, when ſome Rope-Yarn, or the like, is rowled round about one end of the Iron-Barr which runneth thro' the Shot, both that the Shot may be the better *rammed* down into the Gun; and alſo chiefly, leaſt the ſharp end of the Bar ſhould catch into any *Honey Combs* within the Cylinder of the Piece.

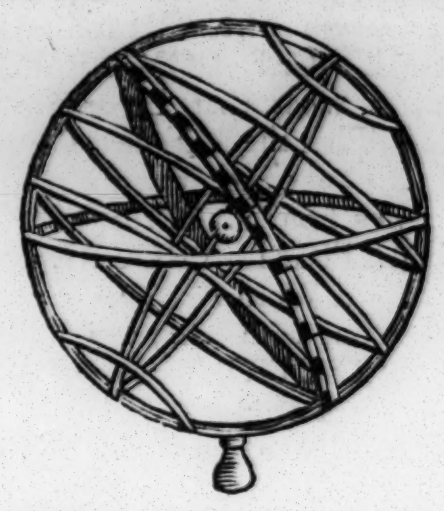
A Load-ſtone is alſo ſaid to be *Armed*, when it is *capped* or *caſed*, or ſet in Iron; in order to make it up the greater Weight, and alſo to diſtinguiſh readily its Poles. *Kircher*, in his Book *de Magnete*, tells us, That the beſt way to arm a Loadſtone, is to drill a Hole thro' the Stone from Pole to Pole, and in that to place a Steel Rod of a moderate length; which Steel Rod will, he ſaith, at the end, take up more Weight, than the ſame Stone armed the common way can do; as he ſaw tried at *Rome*.

ARMED, is the proper Term in Heraldry for Blazoning the Beaks and Feet of Cocks, and all Birds of Prey; and theſe are always painted of a different Colour from the Bird it ſelf, and therefore they ſay he beareth a Cock, or a Falcon *Armed Or*, *Gules*, &c.

ARMILLARY SPHERE, is when the greater and leſſer Circles of the Sphere being made of

Braſs, *Wood*, *Paſt-board*, *&c.* are put together in their natural Order, and placed in a Frame, ſo as to repreſent the true Poſition and Motion of thoſe Circles.

See the Figure following.



ARMONIACK SALT, ſee *Sal Almoniack.*

ARMONIACK *Volatile Spirit*, ſee *Volatile Spirit of Sal Armonick.*

ARMORY, the ſame with Heraldry, being the Art of truly *Blazoning* and *Marſhalling* all Coats of Arms, and appropriating them to their proper Bearers.

AROMATICK, the ſame with Odoriferous, or Sweet Scented.

AROMATICK *Volatile Salt*, the ſame with *Sal Volatile Oleoſum*, which ſee.

AROMATIZATION, or *Aromatizing* of Medicines, is mingling them with a due Proportion of Aromatick Spices, *&c.* in order to make them more grateful and uſeful.

ARQUEBUSE, or *Harquebuſs*, is a large Hand-Gun ſomething bigger than our Muſquet; by ſome 'tis called a *Caliever*.

ARRAIGN, is to put a thing in order, or in his Place.

ARRAIGNE the *Aſſize*, is to cauſe the Tenant to be called, to make the Plaint, and to ſet the Cauſe in ſuch order as the Tenant may be enforced to anſwer thereto.

Alſo a Priſoner is ſaid to be *arraign'd*, when he is indicted and put to his Tryal.

ARRAY, (in Law) is the ranking or ordering a Jury or Inqueſt of Men that are Impannelled upon any Cauſe.

ARRENTATION, ſignifies the licencing an Owner of Lands in the Foreſt to encloſe them (with a Hedge and a little Ditch) under a yearly Rent.

Saving of the Arrentation, is the ſaving Power to give ſuch Licences for a yearly Rent.

ARRERAGES, are Duties behind unpaid after the Days and Times in which they are due, and ought to have been paid, whether they be Rents of a Mannor, or any other thing reſerv'd.

ARREST, is when one is legally taken and reſtrain'd from his Liberty.

ARRESTANDIS *bonis ne diſſipanter*, is a Writ which lies for him whoſe Cattel or Goods are taken by another, who, during the Controverſy, doth, or is like to waſte or conſume them, and will hardly be able to make Satisfaction for them afterwards.

ARRESTANDO *ipſum qui pecuniam recepit ad proficiandum in obſequium Regis*, *&c.* is a Writ that lieth for the Apprehenſion of him that hath taken Preſt-money towards the King's Wars, and hides himſelf when he ſhould go.

ARRESTO *facto ſuper bonis mercatorum alienigenorum*, is a Writ that lies for a *Denizon* againſt the Goods of Strangers of another Country, found within the Kingdom, in Recompence of Goods taken from him in that foreign Country, after denial of Reſtitution. This, among the *Civillians*, is called *Clarigatio*, but now barbarouſly *Repriſalio*.

ARRETTED, (in Law) is he that is convented before any Judge, and charged with a Crime.

ARRIERE-GARDE, ſee *Rear-Guard*.

ARSENAL, is a Royal or Publick Magazine, or Place appointed for the making and keeping of all Arms neceſſary either for Defence or Aſſault.

ARSIS & THESIS, are certain Terms in Muſical Compoſition; as where a Point being inverted, is ſaid to move *per Arſin & Theſin*, that is to ſay, where a Point riſeth in one part, and falls in another; or on the contrary, where it falls in one part, and riſeth in another; whence is produced a very agreeable Variety.

ARTERY: There are three kinds of Ducts in an Animal Body which bear the Name of *Artery*, the *Aſperia Arteria* or *Trachea*, the *Arteria Pulmonaris* or *Vena Arterioſa*; both which ſee: And moſt properly, the *Aorta* or *great Artery*, which carries the Spirituous Blood from the left Ventricle of the Heart by its Branches, to all Parts of the Body; *This*, and its Ramifications, are the only true *Arteries*. The Word *Artery*, ſome ſay, is derived from ἀπὸ τῦ αἴρειν, becauſe 'tis continually riſing or moving with a Pulſe like Motion; and may be defined to be an Organical and Similar Part, oblong and round, appointed to convey Spirituous Blood to all Parts of the Body.

The greateſt *Aorta* in the whole Body is the *Aorta*, for that Reaſon often called the *Arteria magna*; and from it all the *Arteries* in the whole Body are derived, except the *Arteria Pulmonaris*. A brief Account of which, and how they ſpring from the *Aorta*, I ſhall here ſubjoin.

Before it comes out of the *Pericardium*, it ſends out ſometimes one, but oftner two ſmall *Arteries*, on each ſide one, which compaſs the *Baſis* of the Heart like a Garland in their Circuit, ſending down divers Twigs lengthways on the Heart; and theſe are called the *Arteriæ Coronariæ*. When theſe two ſmall *Arteries* have encompaſſed the Baſis and meet, they inoſculate one with another, but not with the Veins: At their riſe out of the *Aorta*, there is a Valve to hinder the Reflux of the Blood into the *Aorta*. Theſe Coronary Arteries Dr. *Ruyſch* obſerves, ſend Branches to the *Auricles*, and to the very Subſtance of the Heart it ſelf, and to the Root of the Trunk of the *Aorta*.

The *aſcending* Trunk then running up under the *Vena Cava*, lies upon the Wind-pipe, and preſently ſendeth forth two large Branches, whereof one paſſeth to the Right, the other to the Left Arm: They are called *Rami ſubclavii*, becauſe they march under the *Calviculæ*; and as ſoon as they are gone out of the Breaſt, are called *Axillares*. The Right is the larger, and riſing higher, goes a more direct way towards the Right Arm; the Left is leſs, and riſing lower, aſcends more obliquely towards the Left Arm. They ſend

out

out ſeveral Branches both from their *lower* and *upper* ſide.

From the *Lower* proceeds the *Superiour Intercoſtal*, which runs along the Interſtices or Intervals of the four uppermoſt Ribs, and ſends Slips to the neighbouring Muſcles and ſpinal Marrow. Theſe ſometimes are propagated from the Cervical Arteries coming out thro' the Holes of the *Vertebræ*.

From the *upper* ſide of each *Subclavian* ſprings firſt the *Mammari*, which deſcends towards the Breaſt thro' the Muſcles that fill up the Interſtices of the Cartilages of the true Ribs; and a conſiderable Branch of each deſcending out of the *Thorax* by the Sides of the *Cartilago enſiformis*, run down the *Abdomen* under the *Muſculi Recti*, ſpreading there into many Twigs, which are ſaid to inoſculate with the Extremities of the like Twigs of the Epigaſtrick Artery aſcending. But that Opinion is ſo oppoſite to the Circulation of the Blood, that it is impoſſible to be true; for no Blood can aſcend by the *Mammariæ*, nor deſcend by theſe aſcending Twigs of the *Epigaſtriæ*.

The next is *Cervicalis* (otherwiſe called *Vertebralis*) which ſendeth Slips to the *Vertebræ* and Muſcles of the Neck, at whoſe ſeventh *Vertebra* it enters in by the Holes of the tranſverſe Proceſſes, and pierceth the Membrane that inveſts the Spinal Marrow, beſtowing Twigs both on the Membrane and Marrow, and runs up therewith in at the great Hole of the *Occiput*, and being enter'd the Skull, both Branches (the Right and Left) join under the *Medulla Oblongata*, and then are divided into innumerable moſt ſmall Twigs, which make wonderful Net-like *Plexus* in the *Pia Mater* about the *Cerebellum*, and run into the Subſtance of the *Cerebellum* it ſelf; and ſome of them being united with thoſe of the *Carotides*, make part of the very *Rete mirable*.

The third *Artery* that riſeth out of the *upper* ſide of the *Subclavian* is *Muſcula*, which is ſpent on the Muſcles of the Neck, and ſometimes alſo on ſome of the Arm.

After the *Subclavians* have had all theſe Pairs of Arteries going out of them, they paſs out of the *Thorax*, and begin to be called *Axillar*.

At the ſame Place, or very near, where the aſcending Trunk of the *Aorta* ſends out the *Subclavians* ſideways, the remainder of it is divided into two, called *Carotides*, which aſcend directly *upwards* (tho' the Right ſometimes ariſe from the right *Subclavian*.) Theſe, at their riſe, are ſuſtained by the *Thymus*; and having beſtowed Twigs on the *Larynx*, *Tongue*, the Muſcles of the *Os Hyoides*, and the neighbouring Gland, paſs up on each Side by the ſides of the Wind-pipe to the Jaws, with the Internal Jugular Vein, and there are each ſubdivided into the *External* and *Internal* Branches.

The *External* is ſmaller, and is diſperſed into all the Muſcles of the Cheeks, Fore-head, Temples, Lips, and, in general, thro' all the outer Parts of the Head and Face.

The *Internal*, which is larger, ſends forth ſome more Twigs to the *Larynx*, *Tongue*, &c. as alſo to the Glands behind the Ears, and the ſpongy Parts of the Palate and Noſe. Then it entreth the upper Jaw, and beſtows a ſmall Slip on the Root of each Tooth (as the *External* did on the Roots of the Teeth of the lower Jaw) whereby ſharp Humours flowing in upon them, ſometimes cauſe a very painful Tooth-ach. The remainder of it climbs upon the Skull, being about the *Baſis* divided into two Branches: The *leſs* and hinder whereof having ſent one Slip to the inner Muſcles of the Neck, and another thro' the Hole of the uppermoſt *Vertebra* into the Membrane that inveſts the Spinal Marrow, aſcending farther, enters the Skull, at the Hole by which the ſixth Pair of Nerves (commonly ſo called) comes out, and creeping along the *Dura Mater*, ends near its *Sinus* (which yet ſome ſay it enters.) The *larger* Branch, tending upwards, is carried thro' the bony Channel in the Wedge-like Bone, with a winding Duct to the *Sella equina*; at whoſe *Baſis*, after it has ſent out a Twig on each Side into the *Dura Mater*, it opens it ſelf into many ſmall Slips, which being interwoven with thoſe of the Cervical Artery (above-mentioned) make the *Rete mirable*, which is more obſervable in Beaſts than in Men. Yet it is not all ſpent on the ſaid Slips, but perforating the *Dura Mater*, it enters the *Pia Mater* with two notable Branches, which being divided into very ſmall Twigs, are mingled with thoſe of the Cervical Artery, with which they paſs out of the Skull, and accompany the Spinal Marrow even to the Loins: Afterwards it ſends a ſmall Branch thro' the ſecond Hole of the Wedge-like Bone with the Optick Nerve, out of the Skull to the Eye; and yet ſtill ſupplying more Twigs to the Subſtance of the Brain and *Pia Mater*, and being united with ſome other Twigs of Cervical Artery, it makes the *Plexus Choroides*.

The deſcending Trunk of the *Aorta*, which is larger than the aſcending, goes down by the Gullet to which it cleaveth. And hence is a Man that is hot, ſo much cooled with a draught of cool Drink; for the Gullet being cooled thereby, the Blood in the *Aorta* contiguous to it, muſt needs be cooled likewiſe.

Before it arrive at the *Diaphragm* it ſends out of its hinder ſide the *Inferiour Intercoſtals*, which run along the Interſtices of Eight or Nine of the lower Ribs, namely, thoſe which the *Superiour Intercoſtals* did not ſupply. They likewiſe ſend Sprigs by the Holes of the *Vertebra*, made for the Nerves, to the Marrow of the Back, and to the Muſcles which reſt upon the *Vertebræ*, and alſo to thoſe of the *Thorax*. Sometimes above this, and ſometimes below it, there ariſeth alſo out of the hinder part of the *Aorta* and Artery called *Bronchialis*, firſt found out and ſo named by *Frederick Ruych*, which accompanies all the *Bronchia* of the Wind-pipe.

When it comes to the Midriff, there ſprings out of it the *Phrenicæ*, one on each ſide; theſe running all thro' the *Diaphragm*, paſs up into the *Mediaſtinum*, and ſometimes into the *Pericardium*.

Then having penetrated the Midriff it deſcends in one Trunk to the fifth *Vertebra* of the Loins; in which Paſſage it firſt ſendeth forth the *Cæliaca*, which ariſeth ſingle, and is ſo called, becauſe it ſendeth Twigs to the Stomach. This ſpringeth from the fore-part of the Trunk at the firſt *Vertebra* of the Loins, and deſcending under the hollow of the Liver, upon the Trunk of the *Vena Porta*, it is divided into two Branches, the *Right* and *Left*.

The *Right* which is the ſmaller, aſcending, produces in its upper part the *Gaſtrica dextra*, that comes

comes to the *Pylorus*, whence *Spigelius* calls it *Pylorica*: And beſides, the *Cyſticæ gemellæ*, which are very ſmall, and are diſperſed thro' the Gall-Bladder. And out of its lower ſide there ſpring;

1. *Epiploïs dextra*, which runs thro' the right ſide of the inner or hinder Leaf of the Caul and the *Colon* that it is annexed to.

2. *Inteſtinalis*, beſtow'd on the *Duodenum* and beginning of *Jejunum*.

3. *Gaſtro-epiploi dextra*, on the right ſide (to the middle) of the bottom of the Stomach, and alſo on the Caul that it is knit to its bottom.

4. *Hepaticæ*, which are two ſmall ones: Theſe are ſpent on the inveſting Membrane of the Liver (for its *Parenchyma* is nouriſhed by the *Porta*) the *Capſula Communis*, the Gall-Bladder and *Porus Bilarius*.

The Remainder of this *Right* Branch enters the Meſentery with many Twigs.

The *Left* Branch of the *Cœliaca*, which is call'd *Splenicus* (ſometimes ſpringing immediately from the *Aorta*) is larger than the *Right*; and as it goes towards the Spleen, it ſendeth forth of its *upper* ſide *Gaſtrica major*, which after it hath beſtow'd a Slip upon the upper and middle part of the Stomach, is divided into two others; the firſt whereof is called *Coronaria Stomachica*, which encompaſſes the upper Orifice of the Stomach like a Garland, and ſends many Twigs to the Body of the Ventricle it ſelf; the other *Gaſtrica ſiniſtra* which (according to *Diemerbroeck*) is carried towards the Right Hand into the upper part of the Stomach, and to the *Pylorus*. Out of its lower ſide ſpring, firſt *Epiplois poſtica*, which runs to the hinder Leaf of the *Omentum*, and the *Colon* annex'd to it; ſecondly, *Epiplois ſiniſtra*, which is beſtow'd on the lower and left ſide of the *Omentum*.

Juſt as the Splenick Branch is entring into the Spleen, there ariſes out of its upper part *Vas breve arterioſum*, which goeth ſtreight to the Left part of the bottom of the Stomach; and the *Gaſtro-epiplois ſiniſtra*, which being ſuſtain'd by the upper or fore-leaf of the *Omentum*, ſends ſome Twigs thereto, and alſo to the Left part of the bottom of the Stomach, and to both its fore and hinder ſides, then it enters into the Spleen.

All theſe Arteries ſpring from the *Cœliaca*, and accompany the Veins of the *Porta* of the like denomination.

The next that ariſeth out of the Trunk of the *Aorta* is the *upper Meſenterick*, which ſprings from the fore-part of it as the *Cœliack* did. It accompanies the *Vena Meſariaca* of the *Porta*, and runs thro' all the upper part of the Meſentery, and beſtows many Branches on the Guts, *Jejunum Ileum*, and that part of *Colon* that lieth in the right Hypochonder.

Immediately below this, about the ſecond *Vertebra* of the Loins, there go out of each ſide of the deſcending Trunk of the *Aorta* an *Emulgent Artery*, each of which being after its riſe divided into two, and ſometimes into three Branches, enters the Kidney on its own ſide. The Right ſprings out of it a little lower than the Left: both are ſubdivided into innumerable Twigs in the *Parenchima* of the Kidneys, (all of which are inveſted with the Veins in one common *Capſula* borrow'd from the *Pelvis*) and their Capillaries end in the Glands, wherein the *Serum* that theſe Arteries bring with the Blood is ſeparated there-from, and carried from them by the Urinary *Siphons* into the *Pelvis*.

Next to theſe ariſe the *Spermaticæ* (called *Arteriæ præparantes*). Theſe go out of the fore-part of the Trunk very near together (very ſeldom either of them out of the Emulgents, as the Left Spermatick Vein does) and the Right paſſes over the Trunk of the *Vena Cava*: About 2 Fingers breadth from their riſe they are each joyn'd with the *Vena præparans* of their own ſide, and deſcend with them, in *Men*, thro' the Proceſs of the *Peritonæum* to the Stones, being divided into two Branches a little before they arrive at them, one of which runs towards the *Epididymis*, and the other to the *Teſtes*. In *Women*, when they come near the *Teſtes* (or *Ovaria*) they are divided alſo into two Branches, one whereof goes to the *Teſtes*, and the other to the bottom of the Womb. Next below the Spermatick ſprings the *lower Meſenterick* out of the Trunk a little before it is divided into the *Rami Iliaci*. This entreth the lower Region of the Meſentery, and diſtributes many Branches to the Left part of the *Colon*, and to the ſtreight Gut; and laſtly, deſcending to the *Anus*, makes the internal Hemorrhoidal Artery.

Very near to this, out of the Trunk ſtill ariſe the *Lumbares*, reckon'd four in number: Theſe go out of the back-ſide of the *Aorta*, and are diſtributed, not only to the neighbouring Muſcles of the Loins, and to the *Peritonæum*, but enters in at Holes of the *Vertebra* of the Loins, and run along the Membrane that involves the Spinal Marrow, and penetrates into the Marrow it ſelf.

Beſides theſe ſome reckon other two, on each ſide one, call'd *Muſculæ Superiores* (which run to the Muſcles of the *Abdomen*) unleſs theſe be two of the four call'd *Lumbares*.

When the Trunk is deſcended as low as the fifth or laſt *Vertebra* of the Loins, and the top of *Os Sacrum*, it begins to climb upon the *Vena Cava*, under, or behind which it paſſed thus far: But as it begins to get upon it, it is divided into two equal Branches call'd *Rami Iliaci*, and at its very diviſion there ſprings out of it *Arteria Sacra*, whoſe ſmall Twigs entring in at the Holes of the *Os Sacrum* penetrate into the Marrow contained in it.

The Trunk of the deſcending *Aorta* being divided into the *Rami Iliaci*, theſe are ſub-divided preſently into the *interiour* and *exteriour* Branches. From the *interiour*, which is leſs, proceed three others.

Firſt, The inferiour *Muſcula* (called otherwiſe *Glutæa*) which is beſtow'd on the Muſcles, named *Glutæi* that makes the Buttocks, and alſo on the lower end of the Iliack Muſcle and the *Pſoas*.

Secondly, The *Hypogaſtrick*, which is large, and at the lower end of the *Os Sacrum* runs to the Bladder and its Neck, and the Muſcles that cover the *Oſſa Pubis*. In Men it goes alſo along the two Nervous Bodies of the *Penis* as far as the *Glans*; and in *Women* it is diſtributed in numerous Branches into the bottom of the Womb and its Neck, out of which, for the greateſt part, iſſue the *Menſes* in their Monthly Purgation. It goes alſo to the *Podex*, where it makes the external Hemorrhoidal Artery.

Thirdly, The *Umbilical Artery*, which aſcending by the ſides of the Bladder, and being inſerted into the *Peritonæum*, proceeds betwixt the two Membranes thereof to the Navel, out of which it paſſes in a *Fœtus* in the Womb, and runs into the *Placenta Uterina*: But after the Infant is born, when there is no more uſe of it, it cloſes up, and turns into

into the nature of a Ligament, in ſome meaſure ſuſtaining the ſides of the Bladder, and hindring it from preſſing on its Neck.

From the *Exteriour Branch* of the *Ramus Iliacus* two Arteries ariſe.

Firſt, The *Epigaſtrick*, which turning upwards on the outſide of the *Peritonæum* runs betwixt it and the *Muſculi Recti* of the *Abdomen* as high as the Navel, where the Mammary Artery meets it, and according to Tradition (tho' falſe) inoſculates there with it.

Secondly, *Pudenda*, which ſends forth a notable Artery on each ſide into the Nervous Body of the *Penis* in Men, and into the *Clitoris* in Women. Hence it is carried inwards by the joynting of the *Oſſa Pubis* to the *Pudenda* and Groins, and their Glands, and is ſpent on the Skin of thoſe Parts, and of the Yard, in Men. When all theſe pairs of Arteries have ariſen out of the *Rami Iliaci*, they run down out of the *Abdomen* to the Thighs, where they begin to be called *Crurales*.

ARTERIA VENOSA: See *Pulminaria Arteria*.

ARTERIOTOMY, is the artificial opening of an Artery for the letting of Blood in an inveterate Head-ach, Madneſs, Falling-ſickneſs, Pain and Inflammation in the Eyes and Ears, and the Section is made in the Fore-head, Temples, or behind the Ears: The manner of it is thus; after the Ligature is made in the Arms or Neck, the Artery is cut juſt as a Vein is, and when the Blood is emitted, you apply a very Aſtringent Plaiſter with a Leaden Plate to the Orifice, and then ſwathe it well. *Blanchard.*

ARTHRITIS, *Morbus Articularis*, the Gout, is a Pain in the Joints of the Limbs, ſometimes accompanied with a miſerable Contraction of the Nerves, Tendons, Ligaments, and thin Membranes about the Bones, with Swelling and Redneſs, and now and then with hard chalky Concretions. They account it four-fold: *Chyragra* the Hand Gout; *Iſchias*, the Gout in or about the Bone connected to the *Os Ilium*, which therefore ſome call the Hip-Gout: *Gonagra*, in the Knees; and *Podagra*, in the Feet.

ARTHRITIS PLANETICA, } the wandring
ARTHRITIS VAGA, } Gout, which flies or moves from one Limb to another.

ARTHRITICK, or *Arthritical*, Gouty, Diſeaſed in the Joints, *&c.*

ARTHRODIA, is the Articulation of one Bone into the ſhallow *Sinus* of another, as the *Radius* receives the *Humerus*.

ARTHROSIS, the ſame with *Articulation*.

ARTICK POLE, is the *North Pole* of the World.

ARTICK CIRCLE: See *Polar Circle*.

ARTICLE, in Arithmetick, is *Ten*, with all other whole Numbers that may be juſtly divided into ten Parts, as 20, 30, 40, *&c.* they are ſometimes called *Decads*, and ſometimes Round Numbers.

ARTICLE, in Grammar, is a ſmall Word or Particle uſed to Decline or Vary the Caſes, and to diſtinguiſh the Genders of Nouns and Pronouns, as *Hic*, *Hæc*, *Hoc* in the Latin Tongue.

ARTICULATION, is that part of *Grammar* which treateth, firſt of Sounds and Letters (which are called the Elements of Speech) and then of the manner of their Combination for the compoſing of Syllables and Words; ſo that he which pronounces his Words clearly and diſtinctly, is ſaid to pronounce them *articulately*. And ſuch Sounds as can be expreſſed by Letters, and which form Words, are called *Articulate Sounds*.

ACTICULATION, in Anatomy, is a Conjunction of the Limbs of an Animal Body, for the due performance of Motion: Some make this twofold, *viz. Diarthroſis*, which is a more looſe, and *Synarthroſis*, which is a more cloſe Conjunction.

The Term is alſo uſed by the *Botaniſts* for the Joints or Knots that are in ſome *Siliquæ*, as thoſe of the *Ornithopolium*, and in the Roots of the *Polygonatum*, and the Diſtance or Space between Knot and Knot, or Joint and Joint they call the *Internodium*.

ARTIFICIAL DAY: See *Day*.

ARTIFICIAL NUMBERS, *Secants*, *Sines* and *Tangents*: See *Logarithmetical Numbers*, *Secants*, *Sines* and *Tangents*.

ARTIFICIAL LINES, on any Sector or Scale are Lines ſo contrived as to repreſent the Logarithmetick Sines and Tangents, which, by the help of the Line of Numbers, will ſolve all Queſtions in Trigonometry, Navigation, *&c.* tolerably exact.

ARTILLARY, is all ſorts of great Fire-Arms with their Appurtenances; as Cannons of all ſorts, Mortars, Muskets, Carbines, *&c.*

ARYTÆNOIDES, or *Gutturales*, are two Cartilages which with others make up the top of the *Larynx*; and theſe are ſo called, becauſe when their Proceſſes are joined together, they repreſent the Month of an Ewer *(Gutturium)* or the indented Lip of a Cup or Veſſel.

ARYTÆNOIDEUS, is the ſmalleſt Muſcle belonging to the *Larynx*; it's in the Opinion of ſome, double; but has always (ſays Mr. *Cowper*) appeared to us ſingle. It ariſes from the external part of one of the *Aritenoidal Cartilages*, and running tranſverſly, is inſerted to the other. This pulls the *Arytenoidal Cartilages* nearer each other, and ſhuts the *Rimula* adequately, by forcing down the *Epiglotis*, which quite cloſes the *Glottis* ſo that no Air can enter.

ASAPHY, is a lowneſs of the Voice, proceeding from an ill Conſtitution, or Contemporation of the Organs of Speech.

ASBESTINE *Paper* or *Cloth*, is ſuch as will burn in the Fire, be purified by it, and yet not conſume. 'Tis made of the *Asbeſto* or *Lapis Amianthus*, and is by ſome called *Linum Vivum*.

ASCARIS, or *Aſcarides*, are little Worms which breed in the *Inteſtinum Rectum*, and tickle and trouble it.

ASCENDANT, is that part of the Heavens which aſcends, or is coming up above the Horizon in the *Eaſt*.

ASCENSION, is the riſing of the *Sun* or *Star*, or of any part of the *Equinoctial* with it, above the *Horizon*. *Deſcenſion* is the ſetting of the ſame. Theſe *Aſcenſions* and *Deſcenſions* are either *Right* or *Oblique*; which ſee.

ASCENSIONAL *Difference*, in Aſtronomy, is the *Difference* between the *Right* and *Oblique Aſcenſion* or *Deſcenſion*; or, it's the ſpace of Time, the *Sun riſeth* or *ſetteth* before, or after ſix of the Clock.

To find the *Aſcenſional Difference* Trigonometrically, having the Latitude of the Place, and the *Sun*'s Declination given.

Say,

Say, As the Co-Tangent of the Latitude: Is to the Tangent of the Sun's Declination :: So is the Radius: To the Sine of the *Aſcenſion Difference.*

Example. Suppoſe the *Latitude* be 51°. 30'. and the *Sun's Declination* be 9°. 00'.

Then to the Ar. co. of the Co-Tangent of	51°. 30'. --	0,099395
add the Tangent of --	9°. 00'. --	9,199712
Sum is the Sine of	11°. 29 =	9,299107

Which is the *Aſcenſional Difference* required; and being reduced into Time, by allowing 4 Minutes of an Hour for every Degree, 'twill be 44'. 29".

ASCII, are the Inhabitants of the *Torrid Zone*, which twice a Year have the *Sun* (at Noon) in their *Zenith*, and conſequently, then their Bodies caſt no Shadow; whence comes the Name of *Aſcii*, ἄσκιοι.

ASCITES, is a Dropſie or ſwelling of the *Abdomen*, and conſequently, of the *Scrotum*, Thighs and Feet, proceeding from a Serous, and ſometimes Lymphatick or Chylous Matter, like the waſhing of Fleſh, collected in the Cavity of thoſe Parts.

ASCITICK, is he that is affected with the *Aſcites*.

ASCLEPIAD, a Greek or Latin Verſe of four Feet, containing a *Spondee*, a *Coriambus*, and two *Dactyles*; as,

Sublimi feriam ſidera vertice.

ASPARAGUS, in Botanicks, ſignifies the firſt *Germen*, *Sprout* or *Shoot* of a Plant; which is either edible by it ſelf, or boiled in Broth: It comes out before the Leaves are unfolded. And hence (*i. e. a* σπείρω) the famous Plant of this Name receives its Denomination.

ASPECT, a Term in Aſtronomy, ſignifying the Situation of the Stars and Planets, in reſpect of one another. Of theſe they uſually reckon five.

1. The *Sextile*, when two Stars or Planets are 60 *degr.* from one another.
2. *Quartile*, when they are 90 *degr.* diſtant.
3. The *Trine*, when they are diſtant 120 Degr.
4. *Oppoſition*, when they are 180 diſtant.
5. *Conjunction*, when they are both in the ſame Degree.

Kepler added 8 new *Aſpects* more; as the *Demiſextile* of 30°. the *Decile* of 36°. the *Octile* of 45°. the *Quintile* of 72°. the *Tredecile* of 108°. the *Seſquartile* of 135°. the *Biquintile* of 144°. and the *Quincunx* of 150°.

How the Diſtance is reckoned, and on what Circle, ſee the Word *Secondary Circles*.

ASPERA *Arteria*, or *Trachea*, is an oblong Pipe conſiſting of various Cartilages and Membranes, which begins at the Throat, or lower part of the Jaws, lies upon the Gullet, deſcends into the Lungs, and is diſperſed by manifold Ramifications or Branches thro' their whole Subſtance: The upper Part is called *Larynx*, and the Lower *Bronchus*, to which *Malpighius* adds a third, or loweſt, called by him *Veſicular*: It is ſubſervient to Speech and Reſpiration.

That part of the *Aſpera Arteria* which is called the *Bronchus*, contains all of it, but the *Larynx*; being the Body of the Pipe as well before as after its Inſertion into the Lungs, all the Cartilages of this *Bronchus* are like the loweſt of the *Larynx*, to which the uppermoſt of the *Bronchus* adheres. Theſe Cartilages are ſeated one below another at equal Diſtances, and keep in their Places by both the Membranes of the *Trachea*, which fill up their Interſtices, and tye them one to another like Ligaments. Yet theſe Rings have not their Circle entire, but on the backſide of the *Bronchus* next the Gullet, that they might give way to the Meat in ſwallowing, they paſs into a Membrane, ſo that they are in Figure like the Letter C. But this Interſtice in their Circle, which moſt Anatomiſts affirm to be Membranous, *Caſp. Bartholin* (after his Father) ſays, is rather a Carnous Fibres that run from one Side or End of the Cartilage acroſs to the other, which, in Expiration (eſpecially violent) contracting themſelves, draw the Ends of the Cartilage towards one another on each Side, and thereby ſtraiten the Pipe of the *Trachea*.

And tho' the Cartilages, ſo far as they are contiguous to the Gullet (being about twenty in number) are thus ſemilunar as it were; yet thoſe of the Branches of the *Bronchus* within the Lungs, have no Interſtice in their Circumference, being all Cartilaginous, tho' not all of a Circular Figure, but ſome Four-ſquare, other Triangular, *&c.* as *Diemerbroeck* obſerves, the inner Membrane is plentifully beſet with military Glands, out of which a good part of that mucous Matter that bedaubs its Inſide iſſues, for the lubricating of it. The *outer* Membrane helps to connect the Cartilages the more firmly one to another, and the whole *Trachea* to the neighbouring Parts, that it may more ſafely and firmly deſcend into the *Thorax*. This is much thinner than the other; for the Inner (according to Dr. *Wallis*) has two Rows of Muſcular Fibres, the Outer ſtreight, the Inner Oblique, the Firſt by their Contraction ſhorten the *Trachea*, the Latter ſtraiten it; ſo that he thinks they aſſiſt Expiration, eſpecially when it is violent, as Coughing, Hawking, or the like. Yet he ſays, this inner Membrane has two others growing upon it, as it were, one Glandulous, and another Vaſcular. Thro' this latter do the Blood-Veſſels and Nerves every where run; and the Glands placed in the former, receive and keep all the ſuperfluous Moiſture or *Lympha* depoſited by the Arteries, which the Veins do not imbibe, till they can remand it by the Lympheducts (which ſpring from them) or if it be over plentiful, ſo that the Lympheducts cannot receive it at all, then it iſſues both out of theſe Glands, and out of the Arteries into the Cavity of the Wind-pipe, and cauſes a Catarrh. But the Inſide of this Membrane is naturally moiſt, being beſmear'd with a fattiſh and muccous Humour, to hinder its drying, and to make the Voice ſmoother; ſo that when this Humour is fretted off in Catarrhs, or the Inſide of this Membrane becomes rough from any Cauſe, the Voice becomes hoarſe; and when it is dried by too much Heat, as in Feavers, it becomes ſqeaking.

The *Aſpera Arteria* has *Veins* from the external Jugulars. *Arteries* from the *Carotides*, and from the *Arteria Bronchialis* (firſt found out by *Frederick Ruyſch*) which ſprings from the backſide of the deſcending Trunk of the *Aorta*, a little above the lower Intercoſtals. *Nerves* it receives from the recurring Branches of the *par Vagum*, which run moſtly along its inner Membrane, whence it becomes ſo exquiſitely ſenſible.

When it is deſcended as low as the fourth *Vertebra* of the *Thorax*, it is divided into two Trunks, whereof one goes into the right Lobe of the Lungs, the

the other into the left, and each is presently again divided into two, and those into others, till at last they end in very small Branches, which are dispersed among the like Branches of the Pulmonary Artery and Vein, and end in and are continued with the little Bladders that make up the greatest part of the Bulk of the *Lungs*.

ASPERIFOLIÆ *(Plantæ)* is one of the Divions or kinds of Plants: See (*Plants*, *N.* 11.)

In this kind of Plants, the Leaves stand alternately, or without any certain order on the Stalks: The Flowers are *monopetalous*, but having the Margin cut into 5 Divisions, sometimes deep, sometimes shallow; and the upper Spike or top of the Plant is often curved back something like a Scorpion's Tail. They are called *Asperifoliæ* because they are usually *rough leaved*, but they are not always so. After each Flower of this kind of Plants, there usually succeed four Seeds: There being only the *Cerinthe* reckoned by Mr. *Ray* to belong to this Genus, which hath less than four Seeds at the Root of each Flower, but that hath but two.

The *Herbæ Asperiofolæ* are, the *Pulmonaria Maculosa*, *Cynoglossa*, *Borago*, *Buglossa*, *Anchusa*, *Echium*, *Linum Umbilicatum*, *Heliotropium majus*, *Aparine major*, *Consolida major*, *Lithospermum*, *Echium Scorpoides* and *Cerinthe*.

ASPERITY, is the inequality or roughness of the the Surface of any Body, whereby some parts of it do so stick out above the rest, as to hinder one's Hand, *&c.* from passing over it easily and freely.

ASPHYXIA, or a Cessation of the Pulse of the whole Body, is the highest degree of Swooning, and next to Death.

ASPIRATION, or the pronouncing of any Syllable or Word strongly, with a good deal of Breath and some Vehemency; as we do those Words which have the Letter *H* before them, as *have*, *hear*, *heat*, &c. whereas they are sounded much softer and easier without the *H*; as *ear*, *eat*, &c.

ASPYXIA, a sensible decayed Pulse, the same with *Asphyxia*.

ASSART, a Term in Law, signifying an Offence committed in the Forest, by plucking up the Woods by the Roots: Also to make Glades in a Wood, to grub up or clear a Ground of Bushes and Shrubs, *&c.* or to lop off the Boughs of a Tree.

ASSATION, is a Term in Pharmacy, used for a peculiar kind of *Decoction* or Boiling of Plants, *&c.* in their own Juice.

ASSAULT (in Law) signifies a violent kind of Injury offered to a Man's Person, of a more large extent than Battery; for it may be committed only by offering to give a Blow.

ASSAULT (in the Art of War) is taken also for a general Attack made upon the Fortress to get it by main Force, without defending themselves in the Attack by any Works: The Words are, to *give an Assault* to such a Place; *to be commanded to the Assault*; *to stand an Assault*, *to second an Assault*; *to repulse an Assault*; *to carry by Assault*, &c. While an Assault lasts, and both Parties are mixt, there is no fear of Cannon on either Side, for they are afraid of destroying their own Men thereby.

ASSETS (in Law) signifie Goods enough to discharge that Burden which lies upon the Executor or Heir, in satisfying the Testators or Ancestors Debts or Legacies.

ASSEWIARE, signifies to draw or drain out Water from a Marshy Ground.

ASSIGN, (a Law Term) is he that is appointed or deputed by another to do any Act, or perform any Business, or enjoy any Commodity: And it is either in *Deed* or in *Law*.

ASSIGN *in Deed*, is he that is appointed by the Person himself.

ASSIGN *in Law*, is he whom the Law so makes, without any appointment of the Person.

ASSIMILATION, is a Term in Anatomy, by which they express the Change that is made either of Chyle into Blood, or of the Nutritious Juice into the Substance of an Animal Body. Thus the Modern Anatomists say, Sanguification is not performed by the Liver only, as the Ancients supposed, but by a gradual changing of the Chyle into Blood by frequent Circulations, and the manner of this Change they call *Assimilation*.

ASSISA *Cadere*, in Law, signifies to be Nonsuited.

ASSISA *Nocumenti*, an Assize of Nuisance.

ASSISA *Continuanda*, is a Writ directed to the Justices assigned, to take an Assize for the continuance of a Cause, where certain Records alledged cannot in time be procured by the Party that would use it.

ASSISA *Proroganda*, is a Writ directed to the Justices of Assize for the stay of Proceedings, by reason of the King's Business, wherein the Party is employed.

ASSISE, *de mort d' ancestor*: See *Cosinage*.

ASSISE *de utrum*, lieth for a Parson against a Lay-Man, or a Lay-Man against a Parson, for Land or Tenement doubtful whether it be Lay-fee, or Free-Alms.

ASSIZE, in Law, properly signifies a Writ that lies where any Man is put out of his Lands, Tenements, or of any Profit to be taken in a certain Place, and so disseised of his Free-hold. In an *Assize* it is needful always that there be one Disseisor, and one Tenant, or otherwise the Writ shall abate.

There is also another *Assize*, called *Assize of fresh Force*, and lies where a Man is disseised of Tenements which are devisable; as in *London* or other Boroughs that are Franchises: For there the Tenant shall come into the Court of the Town or Borough, and enter his Plaint, and accordingly shall have a Writ directed to the Mayor or Bayliffs, *&c.* and thereupon shall pass a Jury in manner of *Assize of Novel Disseisin*; and in case the Officer delay Execution, the *Plaintiff* shall have another *Writ of Execution*, then a *sicut alias*, and after that a *Pluries*, &c. And from things of this Nature being done by the Judges in their Circuits; when at any Place they sit to do Justice by Commission, that Court or Meeting is called the *Assizes*.

But besides this, the Judges of the *Assizes* have several other Commissions; as, 1. A Commission of *Oyer* and *Terminer*, directed to them, and to many others of the best Account in their Circuits; but here the Judges are of the *Quorum*, so as without them there can be no proceeding: By this Commission they enquire into and punish Murders, Treasons, Felonies, *&c.* 2. They have a Commission of *Goal Delivery*; this is directed only to themselves, and the Clerk of the Assize Associate, and by this Commission they deal with all Prisoners in Goal, for whatever Offences there committed. 3. They have also a Commission of *Nisi*

Prius, directed to the Judges themſelves and the Clerk of the Aſſize, by which they are commiſſionated to take *Niſi Prius*, &c. 4. They have alſo a Commiſſion of the Peace, in which all the Juſtices of the Peace of the ſeveral Circuits are obliged to aſſiſt them; for Default of which they are fineable at the Diſcretion of the Judges.

ASSIZE *de darrain Preſentment*: See *Quare impedit*.

ASSIZE *of Novel Diſſeiſin*, lies where a Tenant in Fee-ſimple, Fee-tail, or for term of Life, is lately diſſeiſed of his Lands or Tenements, or elſe of a Rent-ſervice, Rent-ſeek, or Rent-charge of Common, of Paſture, of an Office, *&c.*

ASSIZE *of the Foreſt*, is a Statute or Condition, touching Orders to be obſerved in the King's Foreſt.

ASSIZE *of Bread and Beer*, is the Power a Magiſtrate has of aſſizing or adjuſting their Weights and Meaſures.

ASSOCIATION, is a Patent ſent by the King, either of his own Motion, or at the Suit of the Party Plantiff to the Juſtices of Aſſize, to have other Perſons aſſociated to them to take the Aſſize: And upon this Patent of the Aſſociation, the King will ſend his Writ to the Juſtices of Aſſize, by it commanding them to admit them that are ſo ſent.

ASSODES *Febris*, is a kind of burning Fever, in which the ſick Perſon inceſſantly tumbles and toſſes, being exceeding reſtleſs, and ſubject to Sickneſs at the Stomach, and Vomiting, by reaſon that the Diſtemper uſually ariſes from the Vexation of the Stomach, by ſharp and cholerick Humours, biting the Orifice or Coat thereof. *Blanch.*

ASSOYLE, (a Law Term) ſignifies to deliver or diſcharge a Man of an Excommunication,

ASSUMPSIT (in Law) or *Nude Contract*, is a voluntary Promiſe made by Word, by which a Man aſſumes and takes upon him to perform, or pay any thing to another: Or a Promiſe may ariſe in Law, as upon the ſale of Goods, *&c.*

ASSUMPTION, in Logick, is the *Minor* or *Second Propoſition* in a *Categorical Syllogiſm*.

ASTERICK, is a ſmall Star ſet over any Word or Sentence, to make it the more conſpicuous or taken notice of by the Reader.

ASTERISM, the ſame with *Conſtellation*; or a Collection of many Stars into one Claſs or Syſtem, which is uſually on the Globe repreſented by ſome one particular Image or Figure, to diſtinguiſh the Stars that compoſe this Conſtellation from thoſe of others.

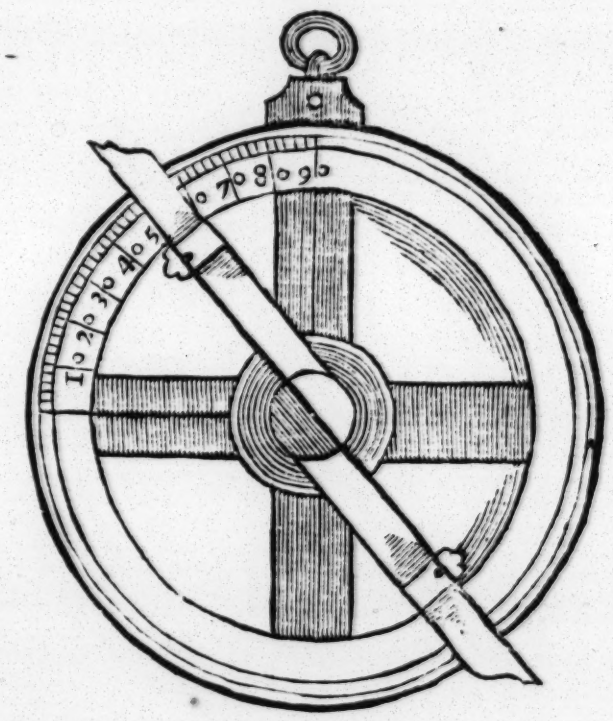
ASTHMA, or *Phthiſick*, is a difficulty of breathing, proceeding from the ill affection of the Subſtance of the Lungs, and the intercoſtical Muſcles ſerving to Reſpiration.

ASTRAGAL, in Architecture, is by the *French* called the *Talon*, by the *Italians* *Tondino*, and is a kind of half *Tore*, ſometimes wrought (in the Richer Orders) like a kind of overcaſt Hem or Edge to the larger *Tore*; which frequently is placed between, as in the *Ionick Baſe*, with two *Scotia's* or *Trochiles*; and ſometimes, but rarely, juſt about the Plinth of the Baſe. Sometimes it is taken for the Collar or Cincture next the *Hypotrachelium* and Diminution of a Pillar liſted on both Edges; and it runs alſo round under the *Echinus* of the *Ionick*. We find it alſo ſometimes dividing the *Faſcia* of the Corinthian Architrave, where it is wrought in Chaplets, and Beads or Berries; and ſometimes 'tis uſed both above and below the *Liſts*, and joining immediately to the Square or Die of a Pedeſtal, where the *Stylobata* is introduced. Freart's *Parallel of Architect.*

ASTRAGAL, in Gunnery, is the Cornice Ring of a Piece of Ordinance.

ASTROLABE, is a Mathematical Inſtrument ſerving to take the Height of the Sun or Stars. It conſiſts of an entire Circle, whoſe Limb (or what Part of it is neceſſary) is divided into Degrees and Decimal Parts of a Degree, with a moveable Ruler or Label which turns upon the Centre, and carries two Sights. At the Zenith is a Ring to hang it by in time of Obſervation, and then you need only turn it ſo to the Sun, that the Rays may paſs freely through both the Sights, and the Edge of the Label cuts the Altitude in the Limb. This *Aſtrolabe*, though now not much in uſe at Sea, yet if well made, graduated and poiſed, and of a great Thickneſs and Weight, that it may hang the ſteadier, it may be a very ſerviceable Inſtrument, eſpecially between the Tropicks, where the Sun comes near the Zenith; and in calm Weather. There are alſo ſome Projections of the Sphere which are called by this Name, as that of *Gemma Frizius* and *Stoffler*.

The Common Sea Aſtrolabe.



ASTROLOGY, is an Art which pretends to foretel future things from the Motion of the Heavenly Bodies, and their Aſpects to one another; and alſo from ſome Imaginary Qualities, which the fooliſh Admirers of this Cheat will have to be in the Stars, as the Cauſes of great Sublunary Effects; though they have no tolerable Grounds to prove that there are any ſuch things. And therefore as I wiſh that ſuch a ridiculous Piece of Foolery as this may be quite forgotten, ſo I have every where omitted explaining any of its Terms, unleſs they fall in with *Aſtronomy*.

ASTRONOMICAL *Calendar*, is an Inſtrument engraved on Copper Plates, printed on Paper, and paſted on Board, with a Braſs Slider, which carries a Hair, and ſhews, by Inſpection, the *Sun's Meridian*, *Altitude*, *Right Aſcenſion*, *Amplitude*, *Declination*, *Time of its Riſing and Setting*, &c. to greater nicety than the largeſt Globes now made.

ASTRONOMICAL *Numbers*: See *Sexageſimal Fractions*.

ASTRONOMICAL *Place of a Star or Planet*, is its *Longitude* or Place in the Ecliptick, reckoned

ed from the beginning of *Aries*, *in Conſequentia*, or according to the natural order of the Signs.

ASTRONOMICAL *Quadrant*, is an Inſtrument curiouſly framed, and the Degrees exactly and minutely divided by the help of a Screw on the Edge of the Limb, fitted with Teleſcopes, and either apply'd to a Wall in the Meridian; or on a ſtrong Axis or Pedeſtal, with two Semi-circles placed at Right Angles on two endleſs Screws, which readily direct or guide the Inſtrument to take Obſervations of the Sun, Moon or Stars.

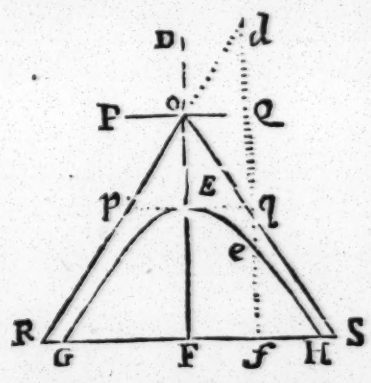
ASTRONOMY, is a Mathematical Science, teaching the Knowledge of the Stars or Heavenly Bodies, and their Magnitudes, Diſtances, Eclipſes; Order, and Motions: By ſome 'tis taken in ſo large a Senſe, as to contain in it alſo the Doctrine of the Mundane Syſtem, the Laws of the Planetary Motions, *&c.* which others reckon as a part of Phyſicks or Natural Philoſophy.

ASYMMETRY, the ſame with *Incommenſurability*, which ſee.

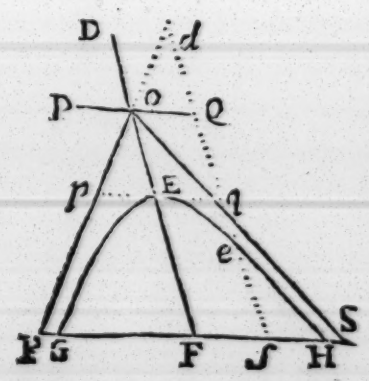
ASYMMETRAL, the ſame with *Incommenſurable*.

ASYMPTOTES, are Lines which continually approach nearer to each other, but tho' continued Infinitely, can never meet. Of theſe there are many kinds, as the *Curve* of the *Conchoid*, &c. but it may be enough here to mention the Famous.

ASYMPTOTES in *Conick Sections*, which are the Lines *OS* and *OR*; and are thus drawn; Imagine, in the *Hyperbola*, the *Second* or *Conjugate Axis PQ* to deſcend ſtill keeping parallel to the *Ordinates*, till it touch the *Vertex* of the Section *E*, for then, if thro' the Centre *O*, you draw Lines thro' the Ends of this Tangent Line *p q*. Theſe are the Famous *Aſymptotes* mentioned by *Apollonius*, *Lib.* 2. *Prop.* I. and of which he demonſtrates, that tho' infinitely produced, and tho' the Curve come continually nearer and nearer to them, yet can they never be Co-incident with the Sides of the *Hyperbola*, nor ever meet it, or touch it; whence comes their Name of *Aſymptotes*: And by ſome Latin Writers they are called *Intactæ*, for the ſame reaſon. This *Non-Co-incidence* appears very plainly, where the Section of the *Hyperbola* is made parallel to the Triangular Section of a Cone by the Ax; As,

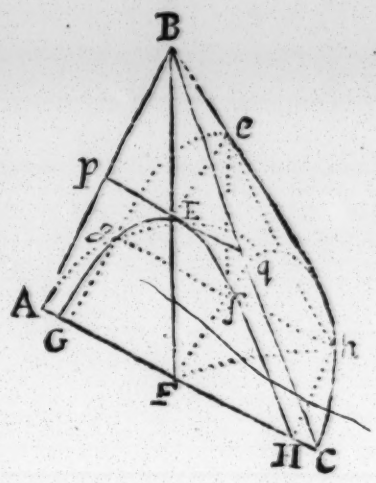


Suppoſe along the Line *e f* parallel to *E F*. For if you imagine the Hyperbola *g e b* to be moved forward parallel to it ſelf, as far as the length of the equal and parallel Lines, *g G*, *f F*, *E q*, *H b*, till it come to be in the poſition *G E H*, or to be co-incident with the Triangular Section by the Axis, then it will be manifeſt, that the Hyperbolick Line *G E H* is diſtant each way from the Aſymptotes *BC*, *BA*, by the length of the verſed Sines of the equal Arks *b C* and *g A* in the Circumference of the Circular Baſe of the Cone; and that at the ſame time it comes, if produced, ſtill nearer and nearer to them. And conſequently, I ſay,



1. *RG* and *HS*, or *AG* and *HC* being always equal to one another; as are alſo the Ordinates *GF* and *FH*, &c. The Rectangles *RGS* and *SHR*, *AGC* and *CHG*, will always be reſpectively equal to one another.

2. The *Curve* and the *Aſymptote* can never meet, becauſe the Circles generated by *E Q*, and the Rings generated by *RS*, and *HC*, &c. (which will ariſe from the Imaginary Revolution of the whole Figure round the Axis *FE*) will always be equal to one another, and to the Circle made by the Revolution of the Radius *E q*, as is plain by comparing this laſt Figure with the former in N°. 1, 2.



For the Spaces generated by the Lines *E q*, *FC*, &c. will be as the Squares of their Diameters, or of the Generating Lines. But 'tis certain, that the Square of *Fb* or of *FC*, exceeds the Square of *Fb*, by the Square of *bH* or *fF*; that is, by the Square of *E Q*, by the Suppoſition above; wherefore the Circle generated by the Motion of *FC*, will exceed that generated by *FH*, by that Circle generated by *E Q*. But the Space generated by *FC*, exceeds that generated by *FH*, by the Ring generated by *HC*; wherefore that Ring made by *HC*, muſt be equal to the Circle made by *E Q*, *Q E D*. And this will always be ſo; and therefore the Line *HC*, can never grow of no length, and conſequently the Curve and the *Aſymptote* can never meet.

There are other *Aſymptotes* to other *Curves*; and tho' the *Parabola* hath no *Aſymptote*, yet two *Parabola's* may be drawn *Aſymptotically* to each other.

The following general Obſervations about *Aſymptotes* and *Aſymptotick Curves*, I had communicated from Mr. *Humphrey Ditton*, now Maſter of the New Mathematical School in *Chriſt's Hoſpital*, a Perſon peculiarly skilful in theſe Matters, and are as follows.

Some General Obſervations about Aſymptotes, *and* Aſymptotical Curves.

I. Tho' it be certain that all ſuch *Curves* as have *Aſymptotes*, be of the Number of thoſe which (running on in *Infinitum*) do not include a Space; yet is not true, on the other hand, that whereever we have a Curve of that Nature and Property, we find an *Aſymptote* alſo. For this infinite Continuation of the Curve, is viſible in all thoſe of the Parabolick Family, and yet none of all theſe can have an *Aſymptote*; that is, not any Right Line placed in any Poſition to the Curve, which can infinitely approach to it, and yet not cut it, as is not hard to be demonſtrated.

II. Of thoſe Curves that have an *Aſymptote*, ſome there are that have two, others that have only one. Inſtances of the former kind are all the ſorts of Hyperbolick Curves, which from the Principle of their Geneſis (as being formed from Reciprocal Series) are eaſily proved to have two *Aſymptotes*. And of the latter ſort we have the *Conchoid*, the *Ciſſoid*, and the *Logarithmick Curve*,

the Nature of which conſidered, as clearly ſhews that they have one and no more.

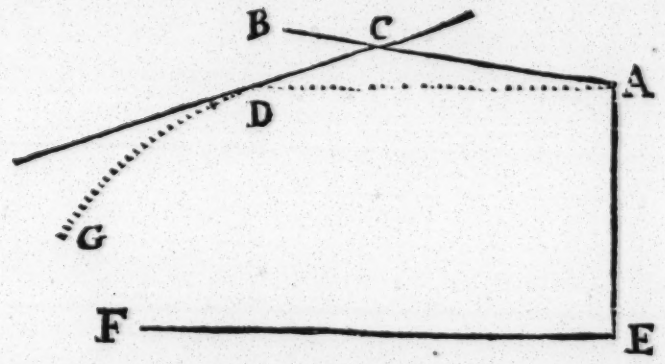
III. As a Right Line and a Curve may be *Aſymptotical* to one another, ſo alſo may Curves and Curves: And here are two or three Varieties to be conſidered.

1. Any of theſe Curves that have from their own Nature and Conſtruction an *Aſymptote*, are capable of being Aſymptotical to one another. Thus in Conick Sections 'tis demonſtrated, that Hyperbola's that have the ſame common *Aſymptote*, are alſo themſelves *Aſymptotes* to each other; and this ſhall afterwards be ſhewn univerſally of all ſuch Curves.

2. Not only thoſe Curves which are endowed with an *Aſymptote*, but even ſuch as in their own Nature admit of no ſuch thing, may alſo have this Affection. The Parabola (for inſtance) we know has no *Rectilineal Aſymptote* belonging to it; and yet two Parabola's, with their Axes placed in the ſame Right Line, will be Aſymptotical to each other; as *De la Hire* has demonſtrated, *Sect. Conic. Lib.* 6.

3. But no Curve that has any *Aſymptote* belonging to it, can ever be Aſymptotical to another whoſe Nature refuſes a *Rectilineal Aſymptote*; for if it were ſuppoſed to be ſo, then this latter Curve would have the *Aſymptote* of the former Curve for its own *Aſymptote* too, which is contrary to the Hypotheſis of its having none at all. Thus, for Inſtance, a Parabola and an Hyperbola can never be Aſymptotical to one another; for were it ſo, the *Aſymptote* of the Hyperbola would be alſo an *Aſymptote* to the Parabola; which is impoſſible, ſince that Curve can have no *Aſymptote*.

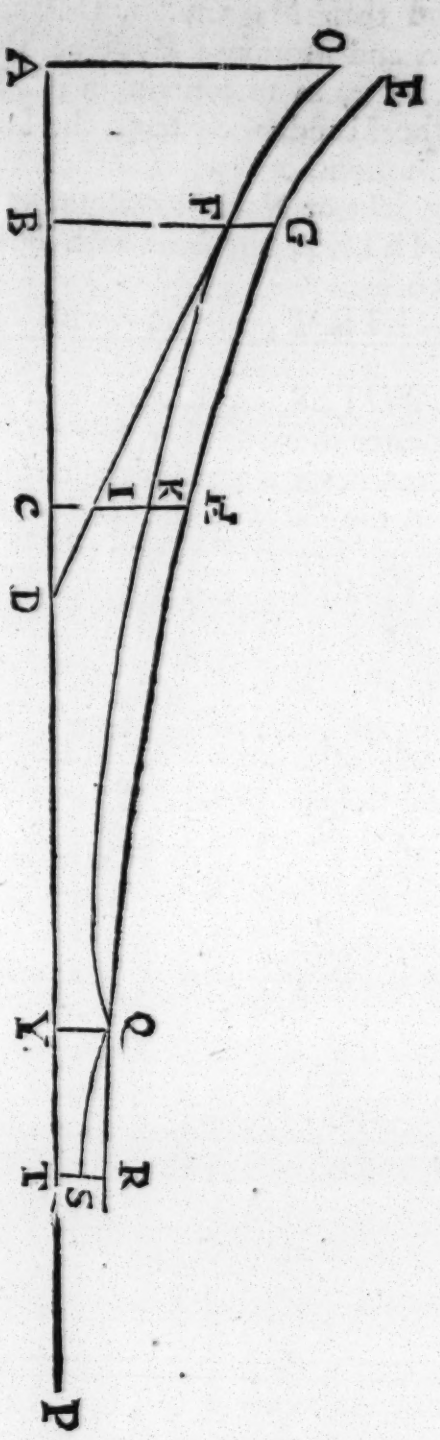
IV. No Right Line can ever poſſibly be an *Aſymptote* to a Curve that is every where concave towards that Right Line: This is very clear from the bare Conſideration of the Curvature, and the Tendency of it; and may be thus brought into Demonſtration.



Let the Curve *ADG* (whoſe Ax is *AE*) be concave in all its Parts towards the Right Line *FE*; this Line then *FE*, ſhall never be an *Aſymptote* to the Curve *ADG*. Let *AB* touch the Curve in the Vertex *A*, and be imagined parallel to *FE*; then any other Tangent as *CD*, ſuppoſe ſhall, if it be produced, meet with *FE* in ſome Point or other; but becauſe *CD* is a Tangent, therefore the Curve Line it ſelf falls between the Tangent and the Line *FE*; but it is by the Hypotheſis alſo concave to all its Parts; therefore if the Tangent *CD* produced, interſects *FE*, *a fortiori*, the Curve *CDG* ſhall meet with it alſo; and therefore *FE* is not an *Aſymptote*.

V. But a Right Line may be an *Aſymptote* to a mixt Curve that is partly Concave and partly Convex towards the ſame Line. An Inſtance of this we have in the *Concboid* of *Nicomedes*, which is Concave (for ſome Parts of it) to its *Normal*, and then after the *Punctum Flexus*, in which 'tis neither Concave nor Convex, it is for ever Convex towards the ſame. Concerning which *Punctum Flexus*, ſee *Schoten. Comment upon Cart. Geometry*, Lib. 2.

VI. All Curves that have one and the ſame *Common Aſymptote*, are alſo Aſymptotical to one another.

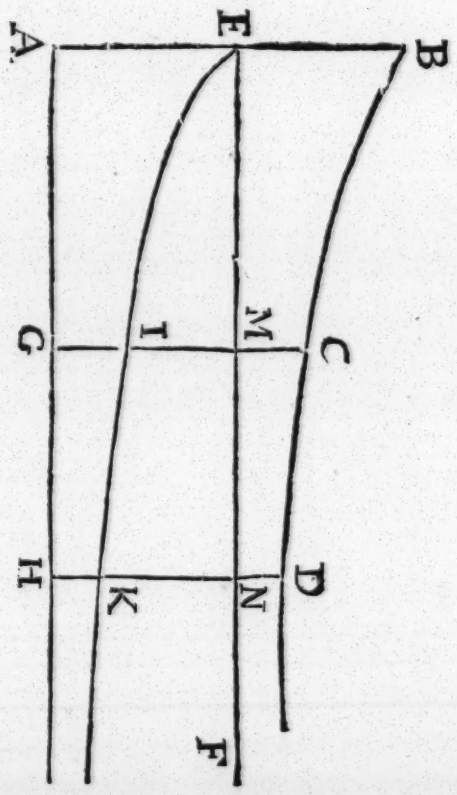


Let the Curves *EGH*, *OFK*, have the common Aſymptote *ADP*; then they ſhall be Aſymptotical to each other. Firſt of all it is evident, that they continually approach to one another; for inſtance, drawing the Line *FD* a Tangent to the Curve *OK* in *F*, to meet with the Aſymptote in *D*, and producing *BF* to *G* in the Curve *EH*, draw *GH* a Subtenſe in that Curve parallel to *FD*; and then from *H*, the Line *HKC* parallel to *GB*, 'tis clear, that *FG*=*HI*, and *HI* ⌋ *HK*, becauſe *FD* touches in *F*; therefore *FG* ⌋ *HK*, that is, the Curves are nearer to one another in the Points *H*, *K*, than in *F*, *G*; and the ſame may be ſhewn of any other Points taken from the Parts of *B*, *C*, towards *P*. But then again, theſe Curves can never poſſibly meet with, or cut one another. For imagine they could, and did interſect each other, at the Point *Q* ſuppoſe; and let *QY*, *RT* be parallel to *BG*, *HC*. The Curve *OKF* goes above

above the Curve *EGH* (after the Interſection in *Q*) into *R* ſuppoſe, and the other falls below, as ſuppoſe at *S*. Now if two Curves as *QR*, *QS*,

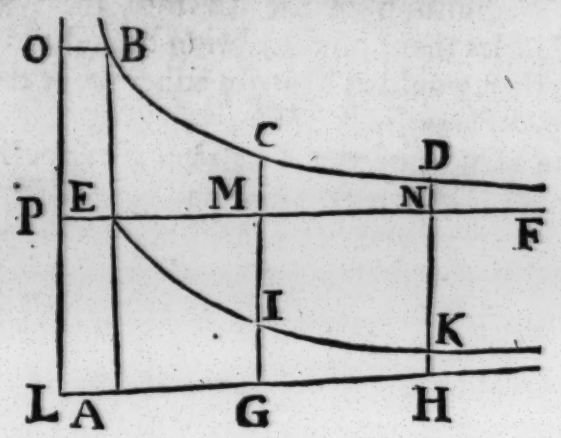
cut in *Q* the Curve *QR* departing from *QS*, 'tis plain that ſome Point, as *R*, may be taken in the Curve *QR*, from whence a Right Line, as *RT*, drawn to another Line, as *YT*, ſhall be equal to *QY*, the Line from *Q*, the common Section of the Curves to the ſame Line *YT*. This follows from the Nature of Curve Lines in general. Now let us ſuppoſe theſe Curves that cut thus to have the Line *YT* for their common *Aſymptote*; then from the general Nature of Curves, we can find the Point *R*, from whence *RT* ſhall be = *QY*, but upon the Hypotheſis that *YT* is an *Aſymptote*, 'tis impoſſible that *RT* ſhould be = *QY*, for the Lines intercepted between the Curve and its *Aſymptote*, are ſtill leſs and leſs, and therefore *RT* muſt be leſs than *QY*, becauſe of the *Aſymptote*; and from hence 'tis certain, that two Curves, which have one and the ſame *Aſymptote*, can never cut each other.

VII. Two equal Curves of the ſame ſort, whoſe *Aſymptotes* are parallel, with themſelves be equidiſtant in all their Points. Theſe Curves are ſuppoſed to be ſuch as have but one *Aſymptote* a piece.



Let *EF* be the *Aſymptote* of the Curve *BCD*, and *AH* the *Aſymptote* of the Curve *EIK*; and the Curves being by the Hypoth. of the ſame kind and equal, therefore *EB* = *EA*, and *IG* = *CM*, and *DN* = *KH*, and *IG* + *IM* = *CM* + *IM*, and ſo *DN* + *NK* = *KH* + *NK*; but *KH* + *NK* = *IG* + *IM* (for *EH* is a Parallelogram) therefore *CM* + *IM* = *DN* + *KN*, that is, *CI* = *DK*; and ſo in all other Points from whence the Curves are equi-diſtant.

VIII. The ſame thing is true alſo of equal Curves of the ſame ſort that have two *Aſymptotes* each, but with a Limitation. Suppoſe *LO* to be one common *Aſymptote* to both Curves, and *PN* the other for the Curve *BCD*, as *LH* is for the Curve *EIK*; where the lower Curve cuts the



Aſymptote of the upper in *E*, drawing *BEA* parallel to *OL*; 'tis evident that from the Points *B* and *E* to the Parts of *D* and *K* infinitely, the Curves are equi-diſtant from one another: For by the Hypotheſis, the Points *P* and *L* are the Concourſes of the *Aſymptotes*, and *PE* being = *LA*, *BE*, *CM*, *DN*, are ever = *EA*, *IG*, *KH*, &c. from whence the Concluſion follows as before.

ASYNDETON, is a Figure in Grammar, implying a Defect or want of Conjunctions in a Sentence (as *Polyſyndeton* is a Redundancy of them) as in this Inſtance, *Græculus Eſuriens, in Cœlum juſſeris, ibit*; where the *Si* before *Juſſeris* is omitted.

ATCHIEVEMENT, in Heraldry, ſignifies the Coat of Arms of any Gentleman duly Marſhalled with Supporters, Helmet, Wreath and Creſt, and with Mantles and Woods, or as the Heralds call it, with *Heaulme* and *Timbre*, *i.e.* with *Helmet* and *Creſt*. Such are uſually hung out on the Fronts of Houſes after the Death of the Lord, Lady, Maſter, or ſome conſiderable Perſon; and are now corruptly called *Hatchments*.

ATHANOR, a kind of digeſting Furnace in Chymiſtry, fix'd and large, and made with a Tower, which is contrived ſo as to keep a conſtant Heat for 14 Days, a Month, *&c.* or the Heat may be encreaſed or diminiſhed at pleaſure, by opening or ſhutting the *Regiſters*.

ATHEROMA, a ſort of Tumour or Swelling conſiſting of a thick and tough Humour like Pap, contained in a Bag or Membranous Coat. It neither cauſes Pain, nor changes the Colour of the Skin. It doth not eaſily yield to the Touch, nor leaves any dint after it is compreſſed.

ATHYMIA, is a Dejection or Anxiety of Mind.

ATLAS, in Anatomy, is the firſt *Vertebra* of the Neck under the Head; ſo called, becauſe it ſeems to hold up the Head: it wants Marrow.

ATMOSPHERE, is the lower part of the Region of the Air or Ether, with which our Earth is encompaſſed all round; and up into which the Vapours are carried, either by Reflection from the Sun's Heat, or by being forced up by the Subterranean Fire.

The Preſſure of the *Atmoſphere*, Mr. *Boyle* undertakes to demonſtrate from many Experiments, as,

1. That two poliſhed Marbles of about three Inches Diameter, and which would in the open Air ſuſtain a Weight of 80 *lb.* before they would fall aſunder, would, in the exhauſted Receiver, fall aſunder with a Pound, and ſometimes with half a Pound Weight. Nay, though when the Re-

Receiver was evacuated, the upper Marble being let down to touch the other, it would by no means adhere to it; yet when this was tryed after the Re-admiſſion of the Air into the Receiver, the Marbles then, on their being brought to touch each other, would as ſtrongly adhere as at the firſt. *Hiſtory of Firmneſs*, P. 288.

The Height of the *Atmoſphere* is variouſly conjectured: *Kepler* makes it about eight Miles; but other eminent and later Aſtronomers, eſpecially the Learned and Diligent *Ricciolus* makes it probable, that the *Atmoſphere* may be at leaſt fifty Miles high.

Mr. *Boyle* makes the common Height of the *Atmoſphere*, when the Mercury in the *Baraſcope* is at 30 Inches, to be 35000 Foot, or ſeven Miles; but this Account is upon a Suppoſition, that all our Air is of the ſame Denſity and Weight from the Surface of the Earth to the Top of the *Atmoſphere*; which can by no Means be ſuppoſed, and therefore he rightly concludes it muſt be much more. Nay, in his Book againſt *Linus* he ſuggeſts, that 'tis probable it may be ſome *Hundreds*, and even *Thouſands* of Miles high, in caſe the *Atmoſphere* be not a bounded Portion of the Air, but reach as high as it.

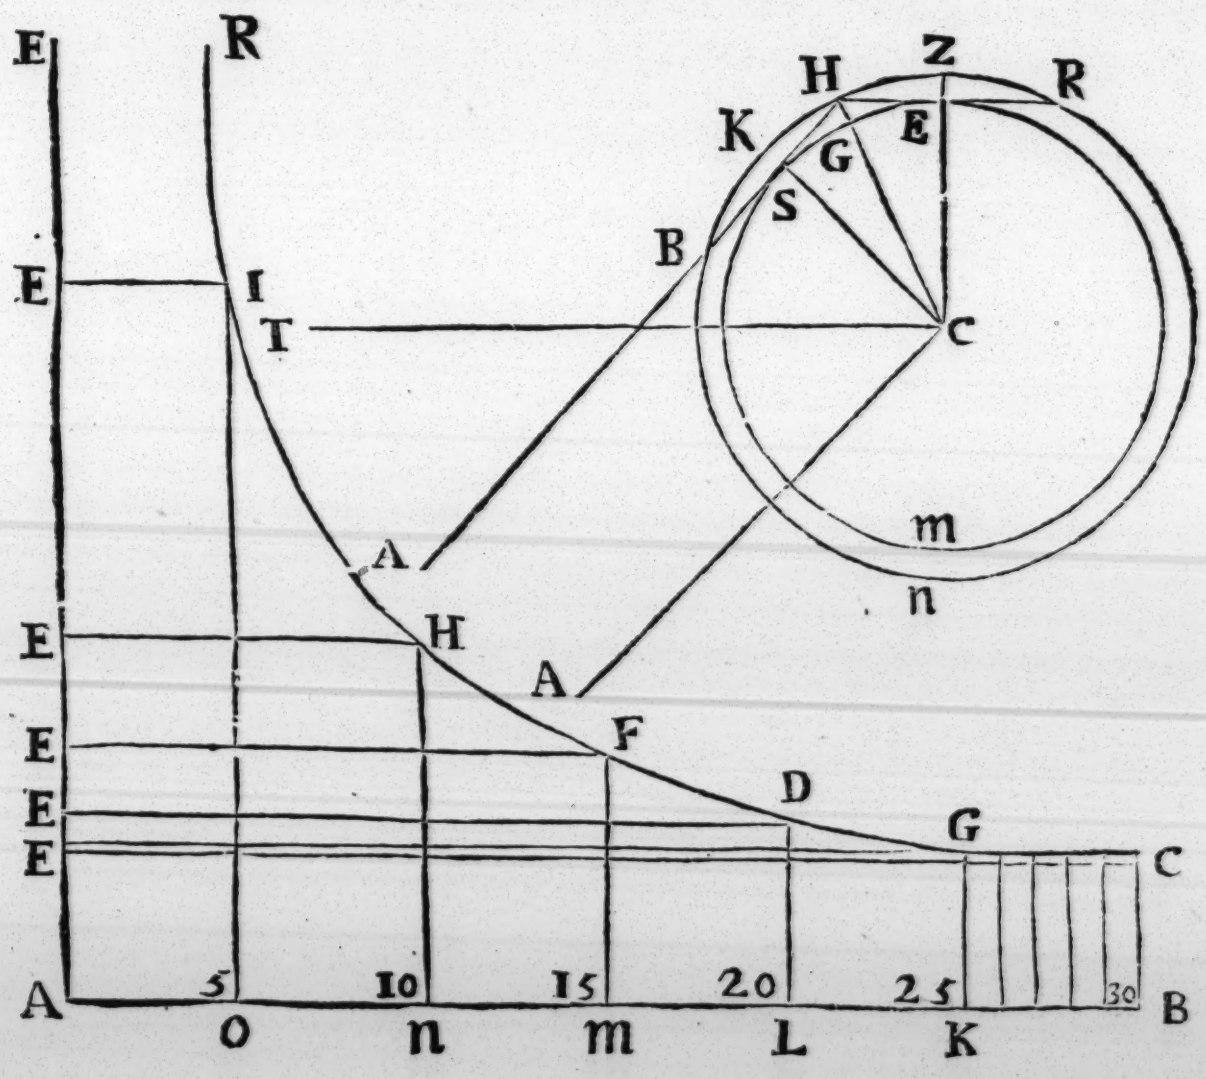
The ſame Honourable Philoſopher got a hollow Cylinder of Braſs to be exactly turned by a good Artiſt, whoſe Length was 3 Inches, and the Diameter of its Bore juſt an Inch: This had a Bottom nicely fitted to it; and then being filled with Quickſilver (the Weight of the Cylinder being before known) it held as much as weighed 17 *Oz.* 1 *Drachm*, 45 *gr. Troy*. This being multiplyed by 10 (becauſe the Baraſcope then ſhewed the Mercury to be at 30 *gr.*) gave 14 *lb.* 2 *oz.* and above 3 *drachms Troy*, for the Weight of a Column of Mercury of an Inch in Diameter, and 3 Inches in Length. And ſo much conſequently was the Weight of a Column of Air of an Inch in Diameter, and of the whole Height of the *Atmoſphere*.

Hence, knowing the Proportions of Cylinders, (*which ſee under* Cylinder) 'tis eaſy to calculate the Weight of a Cylinder of Mercury, and conſequently of Air to the Top of the *Atmoſphere*, of any given Diameter. For as 1. the Square of the Diameter of the Cylinder above-mentioned, is to the Square of the given Diameter of the Cylinder ſought (which, if it were two Inches Diameter, will have its Square 4) :: So is the Weight of the Cylinder above-mention'd, to the Weight of that ſought. Work as in the Rule of Three, and you have your Deſire.

In Mr. *Boyle*'s Deſcription of his *Statical Baroſcope*, he tells us, That he found a Pillar of Air incumbent on a ſquare Inch, to weigh 18 *lb.* $\frac{1}{3}$ *Troy*. From which Account I calculated the Weight of the whole Air, all round the Globe, to be 8.990405732208000000 Pounds *Troy*, which agrees nearly with the Weight of it calculated by Mr. *Paſchal* (tho' he proceeded a very different way) for he makes it to be 8.283889440000000000.

Mr. *Halley* by undoubted Experiments, found that the Weight of *Mercury* to Water, is as $13\frac{1}{2}$ to 1, or very near it; and that the Specifick Gravity of *Air* to Water, is as 1 to 800, ſo that the Weight of *Mercury* to *Air*, is as 10800 to 1; and a Cylinder of *Air* of 10800 *Inches* or 900 *Feet*, is equal to an *Inch* of *Mercury*; ſo that were the *Air* of an equal Denſity like Water, the whole *Atmoſphere* would be no more than $5\frac{1}{10}$ *Miles* high; and in the Aſcent of every 900 *Feet*, the *Barometer* would ſink an Inch. But the Expanſion of the *Air* encreaſing in the ſame Proportion as the incumbent Weight of the *Atmoſphere* decreaſes, that is, as the *Mercury* in the *Barometer* ſinks, the upper Parts of the *Air* are much more rarified than the lower, and each Space anſwering to an *Inch* of *Quick-ſilver*, grows greater and greater; ſo that the *Atmoſphere*, muſt be extended to a much greater Height.

To determine the Height of the Mercury at any aſſigned Height of the Air; or having that given, to find the Height of the Place where the Barometer ſtands.



Sine

Since the Expanſion of the *Air* is Reciprocally as the Height of the *Mercury*, it is evident, that by the help of the Curve of the *Hyperbola* and its *Aſymptote*, the ſaid Expanſions may be expounded to any given Height of the *Mercury*.

For by the 65th *Prop. Lib.* 2. *Conic. Mydorgii*, the Rectangles *ABCE*, *AKGE*, *ALDE*, &c. are always equal; and conſequently the Sides *CB*, *GK*, *LD*, &c. are reciprocally, as the Sides *AB*, *AK*, *AL*, &c. If then the Lines *AB*, *AK*, *AL*, be ſuppoſed equal to the Heights of the *Mercury*, or the Preſſures of the *Atmoſphere*, the Lines *CB*, *KG*, *LD* anſwering thereto, will be as the Expanſions of the *Air* under thoſe Preſſures, or the Bulks that the ſame quantity of *Air* will occupy; which Expanſions being taken infinitely many, and infinitely little (according to the Method of Indiviſibles) their Sum will give the Spaces of *Air*, between the ſeveral Heights of the *Barometer*; *viz.* the Sum of all the Lines between *CB* and *KG*, or the Area *CBKG* will be proportioned to the Diſtance or Space intercepted between the Levels of two Places in the *Air* where the *Mercury* would ſtand at the Heights repreſented by the Lines *AB*, *AK*; ſo then the Spaces of *Air* anſwering to equal Parts of *Mercury* in the *Barometer*, are as the *Area's CBKG*, *GKLD*, *DLFM*, *&c.* But theſe *Area's* are proportionate to the *Logarithms* of the Numbers expreſſing the *Rationes* of *AK* to *AB*, of *AL* to *AK*, of *AM* to *AL*, *&c.* as was demonſtrated by *Gregory* St. *Vincent*; ſo then, by the common Table of *Logarithms*, the Height of any Place of the *Atmoſphere*, having any aſſigned Height of *Mercury*, may moſt eaſily be found; for the Line *CB* in the *Hyperbola*, whereof the *Area's* deſign the *Tabular Logarithms*, being 0,0144765; 'twill be as 0, 0144765, to the difference of the *Logarithm* of 30, or any other leſſer Number, ſo 900 *Feet*, or rhe Space anſwering to an Inch of *Mercury*, if the *Air* were equally preſt with 30 *Inches* of *Mercury*, and every where alike to the Height of the *Barometer* in the *Air*, where it will ſtand at the leſſer Number of Inches: And by the Converſe of this Proportion may the Height of the *Mercury* be found, having the Altitude of the Place given.

Upon theſe Suppoſitions 'twill appear, that at the Height of 41 *Miles* the *Air* is ſo rarified, as to take up 3000 times the Space it occupies here, and at 53 *Miles* high, it would be expanded above 300000 times; but 'tis probable that the utmoſt Power of its Spring cannot exert it ſelf to ſo great an Extenſion, and that no part of the *Atmoſphere* reaches above 45 *Miles* from the Surface of the Earth.

This is further confirmed from the Obſervations of the *Crepuſculum*, which is obſerved commonly to begin and end when the *Sun* is 18 *Degrees* below the *Horizon*; for ſuppoſing the *Air* to reflect Light from its moſt rarifie Parts, and that as long as the *Sun* illuminates any of its *Atoms*, they are viſible to an Eye not intercepted by the Curvity of the Earth; it will follow that the Proportion of the Height of the whole *Air*, to the Semi-diameter of the Earth, is much about, as 1 to 90, or as the Exceſs of the *Secant* of about $8\frac{1}{2}$ Degrees to the *Radius*. For if *E* be the Eye of the Obſerver, *S* a Place where the *Sun* ſets at the end of Twilight in *E*, and the Ark *ECS*, or *TCA*, be found 18 *Degrees*, the Exceſs of the *Secant* of half thereof *ECH*, would be the Height of the *Air*, *viz.* *GH*. But the Beam of the *Sun ASH*, and the viſual Ray *EH*, do each of them ſuffer a Refraction of about 32 or 33 *Minutes*, whereby being bent inwards from *H* towards *G*, the Height of the *Air* need not be ſo great as if they went ſtrait; and having from the Angle *ECS* taken the double *Refraction* of the *Horizontal Ray*; the half of the Remainder will be $8\frac{1}{2}$ *Deg cerciter* whoſe *Secant* being 10111, it follows, that as 10000 to 111, ſo is the Semi-diameter of the Earth, ſuppoſed 4000 *Miles*, to 44, 4 *Miles*, which will be the Height of the whole *Air*, if the Places *ES*, whoſe viſible Portion of the *Atmoſphere ERZH*, and *SHKB* juſt touch one the other, be 18 *Degrees* aſunder.

At this Height the *Air*, is expanded into above 3000 times the Space it occupies here; and we have ſeen the Experience of condenſing it into the 60th part of the ſame Space; ſo that it ſhould ſeem, that the *Air* is a Subſtance capable of being compreſs'd into the 180000th part of that Space it would naturally take up when free from Preſſure.

ATMOSPHERE *of conſiſtent Bodies*: The Honourable Mr. *Boyle* hath written a ſmall Eſſay on this Subject, in which he proves, that very many, and therefore probably all *ſolid*, *firm* and *conſiſtent Bodies* (*i. e.* ſuch as are not Fluid) have, at ſome certain times (at leaſt) *effluvia* of Particles of Matter which exhale from them: For he found, that many ſuch Bodies would in a little time be very ſenſibly diminiſhed in Weight: That ſome *Electrical Bodies*, as Amber and Glaſs, would exert *that Property* uniformly all round them when they were heated; which they uſually exhibit upon Rubbing or Chafing; *viz.* That of attracting ſmall Bodies to them: That Glaſs, Stones and hard Metals, would, on being rubb'd one againſt another, ſtrongly emit not only ſenſible, but even offenſive Odours, *&c.*

ATOME, is ſuch a very ſmall Particle of Matter, that it cannot Phyſically be cut or divided into leſſer Parts: *Epicurus* and his Sect of Philoſophers, firſt called the component Principles of all Bodies, which they ſuppoſed to be infinitely ſmall and hard, by this Name of *Atoms*. Theſe *Atoms* may be ſuppoſed to have theſe 4 inſeparable Properties; 1. That they are all of the ſame Nature, Subſtance or Matter; for all Matter abſtracted from Form is the ſame. 2. That they have all ſome Magnitude or Quantity; for they are not Indiviſible Points, but Phyſical Bodies of ſome (though ſmall) determinate Bulk. 3. They have alſo all of them ſome determinate Figure or Shape. And, 4. They muſt have alſo, each of them, ſome real Gravity or Weight. To theſe *Sextus Empiricus* adds ἀντιτυπία or *Renitency*; but this rather may be ſuppoſed to be the Conſequence of their being *Solid* and *Inſectile*, which they are, as they are *Atoms*.

The Original Qualities of *Atoms* can only be their *Size* and their *Figure*, and theſe taken together make their *Form*.

ATONY, is a Faintneſs, Infirmity or Defect of Strength.

ATRA *Bilis*, is ſuppoſed to be a kind of a Sulphureous Terrene and Aduſt Salt, which being bred in the Body (ſome will needs have it in the Spleen) is circulated about in the Blood, and by that means makes and undue Fermentation in it, and is the Occaſion of Melancholly and other ſuch like Diſtempers.

ATREUS,

ATREUS, is one whose Fundament or Privy Parts are not perforated.

ATROPHY or *Tabes*, a Conſumption ariſing from want of Nouriſhment, and when either the whole Body, or ſome particular Limb, withers and decays away. Though *Tabes* is often taken only for an Ulcer in the Lungs, from whence the whole Body by degrees decays and periſhes.

ATTACHIAMENTA *Bonorum*, a Diſtreſs taken upon the Goods or Chattels of any one ſued for Perſonal Eſtate or Debt by the Legal *Attachiators* or Bayliffs, as a Security to anſwer the Action.

ATTACHIAMENTA *de Spinis & Boſco*, is the Privilege granted to the Officers of a Foreſt to take to their own uſe Thorns, Bruſh and Windfall, within ſuch Precincts or Liberties committed to their Charge.

ATTACHMENT, (in Law) is a Taking or Apprehending by Command or Writ: It differs from an *Arreſt* in this, that an *Arreſt* lies only upon the Body of a Man, whereas an *Attachment* is ſometimes on the Goods only, and ſometimes on Body and Goods.

ATTACHMENT *of Privilege*, either gives Power to apprehend a Man in a Place privileged, or by Vertue of an Office or Privilege, to call another into that Court whereunto himſelf belongeth.

ATTACHMENT *Foreign*, is a Proceſs which is uſed to attach the Goods of Foreigners found within the Liberty or City, for a Debt due to the Party himſelf.

ATTACHMENT *of the Foreſt*, is a Court held there every 40 Days throughout the Year,

ATTACK *of a Seige*, (in the Art of War) is the Effort made by the Beſiegers with Trenches, Mines, Galleries and Breaches, in order to make themſelves Maſters of a Fortreſs in Storming one of its Sides.

ATTACK *Falſe*, is that which is not vigorouſly proſecuted, ſerving only to make a Diverſion among the Beſieged, and to oblige them to divide their Forces, that the true *Attack* may be carried on with greater Succeſs.

To ATTACK *in Flank*, is to *attack* both Sides of the *Baſtion*.

To gain a Place by Right Attack, is to carry it by formal *Attack* and regular Works, without a general Storm.

ATTAINDURE, is when a Man hath committed Felony or Treaſon, and Judgment is paſſed upon him. The Children of a Perſon attainted of Treaſon cannot be Heirs to him, or any other Anceſtor; and if he were Noble and Gentile before, thereby his Poſterity are degraded and made Baſe; and this Corruption of Blood cannot be ſalved but by an Act of Parliament, or unleſs the Judgment be reverſed by Writ of Error.

ATTAINT, (in Law) is a Writ that lies where a falſe Verdict is given by twelve Men, which, if found to be a falſe Verdict, the twelve Men are *Attaint*, and the Verdict ſhall be, that their Meadows ſhall be egred, their Houſes broken down, their Woods turned up, and their Lands and Tenements forfeited to the King. But if it paſs againſt him that brought that *Attaint*, he ſhall be impriſoned, and grievouſly ranſomed at the King's Will.

ATTAQUES: See *Attack*.

ATTENTION, is to regiſter in the Memory thoſe Trains of Idea's which continually offer themſelves to the Mind, and are taken notice of.

ATTENUATING *Medicines*, are thoſe things which opening the Pores with their Acute Particles, cut the thick and viſcous Humours in the Body into ſuch ſmall Particles as that they may eaſily be circulated through the Veſſels, and ſo there is made by degrees an

ATTENUATION, or leſſening of the Power or Quantity of the Morbifick Matter.

ATTICK, a kind of *Order* in Architecture after the Manner of the City of *Athens*. *Vitruvius* makes it the Name of a *Baſis*, which the Modern Architects have ſince given to the *Dorick Pillar*. In our Buildings, the *Attick* is a little *Order* placed upon another much greater, having, inſtead of Pillars, nothing but *Pilaſters* of a particular Form or Faſhion.

ATTIRE, the Heralds call the Horns of a Stag or Buck *his Attire*.

ATTIRE, in Botany, ſignifies, according to Dr. *Grew*, the third part belonging to the Flower of a Plant; of which the two former are the *Empalement* and the *Foliation*. This *Attire* he finds to be of two kinds, *Semini-form* and *Florid*; the *Semini-form Attire* conſiſts of two Parts, *Chieves* (or the *Stamina*, as ſome call them) and *Semets* or *Apices*, one upon each *Attire*. The *Florid Attire* is uſually called *Thrums*, as in the Flowers of *Marigold*, *Tanſey*, &c. Theſe *Thrums* the Dr. calls *Suits*, which conſiſt of two, but moſt times of three Pieces; the outer Part of the *Suit* is the *Floret*, whoſe Body is divided at the Top like a *Cowſlip* Flower into 5 Parts or diſtinct Leaves.

ATTOLLENS *Auriculam*, is a Muſcle which conſiſts of divers fleſhy Fibres, and is annexed to that Part of the *Pericranium* that covers the Temporal Muſcle, whence it deſcends directly to its Implantation at the Superiour Part of the ſecond Wrinkle of the Cartilage of the Ear. Its Name ſhews its Uſe.

ATTOLENS *Oculos*, or *Superbus*, one of the ſix Pairs of Muſcles that belong to the Eye, ſerving to lift them upwards.

ATTOLENS *Nares*, a Muſcle of the Noſe, whoſe Name ſhews its Uſe.

ATTOLLENTES, are a Pair of Muſcles which acting both together, draw all the upper Lip directly upward and outward; but if only one, then one Side of the Lip is drawn obliquely.

ATTONITUS, *Stupor, ſeu Morbus Attonitus*: See *Apoplexy*.

ATTORNATO *faciendo vel recipiendo*, is a Writ which a Man owing Suit to a County, Hundred, Wapentake, or other Court, and deſiring to make an *Attorney* to appear for him, whom he doubteth whether the Sheriff or Bayliff will admit or not, purchaſeth to command him to receive and admit him.

ATTOURNMENT, (in Law) is when one is Tenant for term of Life, and he in Reverſion or Remainder grants his Right or Eſtate to another, then it behoves the Tenant for Life to agree thereto; and this Agreement is called an *Attournment*.

ATTRACTING, or *Drawing* Medicines or Things, are thoſe which opening the Pores with their little Particles, and dilating the Humours and expelling them, where their Reſiſtance is ſmaller, not only ſhews the Parts, and makes them Red,

Red, but by driving more Vapours and Humours out of the Skin and Fleſh, than can make their way thro' the thick inner Skin, gather them under it, and ſwell it into little Bladders.

ATTRACTION, is the drawing of one thing to another. Whether among the Operations of Natural Bodies one upon another, there be any ſuch thing as *Attraction*, properly ſo ſpeaking, is a Queſtion that hath been much debated amongſt Philoſophers: And perhaps *moſt* of thoſe Effects which the Ancients, not knowing ſo well the Cauſes of, did uſe to attribute to *Attraction*, may now be very well ſolved by *Pulſion*. See *James Bernouli*, *de Gravitate Ætheris*, *Amſterdam* 1683, in 8°. However the Word is retained by good Naturaliſts, and in particular, by the Excellent Sir *Iſaac Newton* in his *Principia*; but without there determining any thing of the *Quale* of it, for he doth not conſider things ſo much Phyſically, as Mathematically. This therefore being premiſed, he lays it down as an Axiom; That ſince *Action and Re-action are always equal and directly contrary to each other*; therefore if any thing Attract another, it is it ſelf alſo as much attracted by that other thing; taking *Attraction* in the largeſt and moſt general Senſe, for the *Conatus* of one Body towards another, however it be cauſed. And in *Cor.* 1. *Prop.* 58. he ſhews,

1. That if two Bodies mutually do *attract each other* (by which he means the ſame as *gravitate* towards one another) by Forces proportionable to their Diſtances, they will deſcribe both about the common Centre of Gravity, and about one another Concentrical Ellipſes; and *vice verſa*, if any Body do deſcribe ſuch Figures, their Gravitating or Attacting Forces are proportional to their Diſtances.

2. That if they Attract each other with Forces proportional to the Squares of their Diſtances, they will deſcribe both about the common Centre of Gravity, and alſo about one another, *Conick Sections*, having their *Umbilici* in the Centre about which the Figures are deſcribed; and *vice verſa*, &c.

3. He demonſtrates alſo, That any Particle of Matter within the Superficies of any Sphere or Globe, is attracted or gravitates by a Force proportional to its diſtance from the Centre; but without the Surface of the Sphere, by a Force proportional to the Square of its diſtance from the Centre, *Prop.* 73, 74. *Lib.* 1.

Hence it will follow, he ſaith,

1. That at equal Diſtances from the Centre of Homogeneal Spheres, *The Attraction will be as the Sphere.*

2. And at any Diſtance whatever, the Attracti on is as the Sphere divided by the Square of the Diſtance.

3. Which laſt holds alſo in the Attractions of Spheres towards one another; *i.e.* the Attractions are as the attracting Globes divided by the Squares of the Diſtances, tho' the Globes mutually attract each other.

The Quantity of the Force of Attraction in all Bodies at equal Diſtances, is exactly proportionable to the Quantity of Matter in the Attracting Body, as being in reality nothing but the Reſult or Sum of the united Forces of all thoſe ſingle Particles of which it is compoſed. *See Vol.* II.

ATTRACTIVE, the ſame with *Attracting*.

ATTRIBUTE, is whatever Property belongs properly to any Subſtance or Being, and is affirmed of it, or duly *attributed* to it, or *predicated* of it, as the Logicians ſpeak.

ATTRITION, in Phyſick, is the Rubbing of one thing againſt another; as when Amber and other Electrick Bodies are rubb'd, to make them attract or emit their Electrick Force.

ATTRITION, in Theology, is a Sorrow for offending God, ariſing from the Apprehenſion of being obnoxious to Puniſhment and Miſery on the Account of ſuch Offence.

ATTURNEY, or *Attorney*, in a Legal Acceptation, ſignifies one appointed by another Man to do any thing in his ſtead, and is as much as *Procurator* or *Syndicus* in the Civil Law; or *Attorneys* are ſuch Perſons, as are by the Conſent, Commandment or Requeſt of another, to take heed, ſee to, and to take upon them, the Charge of another Man's Buſineſs in his abſence.

AVANT *Foſſe*, or *Ditch of the Counterſcarp*, in Fortification, is a Moat or Ditch full of Water running round the Counterſcarp on the outſide next the Campaign at the Foot of the *Glacis*. It is not eligible to have ſuch a Water-Ditch where it can be drained dry; becauſe it is a Trench ready made for the Beſiegers to defend themſelves againſt the Sallies of the Beſieged. Beſides, it hinders putting Succours into the Place, or at leaſt makes it more difficult ſo to do.

AVAST, a Word uſed very commonly aboard a Ship, ſignifying to ſtop, hold or ſtay.

AUDIENCE *Court*, is a *Court* belonging to the Archbiſhop of *Canterbury*, of equal Authority with the *Arches Court*, tho' inferiour both in Dignity and Antiquity.

AUDIENDO *& Terminando*, is a Writ, but more properly a Commiſſion, directed to certain Perſons, when any Riotous Aſſembly, Inſurrection, or heinous Miſdemeanour, or Treſpaſs is committed againſt any Place.

AUDITA *Querela*, is a Writ that lies where one is bound in a Statute or Recogniſance, or where Judgment is given againſt him for a Debt, and his Body in Execution thereupon; for if he have a Releaſe, or any other ſufficient Diſcharge, but has no Day in Court to plead it, then he ſhall have this Writ againſt him which hath recovered, or againſt his Executors.

AUDITORY *Nerve* is the ſeventh Pair of Nerves that comes from the *Medulla Oblongata*, ariſing from the hinder part of the *Proceſſus Annularis*; it enters the Hole in the inner Proceſs of the *Os Petroſum*. It is divided into two Branches; that which is ſoft is called *Portio Mollis*, and it is diſtributed into the Labyrinth, *Cochlea*, and the Membranes which cover the Cavities of the Ear. That which is hard, is called *Portio Dura*; it goes out of the Ear by the Hole which is between the *Proceſſus Maſtoides* and *Styloides*; it is divided into two Branches, of which one goes to the Muſcles of the Tongue, or *Os Hyoides*, and it gives a ſmall Branch to the eighth Pair; the other is diſtributed in the External Ear, Noſe, Lips and Cheeks.

AUDITOR, according to our Law, is an Officer of the King or ſome other great Perſon, which yearly, by examining the Accounts of all under Officers accountable, makes up a general Book; with the Difference between their Receipts and Charge, and their Allowances, commonly called *Allocations*; as namely, the Auditors of the Exche-

quer take the Accounts of thoſe Receivers, who collect the Revenues of the Aumentation, as alſo of the Sheriffs, Eſcheators, Collectors and Cuſtomers, and ſet them down, and perfect them.

AUDITORS *of the Preſt or Impreſt*, are Officers in the *Exchequer*, who take and make up the great Accounts of *Ireland*, *Berwick*, the *Mint*, and of any Money impreſt to any Man for the King's Service.

AUDITOR *of the Receipts*, is an Officer of the *Exchequer* that files the Teller's Bills, and makes an Entry of them, and gives the Lord Treaſurer a Certificate of the Money received the Week before. He maketh *Debentures* to every Teller, before they pay any Money, and taketh their Accounts: He keepeth the *Black Book of Receipts*, and the *Treaſurer's Key* of the *Treaſury*, and ſeeth every Teller's Money lock'd up in the New Treaſury.

AVE, ſee *Aile*.

AVELANE, the Form of a Croſs which the Heralds give us, which reſembles four Filberds in their Husks or Caſes, joined together at the great End; from whence it ſeems to take its Name, for a Filberd is *Nux Avellana*.

AVENTURE, (but more properly) *Adventure*, is a Term in Law ſignifying a Miſchance, cauſing the Death of a Man without Felony, as when he is ſuddenly drowned or burnt, falling into the Water or Fire, or killed by any Diſeaſe or Miſchance.

AVENUE, (in Fortification) is an opening or inlet into any Fort, Baſtion, or ſuch like Place.

AVERAGE, (in Law) is that Service which the Tenant owes to his Lord, to be done by the Beaſts of the Tenant.

It alſo ſignifies a certain Contribution which Merchants and others pay proportionably towards their Loſſes that have their Goods caſt away in a Tempeſt, for the ſaving of the Ship or Goods, or the Lives of them that are therein.

AVERIIS *captis in Withernam*, is a Writ for the taking of Cattel to his uſe, that hath his Cattel unlawfully taken by another, and driven out of the County where they are taken, that they cannot be replevy'd.

AVERMENT, (in Law) is where a Man pleads a Plea in Abatement of the Writ, or Barr of Action, which he ſays he is ready to prove, as the Court will award. This offer to prove the Plea is called an *Averment*.

AVERPENY, is to be quit of divers Sums of Money for the King's Arrearages.

AVERRUNCATION, in Agriculture, ſignifies the lopping off ſuperfluous Branches.

AUGE, an Aſtronomical Term, the ſame as *Apogæum*, is that Point of the Orbit, wherein a Planet being, is furtheſt diſtant from the Central Body about which it revolves, and is then ſloweſt in Motion, inſomuch that from this Point the diſtance of a Planet is reckoned, to find thereby the Inequality of its Motion.

AUGMENTATION, was the Name of a Court erected by King *Henry* the Eighth, for the encreaſe of the Revenues of the Crown, by the Suppreſſion of the Abbies and Religious Houſes: This Court was diſſolved in Queen *Mary*'s Reign; but the Office of *Augmentation* remains to this Day, wherein there are many Records of great uſe and importance.

AUMONE, (Tenure in *Aumone*) is a Tenure *per liberam Eleemoſynam*, as where Lands are given to ſome Church, or Religious Houſe, upon Condition that ſome Service or Prayers ſhall be offered at certain times for the good of the Donor's Soul.

AVOWEE, is he to whom the Right of *Advowſon* of any Church appertaineth, ſo that he may preſent in his own Name; and is called *Avowee*, for a difference from thoſe that ſometimes preſent in another's Name, as a Guardian that preſenteth in the Name of his Ward: And alſo to be diſtinguiſhed from thoſe which have the Lands whereunto an *Advowſon* appertaineth, but only for term of their Lives, of Years, or by Intruſion, or by Diſſeiſin.

AVOWRY (a Law Term) is, when one takes a Diſtreſs for Rent or other thing, and the other ſues *Replevin*; now he that took the Diſtreſs juſtifying the Act, is ſaid to *Avow* it.

AURICULÆ *Cordis*, are two *Appendages* to the Heart, ſeated at its Baſis over the Ventricles; they are ſo called from ſome Reſemblance that they bear to the Ears of a Man's Head. They ariſe from a long Baſis, and end in an obtuſe Point, thereby forming an obtuſe Triangle. They are of the ſame Fabrick and uſe with the Ventricles over which they ſtand, being Muſcles as they are, made up of the ſame order of Fibres, which are carried into oppoſite Tendons; whereof that at the Baſis of the Heart is common to it and the *Auriculæ*, and the other runs along their upper part. The Right *Auricle* is larger and ſofter than the Left. The Superfices of both is ſmooth when they are full, but wrinkled when empty, and more ſo in the Left than in the Right One. On being cut open they exhibit many fleſhy Columns running from the Upper Tendon to the Lower, and between them there are pretty deep Furrows or long Cavities, but fewer in the Right Auricle than in the Left. They are dilated and contracted in like manner as the Heart is, but at different times; for the *Syſtole* of the Ventricles is at the ſame time with the *Diaſtole* of the Auricles and *vice verſa*; ſo that the Auricles are receiving their Blood from the Veins, while the Ventricles are expelling theirs into the Arteries: But when the Ventricles are relaxed and empty in their *Diaſtole*, then the Auricles force the Blood into them by their *Sylſtole*. They are nouriſhed by Branches of Arteries ſpringing from the *Coronaria*, which Dr. *Ruyſch* (who ſeems firſt to have taken notice of this) calls therefore *Arteriæ Auriculares*, and no doubt but they have Branches alſo of Veins to attend them. Their Uſe is to receive the Venal Blood which comes immediately out of the *Vena Cava* and *Pulmonaris*, and to meaſure it as it were (ſaith *Gibſon*) into the Ventricles; and to expel it thither with the greater Force, the Internal Fibres or Columns of their Cavity ariſing from their Root where they are joined to the Baſis of the Heart, reach directly outwards towards the *Vena Cava* and *Pulmonaris*; and in the *Diaſtole* of the *Auriculæ*, graſp the Blood contained in their Cavities like ſo many Fingers, and ſqueeze it into the Ventricles, now relaxed in their *Diaſtole*.

AURIGA, a Conſtellation conſiſting of 23 Stars in the *Northern* Hemiſphere.

AURIPIGMENTUM, yellow Arſenick.

AURUM *Fulminans*, or *Saffron of Gold*, is thus made; put a *Drachm* of thin Plates of Gold into a Matraſs, and then pour on it by little and little (or elſe there will be ſo great an Effervescence, that the Matter will boil over the Glaſs) 3 or 4 *Drachms* of *Aqua Regalis*. Set the Matraſs in warm Sand, and when the Ebullitions are over, the *Menſtrum* will have diſſolved as much of the

Gold

Gold as it can contain. Pour off the Solution, by Inclination, into another Glaſs, and then pour into the Mixture gradually, ſome of the Volatile Spirit of *Sal Armoniack*, or Oil of *Tartar per deliquium*, and the Gold will precipitate to the Bottom of the Glaſs: Let it ſtand a while till all is fallen down, then pour off the Liquor, and waſh the Powder carefully with warm Water till it grows inſipid: Then dry it in a Paper by a gentle Fire, taking care it do not fire, which 'tis apt to do with a terrible Noiſe. If you diſſolve a *Drachm* of Gold, there will be 4 Scruples of *Aurum Fulminans* well dried. It takes its Name from its fulminating or making a great Noiſe like Thunder, when 'tis heated over the Fire in a Spoon, for it will go off like a Gun, but without doing any Miſchief, its Force being chiefly downward. The Effect ſeems to come from ſome Parts of the *Aqua Regalis*, which remain ſtill ſticking in the Gold, and theſe being of a very Spirituous and Volatile Nature, do break out with great Violence when the Powder comes to take Fire.

Thoſe who would know a way to make as great, but yet a much leſs expenſive Noiſe, may ſee the Word *Pulvis Fulminans*. If half its Weight of *Sulphur* powdered, be mingled with *Aurum Fulminans*, its fulminating Quality will be deſtroyed.

Though on ſeveral Trials deſignedly made to make Gun-powder take Fire in Mr. *Boyle*'s exhauſted Receiver, it could not be effected; yet he found that *Aurum Fulminans* would take Fire *there*, and go off, both by means of a Burning-Glaſs, and of a Piece or hot Iron.

AURUM *Moſaicum*, is made by mixing and ſubliming Mercury, Tin, Sulphur and Sal Armoniack all together.

AURUM *Potabile*: The Alchymiſts pretend to be able to ſeparate the Salt and Sulphur of Gold, and then diſſolving it in a Liquor, it may be drank, and therefore is called *Aurum Potabile*: But this is a meer Impoſture, the *Aurum Potabile* being nothing uſually but ſome rich Cordial Liquor with Pieces of Leaf-Gold in it.

AUSTERE *Taſt*, is ſuch an one as moderately conſtringes the Mouth and Tongue with ſome Aſperity, as is the Taſt of unripe Fruits.

AUSTRAL, the ſame with *Southern*: Thus,

AUSTRAL *Signs*, are the ſix laſt Signs of the *Zodiack*; ſo called, becauſe they are on the South Side of the *Equinoctial*.

AUTHENTICKS, the Word *Authentick* ſignifies of good Authority; and therefore the 3d Volume or Tome of the Civil Law, is called *The Authenticks*, from the Greek Word αὐθεντεῖν, becauſe it hath its *Authority* from it ſelf, and proceeding from the Emperor's own Mouth; or elſe that they are Originals to other Writings which are tranſcribed out of them. They are a Volume of new Conſtitutions, ſet out by *Juſtinian* the Emperor, after the *Code*, and brought into the Body of the Law, under one Book.

There is not in theſe that good Order and Method obſerved, as there is in the *Code*, or in the *Digeſt*; but as any doubtful Point came to be conſidered, you have here the Princes Determination of it; and that ſet down as the Caſes occaſionally occurred.

The whole Volume is divided into Nine *Collations*, *Conſtitutions* or *Sections* (I mean in the Latin Verſion, for in the Greek there is not this Diviſion into *Collations*) and theſe are ſubdivided into 168 *Novels*, each of which is diſtributed into ſeveral Chapters. They are called *Novels*, becauſe they were *New Laws* in compariſon of the *Code* and *Digeſt*; juſt as the *Conſtitutions* of the Emperors which were *newly* publiſhed after the *Baſilica* were called the *Novels* of *Leo*, *Nicephorus*, *Michael*, &c.

AUTOGRAPHY, is the peculat Hand Writing of any particular Perſon; or the Original of any Treatiſe or Diſcourſe, in reſpect of a Copy.

AUTOMATA, are Mechanical or Mathematical Inſtruments or Engines, that going by a Spring, Weight, *&c.* ſeem to move of themſelves, as a Watch, a Clock, *&c.*

AUTOPSY, is Ocular Inſpection, or ſeeing a thing with our own Eyes.

AUX, the ſame with *Apogæon*.

AUXILLIARY *Verbs*, in Grammar, are ſuch as help to form or conjugate others; as *to have* and *to be* in the *Engliſh* Tongue, *Eſtre* and *Avoir* in the *French*, *Italian*, *Spaniſh*, &c.

AUXILIUM *Curiæ*, a Precept or Order of Court, for the citing or convening of one Party at the Suit of another.

AUXILIUM *Petere*, in Law, ſignifies to pray Suit in a Cauſe; that is, when an inferior Tenant is impleaded, and not capable to defend the Right in his own Name; he prayeth Aid of the Superior Lord to aſſiſt and juſtify his Plea.

AUXILIUM *Regis*, King's Aid, or Money levy'd for the King's Uſe, and publick Service.

AUXILIUM *Vicecomitum*, the Aid or Cuſtomary Dues paid to the Sheriff, for the better ſupport of his Office.

AWARD, (a Term in Law) properly ſignifying the Judgment of one that is neither aſſigned by Law, or appointed by the Judges for the ending a Matter in Controverſie, but is choſen by the Parties themſelves that are at variance.

AWN, in Botany, *Ariſta*, is the Beard growing out of the Husk of Corn or Graſs.

AWNING, aboard a Ship, is when a Sail, a Tarpaulin, or the like, is hung over any part of the Ship above the Decks, to keep off the Sun, the Rain, or the Wind. In a Long-Boat, they make an Awning by bringing the Sail over the Yard and Stay, and boming it out with the Boat-Hook.

AX or *Axe*, the ſame with *Axis*, which ſee.

AXILLAR *Veins*, are the two Branches of the aſcending Trunk of the *Vena Cava*, called *Rami Subclavii*, which running obliquely under the *Claviculæ*, as ſoon as they are paſt them, and go up to the Armpits, are called *Axillares*: And each of theſe parts it ſelf into two Veins, the *Cephalica* and *Baſilica*.

AXILLARY *Artery*, is that part of the *Subclavian* Branches of the aſcending Trunk of the *Aorta*, that is got out of the *Thorax* and comes into the Arm-pits.

AXIOM, is ſuch a common, plain, ſelf, evident and received Notion, that it cannot be made more plain and evident by Demonſtration, becauſe 'tis its ſelf much better known than any thing that can be brought to prove it; as, *That nothing can act where it is not: That a thing cannot be and not be at the ſame time: That the Whole is greater than a Part: That where there is no Law, there is no Tranſgreſſion*, &c.

AXIS, is the third *Vertebra* from the Skull.

AXIS *of a Cylinder*, is that Quieſcent Right

Line, about which the Parallelgram is turned, which by its Revolution forms the Cylinder.

AXIS *of a Conick Section*, is a Line paſſing through the Middle of the Figure, and perpendicular to the Ordinates.

AXIS *of a Figure*, is a Streight Line, conceived to proceed from the Vertex to the Baſe.

AXIS *of a Circle or Sphere*, is a Streight Line paſſing through the Center from one Side to another; and is the ſame with the *Diameter*.

AXIS *of the World*, is an imaginary Line conceived to paſs through the Center of the Earth from one Pole to another.

AXIS *of the Zodiack*, is alſo conceived to paſs through the Earth, and to be terminated in the Poles of the *Zodiack*.

AXIS *of Rotation* or Circumvolution, is an imaginary Line, about which any plain Figure is conceived to be turned to make a Solid: Thus a *Sphere* is conceived to be made by the Rotation of a Semi-circle about its Diameter, and a *Right Cone* by that of a Right angled Triangle about its Perpendicular.

AXIS *Secudus*, in the *Hyperbole* and *Ellipſis*, is the *Conjugate Diameter*, which ſee. This is ſometimes called the *Axis Rectus*.

AXIS, in *Opticks*, is the Ray which of all that are ſent to the Eye falls perpendicularly on it, and which by conſequence, paſſed through the Center of the Eye.

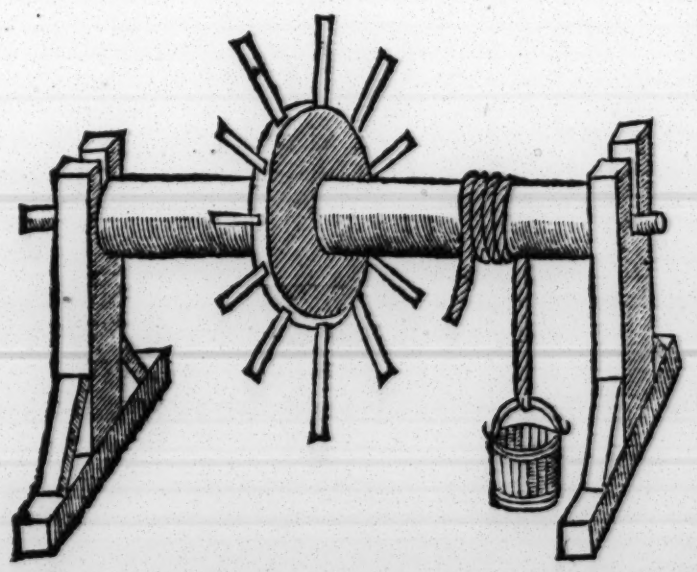
AXIS *Common or Mean*, is a Right Line drawn from the Point of Concourſe of the two *Optick Nerves* through the Middle of the Right Line which joins the Extremity of the ſame *Optick Nerves*.

AXIS *of Incidence*, in Dioptricks, is a Right Line drawn through the *Point of Incidence*, and perpendicular to the Refracting Surface.

AXIS *of Refraction*, is that which is made by the *Ray of Incidence*, directly prolonged on the Inſide of the ſecond *Medium* by the *Ray of Refraction*.

AXIS *of any Glaſs* (in Opticks) is a Right Line drawn perpendicularly through the Centre of the Glaſs; or if it be a *Convex* Glaſs, through the thickeſt Part; if a *Concave*, through the thinneſt Part (which in each is called the *Pole of the Glaſs*) directly on to the Centre of the Sphere, the Glaſs Figure is a Segment of.

AXIS *in Peritrochio*, is a Machine for the raiſing of Weights, conſiſting of a Cylindrical Beam (which is the *Axis*) lying Horizontally, and ſupported at each End by a Piece of Timber; and ſomewhere about it, it hath a kind of *Tympanum* or Wheel, which is called the *Peritrochium*, in whoſe Circumference are Holes made to put in Staves (like thoſe of a Windleſs or Capſtain) in order to turn the *Axis* round the more eaſily, and thereby to raiſe the Weight required by Means of a Rope which winds round the *Axis*. *See Vol.* II.



AXIS *Indeterminate* of an *Hyperbola*, is a Right Line which divides into two equal Parts, and at Right Angles, an infinite number of Lines drawn parallel to one another within the *Hyperbola*.

AXIS *Determinate*, in that Figure, is a Right Line drawn between the Vertexes or Tops of the oppoſite Sections or *Hyperbola*.

AXIS *Conjugatus*, in the *Hyperbola*: See *Conjugate*.

AZIMUTH, is an Arch of the Horizon comprehended between the Meridian of the Place, and any other *Azimuth Circle*; or contained between the *Prime Vertical*, and any other *Azimuth Circle*.

To find the *Azimuth* at any time: See the 11th Caſe of *Oblique angled Spherical Triangles* under the Word *Trigonometry*.

To find the Sun's *Azimuth*, as alſo the *Hour*, by the *Globe*, having the Sun's *Place* and *Altitude* given.

Rectify your Globe, and fit the Quadrant; then turn both Globe and Quadrant about till the Sun's Place cut the given Altitude in the Quadrant; for then the Index ſhews the *Hour*, and the Quadrant the *Azimuth* in the Horizon.

To find the Sun's *Azimuth* at Six, having the *Latitude of the Place*, and the *Sun's Declination* given.

Say, As the Co-Sine of the Latitude: Is to the Radius :: So is the Co-Tangent of the Sun's Declination: To the Tangent of the Sun's Azimuth at Six.

Example. Let the Latitude be 51 *Deg.* 30. *Min.* and the Sun's Declination be 11°. 30′.

Then to the Ar. co. of the Co-Sine of	51°. 30′.—0,205850
Add the Co-Tangent of	11°. 31′.—10,690891
Sum is the Tangent of	83°. 50′.=10,896741

which is the *Azimuth* at Six required.

To find the Time when the Sun will be exactly on the *Eaſt* or *Weſt Azimuth*, having the Sun's Declination and Latitude of the Place given.

Say, As the Co-Tangent of the Declination: Is to the Co-Tangent of the Latitude: : So is Radius: To the Sine of an Ark; which converted into Time, ſhews the Hour from Six.

Example. Suppoſe the Declination be 11°. 31′.
The Latitude of the Place 51. 30.

Then to the Ar. co. of the Co-Tangent of	11°. 31′.—9,309108
Add the Co-Tangent of	51 .30′.—9,900605
Sum is the Sine of	09°. 12′.=19,209713

which is 48 Minutes of an Hour.

Therefore

Therefore the Sun will be due *East* in the Morning 12 *Minutes* before 7, and *West* in the Evening 12 *Minutes* after 5.

To find the *Azimuth*, having given the Latitude of the Place, the Sun's Altitude at Six, and present Altitude.

In *Summer*.

Say, As the Co-fine of the Altitude: Is to the Tangent of the Latitude :: So is the Difference between the Sines of the Sun's Altitude at 6, and present Altitude: To the Sine of the *Azimuth* from *East* to *West*.

In *Winter*.

Say, As the Co-fine of the Altitude: Is to the Tangent of the Latitude :: So is the Sum of the Sines of the Sun's Altitude at 6, and present Altitude: To the Sine of the *Azimuth* from *East* or *West*.

AZIMUTH *Compaſs*, is an Inſtrument made in a large Box, with Jambols and a broad Limb, having 90 *Deg.* diagonally divided, with an Index and Thread to take the Sun's *Amplitude* or *Azimuth*, in order to find the Difference between the *Magnetical Meridian* and the *Sun's Meridian*, which ſhews the *Variation of the Compaſs*.

AZIMUTH *Magnetical*: See *Magnetical Azimuth*.

AZIMUTHS, or *Vertical Circles*, are great Circles interſecting each other in the *Zenith* and *Nadir*, (as *Meridians* or Hour-Circles do in the Pole) and cutting the Horizon at Right Angles.

On the *Globes* theſe Circles are not drawn, but are repreſented by the *Quadrant of Altitude* when it is Screwed in the *Zenith*.

And on theſe *Azimuths* is reckoned the Sun's Altitude, when he is not on the Meridian.

AZOTH, among the Chymiſts, ſignifies ſometimes an Univerſal Medicine, ſometimes the Mercury of a Metal.

AZURE, the Herald's Term for a Blue Colour in the Coats of all Perſons under the Degree of a Baron; but in the Eſcutcheons of the Noblemen 'tis called *Saphir*; and in thoſe of Sovereign Princes 'tis called *Jupiter*. In Engraving 'tis repreſented by Strokes or Hatches drawn only Horizontally, thus, as in the annexed Figure.

AZUGUS or AZYGOS, is a notable Branch of the *Vena Cava*, called *Vena ſine pari*, becauſe it is ſingle, having no Fellow. It deſcends thro' the right ſide of the Cavity of the Thorax, and when it is come as far as the Eighth or Ninth *Vertebra*, it begins juſt to keep the Middle, and ſends forth on each Side Intercoſtal Branches to the Interſtices of the Eight loweſt Ribs, and there is divided into two Branches, of which the Larger deſcends to the Left, betwixt the Proceſſes of the Diaphragm, and is inſerted ſometimes into the *Cava* above or below the Emulgent, but oftner into the Emulgent it ſelf. The other, which goes down on the Right-hand, enters the *Cava*, commonly a little above the Emulgent, but very ſeldom is joined to the Emulgent it ſelf.

Line, about which the Parallelgram is turned, which by its Revolution forms the Cylinder.

AXIS *of a Conick Section*, is a Line paſſing through the Middle of the Figure, and perpendicular to the Ordinates.

AXIS *of a Figure*, is a Streight Line, conceived to proceed from the Vertex to the Baſe.

AXIS *of a Circle or Sphere*, is a Streight Line paſſing through the Center from one Side to another; and is the ſame with the *Diameter*.

AXIS *of the World*, is an imaginary Line conceived to paſs through the Center of the Earth from one Pole to another.

AXIS *of the Zodiack*, is alſo conceived to paſs through the Earth, and to be terminated in the Poles of the *Zodiack*.

AXIS *of Rotation* or Circumvolution, is an imaginary Line, about which any plain Figure is conceived to be turned to make a Solid: Thus a *Sphere* is conceived to be made by the Rotation of a Semi-circle about its Diameter, and a *Right Cone* by that of a Right angled Triangle about its Perpendicular.

AXIS *Secudus*, in the *Hyperbole* and *Ellipſis*, is the *Conjugate Diameter*, which ſee. This is ſometimes called the *Axis Rectus*.

AXIS, in *Opticks*, is the Ray which of all that are ſent to the Eye falls perpendicularly on it, and which by conſequence, paſſed through the Center of the Eye.

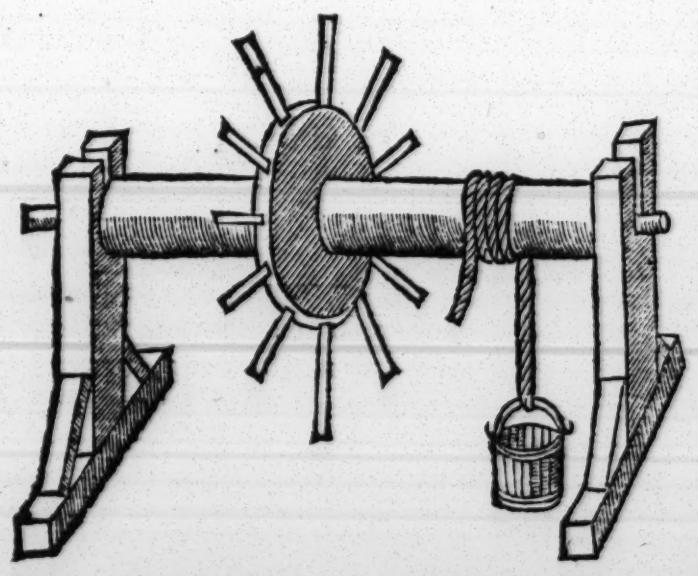
AXIS *Common or Mean*, is a Right Line drawn from the Point of Concourſe of the two *Optick Nerves* through the Middle of the Right Line which joins the Extremity of the ſame *Optick Nerves*.

AXIS *of Incidence*, in Dioptricks, is a Right Line drawn through the *Point of Incidence*, and perpendicular to the Refracting Surface.

AXIS *of Refraction*, is that which is made by the *Ray of Incidence*, directly prolonged on the Infide of the ſecond *Medium* by the *Ray of Refraction*.

AXIS *of any Glaſs* (in Opticks) is a Right Line drawn perpendicularly through the Centre of the Glaſs; or if it be a *Convex* Glaſs, through the thickeſt Part; if a *Concave*, through the thinneſt Part (which in each is called the *Pole of the Glaſs*) directly on to the Centre of the Sphere, the Glaſs Figure is a Segment of.

AXIS *in Peritrochio*, is a Machine for the raiſing of Weights, conſiſting of a Cylindrical Beam (which is the *Axis*) lying Horizontally, and ſupported at each End by a Piece of Timber; and ſomewhere about it, it hath a kind of *Tympanum* or Wheel, which is called the *Peritrochium*, in whoſe Circumference are Holes made to put in Staves (like thoſe of a Windleſs or Capſtain) in order to turn the *Axis* round the more eaſily, and thereby to raiſe the Weight required by Means of a Rope which winds round the *Axis*. *See Vol.* II.



AXIS *Indeterminate* of an *Hyperbola*, is a Right Line which divides into two equal Parts, and at Right Angles, an infinite number of Lines drawn parallel to one another within the *Hyperbola*.

AXIS *Determinate*, in that Figure, is a Right Line drawn between the Vertexes or Tops of the oppoſite Sections or *Hyperbola*.

AXIS *Conjugatus*, in the *Hyperbola*: See *Conjugate*.

AZIMUTH, is an Arch of the Horizon comprehended between the Meridian of the Place, and any other *Azimuth Circle*; or contained between the *Prime Vertical*, and any other *Azimuth Circle*.

To find the *Azimuth* at any time: See the 11th Caſe of *Oblique angled Spherical Triangles* under the Word *Trigonometry*.

To find the Sun's *Azimuth*, as alſo the *Hour*, by the *Globe*, having the Sun's *Place* and *Altitude* given.

Rectify your Globe, and fit the Quadrant; then turn both Globe and Quadrant about till the Sun's Place cut the given Altitude in the Quadrant; for then the Index ſhews the *Hour*, and the Quadrant the *Azimuth* in the Horizon.

To find the Sun's *Azimuth* at Six, having the *Latitude of the Place*, and the *Sun's Declination* given.

Say, As the Co-Sine of the Latitude: Is to the Radius :: So is the Co-Tangent of the Sun's Declination: To the Tangent of the Sun's Azimuth at Six.

Example. Let the Latitude be 51 *Deg.* 30. *Min.* and the Sun's Declination be 11°. 30′.

Then to the Ar. co. of the Co-Sine of 51°. 30′.—0,205850
Add the Co-Tangent of 11°. 31′.—10,690891

Sum is the Tangent of 83°. 50′.=10,896741 which is the *Azimuth* at Six required.

To find the Time when the Sun will be exactly on the *Eaſt* or *Weſt Azimuth*, having the Sun's Declination and Latitude of the Place given.

Say, As the Co-Tangent of the Declination: Is to the Co-Tangent of the Latitude: : So is Radius: To the Sine of an Ark; which converted into Time, ſhews the Hour from Six.

Example. Suppoſe the Declination be 11°. 31′.
The Latitude of the Place 51. 30.

Then to the Ar. co. of the Co-Tangent of 11°. 31′.— 9,309108
Add the Co-Tangent of 51 .30′.— 9,900605

Sum is the Sine of 09°. 12′.=19,209713 which is 48 Minutes of an Hour.

Therefore

Therefore the Sun will be due *East* in the Morning 12 *Minutes* before 7, and *West* in the Evening 12 *Minutes* after 5.

To find the *Azimuth*, having given the Latitude of the Place, the Sun's Altitude at Six, and present Altitude.

In *Summer*.

Say, As the Co-fine of the Altitude: Is to the Tangent of the Latitude :: So is the Difference between the Sines of the Sun's Altitude at 6, and present Altitude: To the Sine of the *Azimuth* from *East* to *West*.

In *Winter*.

Say, As the Co-fine of the Altitude: Is to the Tangent of the Latitude :: So is the Sum of the Sines of the Sun's Altitude at 6, and present Altitude: To the Sine of the *Azimuth* from *East* or *West*.

AZIMUTH *Compaſs*, is an Inſtrument made in a large Box, with Jambols and a broad Limb, having 90 *Deg.* diagonally divided, with an Index and Thread to take the Sun's *Amplitude* or *Azimuth*, in order to find the Difference between the *Magnetical Meridian* and the *Sun's Meridian*, which ſhews the *Variation of the Compaſs*.

AZIMUTH *Magnetical*: See *Magnetical Azimuth*.

AZIMUTHS, or *Vertical Circles*, are great Circles interſecting each other in the *Zenith* and *Nadir*, (as *Meridians* or Hour-Circles do in the Pole) and cutting the Horizon at Right Angles.

On the *Globes* theſe Circles are not drawn, but are repreſented by the *Quadrant of Altitude* when it is Screwed in the *Zenith*.

And on theſe *Azimuths* is reckoned the Sun's Altitude, when he is not on the Meridian.

AZOTH, among the Chymiſts, ſignifies ſometimes an Univerſal Medicine, ſometimes the Mercury of a Metal.

AZURE, the Herald's Term for a Blue Colour in the Coats of all Perſons under the Degree of a Baron; but in the Eſcutcheons of the Noblemen 'tis called *Saphir*; and in thoſe of Sovereign Princes 'tis called *Jupiter*. In Engraving 'tis repreſented by Strokes or Hatches drawn only Horizontally, thus, as in the annexed Figure.

AZUGUS or AZYGOS, is a notable Branch of the *Vena Cava*, called *Vena ſine pari*, becauſe it is ſingle, having no Fellow. It deſcends thro' the right ſide of the Cavity of the Thorax, and when it is come as far as the Eighth or Ninth *Vertebra*, it begins juſt to keep the Middle, and ſends forth on each Side Intercoſtal Branches to the Interſtices of the Eight loweſt Ribs, and there is divided into two Branches, of which the Larger deſcends to the Left, betwixt the Proceſſes of the Diaphragm, and is inſerted ſometimes into the *Cava* above or below the Emulgent, but oftner into the Emulgent it ſelf. The other, which goes down on the Right-hand, enters the *Cava*, commonly a little above the Emulgent, but very ſeldom is joined to the Emulgent it ſelf.

BACCIFEROUS *Plants*, whether Trees, Shrubs or Herbs, are ſuch as bear Berries; and Berries are Fruits covered with a thin Membrane, in which is contained a Pulp, which grows ſoft and moiſt when ripe, and contains the Seed within the Subſtance. The *Bacciferous Herbs* are the *Chamæmorus*, *Smilax aſpera*, *Bryonia Alba* and *Nigra*, *Angelica Baccifera*, *Aconitum Racemoſum*, *Solanum Racemoſum Americanum*, *Hypogloſſum*, *Laurus Alexandrina*, *Oxymyrſine*, *Polygonatum*, *Lilium Convallium*, *Monophyllon*, *Mandragora*, *Herba Paris*, *Solanum Lethale*, *Malum Inſanum*, *Solanum Vulgare*, *Alſine Baccifera*, *Solanum Somniferum*, *Alkekengi*, *Aſparagus*, *Vitis Idæi palluſtris*, &c.

The *Bacciferous Trees*, Mr. *Ray* divides into four kinds.

1. Such as bear a Caliculate or Naked Berry, the Flower and Calix both falling off together, and leaving the Berry bare, as the *Saſſafras Tree*, &c.

2. Such as have a Naked, *Monopyrenous* Fruit, *i. e.* containing in it only one Seed; as the *Arbutus Terebinthus*, *Lentiſcus*, *Viſcus*, *Phylleræa*, *Sambucus*, *Aquaticus*, *Laureola*, *Chamælæa Germanica* (or *Mezereon*) *Viburnum*, *Cornus*, *Rhamnus*, &c.

3. Such as have alſo a Naked but *Polypyrenous* Fruit; *i. e.* one containing two or more Kernels or Seeds within it; as the *Jaſaminum*, *Liguſtrum*, *Alnus*, *Berberis*, *Alaternus*, *Sambucus Vulgaris*, *Vitis*, the *Tea Plant*, *Euonymus Vulgaris*, *Agrifolium*, *Rhamnus Catharticus*, *Capparis*, *Erica Baccifera*, &c.

4. Such as have their Fruit compoſed of many *Acini* or round ſoft Balls (for the Word *Acinus*, in Botany, is rather a *Grape* than a *Grape-ſtone*) ſet cloſe together like a Bunch of Grapes; as the *Uva Marina*, *Rubus Vulgaris*, *Rubus Idæus*, and the *Rubus minor fructu Cæruleo*.

BACCIVOROUS *Creatures*, are ſuch Animals as feed upon Berries.

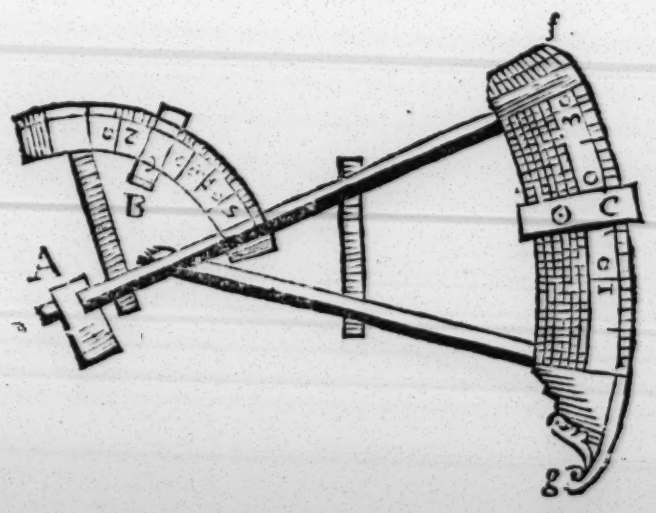
BACCERIND *Thief*, (a Term in Law) ſignifying a Thief taken with the Manner (as the ſay) *i. e.* having on his Back or about him, thoſe things he hath ſtollen. It is by ſome taken for an Offender againſt Vert or Veniſon in the Foreſt.

BACCHIUS, is a Foot of a Latin Verſe, conſiſting of three Syllables, where the firſt is ſhort, and the two laſt long, as *Egeſtas*: This is the Reverſe of a *Dactyle*.

BACILLI, are thoſe Medicines which are of a long round Figure like a Stick, *&c.*

BACK STAYS, of a Ship, ſee *Stays*.

BACK-STAFF, the ſame with *Davis*'s Quadrant, or the *Engliſh* Quadrant, as 'tis called by the



French. 'Twas invented by one Capt. *Davis* a *Welchman*; and is a Sea Inſtrument of good uſe to take the Sun's Altitude at Sea. It conſiſts of three Vanes *A*, *B* and *C*; and of two Arches.

The Vane at *A* is called the *Horizon Vane*; that at *B* the *Shade Vane*; and that at *C* the *Sight Vane*. The leſſer Ark *B* is of 60 *Degrees*, and that of *C* (or *f g*) of 30 *Degrees*. In time of Obſervation the Shadow Vane *B* is ſet upon the 60 Arch juſt to an even Degree of ſome Altitude leſs than you judge the Complement of the Sun's Altitude will be, by 10 or 15 *Degrees*. The Horizon Vane is put on at *A*, and the Sight Vane on the 30th Ark *f g*; and then the Obſerver's Back being turned to the Sun (whence the Name of *Back-Staff* or *Back-Quadrant*) he lifts up the Inſtrument, and looks thro' the Sight Vane, riſing or falling the Quadrant till the Shadow of the upper Edge of the *Shade Vane* fall on the upper Edge of the Slit in the *Horizon Vane*; and if then you can ſee the Horizon thro' the ſaid Slit, the Obſervation is well made: But if the Sea appear inſtead of the Horizon, move the Sight Vane lower towards *g*; If the Sky appear, move it upwards towards *f*: and ſo try till it comes right.

Then obſerve how many Degrees and Minutes are cut by that Edge of the *Sight Vane*, which anſwers to the *Sight Hole*, and to them add the Degrees cut by the upper Edge of the *Shade Vane*: The Sum is the Sun's Diſtance from the Zenith, or the Complement of his Altitude.

To find the *Meridian Altitude* by this Inſtrument, you muſt continue the Obſervation as long as you perceive the Altitude to be increaſing; which you will find by the Sea's appearing ſtill thro' the Slit inſtead of the Horizon, and as you move the *Sight Vane* lower: But as ſoon as ever you ſee the Sky appear inſtead of the Horizon, the Altitude is then diminiſhing, and you muſt deſiſt; and adding as before the Degree and Minutes on the two Arks together into one Sum, it gives the Sun's Zenith Diſtance, or his Co-Altitude; and this ſubſtracted from 90°. leaves the true Altitude above the Horizon.

That excellent Aſtronomer Mr. *Flamſtead*, contrived a Glaſs Lens or double Convex to be placed in the Middle of the *Shade Vane*, which makes a ſmall bright Spot on the Slit of the Horizon Vane, inſtead of the Shade: And this is a great Improvement, if the Glaſs be truly made, for by this Means the Inſtrument may be uſed in Hazy Weather, and a much more accurate Obſervation made in clear Weather, than could be by the Shadow.

But after all, this Quadrant is by no Means ſo accurate as could be wiſhed; and a large heavy Braſs Aſtrolabe muſt needs be a much better Inſtrument.

BACULE (in Fortification) is a kind of Port-Cullis or Gate made like a Pit-fall with a Counterpoiſe, and ſupported by two great Stakes. 'Tis uſually made before the *Corps de Gards* advanced near the Gates.

BACULOMETRY, according to ſome, is the Art of meaſuring acceſſible and inacceſſible Lines, by the help of one or more Staves.

BADGER (in Law) is one that is Licenced to buy Corn or other Victuals in one Place, and carry it to another.

BAILE or *Bale*; the Seamen call lading or casting the Water by Hand out of a Boat *Bailing*; and when the Water is thus Bailed out, they say, the *Boat is freed*. They call also those Hoops that bear up the Tilt of a Boat *Bailes*.

BAILE (in Law) is the setting at liberty one Arrested or Imprisoned upon an Action either Civil or Criminal, under Sureties taken for his Appearance at a Day and Place certainly assigned: And there is both *Common* and *Special Baile*; *Common Baile* is in Actions of small Prejudice, or slight Proof, in which Case any Sureties are taken: *Special Baile* is given in Cases of greater Weight, who must be subsidy Men at the least, and they according to the Value.

BAILEMENT (a Term in Law) signifying the Delivery of things, whether Writings or Goods, to another, sometimes to be delivered back to the Bailor, that is, to him that so delivers them, sometimes to the use of him to whom they are delivered; and sometimes to a third Person.

BAILIFF, is an Officer that belongs to a Mannor, to order the Husbandry, and hath Authority to pay Quit-Rents issuing out of the Mannor, sell Trees, repair Houses, *&c.* This Officer is he whom the ancient *Saxons* called a *Reeve*.

BAILIFF *Errant*, is one that the Sheriff makes and appoints to go about the Country to execute Writs, to summon the Country Sessions, Assizes, *&c.*

BAILIFF *Franchises*, are those which are appointed by every Lord within his Liberty, to do such Offices within his Precincts, as the *Bailiff Errant* doth abroad in the Country.

BAILIWICK, is the Jurisdiction of a Bailiff within his Lord's Franchise.

BAKER's *Central Rule* for Constructing Equations: See *Constructions of Equations*.

BALANI, are certain Excresences usually growing to the Shells of the larger sorts of Sea Shell-Fishes.

BALANUS (as it is called by some) or *Glans*, is the Nut of the Yard covered with the Foreskin; sometimes the *Clitoris* is so called. It often also signifies a Suppository. *Blanchard*.

BALL *and Socket*, is an Instrument made of Brass, with a perpetual Screw to hold any *Telescope*, *Quadrant*, or *Surveying Instrument*, on a Staff for Surveying, Astronomical, or other uses.

BALLANCE or *Libra*, is one of the Six simple Powers in *Mechanicks*, which serves to find out the Equality or Difference of Weights in heavy Bodies. It is only a double Lever whose *Hypomochlion* is at the Centre of its length.

BALLANCE *of the Air*, see *Barometer*.

BALLANCE *of a Watch or Clock*, is that part of it, which by its Motion regulates and determines the *Beats*: The circular Part of it is called the *Rim*, and its Spindle the *Verge*: There belongs to it also two *Pallats* or *Nuts*, which play in the Fangs of the Crown-wheel. In Pocket Watches that strong stud, in which the lower *Pevet* of the *Verge* plays; and in the Middle of which one *Pevet* of the Crown-wheel runs, is called the *Potans*, or rather *Potence*. The wrought Piece which covers the *Ballance*, and in which the upper *Pevet* of the *Ballance* plays, is the *Cock*. The small Spring in new Pocket Watches is called *Regulator*.

BALLANCE or *Libra*, is the Name of one of the twelve Signs of the *Zodiack*; into the first Degree of which when the Sun comes, the Autumnal Equinox happens, and is the 12th of *September*.

BALLAST *of a Ship*, is some heavy Matter, as Stones, *&c.* laid in the Hold next to the Keelson or false Keel, in order to keep a Ship stiff, so that she may bear the more Sail. The Words about it are *Trench the Ballast*, *i. e.* divide it into two or more Parts. The *Ballast is Shot*, that is, 'tis run over from one Side to the other: When a Ship hath not Ballast enough, they say she is *Walt*,

BALLESTER, or *Balluster*, in the Capital of the *Ionick Column*, is the lateral Part of the Scroll which makes the *Curl-turf*,

BALLISTA, an ancient Warlike Engine to cast or shoot Darts or Stones, to batter and shake City Walls.

BALLIVO *amovendo*, is a Writ to remove a Bailiff out of his Office, for want of sufficient living in his Bailiwick.

BALLON or *Balon*, is the *French* Word for a large Receiver or Vessel used in Chymistry, to receive what is distilled or drawn off by the Fire.

BALLON, in Architecture, is taken for a round Globe, or top of a Pillar.

BALLS or *Ballets*, a frequent Bearing in Coats of Arms; but they are never called so in Heraldy, but according to their several Colours have the following Names;

Besants, when the Colour is Or.
Plates, when 'tis Argent.
Hurts, when 'tis Azure.
Torteauxes, when 'tis Gules.
Pomeis, when 'tis Vert.
Pellets or *Agresses*, when Sable. Some write it *Ogresses*.
Golpes, when Purpure.
Orenges, when Tenne.
Guzes, when Sanguine.

And these Nine contain all the Colours usually mentioned Heraldy.

BALLUSTRADE, in Architecture, signifies a Row of little turn'd Pillars, high enough for a Man to rest his Elbows on, fixed upon a Terrass, or upon the Top of a Building; or to make any Separation between one Part of it and another.

BALNEUM, a Word much used by the Chymists; it properly signifies a Vessel of Water, in which the *Body* or *Cucurbite* containing any Matter to be *distilled* is placed, that so the Water heating, may heat the Cucurbite gently and by degrees. And this is what they call corruptly.

BALNEUM *Mariæ*; but it should be *Balneum Maris*, *i. e.* a *Sea* or *Water Bath*. And in respect to the Mildness of the Heat in this way of Distillation, where the Fire never touches the *Cucurbite* immediately. They call several other gentle ways of Distillation by the Name of *Balneum*, as.

BALNEUM *Vaporosum*, where the Vessel containing the Matter to be distilled heated by the Steam of hot or boiling Water.

BALNEUM *Arenæ* or *Sineris*; which they call also sometimes *Balneum Brenosum*, and *Balneum Cinereum*, is when the Cucurbite, or Retort, or Vessel holding the Matter to be distilled is placed in a Pot of *Sand* or *Ashes*, and so is heated by the Heat of the Sand of Ashes.

BALSAM, signifies, 1*st*. The Juice of an *Arabian* Tree called *Opobalsamum*, to which are allied the Natural Balsams, as that of *Toli*, *Peru*, *&c.*

2*dly*, A

2*dly*. A ſometime thick and odoriferous, ſpirituous and penetrating Subſtance, of the Conſiſtence of an Ointment, as *Apoplextick Balſam*, *Balſam of Roſes*, *&c.*

3*dly*, A ſort of Liquors drawn or extracted from Gums and Reſinous Subſtances with Spirit of Wine.

4*thly*, This Name is given alſo by the Chymiſts to the Solutions and Preparations of ſome Salts, as Balſam of *Saturn*, *Tartar*, *Sal-gemm*, *&c.*

5*thly*, Some particular Preparations of Medicines in this Form are called by this Name, as *Balſam of Sulphur*, *&c.*

BALSAM *of Saturn*, is a Solution of *Saccharum Saturni* made with Spirit of Oil of *Turpentine*, and digeſted till the Matter hath gained a Red Tincture.

BAN, is a Proclamation made at the Head of a Body of Troops, or in the ſeveral Quarters of the Army, by ſound of Trumpet or beat of Drums, either of obſerving or Martial Diſcipline, for declaring a New Officer, puniſhing a Soldier, or the like.

BANDELET, is a *French* Term for one of the Ornaments in Architecture, which they call alſo *Regle*: 'Tis greater than the *Liſt*, but a little leſs than what they call a *Platte Bande*; it encompaſſes the Pillar quite round about like a Ring.

BANK, in Common Law, ſignifies the Bench or Seat of Judgment: But there is another ſort of *Bank*, where there is a great Sum of Money let out to uſe, returned by Exchange, or otherwiſe diſpoſed to Profit.

BANKRUPT, one that hath conſumed his Eſtate, or is run out in his Trade.

BANNIMUS, the Form of Expulſion of any Member from the Univerſity of *Oxford*, affixing the Sentence, up in ſome Publick Place, as a Denunciation or Promulgation of it.

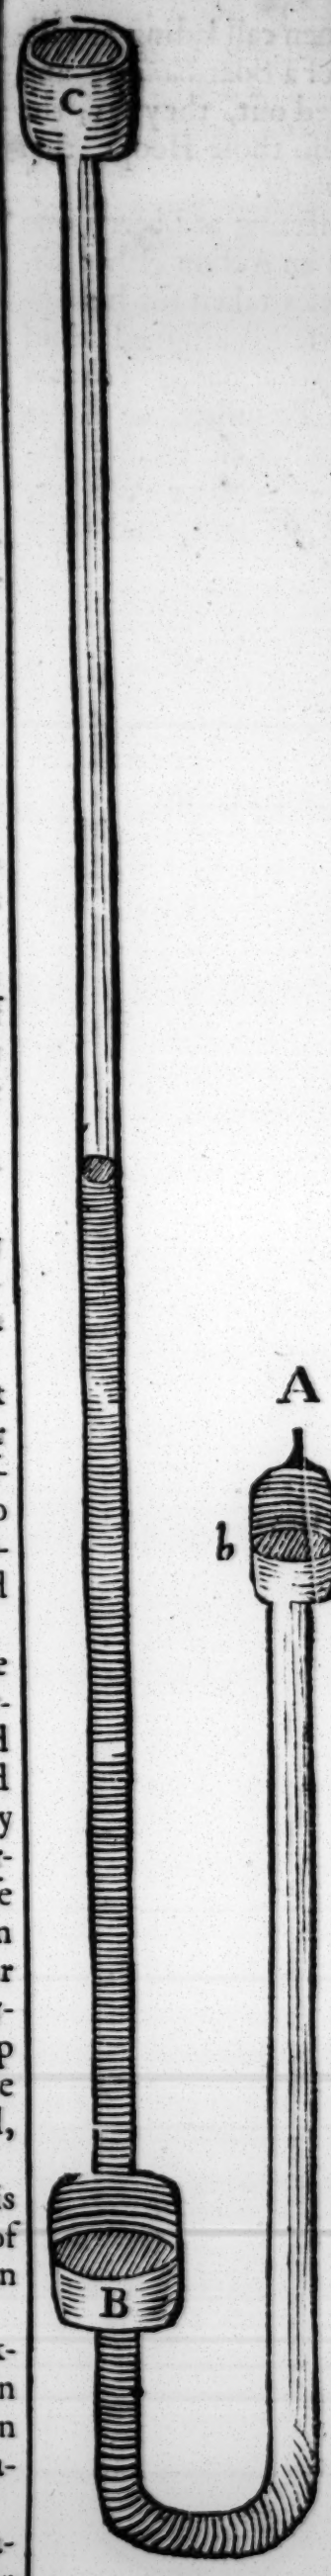
BANQUETTE, in Fortification, is a little Foot Pace or Elevation of Earth in Form of a Step, or the Bottom of a *Parapet*, or that which the Muſqueteers get up to diſcover the *Counteſcarp*, or to fire upon the Enemies in the *Moat*, or in the *Covertway*. Theſe *Banquets* are generally a Foot and a half high, and almoſt three Foot broad.

BARAK or *Baraque*, is an Hutt like a little Cottage for Soldiers to lie in the Camp: Formerly thoſe for the Horſe were called *Baracks*, and thoſe for the Foot *Hutts*; but now *Barack* is uſed for both indifferently. They are made uſually when the Soldiers have no Tents, or when an Army lies long in a Place in bad Weather, becauſe they keep out Cold and Wet much better than Tents. They are generally made by fixing four ſtrong forked Poles in the Ground, and then laying four others acroſs them; then they build up the Walls with Sods, Wattles, or what the Place affords: The Top is either Planked or Thatched, or covered with Turf, as they have Convenience.

BARBE, a Military Word: To fire *an Barbe* is the fire the Cannon over the Parapet, inſtead of putting them through the Embrazures; but then the Parapet muſt be but 3 Foot and $\frac{1}{2}$ high.

BAROCO, one of the barbarous Words expreſſing the Syllogiſtick Moods in Logick; and in this Mood *Baroco*, the firſt Propoſition muſt be an univerſal Affirmative, and the two other Negatives.

BAROMETER, is an Inſtrument for eſtimating the Minute Variations of the *Weight* or *Preſſure* of the Incumbent Air, conſiſting of a long *Tube* of *Glaſs*, *hermetically* ſealed at one End, and being filled with *Quick-ſilver* (according to the *Torricellian* Experiment) is inverted, ſo as to have the open End of it immerſed in Stagnant Quick-ſilver, contained in a larger Glaſs under it, and expoſed to the Preſſure of the outward Air: Out of which open End (after ſuch Immerſion) the Quick-ſilver in the Tube being ſuffered to run as much as it will into the Stagnant Quck-ſilver, in which that Mouth or open End is immerſed, there is wont to remain a Cylinder of Quck-ſilver, ſuſpended in the Tube about 28, 29, or 30 Inches high; meaſuring from the Surface of the *Stagnant Quick-ſilver* perpendicularly; but more or leſs within ſuch Limits, according as the Weight or Preſſure of the Air incumbent on the external ſtagnant Quick-ſilver expoſed to it, is greater or leſſer, leaving the upper Part of the Tube void, or at leaſt empty of common Air.



Dr. *Hook*'s Contrivance to enlarge the Diviſions of the *Barometer* in any given Proportion.

The Glaſs this *Barometer* is repreſented by the adjoining Figure; the Cylinder *A* may be of what Diameter you pleaſe, the bigger the better, but it need not be above two Inches long; the Cane *A D* muſt be ſo long, that the upper Part of the Cylinder *B* may be 29 Inche + ſuch a Part of the Height of the other Cane *B C*, as the Weight or Specifick Gravity of the Liquor that is to fill that Cane is to the Specifick Gravity of *Mercury* below the Line *a b*, in the Cylinder *A*. The third Cylinder *C* may be as high as you pleaſe above the Cylinder *B*, but is moſt conveniently made, ſo as the Square of the Diameter of the Cane *B C* be to the Square of the Diameter of the Cylinders *B* or *C* (which muſt be exactly equal) as the riſe of the

Mercury

Mercury in the Cylinder *B*, is to the whole Length of the Cane *BC*; for in this caſe there will be nothing ſuperfluous, but the Diviſions enlarged to the utmoſt advantage.

To fill this *Baroſcope*;

Let a ſmall Hole be left at the top of the Cylinder *A*, and another near the top of the Cylinder *B*; this latter being well ſtopt, pour in as much *Mercury* at the other Hole in *A*, as ſhall fill both Canes as high as the Level of the ſaid Hole; which done, ſtop either by Hermetically Sealing it, or elſe by a drop of Sealing-wax (the Glaſs being firſt ground rough to make it ſtick) the Hole in *A*; then opening the Hole in *B*, draw off as much of the *Mercury* of the Cane *BC* till it will run no longer; which done, ſtop firmly the Hole in *B* (which you may do as you pleaſe, there being no Preſſure againſt you) and you will have the Cylinder *A* evacuated of *Air* for your purpoſe, and the height of the *Mercury* will be as uſual in the ordinary *Plain* and *Wheel-Barometers*.

Then pour into the Cane *BC* as much Spirit of Wine tinged with *Chochinele* and Oyl of *Turpentine*, equal Parts of each, as ſhall ſtand above the Surface of the *Mercury*, ſo many Feet as you make the enlarged Scale of your *Barometer*, or as is between the middle of the Cylinders *B* and *C*, and you will find the *Mercury* ſink in the Cane *BC*, and riſe in the Cane *AD*, in ſuch proportion, that each 13 Feet of Oyl and Spirit, will raiſe the *Mercury* 10 Inches: Then you muſt pour on, by the Cane *BC*, ſo much *Mercury* as will fill up the Cylinders *A* and *B* to ſuch heights, conſidering the preſent weight of the *Atmoſphere*, that the Surface of the *Mercury* in both, may at the utmoſt Limits, (which have not in *England* been found to exceed 30,6 and 28,6 Inches) always fall within the Bodies of the Cylinders, and never enter into the Canes.

The Effect of this *Baroſcope* will be, that when the *Atmoſphere* is heavy, and the *Mercury* raiſed high in the Cylinder *A*, and retired out of *B*, the *Spirit of Wine* will deſcend into the Cylinder *B*, and the *Oyl of Turpentine* will fill the Cane, ſo as to make the Partition of the two Liquors near the Cylinder *B*. But on the contrary, when the Air is light, the *Mercury* will ſink in *A*, and riſe in *B*, ſo as to drive the *Spirit of Wine* into the Cane, and the *Oyl of Turpentine* into the Cylinder *C*; ſo that the Section of the two Liquors will be near *C*, and the Variation of the height of the *Mercury* will be enlarged into almoſt the length of the Cane, without that the Counter-preſſure from the Liquors will not be in the leaſt altered, the Height and Weight of the Incumbent Cylinder being always the ſame.

The Ingenious Mr. *Hauksbee* (that invented the new Cupping-Glaſſes without Fire, now generally uſed: See his *Air-pump*) ſhewed me a *Baroſcope* where the *Mercury* roſe and fell 60 Inches with very great eaſe, and without breaking or dividing; and it may very eaſily be made for 100 or 200 Inches, if a ſtrait ſmall thin Glaſs Tube can be blown and drawn of that length, and that it were as eaſily manageable.

The *Torricellian* Experiment is made in a Tube of about 31 Inches in length, with a ſmall Ball, or rather Cylindrical Cavity on the Top; at the Bottom of this Tube, at *A*, is a very ſmall Ciſtern with *Mercury* in it, and communicating with the free Air, into which the lower End of the Tube *AB* is put; then at a very Acute Angle, is the ſmall Tube *CD* placed with its open Orifice in the aforeſaid Ciſtern, and juſt under the Surface of the Mercury in it. And thus when the *Atmoſphere* is high and heavy (that is in dry and fair Weather) the Mercury being preſſed up into the Tube *BA*, leaves but little in the Ciſtern, and conſequently there is but a little Weight of Mercury there, to preſs any out into the Tube *CD*, and conſequently then the Mercury will fall or deſcend towards *C*. But when in contrary Weather, the Mercury falls out of the Tube *AB*, there will be more in the Ciſtern, and conſequently the Mercury muſt aſcend further, or run higher up into the Tube *CD*. And this is ſo tender and nice, that while I was in the Room, and looking on it, which was not above an Hour, the Mercury aſcended near 2 Inches (for Rain) in the ſlope Tube.

One great Advantage this Way of managing a ſloping Tube, ſeems to have above the Common One, which is, that the Mercury here moves all together in a Body, without breaking or dragging a Tail after it.

See the Figure of the Plate belonging to the Word Air-Pump.

Baroſcope Statical: So Mr. *Boyle* calls an Inſtrument which he invented to eſtimate the Variations of the Air's Gravity, and is thus deſcrib'd.

A very large and thin Glaſs Bubble (or if ſuch an one cannot be procured, 2 or 3 ſmaller ones added together may do) was counterpoiſed in a very tender Balance which would turn with the 64th Part of a Grain, and then all being hung up in a Frame, he found, that as the Air grew lighter and thinner, the Bubble would preponderate very manifeſtly; but when the Air grew thicker and denſer, the Scale in which the Weights were, would grow heavier, and mount up the Bubble. And this Effect he found would continue and anſwer exactly to the riſe and fall of the Mercury in the common *Barometer* or *Baroſcope*.

The Grounds on which this Noble Gentleman went in contriving this Inſtrument, were theſe:

1. He conſidered, that tho' at firſt ſetting of it up, the Bubble and the Weights would be in *Æquilibrio*, becauſe he carefully made them ſo; yet the Bulk of the Bubble did exceed that of the Metalline Counterpoiſe, by near 200 times (be it more or leſs, according to the Specifick Gravity of the Weights uſed) and therefore he conſidered.

2. That, according to the Laws of Hydroſtaticks, when two Bodies being of the ſame abſolute Weight, but very different Bulks, come to be weighed in another Medium, they can no longer be equiponderant: For if the Medium be heavier or denſer, the greater Body will be more buoyed up there than it was before, and conſtantly will abate of its Weight; but if the Medium ſhould be lighter and rarer, the contrary Effect would follow, and the Weight would be heavier than the Bubble. He conſidered alſo, that this muſt be the Caſe of the Air, whoſe Specifick Gravity is continually changing, according to the various Effluvia it receives from the Terraqueous Globe, and conſequently, that it muſt needs be now denſer, now rarer, and accordingly more or leſs buoy up the Bubble.

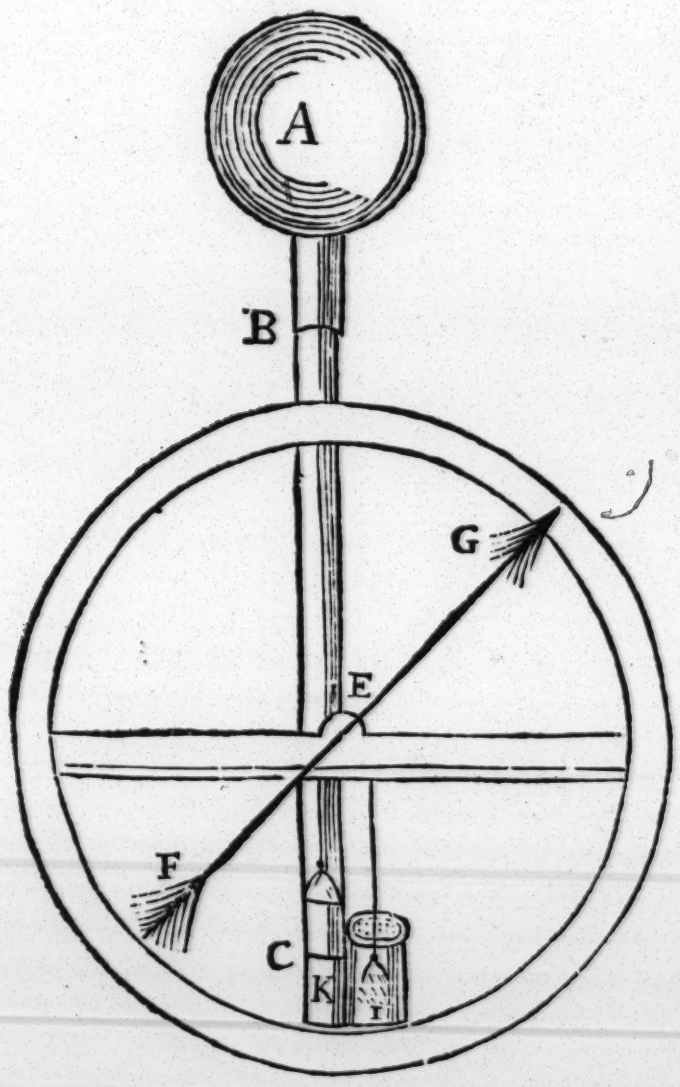
Our Author hints, that this Inſtrument is capable of ſeveral Improvements; and tho' in many Caſes the common *Baroſcope* be preferable before it, yet this hath ſome Advantages above that; as, 1. That this is more parable than the other;

for many Perſons can more eaſily get a Pair of good Scales and a Glaſs Bubble, than they can a Tube and Mercury for the common *Baroſcope*; and this alſo is much more eaſily fitted up than that. This *Statical Baroſcope* is alſo much more eaſily carried from Place to Place. This *Baroſcope* may be adjuſted to the ordinary one, by finding what Weights anſwer exactly to every half Quarter of an Inch of the riſe and fall of the Mercury; and theſe may help us to gueſs at the uſual Variations of the Weather, by ſhewing how much is wanting to bring the Scales to an Æquilibrium.

Alſo an Arch of a Circle, well graduated, may be fitted ſo as that the Tongue of the Balance ſhall play freely by it, and there ſhew the Change of the Gravity of the Atmoſphere, without the Addition of any new Weights at all.

WHEEL-BAROMETER, is a Contrivance for the applying of an *Index* to any *Common Baroſcope*, whether the Glaſs be only a ſingle Cane, or have a round Bolt-head at the Top; and by the Means thereof, the Variation of the Altitude of the *Mercurial Cylinder*, which at moſt is hardly 3 Inches, may be made as diſtinguiſhable as if it were 3 Foot or 3 Yards, or as much more as is deſired.

The *Wheel-Barometer* was invented by Dr. *Hook*, the Manner whereof is viſible in the Figure, where *A B C* repreſents the Tube, which may be either Blunt or with a Head, as *A B C* (by which latter Shape, more room is allowed for any remainder of Air to expand the better.) This is to be filled with Quick-ſilver, and inverted as commonly, and put



into a Veſſel of Stagnant Mercury, made after the Faſhion of *I K*, that is, having its Side about 3 or 4 Inches high, and the Cavity of it equally big both above and below; and if it can be (beſides that Part which is filled by the End of the *Mercurial Tube* that ſtands in it) of equal Capacity with the Hollow of the Cane about *B*, for then the Quick-ſilver riſing as much in the Hollow of *I*, as it deſcends at *B*, the Difference of the Height in the Receiver *I*, will be juſt half the uſual Difference. And if the receiving Veſſel *I K* have a bigger Cavity, the Difference will be leſs; but if leſs, the Difference will be greater. But whether the Difference be made hereby bigger or leſs, 'tis no great Matter, ſince by the Contrivance of the *Wheel* and *Index*, the leaſt Variation may be made as ſenſible as is deſired, by diminiſhing the Bigneſs of the *Cylinder E*, and lengthening the *Index F G*, according to the Proportion requiſite.

But this *Wheel-Barometer* not anſwering fully the deſigned Exactneſs, becauſe the Mercury is apt to ſtick about the Sides of the Glaſs, and would riſe and fall by Leaps, and all at once; and becauſe alſo 'tis very difficult to adjuſt the Ball and Thread, *&c.* and that the Inſtrument is very apt to be out of Order, *&c.* 'tis now out of uſe. And therefore in *Philoſ. Tranſact. N.* 185. the Doctor gives us another Contrivance, (which he had thought of in the Year 1668) by putting the Spirit of Wine, or ſome other Liquor that will not freeze, upon the Mercury; which was deſigned to riſe as the Mercury falls, and fall as it riſes. And by this Means he could, he ſaith, enlarge the Diviſions as much as he pleaſed.

MARINE BAROMETER, is an Inſtrument contrived by Dr. *Hook*, for the Uſe of thoſe that would make a Philoſophical Experiment at Sea.

For the *Mercurial Barometer* requiring a perpendicular Poſture, and the Quick-ſilver vibrating therein with great Violence upon any Agitation, is therefore uncapable of being made at Sea, (tho' it hath lately been contrived to be made portable) ſo it remain'd to find out ſome other Principle, wherein the Poſition of the Inſtrument was not ſo indiſpenſably neceſſary: For this the above-named Perſon invented. Its Deſcription and Uſes the Ingenious Capt. *Halley* in *Philoſ. Tranſact.* N°. 269. gives as follows.

It is about 40 Years ſince, that the *Thermometers* of *Robert de Fluctibus*, depending on the Dilatation and Contraction of included Air by Heat and Cold, have been diſuſed, upon diſcovery, that the Air's Preſſure is unequal; that Inequality mixing it ſelf with the Effects of the Warmth of the Air in that Inſtrument; and inſtead thereof, was ſubſtituted the ſealed *Thermometer* including Spirit of Wine (firſt brought into *England* out of *Italy* by Sir *Robert Southwell*) as a proper Standard of the Temper of the Air, in relation to Heat and Cold, that Ætherial Spirit being of all the known Liquors the moſt ſuſceptible of Dilatation and Contraction, eſpecially with a moderate Degree of either Heat or Cold.

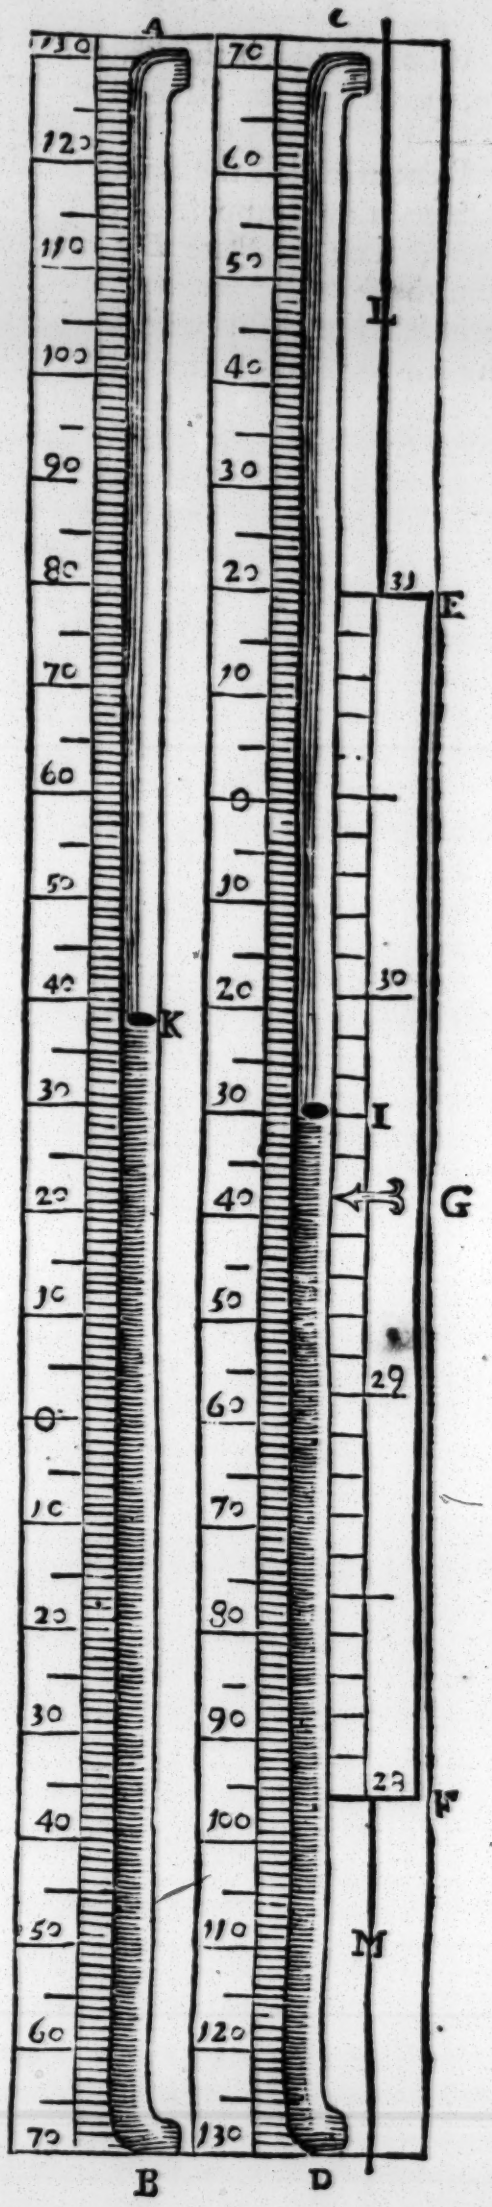
Now this being allow'd as a Standard, and the *Thermometer* that includes the Air being graduated with the ſame Diviſions, ſo as at the time when the Air was included to agree with the *Spirit-Thermometer* in all Degrees of Heat and Cold, noting at the ſame time the preciſe Height of the *Mercury* in the common *Barometers*; it will readily be underſtood, that whereſoever theſe two *Thermometers* ſhall agree, the Preſſure of the Air is the ſame it was when the Air was included and the Inſtrument graduated; that if in the *Air-Thermometer*, the Liquor ſtand higher than the Diviſions marked thereon, correſponding with that on the Spirit Glaſs, it is an Indication that there is a greater Preſſure of the Air at that time, than when the Inſtrument was graduated. And on the

the contrary, it is to be concluded, when the Air-Glaſs ſtands lower than the Spitit, *viz.* that then the Air is ſo much lighter, and the Quick-ſilver in the ordinary Barometers lower than at the ſaid time of Graduation.

And the Spaces anſwering to an Inch of *Mercury*, will be more or leſs, according to the Quantity of Air ſo included, and the Smallneſs of the Glaſs Cane in which the Liquor riſes and falls; and may be augmented almoſt in any Proportion, under that of the *Specifick Gravity* of the Liquor of the *Thermometer* to *Mercury*, ſo as to have a Foot or more for an Inch of Mercury, which is another great Convenience.

In theſe Parts of the World, long Experience has told us, That the Riſing of the *Mercury* forebodes Fair Weather after Foul, and an Eaſterly or Northerly Wind; and that the falling thereof, on the contrary, ſignifies Southerly or Weſterly Winds, with Rain and Stormy Winds, or both; which latter it is of much more conſequence to provide againſt at Sea than at Land; and in a Storm, the *Mercury* beginning to Riſe, is a ſure Sign that it begins to abate, as hath been experienced in high Latitudes, both to the Northwards and Southwards of the Equator.

The Form of this Inſtrument is repreſented by the following Figure.



A B repreſents the *Spirit Thermometer* graduated from *O*, or the Freezing Point, through all the poſſible Degrees of Heat or Cold of the Air, at leaſt in theſe Climates.

C D is the *Air-Thermometer*, graduated after the ſame Manner with the like Degrees.

E F is a Plate applied to the Side of the *Thermometer C D*, graduated into Spaces anſwering to Inches, and Parts of an Inch of Mercury, in the Common Barometers.

G, a Hand ſtanding on the Plate, at the Height of the *Mercury* thereon, as it was when the Inſtrument was graduated; as ſuppoſe here at 29½ Inches.

L M a Wire on which the Plate *E F* ſlips up and down, parallel to the Cane of the *Thermometer C D*.

K, any Point at which the Spirit ſtands at the time of Obſervation; ſuppoſe at 38 on the *Spirit-Thermometer*; ſlide the Plate *E F* till the Hand *G* at 38 on the *Air-Thermometer*, and if the Liquor therein ſtand at 38 likewiſe, then is the Preſſure of the Air the ſame as at the time of Graduation, *viz.* 29, 5; but if it ſtand higher, as at 30 at *L*, then is the Preſſure of the Air greater, and the Diviſions on the ſliding Plate againſt the Liquor, ſhew the preſent Height of the *Mercury* to be 29, 7 Inches.

This may ſuffice as to the Manner of uſing it.

Capt. *Halley* had one of theſe Glaſſes with him in his laſt *Southern* Voyage; and he ſaith, it never failed to give him early Notice of a Storm, and of all the bad Weather they had.

The ſame Ingenious Gentleman, in *Philoſ. Tranſact. N.* 187, hath an excellent Diſcourſe upon the Reaſons of the Riſe and Fall of the Mercury in Fair and Foul Weather: the Subſtance of which is as follows.

1. He premiſes the commonly obſerved *Phænomena* of the Mercurial Baroſcope; which are,

1. That in Calm Weather, when the Air is enclined to Rain, the Mercury is commonly low.

2. That 'tis generally high in good, ſerene, ſettled, fair Weather.

3. That it ſinks loweſt of all on very great Winds, though they are not accompanied with Rain; with Relation to the Point of the Compaſs the Wind blows upon.

4. That, *cæteris paribus*, the greateſt Height of the Mercury is found, when an *Eaſterly* or *North-Eaſterly* Wind blows.

5. That in Calm Froſty Weather the Mercury generally is high.

6. That after very great Storms of Wind, when the Mercury hath been low, it uſually riſes again very faſt.

7. That more *Northerly* Places have a greater Alteration of the Riſe and Fall of the Mercury than the more *Southerly*.

8. That within the Tropicks, and near them, there is little or no Variation of the Mercury's Height in all Weathers.

As to which two laſt *Phænomena*'s, Mr. *Patrick*, the Famous Barometer-maker, tells me, That he hath certain Accounts, that the greateſt Variation of the Baroſcope is in the Latitude of 45°. *N.* or *S.* and that the Riſe and Fall gradually decreaſes towards the Equator and Poles, ſo as in either of thoſe Regions ſcarcely to vary at all.

The Theory that Mr. *Halley* advances to ſolve all which *Phænomena*, is this:

1. He ſuppoſes the principal Cauſe of the riſe and fall of the Mercury, is from the variable Winds, which are found in the *Temperate Zones*, and whoſe great Inconſtancy here in *England* is moſt notorious.

2. A ſecond Cauſe is the uncertain Exhalation and Precipitation of Vapours lodging in the Air, whereby it comes to be at one time much more crowded than at another, and conſequently heavier; but thoſe latter, in a great meaſnre, depend upon the former. Now from theſe Principles, he explicates the ſeveral *Phænomena* of the *Barometer*.

1. *Why in Calm Weather, the Air being inclined to Rain, the* Mercury *is commonly low?*

That the *Mercury*'s being low is an Indication of Rain, becauſe the *Air* being light, the Vapours are no longer ſupported thereby, as being become ſpecifically heavier than the *Medium* wherein they floated; ſo that they deſcend towards the Earth, and in their fall meeting with other Aqueous Particles, they incorporate together, and form little drops of Rain; but the *Mercury*'s being at one time lower than at another, is the Effect of two contrary Winds blowing from the Place where the *Barometer* ſtands; whereby the *Air* of that Place is carried both ways from it, and conſequently, the incumbent Cylinder of *Air* is diminiſhed, and accordingly the *Mercury* ſinks; as for Inſtance, if in the *German Ocean* it ſhould blow a Gale of *Weſterly* Wind, and at the ſame time an *Eaſterly* Wind in the *Iriſh* Sea,; or if in *France* it ſhould blow a *Southerly* Wind, and in *Scotland* a *Northern*, it muſt he granted me, that that part of the *Atmoſphere*, impendant over *England*, would thereby be exhauſted and attenuated, and the *Mercury* would ſubſide, and the Vapours which before floated in thoſe parts of the *Air*, of equal Gravity with themſelves, would ſink to the Earth.

2. *Why in ſerene, good, ſettled Weather, the* Mercury *is generally high?* That the greater height of th *Barometer*, is occaſioned by two contrary Winds blowing *towards* the place of Obſervation, whereby the *Air* of other Places is brought thither, and accumulated; ſo that the Incumbent Cylinder of *Air* being encreaſed both in Height and Weight, the *Mercury* preſſed thereby, muſt needs riſe and ſtand high, as long as the Winds continue ſo to blow; and then the *Air* being ſpecifically heavier, the Vapours are better kept ſuſpended, ſo that they have no Inclination to precipitate and fall down in Drops, which is the reaſon of the ſerene good Weather which attends the greater heights of the *Mercury*.

3. *Why, upon very great Winds or Storms, though accompanied with no Rain, the* Mercury *ſinks loweſt of all, with relation to the Point of the Compaſs upon which the Wind blows?*

This is cauſed by the very rapid Motion of the *Air* in theſe Storms; for the Tract or Region of the Earth's Surface wherein theſe Winds rage, not extending all round the Globe; that Stagnant *Air*, which is left behind, as likewiſe on the ſides, cannot come in ſo faſt as to ſupply the Evacuation made by ſo ſwift a Current; ſo that the *Air* muſt neceſſarily be attenuated when and where the ſaid Winds continue to blow, and that more or leſs according to their Violence. Add to which, that the Horizontal Motion of the *Air*, being ſo quick as it is, may in all probability take off ſome part of the perpendicular Preſſure thereof; and the great Agitation of its Particles, is the reaſon why the Vapours are diſſipated, and do not condenſe into Drops, ſo as to form Rain, otherwiſe the natural Conſquence of the *Air*'s Rarefaction.

4. *Why*, cæteris paribus, *the* Mercury *ſtands higheſt upon an Eaſterly or North-Eaſterly Wind?*

This happens becauſe that in the *Atlantick Ocean*, on this ſide 35th *degree* of *North-Latitude*, the *Weſterly* and *South-weſterly* Winds blow almoſt always *Trade*; ſo that whenever here the Wind comes up at *Eaſt* and *North-Eaſt*, 'tis ſure to be check'd

check'd by a contrary Gale, as ſoon as it reaches the *Ocean*; wherefore, according to what is made out in the Second Remark, the *Air* muſt needs be heaped over this *Iſland*; and conſequently the *Mercury* muſt ſtand high, as often as theſe Winds blow. This holds true in this Country, but is not a general Rule for others, where the Winds are under different Circumſtances; and he himſelf hath ſometimes ſeen the *Mercury* here as low as 29 Inches upon an *Eaſterly* Wind, but then it blew exceeding hard, and ſo comes to be accounted for by what was obſerved upon the third Remark.

5. *Why in calm froſty Weather the* Mercury *generally ſtands high?*

The Cauſe thereof is, That it ſeldom freezes but when the Winds come out of the *Northern* and *North-Eaſtern* Quarters; or at leaſt, unleſs thoſe Winds blow at no great diſtance off, for the *Northern* Parts of *Germany*, *Denmark*, *Sweden*, *Norway*, and all that tract from whence *North-Eaſtern* Winds come, are ſubject to almoſt continual Froſt all the Winter; and thereby the lower *Air* is very much condenſed, and in that ſtate is brought hitherwards by thoſe Winds, and being accumulated by the Oppoſition of the *Weſterly* Wind blowing in the Ocean, the *Mercury* muſt needs be preſt to a more than ordinary height, and as a concurring cauſe, the ſhrinking of the lower Parts of the *Air* into leſſer room by cold, muſt needs cauſe a deſcent of the upper Parts of the *Atmoſphere*, to reduce the Cavity made by this Contraction to an *Æquilibrium*.

6. *Why after very great Storms of Wind, when the* Mercury *has been very low, it generally riſes again very faſt.*

This, he tells you, he has frequently obſerved, and once found it riſen an Inch and a half in leſs than ſix Hours, after a long continued Storm of *South-Weſt* Wind. This ſeems to be occaſioned by the ſudden acceſſion of new *Air* to ſupply the great Evacuation which ſuch continued Storms make thereof in thoſe places where they happen, and by the Recoil of the *Air*, after the Force ceaſes that impelled it; and the reaſon why the *Mercury* riſes ſo faſt, is, becauſe the *Air* being very much rarified beyond its mean Denſity, the neighbouring *Air* runs in the more ſwiftly to bring it to an *Æquilibrium*; as we ſee Water runs the faſter for having great Declivity.

7. *Why in more* Northerly *Places, the Variations of the* Barometer *are greater than in more* Southerly?

The Truth of the matter of fact is proved from Obſervation made at *Clermont* and *Paris*, compared with others made at *Stockholm*, as may be ſeen in the *Appendix* to Mr. *Paſcal*'s Book, *De l' Equilibre des Liquors*. The Reaſon ſeems to be, that the more *Northerly* Parts have uſually greater Storms of Wind then the more *Southerly*, whereby the *Mercury* ſhould ſink lower in that Extream; and then the *Northerly* Winds bring the condenſed and ponderous *Air* from the Neighbourhood of the Pole, and that again being check'd by a *Southerly* Wind, at no great diſtance, and ſo heaped, muſt of neceſſity make the *Mercury* in ſuch caſe ſtand higher on the other Extream.

8. *Why near the* Equinoctial, *as at* Barbadoes *and St.* Helena, *there is very little or no Variation of the Height of the* Barometer?

This Remark, above all others, confirms the *Hypotheſis* of the variable Winds, being the cauſe of theſe Variations of the Height of the *Mercury*, for in the places above-named, there is always an eaſy Gale of Wind blowing nearly upon the ſame Point, *viz. E. N. E.* at *Barbadoes*, and *E. S. E.* at St. *Helena*, ſo that there being no contrary Current of the *Air*, to exhauſt or accumulate it, the *Atmoſphere* continues much in the ſame ſtate: However, upon *Hurricanes*, the moſt violent of Storms, the *Mercury* has been obſerved very low but this is but for once in 2 or 3 Years, and it ſoon recovers its ſettled ſtate of about 29½ Inches: And there is no doubt but the ſame thing is in the *Eaſt* Coaſt of *Africa*, and in *India*, where the *Monſoons* or Winds are Trade for half the Year one way, and half the Year another; only 'tis probable, that there may ſomething worth noting happen, about the time of the change or ſhifting of the Winds; which might be obtained if any Body had the Curioſity to keep the *Barometer* at our *Factories* in *India*.

Snowden-Hill in *North-Wales* was meaſured by Mr. *Caſwell* with Mr. *Adams*'s Inſtruments, and found to be 1240 Yards high.

Mr. *Halley* found by 3 exact tryals the *Mercury* in the *Baroſcope* deſcended at its top 3 Inches, 8 Tenths, and ſomething more, and perhaps 4 Inches may be near enough Truth; if ſo, then divide 1240 by 4, the Quotient is 310 Yards; ſo that any fall of the *Mercury* 1 Inch, argues an Aſcent of juſt 310 Yards in height; but according to Mr. *Halley*'s Account of 3, 8 Inches, he makes 30 Yards height to anſwer to one tenth of an Inch fall; we therefore allow juſt 30 Yards (for Mr. *Halley* thought the fall of the *Mercury* more than $3,\frac{8}{10}$ Inches;) if ſo, then if Dr. *Hook*'s new *Baroſcope* will bear Diviſions of one tenth of an Inch into ten more ſenſible Parts (as I believe it will) each of thoſe ten Parts will anſwer to 3 Yards, and ſo by its help one may take the Level of Places very well, to convey Water, *&c.*

When the *Mercury* is at 30 Inches in the *Baroſcope* (whence may be computed the middle height) the *Atmoſphere* is 5 Miles and ½ high (that is, ſuppoſing the *Air* to be of the ſame Denſity all along; tho' in all probability it is not, but grows more rare in proportion to its Height, which will much encreaſe the Height of the *Atmoſphere.*)

The Ingenious Mr. *Derham*, Rector of *Upminſter*, in *Philoſ. Tranſ. N.* 236, gives an Account of ſome Experiments he made at the Top and Bottom of the Monument; where he found, that at the Height of 32 Feet, the *Mercury* fell $\frac{1}{10}$ of an Inch; and at about 164 Feet, $\frac{2}{12}$ of an Inch, *&c.*

He there alſo deſcribes a *Portable Barometer*, which he conceives might be of great uſe in ſuch Experiments.

In *Philoſ. Tranſ.* N°. 237, he gives a Contrivance to meaſure the Height of the Mercury in the *Barometer*, by a Circle on one of the Weather Plates, to the Hundredth Part of an Inch exactly.

In *Philoſ. Tranſ.* N°. 240, Mr. *Stephen Gray* ſhews alſo a Method of meaſuring the Height of the Mercury in the *Barometer*, by adapting a *double Microſcope* furniſh'd with a *Micrometer* to the *Baroſcope*, by Means of which, the *Mercury*'s Variations may be obſerved to the Thouſandth Part of an Inch.

The following Rules to judge of the Weather by the *Barometer*, I had from Mr. *John Patrick* in *Ship-Court* in the *Old Baily*, the *Torricellian Operator*; and they are the Reſult of his own long Experience and Obſervation.

Rules

Rules and Obſervations on the various Riſing *and* Falling *of the* Mercury, *to foreknow the* Weather *by the* Barometer.

1. It hath been obſerved, That the Motion of the Mercury doth not exceed 3 Inches in its riſing or falling, in the *Barometer* of the Common Form.

2. That its leaſt Alterations are to be minded, in order to the right finding the Weather by it.

3. The riſing of the Mercury preſages, in general, fair Weather; and its falling Foul, as Rain, Snow, high Winds, and Storms.

4. In very hot Weather the falling of the Mercury foreſhews Thunder.

5. In Winter the Riſing preſages Froſt; and in froſty Weather, if the Mercury falls three or four Diviſions, there will certainly follow a Thaw; but in a *continued Froſt*, if the Mercury riſes, it will certainly Snow.

6. When foul Weather happens *ſoon* after the falling of the Mercury, expect but little of it; and judge the ſame when the Weather proves fair *ſhortly* after the Mercury has riſen.

7. In foul Weather, when the Mercury riſes much and high, and ſo continues for two or three Days before the foul Weather is over, then expect a *continuance* of fair Weather to follow.

8. In fair Weather, when the Mercury falls much and low, and thus continues for two or three Days before the Rain comes, then expect a great deal of Wet, and probably high Winds.

9. The unſettled Motion of the Mercury denotes uncertain and changeable Weather.

10. You are not ſo ſtrictly to mind the Words that are engraven on the Plates, tho' for the moſt part it will agree with them, as the Mercury's riſing and falling; for if it ſtands at much Rain, and then riſes up to changeable, it preſages fair Weather; altho' not to continue ſo long as it would have done if the Mercury were higher; and ſo on the contrary.

And I think my ſelf obliged in Juſtice to tell the World, That I have never ſeen better Weather-Glaſſes of all kinds made any where, than by Mr. *Patrick*; who doth really deſerve all poſſible Encouragement for the many Experiments he hath made in order to improve the *Barometer*, and which he is always very willing to ſhew to all Ingenious and Curious Perſons. And tho' I cannot be of Dr. *Leigh*'s Opinion, who in *P.* 16. and 180 of his *Natural Hiſtory of* Lancaſhire, *&c.* ſaith, Mr. *Patrick*'s Experiments demonſtrate, that the Suſpenſion of the Mercury in the Tube is not cauſed by the Weight of the Incumbent Atmoſphere, ſince on a very careful Examination of all Mr. *Patrick*'s Experiments, I find them all accountable by the Doctrine of the Gravitation of Fluids; yet do I really believe the making and conſidering thoſe Experiments, hath given Mr. *Patrick* many uſeful Hints for the Improvement of this Inſtrument, and will continue to do ſo daily. His *Pendent Barometer* is very curious and nice, the Scale being graduated for it by an Air-Pump; it hath no Ciſtern of Stagnant Mercury at the Bottom of the Tube, as in the common Torricellian Experiment; and the Mercury riſes and falls about 12 Inches inſtead of 3, as in the ordinary Barometer: And in a *Diagonal* one (which he very handſomly fits about the Frame of a large Looking-Glaſs, with a Thermometer alſo by it the Mercury riſes and falls near 30 Inches; and) conſequently, the changes of the Weather will be much ſooner perceptable in theſe Inſtruments, than in the *Barometers* of the common Form.

BARON *and Feme*; the Term in Heraldry, when the Coats of Arms of a Man and his Wife are born *per* Pale in the ſame Eſcutcheon, the Man's always on the *Dexter* Side, and the Woman's on the *Siniſter* or Left. But here the Wife is not an Heireſs, for then her Coat muſt be born by the Husband on an Ineſcutcheon or Eſcutcheon of Pretence.

At Common Law theſe words ſignify only a Man and his Wife.

BAROSCOPE, the ſame with *Barometer*: Which ſee.

BARR *of the Port*: See *Shackles*.

BARR, in Heraldry, is a ſmaller *Feſſe*, containing but the fifth Part of the *Field*, whereas the *Feſſe* contains the *Third*.

BARR (in Law) is when the Defendant in any Action pleads a Plea which is a ſufficient Anſwer, and deſtroys the Action of the Plaintiff for ever.

BARR FEE, is a Fee of twenty Pence, which every Priſoner acquitted of Felony pays to the Sheriff or Goaler.

BARREL, is a pretty large Cavity behind the *Tympanum* of the Ear; it is about three or four Lines deep, and five or ſix wide. It is Lined with a fine Membrane, on which there are ſeveral Veins and Arteries. In this Cavity there are four ſmall ſolid Bones, not covered with a *Perioſteum* as the reſt of the Bones of the Body are.

BARREL: See in *Fuſey*.

BARRELS *of Earth*, uſed in Fortification, are as it were half *Hogſheads*, which being fill'd with *Earth*, ſerve for Parapets; as alſo to break the *Galleries* made in the Ditch, and to roll into the *Breaches*.

BARRETOR (in Law) ſignifies a common Wrangler, ſtirrer up, or maintainer of Suits and Quarrels, either in Courts or in Country.

BARRETRY, a Word uſed in Policies of Inſurance for Ships, and ſignifies Diſſentions and Quarrels among the Officers and Seamen.

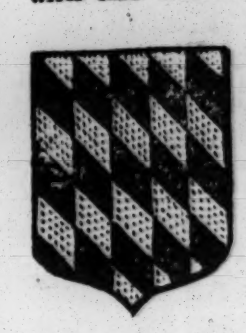
BARRIERS, in Fortification are great Stakes, about four or five Foot high, placed at the diſtance of eight or ten Foot one from another, with their Tranſoms or overthwart Rafters, to ſtop either Horſe or Foot that would enter or ruſh in with Violence. Theſe *Barriers* are commonly ſet up in the void Space between the Cittadel and the Town in Half-moons, *&c.*

BARRICADO, a Warlike Defence of empty Barrels and ſuch-like Veſſels fill'd with Earth, Carts, Trees cut down, againſt an Enemy's Shot or Aſſault; but generally are Trees cut with ſix Faces, which are croſs'd with Battoons as long as a Half-Pike, bound about with Iron at the Feet. Theſe are uſually ſet up in Paſſages or Breaches to keep back as well the Horſe as Foot.

BARRISTERS, in Common Law, are of two ſorts; 1. The Outward or *Utter Barriſters*, who by their long Study in, and Knowledge of the Law (which muſt be for a Term of ſeven Years at leaſt) are called to publick Practice, and undertake the Defence of their Clients Cauſes: Theſe always plead without the Barr. 2. The *Inner Barriſters*, who becauſe they are either *Attorney*, *Sollicitor*, *Serjeant*, or Council to the King, are allowed, out of Reſpect, the Privilege of Pleading within the Barr. But at the Rolls and ſome other inferiour Courts, all *Barriſters* are admitted within the Barr. *Blunt*.

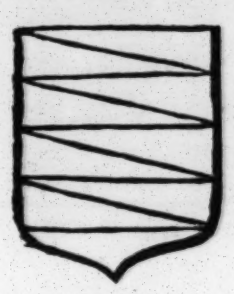
BARRULET, in Heraldry, is the Half of the *Closet*, and the Quarter of the *Barr*.

BARRY, when an Escutcheon is divided *Barr-ways* into an *even Number* of Partitions; 'tis to be expressed in Blazon by the Word *Barry*, and the number of Pieces is to be specified. But if the Divisions be odd, then the Field must be first nam'd, and the number of Bars expres's'd. See *Paly*.



BARRY-BENDY, is when an Esutcheon is divided evenly, both Barr and Bend-ways; as thus.

Barry, Bendy, Argent, and *Sable.*



BARRY-PILY, is when a Coat is thus divided; and 'tis to be Blazoned, *Barry-Pily*, of eight Pieces.
Vid. Guillim, P. 279.

BARTER, a Word used for the Exchange of Wares for Wares.

BARYPHONY, is a Difficulty in Speaking.

BASE, in Fortification, is the exterior Side of the Polygon, *viz.* the Imaginary Line which is drawn from the *Flank'd Angle* of a *Bastion* to that which is opposite thereto.

BASE or *Basis*, in Architecture, is the Foot of a Pillar that sustaineth it, or that Part which is under the Body, and lies upon the Pedestal or Zocle when there is any: Therefore 'tis not used for the lowest Part of a Column, but for all the several Ornaments or Mouldings which reach from *Apophyges* or the rising of the Shafts of Pillars to the *Plinth*..

BASE FEE, or *Base Estate*, is a holding at the Will of the Lord.

BASE COURT (in Law) is any Court that is not of Record.

BASE *of a Triangle*, any one Side of a *Triangle* may be called the *Base*, but usually, and most properly that Side which lies parallel to the *Horizon* is taken for the *Base*. 'Tis also the same as to any other Right lin'd Figure.

BASE *of any Solid Figure*, is its lowermost Side, or that on which it stands.

BASE, *of a Conick Section* (if it have one) is a Right Line in the *Hyperbola* and *Parabola*, arising from the common Intersection of the *Secant Plane* and the *Base* of the *Cone*.

BASE, the least sort of Ordnance, the Diameter of whose Bore is $1\frac{1}{4}$ Inch, Weight 200 Pound, Length 4 Foot, Load 50 Pound, Shot $\frac{1}{2}$ Pound Weight, and $1\frac{1}{8}$ Inch Diameter.

BASE RING, of a Cannon, is the great Ring next behind the Touch-hole.

BASE POINT, in an Escutcheon: See *Escutcheon*.

BASE TENURE, or holding by Villanage or other customary Service, as distinguish'd from the Higher Tenure, *in Capite*, or by Military Service.

BASILARE OS, the same with *Sphænoides*.

BASILICA, is the inner Vein of the Arm, called *Hepatica*, the Liver Vein, it being the inferior Branch of the *Axillaris*, divided into 3 Branches under the Tendon of the *Musculus Pectoralis*.

BASILICA, in the Ancient Architecture, was a great Hall which had two Ranges of Pillars, and two Isles and Wings with Galleries over them. These great Halls were at first made for the Palaces of Princes, afterwards they were turned into Courts of Justice, and at last into Churches.

BASILICK CONSTITUTIONS, were an Abridgment and Reform of the Laws of *Justinian*, made in the Reigns of *Basilius* and *Leo* (whence they had their Name) and were in force in the Eastern Empire till its Dissolution.

BASILICUS, *Cor. Leonis*, a fixed Star of the first Magnitude in the Constellation *Leo*; it *Longitude* is 145°. 21'. *Latitude* 00, 26'. Right Ascension 147 *Deg.* 47. *Min.*

BASIOGLOSSUM (see *Hypsiloglossum*) is a Pair of Muscles that depress the Tongue: It arises Fleshy from the Basis of the *Os Hyoides*.

BASIS, in Anatomy is the upper and broader Part of the Heart, opposite to the *Mucro* or Point: Also the Foundation of the Bone *Hyoides*.

BASKETS *of Earth*: See *Corbeills*.

BASIS, in Musick, is the lowest of all the Parts thereof, which serves as a Foundation to the others.

BAS-RELIEF: See *Relief*.

BASS ENCEINT, or *Bas's Enclosure*, the same with the *Fausse Bray* in Fortification, which see.

BASTON, in Fortification, is now what was anciently called a *Bulwark*: It consists of two *Faces*, as many *Flanks*, formerly a *Gorge*. It is usually made at the Angles or Forts, of a large heap of Earth, sometimes lined with Stone, but usually faced with Sods. The Lines terminating it are *two Faces*, *two Flanks*, and *two Demigorges*. The Union of the two Faces makes the outmost Angle, called the *Angle of the Bastion*. The Union of the two Faces to the two Flanks, makes the Side Angles called the *Shoulders* or *Epaules*; and the Union of the two other Ends of the Flanks to the two Curtains, forms the Angles of the Flanks.

BASTIONS *Solid*, are those that have their Earth equal to the Height of the *Rampart*, without any void Space toward the Centre.

BASTIONS *Void* or *Hollow*, are those that have a *Rampart* and *Parapet* ranging only round about their Flanks and Faces, so that a void Space is left toward the Centre, and the Ground is there so low, that if the *Rampart* be taken, no Retrenchment can be made in the Centre, but what will lie under the Fire of the Besieged.

FLAT BASTION, is that which is built on a Right Line.

CUT BASTION, is that which makes a Reentring Angle at the Point; and is sometimes called,

BASTION *with a Tenaille*, whose Point is cut off, and makes an Angle inwards, and two Points outwards: This is done when Water, *&c.* hinders carrying the Bastion to its full extent, or when it should be too sharp.

BASTION *Composed*, is when the two Sides of the interior Polygon are very unequal, which makes the *Gorges* also unequal.

BASTION *Deformed*, is that which wants one of its *Demi-Gorges*, because one Side of the Interior Polygon is so very short.

BASTION *Demi*, hath but one Face and Flank, and is uſually before a Horn-work or Crown-work. This is alſo called an *Epaulment*.

BASTION *Double*, is that which on the Plain of the great Baſtion hath another Baſtion built higher, leaving 12 or 18 Feet between the Parapet of the lower and the Foot of the higher.

BASTION *Flat*, if the Diſtance between the Angles of the Interior Polygon be double the uſual length, then a Baſtion is made in the middle before the Curtain; but it generally hath this diſadvantage, that unleſs there be an extraordinary Breadth allowed to the Moat, the turning Angle of the Counterſcarp runs back too far into the Ditch, and hinders the Sight and Defence of the 2 oppoſite Flanks.

BASTION *Regular*, is that which hath its due proportion of Faces, Flanks and Gorges.

BASTON, a *French* word in Architecture, the ſame with the *Tore*; in Heraldry the ſame with *Abutton*: Which ſee.

BATHMIS, is a Cavity in the Bone of the Arm or Shoulder, on each ſide one; whereinto, when the whole Hand is ſtretched forth and bended, the Proceſs of the undermoſt and leſſer of the long Bones of the Cubit enters. This is alſo called *Trochlea*.

BATRACHUS, is a Tumour under the Tongue, which makes Men croak like a Toad, when they ſpeak. *Blanchard*.

BATTAILE, is an ancient Trial in our Law, which the Defendant in Appeal of Murder, Robbery, or Felony, might chuſe, that is to fight with the Appellant, for proof whether guilty or not; grown obſolete and wholly diſuſed.

BATTALION, is a Body of Infantry of about 6, 7, or 800 Men, of which uſually $\frac{1}{3}$ are Pikes in the middle, and the other $\frac{2}{3}$ are Muskets poſted on the Wings; But the Number of Men is by no means certain. *Battalions* are uſually drawn up ſix deep, or with ſix Men in File, or one before another; thoſe in length or ſide by ſide being called *Ranks*. Some Regiments conſiſts of but one Battallion; but when they are Numerous they are divided into ſeveral Battalions according to their Strength; and ſo that every one may be about 7 or 800.

The Battalions of *French* Guards have commonly but 5 Companies, becauſe each Company conſiſts of 150 Men. But of other *French* Regiments there go 16 Companies to a Battalion, becauſe they are but 50 Men in a Company. Of the *Swiſs* Guards 4 Companies make a Battalion, becauſe each Company hath 180 Men.

When a Battalion is to be formed out of the Companies of ſeveral Regiments in a Garriſon, *&c.* then thoſe of the Eldeſt Regiments poſt themſelves on the Right; thoſe of the Second on the Left, and ſo all other ſucceſſively on the Right and Left, till the youngeſt fall into the Centre. The Subalteran Officers take their Poſt before their Companies, the Captains on the Right and Left according to their Degree.

Battalions are divided into 3 Diviſions, the Muſqueteers in the Right and Left, and the Pikes in the middle. In Marching, when there is not Room for ſo great a Front, they break into Subdiviſions as the Way and Ground will allow.

The great Art of drawing up a Battalion is to diſpoſe it ſo as that it may beſt reſiſt a Party of Horſe in an open Field, and that it may with advantage engage with either Horſe or Foot.

BATTERY (in Law) is an Act that tends to the breach of the Peace of the Realm.

BATTERY, in Fortification, is a place raiſed on purpoſe where Cannon are planted, from thence to play upon the Enemy; the Platform on which they are fix'd being made of Planks that ſupport the Wheels of Carriages, ſo as to hinder the Weight of the Cannon from ſinking them into the Ground, and incline ſomewhat towards the *Parapet* to check the Recoiling of the Pieces.

BATTERIES *of a Camp*, are Places to plant great Guns on, and are uſually ſurrounded with a *Trench* and *Palliſadoes* at the Bottom, as alſo with a *Parapet* on the top, having as many Holes as there are *Pieces of Artillery*; and with two *Redouts* on the Wings, or certain Places of Arms capable of covering the Troops that are appointed for their Defence.

In all *Batteries* the open Spaces left to put the Muzzles of the great Guns out, are called *Embrazures*, and the Diſtances between the *Embrazures Merlons*. The Guns are generally about 12 Foot diſtant one from another, that the Parapet may be ſtrong, and the Gunners have room to work.

BATTERY *Sunk or Buried*, is when its Platform is ſunk or let down into the Ground ſo that there muſt be Trenches cut in the Earth againſt the Muzzles of the Guns, for them to fire out at, and to ſerve for *Embraſures*. This ſort of Battery which the *French* call *En Terre*, and *Ruinate*, is generally uſed on the firſt making of Approaches, to beat down the Parapet of any Place.

BATTERIES *Croſs*, are two Batteries which play athwart one another upon the ſame thing, forming there an Angle, and beating with more Violence and Deſtruction, becauſe what one Bullet ſhakes, the other beats down.

BATTERY *d' Enfilade*, is one which ſcoures or ſweeps the whole Length of a Strait Line.

BATTERY *en Echarp*, is that which plays obliquely.

BATTERY *d' Revers*, or *Murdering Battery*, is one that bears upon the Back of any Place.

BATTERY *Joint*, or *par Camerade*, is when ſeveral Guns play at the ſame time upon one Place.

BATTEURS *d' Eſtrade*, or Scours, are Horſemen ſent out before, and on the Wings of an Army, a Mile, or two, or three, to make Diſcoveries; which they give an account to the General.

BATTLEMENTS, are the Tops of the Walls of Buildings made in the Form of *Embraſures* and *Merlons*, as in Fortified Places.

BATTOLOGY, is a vain and fooliſh Repetion of the ſame Words over and over again in any Diſcourſe; like the trifling Poet *Battus* mentioned by *Ovid*, who introduces him ſaying, *Montibus (inquit) erant & erant ſub montibus illis.*

BATTOONE, a Term in Heraldry, ſignifying a 4th Part of a *Bend ſiniſter*: It is the uſual Mark of Illegitimacy, and is always born couped, or cut off after this manner.

It alſo ſignifies the Earl Marſhall's Staff.

BAY. is a Term uſed by Geographers and Seafaring Men, for an Arm of the Sea coming up into the Land, and terminated in a Nook. It is a kind of Leſſer Gulph, bigger than a Creek, and

is

larger in the Middle within, than 'tis at the Entrance into it; which Entrance is called the *Mouth of the Bay*.

BEACONS, are Fires maintained on the Sea-Coasts, to prevent Ship-wracks, and to give notice of Invasions, *&c.*

BEADLE (in Law) signifies a Messenger or an Apparitor of a Court, that cites Men to the Court to appear and answer.

BEAK, or *Beak-head*, of a Ship, is that Part of it which is fastened to the *Stem*, and is supported by a *Knee*; and is the becoming Part or Grace of a Ship.

BEAM COMPASSES, is an Instrument made in Wood or Brass, with sliding Sockets to carry several shifting Points, in order to draw Circles with very long *Radii*: They are of good use in large Projections for drawing the Furniture on Wall Dyals, *&c.*

BEAMS *of a Ship*, are the great main cross Timbers which hold the Sides of a Ship from falling together, and which also support the *Decks* and *Orlops*. The *Main Beam* is next the Main Mast, and from it they are reckoned by First, Second, or Third Beam. The great Beam of all is called the *Midship Beam*.

BEAR, a Word used by Seamen in several Senses. They say a Ship *Bears Ordnance*, when she carries any great Guns: She *Bears a good Sail*, they say, when a Ship having her Sails abroad in a Gale of Wind, sails upright in the Water. When a Ship sails toward the Shore, she is said to *bear in with the Land*: When a Ship that was to Windward comes under another Ship's Stern, and so gives her the Wind, she is said to *Bear under her Lee*. If a Ship sails into an Harbour with the Wind large, or before the Wind, she is then said to *Bear in with the Harbour*; and when a Ship keeps off from any Land, she is to *Bear off from it*. When a Seaman would express how any Cape or Place lieth from another, he saith it *beareth off so*, or *so*. In Conding also, they say, *Bear up the Helm*, *i. e.* let the Ship go more large before the Wind; and *Bear up Round*, that is, let the Ship go between her two *Sheats*, directly before the Wind. Lastly, There is another Sense of this Word in reference to the *Burthen* of a Ship (which Word is derived from hence) for they say a Ship *Bears*, when having too slender or *Lean* a Quarter she will sink too deep into the Water, with an overlight Freight, and thereby can carry but a small Quantity of Goods.

BEAR, is also used in Heraldry: He that hath a Coat of Arms is said to *Bear* in it the several Charges or Ordinaries that are in his Escutcheon; as if there are 3 Lions Rampant in it, he is said to *Bear 3 Lions Rampant*.

BEAR; there are two Constellations of the Stars called by this Name, the *Greater* and *Lesser Bear*, or *Ursa Major* and *Minor*. The *Pole Star* is said to be in the Tail of the *Lesser*, because that Star is never above 2 Degrees distant from the *N. Pole* of the World.

BEARING, in Navigation, signifies the Point of the Compass that one Place *bears* or stands off from another.

BEASANTS: See *Balls*.

BEATS, in a Watch or Clock, are the Strokes made by the *Fangs* or *Pallets* of the Spindle of the Ballance; or of the *Pads* in a Royal Pendulum.

To find the *Beats* of the Ballance in all Watches going, or in one turn of any *Wheel*.

Having first found out the number of Turns which the *Crown-wheel* hath in one turn of the *Wheel* you seek for (by the Direction given under the Word *Turn*) and then those turns of the *Crown-wheel* multiply'd by its Notches, will give you half the number of *Beats* in that one turn of the *Wheel*: because the *Ballance* or Swing hath two Strokes to every Tooth of the *Crown-wheel*: For each of the two *Pallets* hath its Blow against each Tooth of the *Crown-wheel*: Wherefore it is, that a Pendulum that strikes Seconds, hath its *Crown-wheel* only 30 Teeth. To explain what hath been said, take this Example (being the Numbers of a Sixteen Hour Watch) wherein the Pinion of Report is 4, the *Dial-wheel* 32, the *Great-wheel* 55, the Pinion of the *Second-wheel* 5, *&c.* The Number of Notches in the *Crown-wheel* 17, being multiplied into 6336 (the Product arising from the continual Multiplication of the Quotients 8, 11, 9, 8) gives 107712 for half the number of *Beats* in one turn of the *Dial-wheel*; for 8 times 17 is 136, which is half the number of *Beats* in one turn of the *Centrate-wheel* 40; and 9 times 136 is 1224, the half *Beats* in one turn of the *Second-wheel*; and 11 times 1224 is 13464, the half *Beats* in one turn of the *Great-wheel* 55; and 8 times 13464 makes 107712, before found. Which, if multiplied by the two Pallets, that is, double it, it gives 215424, which is the number of *Beats* in one turn of the *Dial-wheel*, or 12 Hours. If you would know how many *Beats* this Watch hath in an Hour, 'tis but dividing the *Beats* of 12 Hours into 12 Parts, and it gives 17952, the Train of the Watch, or *Beats* in an Hour. If this be divided into 60 Parts, it gives 299, and a little more, for the *Beats* in a Minute. And so you may proceed to Seconds and Thirds if you will.

```
4) 32 (8
-------
5) 55 (11.
5) 45 (9.
5) 40 (8.
-------
  17.
```

By the Beats *and Turns of the* Fusy, *the Hours that any Watch will go, may be found thus*;

As the *Beats* of the Ballance in one Hour: Are to the *Beats* in one Turn of the *Fusy* :: So is the number of the Turns of the *Fusy*: To the continuance of the Watches going:

Thus, 20196 : 26928 :: 12 : 16.

To find the Beats *of the Ballance in an Hour*; the Proportion is,

As the Hours of the Watches going: To the number of Turns of the *Fusy* :: So are the *Beats* in one Turn of the *Fusy*: To the *Beats* in an Hour:

Thus, 16 : 12 :: 26928 : 20196.

To find the Beats *of a Ballance in one Turn of the* Fusy; you have this Proportion;

As the number of the Turns of the *Fusy*: Is to the continuance of the Watches going in Hours :: So are the *Beats* in one Hour: To the *Beats* of the Ballance in one Turn of the *Fusy*:

That is, 12 : 16 :: 20196 : 26928.

BECHICKS, are Medicines good against a Cough. They are called also *Bechical Medicines*. *Blanchard*.

BED, of the Carriage of a Great Gun, is that thick Plank which lies immediately under the Piece, being as it were the Body of the Carriage.

BELANDRE, is a ſort of little Veſſel with Sails and Tackle like an Hoy, but Broader and Flatter: The covering of the Deck is raiſed up half a Foot higher then the Gunwale, Gunnel, or *Plat-board*, as the *French* call it, and between the Gunnel and the Deck there is a Paſſage left free, for the Seamen to walk upon: They are chiefly uſed to carry Merchant's Goods, and are ſeldom above 24 Tun.

Some will have them called *Fy-landers*, becauſe they ſeldom go out of ſight but Sail *by the Land*.

BELAY, aboard a Ship, ſignifies the ſame as *Eaſtern*: Thus they ſay *belay the Sheat*, or *Tack*, that is, *faſten* it to the *Kennel*, &c.

BELENOIDES, is the proceſs or ſhooting forth of the Bone called *Aliformis*, which is fixed in the Baſis of the Skull. *Blanchard.*

BELLANDER: See *Belandre.*

BEND; at Sea they ſay *Bend the Cable*, when 'tis to be ſeized and made faſt to the Ring of the Anchor; and to *Bend two Cables*, is all one with them as to tye them together. To *unbend the Cable* is to looſen it from the Ring of the Anchor, which is done when a Ship deſigns to be long at Sea. To *bend a Main-Saile*, is to make it faſt to the Yard in its proper place.

BEND, one of the eight Honourable Ordinaries in Heraldry, containing a 5th when uncharged, but when charged a 3d part of the Eſcutcheon. It's made by 2 Lines drawn thwartways from the *Dexter Chief* to the *Siniſter Baſe* Point; thus. He beareth *Or*, a *Bend Sable.*

A *Bend* is ſubdivided into a

BENLET, which is the 6th part of the *Shield*; a *Garter*, which is the Moiety of a *Bend*; a *Coſt*, which is the 4th part of a *Bend*; and a *Ribbon*, which is the Moiety of a *Coſt*.

There is alſo a *Bend Siniſter*, which is drawn from the *Siniſter chief* Point to the *Dexter baſe*, and this is ſubdivided into the *Scrape or Scarp*, and the *Battoone*, which latter is the 4th part of the *Bend*.

This *Battoone* is the moſt uſual Mark of Illegitimacy, but then it never extends it ſelf quite athwart the *Shield*, but is cut off a little at each End.

When 2 ſtreight Lines drawn within the *Bend* run nearly parallel to the outward *Edges* of it, that is called *Voiding*, and he that bears it is ſaid to bear a *Bend voided* thus

He beareth *Ermine*, a *Bend voided Gules*.

BENDY, the Term in Blazonary for an Eſcutcheons being divided *Bendways* into an *even* Number of Partitions; but if they are *odd* the Field muſt firſt be named, and then the Number of the *Bends*.

BENIGN *Diſeaſes*, are thoſe which are not attended with *Anomalous*, and extremely Violent Symptoms.

BERME, in Fortification, is a little Space of Ground three, four, or five Foot wide, left without, between the Foot of the *Rampart* and the ſide of the *Moat*, to receive the Earth that rolls down from thence, and to prevent its falling into the *Moat*. Sometimes for more Security the *Berme* is *Palliſadoed*.

BERTYING *a Ship*, by ſome is meant the raiſing of the Ship's Sides.

BESAILE (in Law) is a Writ that lies for the Heir, where his Great Grand-father was ſeized the Day that he died, or died ſeized of Land in Fee-ſimple, and a Stranger enters the Day of the Death of the Great Grand-father, or abates after his Death, his Heir ſhall have a Writ againſt ſuch a Diſſeiſor or Abater.

BEVEL, an Inſtrument well known to Builders, Carpenters, and Bricklayers, and uſed adjuſting of Angles.

BEVILE, a Term in Heraldry, ſignifying Broken, or opening like a Carpenter's Rule. Thus he beareth *Argent* a *chief Bevile vert.* by the Name of *Beverlis.*

BEWPLEADER, is a Writ that lies where the Sheriff, or other Bailiff in his Court will take a Fine of the Party, Plaintiff or Defendant, to the end that he ſhall not plead fairly, *&c.*

BEZANTS or *Beſants*, a Term in Heraldry for Round Plates of Gold without any Stamp, which are born frequently in Coats of Arms: *Guillim* ſays, a *Beaſant* or *Beaſaunt* is taken for a Maſſy-Plate of Gold of 101 *lb.* and 2 *Ounces* weight; tho' ſome think they were ſmaller Pieces ſtampt at *Bizantium* or *Conſtantinople*; whence the Name.

BEZOAR *Animale*, according to ſome, is the Liver and Heart of Vipers dried and powdered.

BEZOAR *Minerale*, is an Evaporation of the Solution of Butter of Antimony in Spirit of Nitre, till a white Maſs remain at the bottom: On this new Spirit of Nitre is poured, and the Liquor evaporated again; and this is a third time repeated; then the Matter is Calcin'd for about half an Hour, which will turn it into a white Powder fit for uſe.

Mr. *Boyle* calls it *Bezoardicum Minerale.*

BEZOARDICUM or *Bezoartick Remedies*, or *Cordial*, are ſuch as are endued with a Vertue to reſiſt and expel Poiſon and Malignity.

BEZOARDICUM *Joviale*, is a *Regule* made by melting 3 *Ounces* of Regule of Antimony with 2 *Ounces* of Block-Tin, which being powdered is mixed with 6 *Ounces* of Sublimate Corroſive, and then is diſtilled off in a kind of Butter; which Butter is afterwards diſſolved in Spirit of Nitre (of thrice its weight) and then the Solution is diſtill'd three times. The *Bezoar* will remain at the bottom; which muſt be powdered and waſht, and then mingled with Spirit of Wine, and digeſted till it grow inſipid.

BEZOARDICUM *Lunale*, is made by mixing 8 *Ounces* of Rectify'd Butter of Antimony, with an *Ounce* of fine Silver, and then diſſolved in Spirit of Nitre, which muſt be poured on gently freſh and freſh till all the Ebullitions are over, then the Spirit is drawn off from the Matter with a gentle Heat (with three Rectifications) and then the *Bezoar* is managed like the *Jovial Bezoar*: Which ſee.

BEZOARDICUM *Martiale*, is a Diſſolution of *Crocus Martis* made by Reverberation (or at leaſt as much of it as can be effected) in Butter of Antimony; and then Spirit of Nitre is poured on it, and they proceed as in the other *Bezoardick Preparations.*

BIBITORY *Muſcle*, is by ſome ſaid to be that *Muſcle* that draws down the Eye towards the Cup when we drink.

BICEPS,

BICEPS, is a Muſcle of the Cubit, ſo called becauſe it hath two Heads or Beginnings; the firſt, or outmoſt, ariſes with a long round Tendon from the upper part of the Brink of the *Acetabulum Scapulæ*, and runs under the Ligament of the Articulation in a *Sulcus* or Channel on the Head of the Shoulder-bone, where it is incloſed by a proper Ligament. In its deſcent it begins to grow fleſhy as it marcheth under the Termination of the Pectoral Muſcle, where dilating it ſelf into a large fleſhy Body, in-joyns with its other Head or Beginning. The latter ariſeth with a ſomewhat board, flat and long Tendon at the extremity of the *Proceſſus Caracoides Scapulæ*; in its deſcent it ſtrictly adheres to the *Coracobrachialis*, (wherefore ſome Authors not rightly deſcribing that Muſcle amongſt thoſe of the Arm, have miſtaken it for a fleſhy beginning of this.) But then parting from it, both theſe Heads compoſe a large fleſhy Belly, which becoming Tendinous near the *Cubit*, is commonly ſaid to be inſerted by a ſtrong round Tendon to the Tubercle at the upper Head of the *Radius*. But we (ſays *Cowper*) have obſerved this Tendon to be double, the External of which being thin, paſſeth obliquely over the *Muſculus Pronator Radii Teres*, and Membrane-like expanding it ſelf, joins with the *Membrana Communis Muſculorum*, which embraceth all the External Muſcles of the *Carpus* and Fingers: when this Muſcle acteth the *Cubit* is bended.

BICEPS, a Muſcle of the Leg, called ſometimes *Biceps Femoris*, to diſtinguiſh it from the *Biceps Cubiti*. It hath two Heads, the ſuperior and longeſt of which ariſeth with a round Tendon from the Protuberance of the *Iſchium*; in its deſcent it becomes large and fleſhy, and in above half its Progreſs leſſens it ſelf again, where it is joined with its other Head, having a broad, partly Tendinous and partly Fleſhy beginning from the *Linea Aſpera* of the *Os Femoris*, immediately below the Termination of the *Glutæus Maximus*; it being thus united, grows Tendinous, as it marcheth in a Channel on the External *Appendix* of the *Os Femoirs*, becoming perfectly Tendinous at its Implantation to the Superiour *Epiphyſis* of the *Fibula*. Its uſe is to help bend the *Tibia*; it is likewiſe employed in turning the Leg, together with the Foot and Toes, outwards, when we ſit with the Knees bended.

BIGAMY, ſignifies, either, as formerly, thoſe that were married more than once, which was then an Impediment that hindered a Man from being a Clerk; or as uſed in Common-Law, to have more than one Wife at the ſame time.

BIGHT or *Bite*, is any turn or part of a Rope that lies compaſſing; and therefore when they cannot take the End of a Rope in Hand, the Seamen ſay, *give me a Bite*.

BILANCIIS *Deferendis*, is a Writ directed to a Corporation, for the carrying of Weights to ſuch a Haven, there to weigh the Wools that ſuch a Man is Licenſed to Tranſport.

BILANDER, ſee *Belandre*.

BILDGE, of a Ship, is the Bottom of her Floor, *Bildge Water* therefore is that which by reaſon of the Flatneſs of a Ship's Bottom lies on her Floor, and cannot go to the Well of the Pump; and conſequently the *Dutch*, whoſe Ships are often of this Form, do much uſe a ſort of Pumps called *Bildge Pumps*, or as we call them *Burr-Pumps*, to carry off this *Bildge Water*: Alſo when a Ship ſtrikes on a Rock, they ſay, *She is Bildged*. And *Billage* is the Breadth of her Floor when ſhe lies aground.

BILE, or the *Gall*, is a Liquor partly Sulphureous, and partly Saline, which is ſeparated from the Blood of Animals in the Liver; for the receiving and evacuating of which there have been reckoned only two Veſſels or Paſſages, that is, the *Gall-bladder* and the *Porus Bilarius*. By this latter there flows a thicker but milder; by the former a thinner, and more Acrimonious and Fermentative Choler into the Inteſtine. But beſides theſe, there have been lately found out a Third, which we ſhall deſcribe by and by.

The *Gall-bladder*, called in Greek κύστις χοληδόχο, in Latin *Veſica bilaria*, or *Folliculus fellis*, is a hollow Bag placed in the under or hollow Side of the Liver, and in Figure repreſenteth a Pear. It is about two Inches in length, and one in breadth, where broadeſt.

By its upper Part it adheres to the Liver, which doth afford it a Hollowneſs to lodge in; but the lower Part, which hangeth without the Liver, reſteth upon the Right Side of the Stomach and the *Colon*, and doth often dye them both Yellow.

It hath three *Membranes*, one *Common*, which is thin and outmoſt. This ſpringing from the Membrane of the Liver, only covereth that Part which hangeth without the Liver. The two other Membranes are *proper*. The middle is thick and ſtrong, and muſcular, and hath three Ranks of *Fibres*; the outermoſt are tranſverſe, the middle oblique, and the innermoſt ſtreight. But ſome will allow only two Ranks, *viz.* the Streight, which run lengthways of it, and are outer; and the Tranſverſe or Annular, which are the inner.

The inmoſt Coat is Nervous, or Tendinous as it were; and to the inſide of this there adhereth a kind of Glandulous Coat. The Glands herein do ſeparate from the Arteries a kind of Mucous Humour, which ſerves to defend the *Veſica* from being irritated by the Acrimony of the Choler contained in it.

Beſides theſe two *proper* ones, *Verheyen* affirms there is a Third, betwixt that I called *common*, and the middle, and ſays, it is ſo evident, that he wonders this quick-ſighted Age has not yet diſcover'd it. It is interwoven with whitiſh *Fibres* drawn diverſly and irregularly, and has abundance of Nerves and Sanguiferous Veſſels running thro' it, whoſe chief Branches run moſtly from its Neck towards its Bottom; and upon this Account this Coat may be termed *Vaſcular*. In fat People it contains much Fat, and with a little Labour is ſeparated into divers Flakes (or Plates.)

It hath two *Parts*, the *Bottom* and the *Neck*.

The *Bottom* is its larger or wider Part that contains the Choler, and is of the ſame Colour with the Bile that is in it; whence it commonly looks Yellow, but ſometimes Greeniſh, Blackiſh, *&c.*

The *Neck* (otherwiſe called *Meatus Cyſticus*) is its narrower Part, being but about as wide as a Gooſe-quill, and about two Inches long. Betwixt this and the *Veſica* there is a certain Fibrous Ring, which much ſtraitens the Paſſage, and ſo hinders the two haſty Repletion of the *Veſica*. The other End of the Neck is joined to the *Porus Bilarius*, and they both make the *Ductus Communis* or common Paſſage of the Choler, which is inſerted into the Beginning of the *Jejunum*, or the End of the *Duodenum*. *Peucerus* has obſerved, that in ma-

ny Birds, and ſome Fiſhes, this *Meatus* does not join the *Porus bilarius*, but is inſerted ſeparately into the Guts.

The Ancients (whoſe Opinion is of late ſtifly defended by Dr. *Cole*) thought that the Choler in the *Gall-bladder* was received in by its Neck from the *Porus bilarius*, and that it paſſed out into the common Duct the ſame way. And to obviate the Objection, that there uſes not to be a Reciprocation of Humours in the ſame Veſſel (at the ſame time eſpecially.) Dr. *Cole* ſuppoſes, that the Gall paſſes out of the *Gall-bladder* only in the time of the diſtribution of the Chyle, but at all other times it is received into it from the *Porus*, and is ſtored up in it againſt the next Occaſion. But not to enter into this Diſpute, I think Dr. *Gliſſon*'s Account of it the more probable, which is this: The ordinary way of filling the *Gall-bladder*, is by its Fibrous Roots that are diſperſed thro' the Liver. The whole Trunk of theſe Roots enters that Part of the Bladder where 'tis ſtraitned by a Fibrous Ring. This Trunk indeed hardly equals the Hundredth Part of the Roots of the *Porus Bilarius*; yet it diſtributes ſome Twigs and Capillary Veſſels into the hollow Side of the Liver. But if you open the *Gall-bladder* with a Deſign to underſtand the Manner of the Inſertion of this Trunk into it, truly you will not eaſily find it. For tho' this Duct do penetrate the ſaid Bladder, and the Humour contained in it be diſcharged thereinto; yet there is hardly any Print or Sign of this Hole in the Inſide of the Bladder: Which ought not to ſeem hard to be believed by any one, if he remember the Inſertion of the Ureters into the *Veſica*; for tho' theſe do far exceed this Trunk in Width, yet one can hardly find their Inſertion if he cut open the Bladder and look for it. The beſt way (that I could yet find) to diſcover the Inſertion of this Trunk (if you will open the *Gall-bladder*, and ſearch for its Entrance into it) is thus; look carefully for a certain little and ſpongy Protuberance near the Orifice of the Bladder hard by the *Meatus-Cyſticus*; for the aforeſaid Trunk, I think, is pretty plainly inſerted into that Protuberance.

This Protuberance is called a Valve by *Spigelius*.

Beſides this Mr. *Perault* has found out another *new Conduit* for the Bile, which he calls *Ductus cyſt-hepaticus*, becauſe it is common both to the *Veſicula* and the *Porus Hepaticus* (or *Bilarius.*) This Duct has three Roots, which being ſubdivided into numerous Twigs, are diſperſed thro' the *Parenchyma* of the Liver, amongſt the Branches of the *Vena Cava* and *Portæ*: Theſe Roots grow into one Trunk, which creeping along the Surface of the hollow Side of the Liver, has a double Implantation; one into the *Porus Bilarius*, two Inches and an half before the ſaid *Porus*'s, uniting with the *Meatus Cyſticus*; and another into the middle of the *Veſica* (on that Side of it which adheres to the Liver) with a Valve. This Valve ſeems to be formed of the inner Membrane of the *Veſica*, and alſo a proper one, and may be ſaid to be a kind of middle Valve, between the Nature of the *Sigmoides* and *Triglottis* (or *Triſcupis*) of the *Vena Arterioſa* and *Arteria Venoſa* in the Heart. Betwixt its Inſertion into the *Porus Bilarius*, and this into the *Veſica*, there is about ſix Inches length. It contains a thinner Choler in it than the *Porus Bilarius*.

Jo. Alph. Borallus (Profeſſor of the Mathematicks at *Naples*) from the continual and ſpeedy Efflux of the Bile by the *Ductus Communis* into the *Duodenum*, believes, that there is a particular Circulation of it: For he affirms, That in a Day's time, from a Perſon faſting, there paſs thirty four Pound of Bilious Juice into the *Duodenum* by the common *Duct*, whereas the whole Maſs of Gall is not two Pound: Whence he concludes, that ſo great a quantity of Gall cannot be produced in the Liver by way of Fermentation, but that it is ſeparated Mechanically, without the help of any Ferment, only by *Cibration*, from the Minute Veſſels of the *Porta* thro' the Pores of the Glandules of the Liver, as the Urine is ſeparated in the Kidneys; ſo he infers, that there is a particular Circulation of the *Bilis* thro' the *Abdomen*, performed by the *Venæ Meſaricæ* into the Trunk of the *Porta*, thence to the Liver, thence thro' the Bilious Veſſels into the *Duodenum*, to return again by the Meſaraick Veins. He that would enquire more into this Novel, and (to me) improbable Opinion, may conſult his *Opus Poſthumum (pars altera) de motu Animalium.*

It has been taught by ſeveral Anatomiſts, That its Neck or *Meatus* has ſometimes two, ſometimes three *Valves*, to hinder the Recourſe of the Choler; but *Diemerbroeck* profeſſes he could never find any, but only that the Egreſs of the *Veſica* was very ſtrait, and its Neck wrinkled. Dr. *Gliſſon* declares alſo, That he has open'd very many Veſſels of this kind, and never yet ſaw a *Valve* in any of them: But he thinks that the Fibrous Ring (above-mention'd) did impoſe upon thoſe who have thought there was a *Valve*. Beſides, upon tryal he has often found, that the Bile by a light Compreſſion of the Fingers, has fluctuated to and again out of the *Cyſtis* into the *Meatus*, and on the contrary; as alſo out of the *Meatus* into the *Ductus Communis* and back again: Which certainly could not be, if there were any *Valve* in the way, for that would hinder the one or other of theſe Motions.

The *Veſica Fellea* hath two *Veins* called *Cyſticæ Gemellæ*, which ſpring from the *Porta*. It hath Twigs of *Arteries* proceeding from the right Branch of the *Cœliaca*; and it hath a ſmall thread-like Sprig of a *Nerve* from the Meſenterical Branch of the *Intercoſtal*.

Many times Stones are found in it, which are lighter and more ſpongy than thoſe of the Urinary Bladder, and will ſwim above Water, which theſe latter will not do.

The other Paſſage which carrieth the thicker ſort of Choler, is called *Porus Bilarius*, or *Meatus Hepaticus*, becauſe it paſſes directly from the Liver to the *Ductus Communis*.

Within the Liver, its Trunk and Branches are inveſted with a double Coat; its *proper* one which it retains without the Liver alſo, and another that is *common* to it with the *Porta*, called *Capſula Communis*, which it has from the Membrane of the Liver. In this common Coat this *Porus* and the *Porta* are ſo cloſely enwrapped, that you would take them but for one Veſſel, till you hold it either up to the Light (which will diſcover Veſſels of two Colours in it) or very dexterouſly rip up the *Capſula*, and ſo lay them open. Its Roots within the Liver are equally divided with thoſe of the *Porta* every where, ſaving that little Space where the Roots of the *Veſica* are ſpread in the

Sinuous

Sinuous and Right-ſide of the Liver. So that having ſpoken above of the Diviſions of the Roots of the *Porta*, I ſhall only obſerve, that they are far larger and more numerous than thoſe of the *Veſica*, drwaing Choler from all the Parts of the Liver (ſaving whither the Roots of the Bladder reach) and that more thick and viſcous, yet leſs Acrimonious.

This *Porus* ſeems to be a more neceſſary Part than the *Veſica*; for many Creatures, as Harts, Fallow Deer, the Sea-Calf, *&c.* and thoſe which have a whole Hoof, as an Horſe, *&c.* have no Gall-Bladder, but there is none that is deſtitute of this.

Without the Liver it is as wide again as the *Meatus Cyſticus*, with which it is joined at two Inches diſtance from the Liver, and both make the *Ductus Communis Choledochus*.

It has no *Valve* in its whole Progreſs; only the *Ductus Communis*, where it enters the Inteſtine, having pierc'd the outer Coat, paſſes betwixt that and the Middlemoſt about the twelfth Part of an Inch, and at laſt opens with a round Mouth into the Inteſtine. So that this oblique Inſertion (as that of Ureter into the Urinary Bladder) ſerves inſtead of *a Valve* to hinder any thing from regurgitating out out of the Gut into this Duct, eſpecially the inmoſt Tunicle of the Inteſtine hanging ſo flaggy before its Mouth, that when any thing would enter in, it claps cloſe upon it and ſtops it.

As to any *Anaſtomoſes* of the Roots of any of theſe Biliary Veſſels, with thoſe of the *Vena Porta*, ſuch indeed have been much talk'd of, but without truth, for their exreme Twigs or Capillaries terminate in the *Parenchyma* of the Liver, out of whoſe Grape-ſtone-like Glandules they imbibe the Choler there ſeparated from the Blood; as is the Caſe of the Capillaries of the *Cava*, for they receive the Blood it ſelf imported by the *Porta*, in like manner, without any Inoſculations.

The *Uſe* of all theſe *Veſſels* may ſufficiently be learned by what has already been ſaid of them; though ſome are of Opinion, that not only Choler, but other ſuperfluous Humours are evacuated by them, eſpecially upon taking a Purge.

The Ancients lookt upon the *Bile* as a meer Excrement, or at leaſt, to be of no other uſe than by its Acrimony to promote the Excretion of the Guts: Which Opinion continued as long as the Liver was thought to be the *Vas Sanguificans*. But when once that *Viſcus* was diſcovered to have ſcarce any other Office, then to ſeparate the Choler from the Blood, it hath ſeemed unreaſonable to ſuppoſe ſo large a Bowel was made only for the ſeparation of a meer Excrement; and therefore its now generally believed, that the *Bile* is the proper *Ferment* for both the Chile and the Blood. A very good Account of the manner of which *Diembroeck* gives us, as follows: The Blood flowing into the Liver by the *Porta*, out of the Gaſtrick and Meſaraick Veins (and, it may be, a little by the Hepatick Artery) is mixed with an Acrimonious, Saltiſh, and Subacid Juice (made in the Spleen, of the Arterious Blood flowing thither by the Arteries, and of the Animal Spirits by the Nerves) which is brought into the *Porta* by the *Ramus Splenicus*. Now both theſe being entred the Liver by the Branches of the *Porta*, by means of this ſaid Acrimonious and Acid Juice, and the Specifick Vertue or Coction of the Liver, the Spirituous Particles, both Sulphureous and Salt, lying hid in the ſaid Venous Blood, are diſſolved, attenuated, and become alſo a little Acrimonious and Fermenting; a certain thinneſt part whereof like moſt clear Water, being ſeparated from the thicker Maſs of Blood, by means of the conglomerated Glands placed moſtly in the hollow Side of the Liver, is carrid from thence by many Lympheducts, as has been ſaid. But the Fermentaceous Spirits of greater Acrimony, mixed with the thicker and more viſcid ſulphureous Juices (for Sulphur is viſaid) and more ſtrongly boiled, when as through the Clammineſs of the Juices in which they inhere, they cannot enter the conglobated Glands, nor from them the Lympheducts, and yet through their fierce Ebullition are ſeparated from the Blood (as Yeſt from Beer) theſe Fermentaceous Spirits, I ſay, being ſever'd with the Juice in which they inhere, become bitter, and are called *Bile*; which *Bile* being tranſcolated through the Grepe-ſtone like Glandules in the Roots of the *Porus Bilarius*, and of the Call-bladder, paſſes through them by the *Ductus Communis* into the *Duodenum* or *Jejunum*, where it is preſently mixed with the Pancreatick Juice, and both of them with the Alimentary Maſs, concocted in the Stomach, and now paſſing down this way, which it cauſes to ferment. And becauſe at its firſt Entrance it is more Acrimonious, and has its Vertue entire, and ſo cauſes the greateſt Ebullition with the Pancreatick Juice; hence the Milky Juice contained in the Maſs concocted in the Stomach is more readily, and in greateſt quantity ſeparated in the *Jejunum*, and by innumerable Lacteal Veſſels (which are more numerous in this than the other Guts) it is more quickly driven on towards the *Receptaculum Chyli*, and this is the Reaſon that this Gut is always ſo empty. But in the following Guts, becauſe the Fermentaceous Spirits are a little pall'd, the Effervеſcency becomes ſlower and leſs efficacious, and the Chyle is more ſlowly ſeparated from the thicker Maſs, and therefore they have fewer *Vena Lacteæ*. At length what remains of this fermenting Matter, is mixed with the thicker *Fæces* in the great Guts, where by its Acrimony it irritates them to Excretion.

BILINGUIS (in Law) is that Jury which paſſes between an *Engliſhman* and an *Alien*; whereof part ought to be *Engliſhmen*, and part *Strangers*; this is vulgarly called *Party-Jury*.

BILL, is all one with an *Obligation*, only when it is in Engliſh it is commonly called a *Bill*, in Latin an *Obligation*. Or a *Bill* is a ſingle Bond without a Condition; and *Obligation* is a Bond with a Penalty and Condition. Alſo a Declaration in Writing, that expreſſes the Grievance and Wrong which the Complainant has ſuffered by the Party complained of; or elſe ſome Fault committed by him againſt ſome Law or Statute of the Realm.

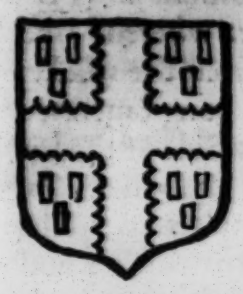
BILL *of Store*, is a kind of Licence granted at the Cuſtom-houſe to Merchants, to carry ſuch Stores and Proviſions as are neceſſary for their Voyages Cuſtom-free.

BILL *of Sufferance*, is a Licence granted at the Cuſtom-houſe to a Merchant, to ſuffer him to Trade from one *Engliſh* Port to another, without paying Cuſtom.

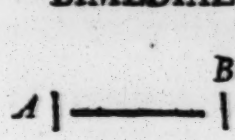
BILLA VERA (a Law Term) ſignifying the Indorſment of the Grand Inqueſt upon any Preſentment or Indictment which they find to be probably true.

BIL-

BILLET, a Bearing very common in Heraldry of this Form. *Argent Billette* a Croſs engrailed Gules, by the Name of Heath. 'Tis called here *Billette*, becauſe the Billets are ſuppoſed to be all over the Field, but ſometimes they are not above ſix, *&c.* and then they are numbred. *Guillim* ſaith, it repreſents a Letter folded up, and not a Billet of Wood. *Bloom* ſaith Billets muſt be numbred, if not above 10.



BIMEDIAL, a Term in Mathematicks, if two *Medial Lines*, as *A B* and *B C* commenſurable only in Power, containing a Rational Rectangle, are compounded, the whole *A C* ſhall be irrational, and is called a *firſt Bimedial Line*, 38. *e.* 10. *Eucl.*



BINOCLE, is a kind of Dioptrick Teleſcope fitted ſo with two Tubes joining together in one, as that you may ſee a diſtant Object with both Eyes together.

BINOMIAL ROOT, in Mathematicks, is a Root compoſed of two Parts or Members, and no more, connected together by the Sign +: Thus *a*+*e*, or 5+3 is a *Binomial Root*, conſiſting of the Sum of thoſe two Quantities: If it have three Parts, as *a*+*b*+*c*, 'tis called a *Trinomial*, *&c.* if it have four Members, 'tis called a *Quadrinomial*, *&c.*

BIOLYCHNIUM, is what ſome call the *Vital Flame*, or Life of Animals. See *Flamma Vitalis.*

BIOVAC, in War, is a Guard at Night performed by the whole Army; which either at a Siege or lying before an Enemy, every Evening draws out from its Tents or Hutts, and continues all Night in Arms before its Lines or Camp to prevent any Surpriſe. When the Troops are much haraſſed, or there is no great dread of the Enemy, the *Biovac* is allowed to be ſufficient if the two Front Ranks by turns ſtand under Arms, while the Rear Ranks reſt on the Ground. To raiſe the *Biovac*, is to return the Army to their Tents or Hutts at break of Day.

BIPARTITION, the ſame with *Biſſection*, or dividing a thing into two equal Parts.

BIQUINTILE, an Aſpect of the Planets, when they are 144 Degrees diſtant from each other.

BIRTH or *Birthing*; the Seamen call a due or proper diſtance obſerved between Ships lying at an Anchor or under Sail a *Birth*; and ſo alſo they do the raiſing or bringing up the Sides of a Ship. Alſo the proper Place aboard for a Meſs to put their Cheſts, *&c.* is called the Birth of that Meſs. Alſo a convenient Place to Moor a Ship in, is called a *Birth.*

BISUTH, or *Tin Glaſs*, by the Ancients was thought to be a natural *Marcaſite* or Mineral; but *Lemmery* ſaith, 'tis a kind of Regulus or Tin, and aſſures us, that good Biſmuth may be made with *Tin*, *Tartar* and *Salt Peter*; and ſome mix *Arſenick* alſo with it, for which Reaſon it ought not to be taken inwardly. Its Flowers and Magiſtery are uſed as Coſmeticks; and the *Pewterers* alſo do uſe Biſmuth to render their Work more Beautiful, and to make the Metal ring the better.

BISSECTION, a Term in Geometry, ſignifying the Diviſion of any Quantity into two equal Parts or Halves; the ſame with *Bi-partition*: Thus to biſſect any Line, is to divide it into two equal Parts.

BISSEXTILE, the ſame in *Chronology* as our Leap-Year; and the Reaſon of the Name is becauſe in every 4th Year they accounted the 6th Day of the Kalends of *March* twice; for once in four Years, the odd Hours (above 365 Days) made up juſt an whole Day, which was inſerted into the *Calender* next after the 24th of *February.*

BITE, in the Sea-Phraſe, is the compaſſing or bringing about of a Rope or Cable; the Seamen call holding by that Part of a Rope which is quoiled or rowled up, *holding by the Bite.*

BITTACLE, is a Fram of Timber ſtanding in the Steerage of a Ship juſt before him that Steereth, and in it is placed the *Compaſs*, by which the Ship is kept in her Courſe, and finds her way.

BITTER, any Turn of a Cable about the Bitts is called a *Bitter*; and 'tis uſed that the Cable may be let out by little and little. And when a Ships is ſo ſtop'd by a Cable, they ſay ſhe is *brought up to a Bitter.* Alſo that End of the Cable which is uſed to be wound or belayed about the Bitts, they call the *Bitter End of the Cable.*

BITTS (aboard a Ship) are two great Pieces of Timber, on, or through whom goeth the *Croſs Piece*, placed uſually abaft the *Manger* in the *Loof* of the Ship, to *belay* (or faſten) the Cable thereto when ſhe is at Anchor: Their lower Ends are faſtened into the *Riders*; and in great Ships their middle Parts are bolted to two great Beams croſs the *Bows*; and yet in great Storms they are fain to faſten the Cable to the Main Maſt, to ſtrengthen the Bitts, and to ſecure the Bows, which are ſometimes elſe torn from the Ships.

There are *Fore Top-ſail Sheat Bitts*, whoſe uſe is to belay or faſten the Fore Top-ſail Sheats.

And there are alſo the *Fore-jeer Bitts*, which ſerve to belay or faſten the *Fore-jeer.*

BIVALVE, is a Word uſed by the Writers of Natural Hiſtory for both ſuch Shell-Fiſhes as have two Shells, as Cockels, Muſcles, Oyſters, *&c.* which are ſaid to be of the *Bivalve kind*; and alſo for the *Siliqua* or Seed-Pods of ſuch Plants as open all their whole Length to diſcharge their Seeds, ſuch as Beans, Peaſe, *&c.* for thoſe the Botaniſts ſay have a *Bivalve Siliqua.*

BIVENTER: See *Digaſtricus.*

BLACKMAIL, ſignifies a certain Sum of Money, (or rather only of) Corn, Cattel, *&c.* given by the Poor People in the *North* of *England*, to the moſt powerful Perſons in thoſe Parts, or in the Hundreds, for a Protection againſt Thieves and Robbers.

BLAKNESS, the Colour ſo called, ſeems to ariſe from ſuch a peculiar Texture and Scituation of the Superficial Parts of any black Body, that it doth as it were dead the Light falling upon it, and reflect none, or very little of it, outwards to the Eye. *See* Colour, *and* Vol. II.

BLACK-ROD, is the *Huiſhier* or Uſher belonging to the moſt Noble Order of the Garter; ſo called from his *Black-Rod* which he carries in his Hand: He is alſo of the King's Chamber, and *Uſher* of the Lord's Houſe in Parliament.

BLADDER, ſee *Veſica.*

BLASS, a Word uſed by *Van Helmont*, as *Blanchard* ſaith, to ſignify the Motion of the Stars, *&c.*

BLAZONING, in Heraldry, is diſplaying or expreſſing the Parts of a Coat of Arms in their proper

proper Colours and Metals; for to lay *Colour* on *Colour*, or *Metal* on *Metal* is falſe *Heraldry*.

In Blazoning a Coat of Arms, you muſt always begin with the *Field*, and then next proceed to the *Charge*; and if there are many things born in the *Field*, you muſt name firſt that which is immediately lying upon the Field. Your Words muſt be very ſhort, and truly proper and expreſſive, without any Expletives, needleſs Particles, or Repetitions. In the Blazon of a Coat of Arms, ſuch Terms for the Colours muſt be uſed as are agreeable to the Station and Quality of the Bearer: All Perſons beneath the Degree of a Noble, muſt have their Coats blazoned by Colours and Metals; Noblemen by precious Stones; and Kings and Princes by Planets.

BLENCH, (in Law) is the Title of a kind of Tenure of Land; as to hold Land in *Blench*, is by Payment of a Sugar-Loaf, a Bever Hat, a couple of Capons, and ſuch like; if it be demanded in the Name of *Blench*, *i. e. nominæ Albæ firmæ*. See *Alba firma*.

BLINDS, in Fortification, are certain Pieces of Wood, Branches of Trees laid acroſs from one Side of the Trench to the other, to ſuſtain the *Fa-vins* or Hurdles laden with Earth; and ſerve to cover the Pioneers from above, and are commonly uſed when the Works are carried on towards the *Glacis*, and when the Trench is extended in Front toward the Place.

BLISTERING *Plaiſterers*, ſee *Veſicatoria*.

BLOCCADE, in the Art Military, is the encompaſſing any Town or Place ſo all round with Armed Troops, that 'tis impoſſible any kind of Supplies can be brought to it, and ſo it muſt be ſtarved or ſurrender; but there is no Deſign of taking it by Attack, *&c.* And when any Place is in this Condition, 'tis ſaid to be *Bloccaded*.

BLOCCADING, is when the Beſiegers take Care to ſtop all Ways and Paſſages, and all Intelligence that may be ſent into or out of the *Town* or *Fort* that is block'd up, but the Place is not regularly beſieg'd, nor attack'd in Form.

BLOCKS, are the Pieces of Wood aboard a Ship in which the Shivers are placed, and wherein go the running Ropes. Of theſe Blocks ſome are ſingle, ſome double, and ſome have 3, 4 or 5 Shivers in them. They are diſtinguiſhed and named by the Ropes they carry, and the Uſes they ſerve for. When in the Haling of any Tackle or Halliard to which there do belong two Blocks, they happen to meet, then they cry *Block and Block*.

BLOOD: *In Phil. Tranſact. N.* 191, is an Eſtimate of the Quantity of the Blood in a Human Body, and of the Celerity of its Motion by Dr. *Allen Moulin*.

Dr. *Lower* was probably miſtaken when he computed the Quantity of Blood in an Ordinary Man to be about 20 Pounds; and the Computation of Dr. *Moulin*, That the Blood is about $\frac{1}{25}$ of the Weight of the whole Animal, ſeems much rather to the Truth; for then an ordinary Man may be ſuppoſed to have about 8 or 10 Pounds of Blood in him.

Of the Circulation of the Blood, Dr. *Gibſon* gives this Account.

Seeing by a continual Reciprocation of the Pulſe there is a conſtant Expulſion of Blood from the Heart into the Arteries, and as continual an Influx of Blood *into* it out of the *Cava*; and ſeeing the *Cava* from whence the Supply is, is never dry; nor, on the other Hand, the Arteries that receive the Blood continually from the Heart, unduly ſwell'd with it; it neceſſarily follows, that this Motion proceeds *circularly*, *viz.* that the Blood is continually driven out of the Heart into the Arteries out of theſe into the Parts to be nouriſhed; from whence it is reſorbed by the Capillary Veins, which conduct it back through the larger into the *Cava*, and ſo at length it returns to the Heart again. The Invention of which Circulation is owing to our Country-man Dr. *Harvey*, and may be proved undeniably by theſe Reaſons.

1. From the great quantity of Blood that is driven out of the Heart into the Arteries at every Pulſe. For though the Ancients who knew not this Circulation, imagined that only a drop or two was expelled by every *Syſtole*, which they were neceſſitated to ſuppoſe, to avoid the great Diſtention that the Arteries muſt be liable to, if any conſiderable Quantity iſſued into them; yet it is certain and demonſtrable, that there muſt needs an Ounce or more be driven into them each time. For (taking it for granted that there is no other way for any Liquor to paſs from the Stomach to the Kidneys, but through the Heart along with the Blood) ſeeing, if ſome Men at ſome times drink three Pints of Drink, they ſhall piſs it out again in half a Hour, yea more of *Tunbridge* Waters in that ſpace; and ſeeing, ſecondly, that there is commonly as much Blood as *Serum* that flows to the Kidneys (the Blood returning back by the emulgent Veins) it is clear, that by the two Emulgents (which are none of the largeſt Arteries) there muſt paſs in Half an Hour's time ſix Pound of Liquor, all which muſt come from the Heart; and how much more then may we conceive to be driven through all the other Arteries that run through the whole Body? This is more accurately evinced by Dr. *Lower*'s Experiment, which is this: I cut aſunder (ſays he) both the *Cervical* Arteries in a large Dog, and at the ſame time through an Hole made in the Left Side of his Breaſt over-againſt the Heart, I compreſs'd the Trunk of the *Aorta* below the Heart, with my Finger, to hinder any Blood from deſcending by it; and laſtly, I took Care alſo to ſtraiten the *Brachial Arteries* under the *Axillæ*, by which Means almoſt all the Blood was driven out of the Heart through the *Cervicals*, (beſides that which was ſent into the *Vertebrals*) and which is wonderful to be related, within the 20th Part of an Hour the whole Maſs iſſued out; ſo that it is not to be denied but that it all paſs through the Heart in that ſpace. And though it may be granted, that amidſt ſuch Wounds and Tortures the Heart does beat ſomewhat quicker than at other times; yet the ſame thing is partly evident from the Wounds in the Limbs when ſome notable Artery is cut aſunder; for it is ſtrange in how ſmall a time a Man will bleed to death, even at that one Artery. Yea, we may give a great gueſs how much Blood is ſent out at every Pulſe, even from the ordinary opening of one *Vein* in the Arm, from whence a notable quaintity of Blood will iſſue in a ſhort time; how much may we then ſuppoſe will flow out of all the Veins, if they were opened at one time? Seeing then 'tis evident, that ſo great a quantity of Blood is expelled out of the Heart at every *Syſtole*, and that for all that the Arteries are not unduly diſtended, nor any Part ſwell'd by it neither, and yet the *Cava* and other *Veins* emptied, 'tis certain that the Blood that's driven

driven into the Arteries flows back to the Heart by the Veins in a conſtant Circulation.

2. A ſecond Argument to prove it, may be taken from the Valves in the Veins, which are ſo framed that Blood may freely flow through them out of the leſſer Veins into the greater (and ſo into the *Cava*) but not, on the contrary, out of the greater into the leſs. Yea, if one blow into the *Cava* through a Pipe, there will no Wind paſs into the ſmaller Veins; but on the contrary, if you blow up the leſſer Viens, the Wind will readily paſs to the larger, and ſo to the *Cava*.

3. And laſtly, the ſame thing is more clear by the Ligature in Blood-letting: For whether you let Blood in the Arm or Foot, you always tie the Fillet above where you intend to make the Orifice, and then the Vein below the Ligature will preſently fill and grow tumid, but above it will fall and almoſt diſappear. Which muſt needs be from hence, for that the Blood being driven along the Arteries towards the extream Parts, returns by the Veins and aſcends upwards, which coming to the Ligature, and being ſtop'd there, ſwells the Vein below the Ligature, and ſpurts out as ſoon as the Orifice is made; but when the Fillet is looſed again, the Blood flows no longer out thereat, but holds on its wonted Chanel in the Vein, and the Orifice cloſes up again.

Having ſufficiently demonſtrated the Circulation of the Blood, we will ſhew two things farther; *Firſt*, How the Blood paſſes out of the Arreries into the Viens; and *Secondly*, in how long time the whole Maſs of Blood may be ſuppoſed to paſs through the Heart in its ordinary Circulation.

As to the *Firſt*, it was the Opinions of *Riolanus*, That the Blood circulated only through the larger Veſſels by Anaſtomoſis or Inoſculation of the Veins with the Arteries; and that that which run into the ſmaller, was all ſpent on the Nutrition of the Parts. But it is clear, that there muſt be a Circulation even in the ſmalleſt, from the great Quantity of Blood that will flow out of the leaſt Artery in the Hand or Foot when it is cut, which is very abſurd to imagine to be all ſpent on the Nouriſhment of the reſpective Part. Now there are but two Ways whereby the Blood can be ſuppoſed to paſs out of the Arteries into the Veins, *viz. either* by the Former's being continued to or opening into the latter by Inoſculation, *or elſe* by the Capillary Arteries letting out their Blood into the Pores of the Subſtance of the Parts, on whoſe Nutrition part is ſpent, and the remainder imbibed by the gaping Mouths of the Capillary Veins. That it is neceſſary to admit of this *latter* Way, is evident, becauſe if part of the Arterial Blood did not iſſue into the Subſtance of the Parts, they could not be nouriſhed by it; for while it is in the Veſſels, it may and Warmth iudeed to the Parts through which it flows, but cannot nouriſh them, ſeeing even the Veſſels themſelves are not nouriſhed by that Stream of Blood that glides along their Cavity, but by Capillaries running through their Coats; and if the Blood be driven into the Subſtance of the Parts, and that in a greater Quantity than ſuffices for their Nouriſhment (as was juſt now ſhewn that it is) what is ſuperfluous muſt needs enter the Mouths of the Capillary Veins, from whence it goes forward to the larger, and ſo to the Heart: But ſeeing this way of transfuſing the Blood thro' the Subſtance of the Parts, has ſeemed to ſome not to anſwer to that haſty Circulation of it we have demonſtrated; they have thought it neceſſary alſo to admit of the *former* way, namely, Anaſtomeſes, by which the Veins are continued to the Arteries, and that not only in their larger Branches (as that notable one of the Splenick Artery with the Splenick Vien) but alſo in their ſmaller Twigs in the extream Parts. But we muſt conſider, that in a living Body the ſolid Parts are infinitely more porous and permeable than in a dead; ſo that tho' the Anatomiſts find their Subſtance ſo denſe and cloſe as to make it ſeem almoſt impoſſible they ſhould permit ſo quick a Paſſage to the Blood through them; yet he ſhould rather believe it, than ſuppoſe ſuch Anaſtomeſes as he cannot diſcover (though it were not difficult to find them out if they had any exiſtence.) For abating that ſingle one of the Splenick Artery with the *Ramus Splenicus* of the *Porta*, and perhaps ſome of the *Arteria* with the *Vena Pulmonarie* is the Lungs, none of the lateſt moſt accurate Anatomiſts have been able to find out any. And as for that mentioned, it ſeems rather to be of an Artery with an Artery (ſuch as are frequent in ſeveral Parts of the Body, as are alſo of one Vein with another) than of an Artery with a Vein.

And *Secondly*, as to the Space of Time in which the whole Maſs of Blood may ordinarily circulate through the Heart, it is probably much ſhorter than many have imagined; for ſuppoſing that the Heart makes two thouſand Pulſes an Hour (which is the leaſt Number any ſpeak of, and ſome have told twice as many) and that at every Pulſe there is expelled an Ounce of Blood (which we may well ſuppoſe, ſeeing the Ventricles are wide enough to contain two Ounces, and that it is probable both that they are filled near full in the *Diaſtole*, and that they are near, if not quite emptied by the ſtrong Conſtriction of the Heart in the *Syſtole*) ſeeing the whole Maſs uſually exceeds not four and twenty Pound, it will be circulated ſix or ſeven times over through the Heart in the ſpace of an Hour. And by ſo much the oftner, by how much the Blood come ſhort of the ſuppoſed Quantity, or the Pulſe either naturally, or by a Fever, Spirituous Liquors, or violent Motion, is rendred more frequent; by which quick Motion the Blood it ſelf is kept from Coagulation and Putrefaction, and the Parts are cheriſhed with vital Heat, which Heat of the Parts is much according to the Slowneſs or Rapidneſs of the Circulation, So when we ſit ſtill, and the Pulſe is ſlow or rare, we grow cold; but when upon running or any violent Exerciſe, the Pulſe becomes more frequent and quick, we become hot.

As to the manner how Blood is made of Chyle, and of its Heat and Colour, and whether the Body be nouriſhed by it, the aforeſaid Dr. gives the following Account.

According to Dr. *Harvey*'s Obſervations, there appears in an *Embryo* a *punctum ſaliens*, or red beating ſpeek, which is Blood, before any the leaſt Lineament of the Heart; ſo that whatever Inſtrument of Sanguification the Heart may appear to be afterwards, it, contribute nothing to the making of the firſt Blood; but it ſeems rather to be made for the Blood's ſake, to tranſmit it to all the Parts of the *Embryo* or *Fœtus*, then the Blood to be made by it. But it muſt be confeſt, that things proceed in the grown *Fœtus* far otherwiſe than they do in the firſt formation: For the Parts of an *Embryo* are nouriſhed and increaſed before it hath a Stomach to concoct any thing, and yet in a perfect *Fœtus*, none

none can deny, that the Stomach does concoct and prepare Nouriſhment for it: So it moves before the Brain is formed ſo perfectly as to be able to elaborate Animal Spirits; and yet after it is perfected, every one knows that the Brain does elaborate ſuch Spirits, as being ſent into all the Parts of the Body by the Nerves, enables them to move. In like manner, though there be Blood in the *Embryo* before the Heart be formed, yet after it be perfected, nothing will hinder but it may at leaſt contribute to Sanguination.

We will ſuppoſe then, that as all the other Parts are formed by the *Vis Plaſtica* or generative faculty of the (firſt) Vegetative and (then) Animal Soul, ſeated in the *Ovum*, and receive their firſt encreaſe by the Aſſimilation of the *Colliquamentum*; but as ſoon as they are perfected, and the *Fœtus* excluded, are nouriſhed by the Blood; ſo the Blood it ſelf as being at firſt made in like manner, as ſoon as the Veins, Heart and Arteries are compleated ſo as it cannot circulate by them, may not improperly be ſaid to be nouriſhed by the Chyle or Nutritious Juice, the Heart aſſiſting the Aſſimulation of the one into the other. And this is done in this manner: The Chyle aſcending by the *Ductus Thoracicus*, and flowing into the Subclavian Vein together with the returning Venal Blood, is poured by the *Vena Cava* into the right Auricle, and ſo into the right Ventricle of the Heart in its *Diaſtole* or Relaxation; then by its *Syſtole* or Contraction it is driven out from thence into the Lungs, from whence it aſcends again into the left Auricle firſt, and then into the left Ventricle of the Heart, out of which it is expelled through the *Aorta*, and paſſing along with the Blood through the Arteries of the whole Body, returns again with it by the Veins to the Heart. For it undergoes many Circulations before it can be aſſimilated to the Blood: Which is evident, both becauſe it is the Chyle (but little altered) that is ſeparated in the *Placenta Uteri* for the nouriſhment of the *Fœtus*, and in the Breaſts for the Infant to ſuck, in the form of milk; and alſo from hence, that if one be let Blood four or five Hours (or later) after a full Meal, there will a great quantity of the milky Chyle it ſelf ſwim a top of the coagulated Blood. But every time the new infuſed Chyle paſſes through the Heart with the Blood, the Particles of the one or more intimately mixed with thoſe of the other in its Ventricles, and the Vital Spirit and other active Principles of the Blood work upon the Chyle; which being full of Salt, Sulphur and Spirit, as ſoon as its *Compages* is looſen'd by its Fermentation with the Blood in the Ventricle of the Heart (eſpecially, but alſo in the Arteries) the Principles having obtained the liberty of Motion do readily aſſociate themſelves, and are aſſimilated with ſuch parts of the Blood as are of a like and ſuitable nature; ſo that at length all the Maſs of Chyle that is capable of being turned into Blood is ſanguified; and what is not, is evacuted by Urine or Stool, or other proper Emunctory.

It is a very difficult Queſtion, by what means the Blood acquires its *Heat*: In order to the Reſolution whereof, it will be neceſſary to conſider how many ways a *Liquid Body* is capable of being heated, and thoſe (according to Dr. *Willis*) are three: *Firſt*, by ſetting it to ſomething that is hot; ſo Water is made hot by being ſet on the Fire, or in the Sun, or a Stove, or by diſſolving Lime in it. *Secondly*, When Saline Corroſives, which are of a contrary nature, being mixt with one another, or with Sulphureous, act one upon another, and by the great ſtruggling, and agitation of their Particles do often excite heat, yea ſometime Smoke and Burning; as when Spirit and Butter of Antimony, or when *Aquæ Stigia* and Oyl of Turpentine are mixt together; as alſo when Corroſive Liquors eat into Metallick Bodies, they often grow hot. *Thirdly*, (which is the only way beſides that a Liquid grows hot) when ſome Humour abounding with Sulphur or much Spirit; is ſet on Fire by holding a Flame to it, and ſo grows hot by Deflagration, as Brandy, *&c.* There are other ways indeed of Calefaction, as *Fermentation*, *Putrefaction* and *Attrition*, whereby *thicker* or *ſolid Bodies* often grow hot, but in *Liquid* they produce no ſuch effect. Thus Leven becomes (ſomewhat) hot by *Fermentation*, and Dung or wet Hay by *Putrefaction*; but neither way will a *Liquid Body* wax hot: For though Wine, Cyder, *&c.* ferment ſo much as to burſt the Sides of the Hogſhead, yet they are not actually hot; nor will Blood become ſo, when it is let out of the Body, diſpoſe it how you will in fit Glaſſes to ferment or putrifie. Indeed the Blood within the Body is fermented, and is thereby deparated, but it is not heated by ſuch Fermentation, as neither is any other Liquid. Neither does the heating by *Attrition* agree to it; for though ſolid Bodies are heated by being rubb'd one againſt another; yet ſhake and agitate Liquids as much as you will, they ſhall be never the warmer for it. Therefore there are only thoſe three ways firſt mentioned whereby actual Heat can be produced in any Liquid, let us ſee to which of them the Incaleſcence of the Blood ought to be aſcribed.

Firſt, Both the Ancients and moſt Moderns are of Opinion, that the Blood is heated the firſt way, *viz.* by the admotion of ſomething that is hot. Thus the former hath taught that the *Innate Heat* and the latter, that the *Vital Flame* is lodged in the Heart, and heats the Blood as it paſſes through it: But both theſe Opinions fall to the Ground, ſince it is clear, that the Heart is a *clear Muſcle*, and contains no fit Fewel for perpetuating a Flame, or I know not what implanted Heat: For though it muſt be acknowledged, that the Circulation of the Blood depends on the continual Motion of this Bowel, yet the *Heart* derives it Heat wholly from the *Blood*, and not the *Blood* its Heat from the *Heart*.

Secondly, This Heat cannot be cauſed in the Blood the ſecond way, becauſe its Liquor in a Natural State is always Homogeneous; and tho' it abound with Salt, yet that is only Volatile, Mild, and Benign. Nor can any one diſcover either in the *Heart*, or in any other Place, a Saline or otherwiſe Heterogeneous Mineral, by acting whereupon, or corroding whereof, the Sanguineous Liquor ſhould conceive Heat.

Thirdly, As to the third way, whereby Liquids grow hot, though it ſeem an hard ſaying, *that the Blood is accended*; yet ſeeing we can attribute its Incaleſcence to no other cauſe, why ſhould we not impute it to this? eſpecially ſeeing the *proper paſſions of Fire and Flame* agree to the *Life of the Blood*.

For the chief and moſt eſſential requiſites to continue a Flame, are theſe three; *Firſt*, That a free and continual acceſs of Air be granted to it as ſoon as it is kindled; *Secondly*, That it enjoy a conſtant Sulphureous Pabulum or Fewel; and *Thirdly*, that it be ventilated, whereby as well its fuliginous, as thicker Recrements may be continually amended

from it; And seeing these agree to the *Vital Flame* as well as to the Elementary, it seems very rational to affirm, *that Life it self is a kind of Flame.*

Thus far that Learned Author, whom the Latin Reader will do well to consult, discoursing farther on this Subject, in his *Exercit. Medicophysica de Sang. incalescentia sive accensione.*

Dr. *Henshaw* thinks that the dissimilitude of Parts between the Chyle and Blood is so great, that it becomes immediately the cause of an extraordinary Ebullition upon their mixture together; which is very much encreased by the Reciprocal Motion of the Lungs, whereby the Blood is wrought almost into a Froth or Foam by that time it gets into the left Ventricle of the Heart. Which sudden excess of Heat, is not unlike what happens upon the mingling several Chymical Liquors together, as Spirit of *Wine*, and Spirit of *Turpentine*, and other such like, where the Heat becomes so great, that it often endangers the Vessels they are contained in. He affirms (contrary to Dr. *Willis*, and I think to the Truth) that new Wine or Must, while it ferments, is hot, and that if the Juice newly pressed out of the Grapes were added to it as it begins to cool, it would again renew its Ebullition, and its Warmth would be continued so long, as one should persist to do so: In like manner he thinks it is the Warmth in the Blood continued by the new Affusion of Chyle, which renews its Fermentation, and consequently invigorates its Heat.

Diemerbroeck is of Opinion, That the *Vital Spirit* (by which he understands the most subtile part of the Blood) while through its great Volatility it always endeavours to fly away, does continually agitate the other thicker Particles of the Blood, with which it is intangled and detained from flight, and is diversly vibrated by them, and beat back; and so the whole Mass being kept in a continual fermentative Motion, there is produced in it an Heat, which in a great Agitation is great, and in a mean, mean; and in a small, small.

I might cite other Opinions concerning the reason of this *Heat*, but they generally fall it with some of those mention'd; of which I shall not make my self an Umpire, but think that Dr. *Willis* has said enough in his above-cited *Exercitation*, to evince that it is not caused either of these latter ways, *viz.* by Fermentation, or by Agitation of the Particles of the Blood in the manner *Diemerbroeck* describes it; and whether the accension of the Blood be the more probable reason of it, let the Reader Judge.

Why the Blood should be of a *red Colour* rather than any other, no satisfactory reason (I think can be given, but the Will of the Creator, though some attribute it to the Heart, others to the mixture of Salt and Subacid Juices with Sulphureous, because from such a Mixture there results a Red Colour, as appears in the Distillation of *Sal Nitre*, (which contains many Sulphureous Particles in it,) or by the pouring Oyl of Vitrol upon Conserve of Roses, or other thing that is of a palish Red (if it contain any thing of Sulphur) for it will be thereby made of a most *deep Red*. We will not spend time to shew in how many Respects these Instances differ from the *Phænomenon* under Consideration, but shall content our selves with inquiring from whence the Difference of Colour arises between the Venal and Arterial Blood. Every one knows that when Blood is let out of a Vein into a Porringer, the *Coagulum* is of a florid Scarlet Colour in its Surface, but of a dark Red from the Superficies to the Bottom, and of such a Colour it appears as it streams out of the Orifice of the Vein. But if an Artery be cut, the Stream then looks of a far brighter Colour, like the Superficies of the Venal Blood when it is coagulated in a Porringer. Now the Arterial Blood receives not this florid Colour in the Heart, but in the Lungs. For if it received it in the Heart then might the Right Ventricle be supposed to give it as well as the Left; but that it does not do so, is clear by this Experiment of Dr. *Lower*'s. If you open the *Vena Arteriosa* which receives the Blood out of the Right Ventricle, the Blood differs nothing in Colour from the Venal, but its crudled part looks every whit as black. But if one open the *Arteria Venosa* as it is entring into the Left Ventricle, it has the perfect Colour of Arterial Blood, which shews, that as it owes not that Colour to the Left Ventricle any more than to the Right (being not yet arrived at it) so it must receive that Alteration of Colour in the Lungs, in which the Nitrous Air being diffused through all the Particles of the Blood, is intimately mix'd with it, and (if you will) accends it. For if there be any such thing as a *Flamma Vitalis* (properly so called) in Animals, though the Blood (or Chyle rather) be to it instead of the Oil or other Matter whereon it feeds, yet it oweth the continuance of its burning to the Air, without the continued Inspiration of which the Animal cannot live, but instantly dies, even as a Candle is presently extinquished, if you put it in a close Place where the Air cannot come to it, or by some Engine be suck'd from it. But this by the bye; for I must confess, that (how plausible soever this Opinion may seem on other Accounts) this Alteration of the Colour of the Blood by the Air in the Lungs, is no sufficient Argument to prove any such Vital Flame, seeing the Arterial Blood being extravasated, retains its florid Colour, when no doubt if ever there was any accension the Flame is extinguished. But this Scarlet Colour is owing meerly to the Mixture of the Particles of the Air with the Blood in the Lungs, from which it transpires in a great measure through the Pores of the Skin, while the Blood circulates in the Habit of the Body, out of the Arteries into the Veins, whence the Venous Blood it self, when extravasated, appears of a Scarlet Dye in its Surface, which is meerly from its being exposed to the Air; for if one turn the congealed Blood in a Porringer upside down, the Bottom, which at the turning is blackish, will in a little while turn to a lighter Red.

Though we have confessed, that the Chyle does circulate through the Body several times before it be perfectly assimilated to the Blood; yet we do not think that it passes into the Nourishment of the Parts in the Form of Chyle. And therefore when speaking of the Nutrition of the *Fœtus* in the Womb, we often mention'd a *Nutricious Juice* (which was Chyle a little alter'd;) we did nor call it so with respect to the solid Parts of the *Fœtus*, but to the Blood it self, whose *Pabulum* or Nourishment it is, as soon as tbe Umbilical Vein is formed, as the Blood is of the Body. For as to the encrease of the first delineated Parts of an imperfect *Embryo*, that is far different from ordinary Nutrition.

The Blood then consisting of Particles of a different Nature, each particle passes into the Nourishment of that Part which is of the same Nature with it:

it: So the Salt and Sulphureous Particles being equally mix'd, are agglutinated and aſſimilated to the Fleſhy or Muſculous Parts; the Oily and Sulphureous to the Fat; the Salt and Tartareous to the Bones, *&c.* Now this is not done by any Election or Attraction of the Parts, as if they pick'd and chus'd (with a kind of Diſcretion) ſuch Particles of the Blood as are ſuitable to their own Nature, for the Maſs of Blood is equally and indifferently carried to all the Parts: But there is that diverſity of Figure both in the ſeveral Particles of the Blood, and in the Pores of each Part, that in the Circulation thro' the Habit of the Body, ſome ſtick in theſe, and others in thoſe, where they are faſten'd and united to the Subſtance of the reſpective Parts; and thoſe which thro' their peculiar Figure are unapt to adhere to one or other, return again to the Veins, and ſo to the Heart, where they receive ſome new Alteration: So that as *the Life of the Fleſh is in the Blood* (according to *Levit.* 17. 11.) ſo has it its vital Heat and Nouriſhment from it alſo.

BLOOD-WIT, is a Word uſed in Ancient Charters of Liberties, and ſignifies an Amerciament for ſhedding Blood; ſo that whoſoever had it given him in his Charter, had the Penalty due for ſhedding Blood granted him.

BLOODY-HAND, is the Apprehenſion of a Treſpaſſer in the Foreſt againſt Veniſon, with his Hands or other Part Bloody, tho' he be not found Chaſing or Hunting. *Manwood*, Part 2. C. 18.

BLUFF-HEADED; a Ship is ſaid to be ſo, when ſhe hath but a *ſmall Rake forward on*, and that her Stern is ſet too ſtrait up.

BOCEHET, is a Decoction of any thing boiled over again. *Blanchard.*

BOARD, a Word variouſly uſed at Sea: To go into a Ship is called *going a-board*; to be within the Ship, is ſaid to be *within Board*, and to be without the Ship, is ſaid to be *without Board*; when a thing is thrown into the Sea, they ſay it is *heaved over Board*; when it ſlips down by the Ship's Side, they ſay it *ſlips by the Board*; when two Ships touch one another, they ſay they are *Board and Board*; that Side of the Ship that is to Windward, they call the *Weather Board*; when a Ship lies up to Windward, ſometimes upon one Tack, and ſometimes upon another, they ſay *She makes a Board*, or *Boards it up*; and if ſhe advances much at one Turning or Tack, they ſay *She makes a good Board*; when they leave Land behind the Ship, they ſay they leave the Land on *Back-board*; to enter a Ship in a Fight, is called *Boarding of her.*

BOAT-ROPE, in a Ship, is that Rope by which the Ship tows her Boat at the Stern.

BOAT-SWAIN, or (as the Seamen call him) *Boorſon*, is an Officer a-board a Ship who hath Charge of all her Rigging, Ropes, Cables, Anchors, Sails, Flaggs, Colours, Pendants, *&c.* He alſo takes Care of the Long-Boat and its Furniture, and ſteers her either by himſelf or his Mate. He calls out the ſeveral Gangs and Companies a-board to the due Execution of their Watches, Works and Spells; and he is alſo a kind of Provoſt Marſhal, ſees and puniſhes all Offenders that are ſentenced by the Captain or Court Marſhal of the whole Fleet.

BOCARDO, the fifth Mood of the third Figure in Logick, in which the Middlemoſt Propoſition is an univerſal Affirmative, the firſt and laſt particular Negatives.

BLOCKLAND, was formerly that which we now call Free-hold Land, or Land held by Charters; and it was by that Name diſtinguiſhed from *Folk-land*, which was Copy-hold Land.

BODY; the Chymiſts uſually call that Veſſel which holds the Matter in Diſtillation of the Spirit of Vegetables a *Body*. 'Tis called alſo a *Cucurbite*, where ſee its Figure.

BODY, in Geometry, is that which hath three Dimenſions, Length, Breadth and Thickneſs; as a Line is formed by the Motion of a Point, and a Superficies by the Motion of a Line, ſo a Body is formed by the Motion of a Superficies.

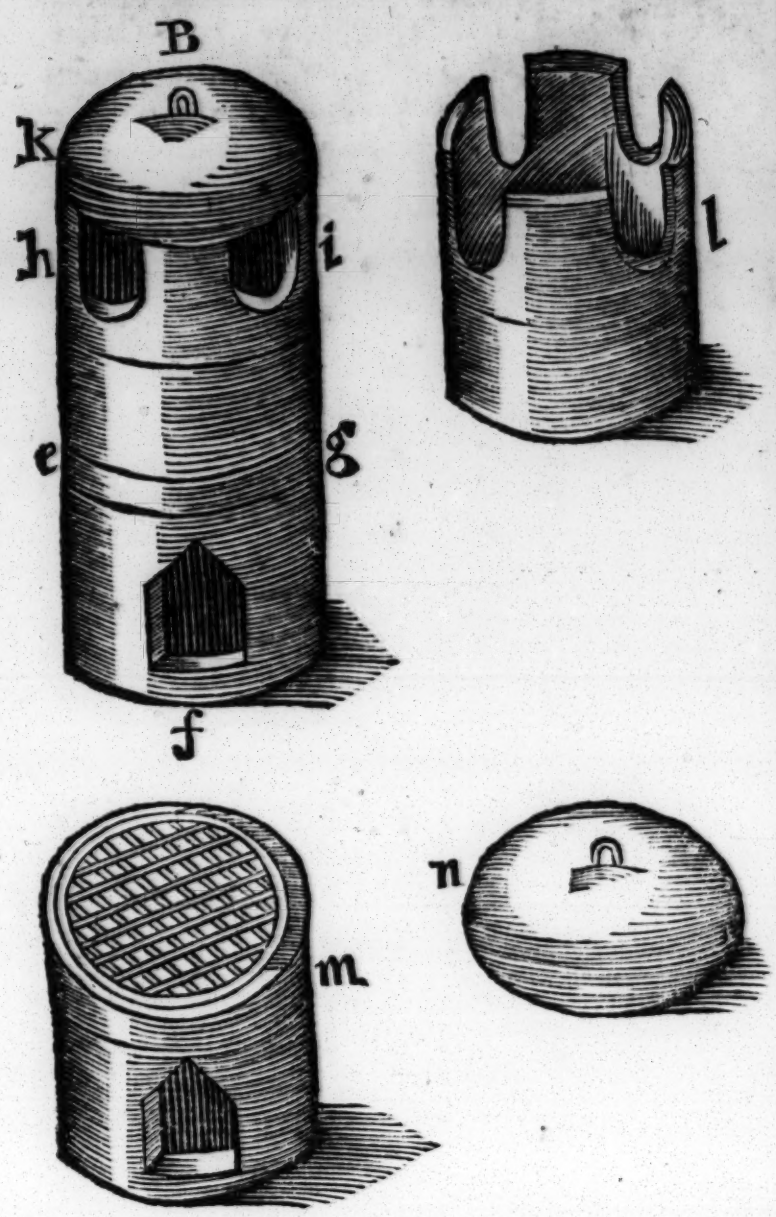
BODY, in Natural Philoſophy, is uſually defined to be a Subſtance impenetrably extended; or which having *Partes extra Partes*, cannot be in the ſame Place with, or penetrate the Dimenſions of any other Body. And this Property Sir *Iſaac Newton* expreſſes by the Word *Solidity*; and according to his excellent Philoſophy, the Idea of a Body is that which is *extended*, *ſolid* and *moveable.*

BODIES *Regular*, ſee *Regular Body.*

BOLONIAN *Stone*, is a ſmall, grey, weighty, ſoft, ſulphureous Stone, about the bigneſs of a large Walnut, and being broken, hath a kind of Chryſtal or Sparry Talk within it. It is found about *Bolonia* in *Italy* (whence its Name) and in many other Parts of the ſame Country, and in great quantity at the Foot of Mount *Paleruo*; where a Shoomaker, one *Vimenzo Coſciarolo*, gathering up theſe Stones, carried ſome of them home and calcined them, hoping to extract ſome Silver out of them; but inſtead of his Aim, he diſcovered this ſtrange *Phænomenon*, that the Stone, when expoſed to Light, would retain it, and afterwards ſhine in the Dark. After this, tho' the Stone was much celebrated for its ſhining Quality, yet the Manner of preparing it, to exhibit this *Phænomenon* was not truly and fully known or diſcovered to the World, till one Mr. *Homberg* a *German* Phyſician, living at *Paris*, took the Matter into freſh Conſideration, and made a Journey into *Italy* to enquire about the Stone, and its manner of Calcination; and 'tis he that hath given us the following Proceſs to prepare it; which *Lemery* in the laſt Edition of his *Chymiſtry*, P. 707. puts down to this Effect.

Take ſeven or eight *Bolonian Stones*, and raſp off all their Coat or Heterogeneous Earth about them till the Stone begins to gliſter and ſhine; then powder one of them in a Brazen Mortar, (which Circumference is of abſolute neceſſity, for elſe the Stone will not ſhine) and ſift the Powder finely, and moiſtening the other ſeven with clear Brandy very well, roll them up and down in the Powder till their Surface be all covered with it. Then having provided a ſmall Furnace of Earth, round, and about a Foot high, beſides the Dome, and near a Foot and half in Diameter; the Aſh-room muſt have two Doors to give the Fire the more Air, one of them right againſt the other; the Hearth need have none, but only three or four hollow Cuts or Notches (as in the Figure) the Dome ſet on it for Reverberating the Fire on the Matter; the Grate ought to be of fine Braſs or yellow Copper, which helps to render the Stone Luminous, and the Holes in it muſt be ſmall.

B, the Furnace all together, *l*, the Hearth of the Furnace ſeparated from the Dome and Aſh-room, that the Hollows or Notches may appear.



m, the Aſh-room with the Braſs Grate. *n*, the Dome by it ſelf, with its Ring to take it on and off.

All things being thus ready, put into the Furnace five or ſix kindled Coals to heat it, and when they are half waſted, fill the Furnace up to the Holes or Notches with ſmall Cinders, and then lay your Stones covered with the Powder upon them; then cover them with other Cinders that the Furnace may be full: Laſtly, fix on the Dome, and without touching it any more, let the Coals and Cinders burn to Aſhes. When the Furnace is half cold, ſeparate the Dome, the Hearth, and Aſh-room, and you will find on the Grate the Stones calcined: Lay the Grate ſoftly on white Paper, and gathering up the Stones carefully keep them in a Box with Cotton.

If theſe Stones be expoſed to the Light in the open Air, as in one's Hand out of a Window, *&c.* (but not to the Sun-beams) for about a Minute, and then carried into a dark Place, they will for ſome time appear like kindled Coals, tho' without any ſenſible Heat; the Light will abate by little and little, but may be recovered anew, by the Stones being again expoſed to the Light of the Day, as before. This ſurpriſing Quality, if well uſed, they will retain for 2, 3, or 4 Years; and when 'tis loſt, it may in part be recovered again by a new Calcination after the ſame manner.

If you draw any Figures on Paper with the White of an Egg, and while they are wet, ſtrew on them the Cruſt of this calcined Stone powdered; then dry them in the Shade, put them in a Frame, and cover them with a Glaſs: They being expoſed to the Light with the Glaſs Cover on, will at any time ſhine if removed into a dark Place.

BOLT-HEAD, *vid. Matraſs.*

BOLT-ROPE, is that Rope into which the Sail of a Ship is fixed or made faſt.

BOLTS, in a Ship, are Iron Pins, of which there are theſe ſeveral ſorts; 1. *Ring-Bolts*, which ſerve for the bringing to of the Planks, and thoſe Parts whereto are faſtned the Breeches and Tackles of the Ordnance. 2. *Drive-Bolts*, and theſe are uſed to drive out other Bolts. 3. *Set-Bolts*, which are employed for the forcing of the Planks and the other Works, and bringing them cloſe one unto another. 4. *Rag-Bolts*, which are on each Side full of Jaggs or Barbs to keep them from flying out of the Holes wherein they are driven. 5. *Clench-Bolts*, which for the ſame End are clenched, that is, made faſt at the Ends where they come thro'. 6. *Fore-Bolts*, which are made like Locks, with an Eye at each End, whereinto a Fore-lock of Iron is driven to prevent ſtarting out. 7. *Fender-Bolts*, made with long and thick Heads, and are ſtruck into the uttermoſt *Bends* or *Wales* of a Ship to ſave her Sides from Bruiſes and Hurts; and thence take their Name.

BOLUS, in a Mineral Senſe, is a kind of Earth, and which Dr. *Grew* ſuppoſes to be a Bed, as it were, the *Materia Prima* of Opacous Stones and Metals; into which he thinks thoſe of the ſaid *Bolus* are tranſmuted by being concerted with divers Salts and Sulphurs, which fly in upon them ſucceſſively.

BOLUS, is a Medicine taken inwardly, of a Conſiſtence ſomething thicker than Honey, and the Quantity for one Doſe is as much as may be conveniently taken at a Mouth-full.

BOMB-CHEST, is a kind of Cheſt, which being filled with Gun-powder and *Bombs* (according to the intended Execution) is placed under Ground to blow it up into the Air, together with thoſe that ſtand upon it. Theſe *Bomb-Cheſts* are frequently uſed to drive Enemies from a Poſt they lately ſeized, or whereof they are about to take Poſſeſſion; and are ſet on fire by the Means of a Sandidge faſtened at one End.

BOMBS or *Granada-Shells*, are hollow Balls of Caſt Iron, which are filled with whole Powder, and ſometimes with Nails, Pieces of Iron, *&c.* along with it. Their uſe is to be ſhot (out of Mortar-pieces) into beſieged Towns, to annoy the Garriſon, fire Magazines, *&c.* The largeſt are about 15, and ſome 18 Inches in Diameter. From theſe Bombs, being uſed in the beſieging of Towns, we ſay ſuch a Place was *Bombarded.*

BON-GRACE (in a Ship) is a kind of Frame made of old Ropes or Junks of Cables, which, in thoſe who ſail into Cold Latitudes, are laid out at the Bows, Sterns and Sides of the Ships, to preſerve them from being injured by the great Flakes of Ice.

BONA *Notabilia*, (in Law) is where a Man dies, having Goods to the Value of 5 Pounds, in divers Dioceſſes, then the Archbiſhop ought to grant Adminiſtration; and if any inferiour Biſhop do grant it, it is void.

BONA *Patria*, a Term in Law, ſignifying an Aſſize of Country-Men, or good Neighbours; ſometimes called *Aſſiſa bona Patria*, when twelve, or more, are choſen out of the Country to paſs upon an Aſſiſe; and they are called *Juratores*, becauſe

cauſe they ſwear judicially in preſence of the Party.

BONES, of an Animal Body. A Bone is by Anatomiſts defined to be a ſimilar Part, moſt dry, cold, hard, inflexible, void of Senſe, and affording Stabiliment and Form to the whole Body.

The Integral or Conſtituent Parts of Bones are their *Perioſteum* or inveſting Membrane, their *Subſtance*, *Pores*, *Marrow*, *Glands*, *Veſſels*, *&c.* of which take the following ſhort Account from Dr. *Haver*'s *Oſteologia*.

The *Perioſteum* hath two Sorts or Series of Fibres, the under deriv'd from the *Dura Mater*, the upper from the Membrane of the Muſcles that lies upon it; which Fibres lie one upon the other, but are not interwoven one with another.

The under Fibres run all parallel directly from one End of the Bone to the other, and are continued from one Bone to another by Means of the Ligaments that join them together in their Articulations, upon which they paſs.

The outer hold the ſame Courſe with the Fibres of the Muſcle from whence they are derived, ſometimes ſtreight, ſometimes oblique, ſometimes tranſverſe, and when they have run ſo far as to make up their Part of the *Perioſteum*, he thinks they are inſerted into the Bone, and are ſucceeded by others from ſome other Muſcles. Some of the Tendons of the Muſcles alſo propagate Fibres to make ſome Part of the *Perioſteum*; but others penetrating it, are immediately inſerted into the Bone.

The inner Superficies of the *Perioſteum* ſticks as cloſe to the Bone as if it were glued to it; and beſides, the *Perioſteum* has little *Fibrellæ* or Threads continued from it, that enter into the Subſtance of the Bone, which gives them (probably) ſome i nternal Senſe.

The *Uſes* he aſcribes to it, are, 1. To be a Tegument to the Bones. 2. To convey Spirits into the Subſtance of the Bones for maintaining their Heat, for preſerving their Senſibility, and to aſſiſt in the Work of their Accretion and Nutrition, by means of the Minute Fibres it emits into them. 3. To help to ſet Limits to the Growth and Extenſion of the Bones, as the Bark is ſometimes obſerved ſo to bind young Trees, that it is neceſſary to open it before they can have the Liberty of thriving. 4. It is ſerviceable in the Conjunction of the Bones and their Epithyſes (while theſe are Cartilaginous) alſo of the Bones which are joyned by Sutures or Harmony, and in the Connexion of the Bones and their Cartilages. 5. To join the Heads and Tendons of the Muſcles faſt to the Bones; namely, of ſuch Tendons as do not penetrate it (as ſome do not.)

Having done with the *Perioſteum*, he comes to the *Subſtance* of the Bones, which he deſcribes after this manner. He ſays, they conſiſt of *Lamellæ* or Plates lying one upon another, and theſe of ſmall Strings or Fibres running lengthways of the Bones (like as we ſee in Whale-bone;) which Strings, though ſome of them run to the very Extremities of the Bones, and others approach near to them, do not terminate there, ſo as to have diſtinct Ends, but they are, where they may be thought to terminate, ſtill continued, and run tranſverſly, and as it were arched, that the Strings of one Side of the Bone proceed as to meet and be united to thoſe that are propagated from the oppoſite; and this at both Extremities, that they are a Continuation, though not in the Figure, yet in the Manner of a Ring; therefore they are not all of a length, but in every Plate they fall one ſhorter than another.

In ſeveral Bones the *Lamellæ* are diſpoſed diverſly: In thoſe Bones which have a large Cavity, they are on every Side contiguous and cloſely united; but in thoſe which have not any great Cavity, but are altogether ſpongious within: Many of the internal *Laminæ* are placed at ſome Diſtance from one another in all their Length, having betwixt them a Cavernous Subſtance or ſmall bony Cells; and ſo have alſo thoſe Bones, which have a large Cavity, ſome of thoſe leſſer Cells at both their Extremities.

Next he comes to their *Pores*, and ſays, That in the Bones, whoſe Plates are Contiguous, there are *Pores* through and between the Plates, beſides thoſe which are made for the Paſſage of the Blood-Veſſels; and theſe are of two ſorts: The one penetrate the *Laminæ*, and are tranſverſe, looking from the Cavity to the external Superficies of the Bone. The ſecond ſort are formed between the Plates, which are Longitudinal and Streight, tending from one end of the Bone towards the other, and obſerving the Courſe of the Bony Strings. The firſt kind are formed not only in the firſt internal *Laminæ*, but in every one, even to the outermoſt, though the nearer they are to the Cavity, the greater is the number of the Pores. And as they paſs, they do not obſerve any ſuch order as to lie directly one under another, to form any continued Paſſage from the Cavity to the external Plate. The ſecond kind, *viz.* the Longitudinal, are not to be obſerved, but by good Glaſſes, unleſs it be now and then in ſome particular Bones. By theſe it is that the Medullary Oil diffuſes it ſelf, and is immediately beneficial to the Plates. The other (*viz.* the Tranſverſe) and but ſubordinate to theſe, and rather deſigned for the Paſſage of the Marrow into them, than for the immediate Communication of it to the Subſtance of the Bone.

The *Medulla* contained in the Bones; conſiſts (beſides the Blood-Veſſels) of an inveſting Membrane, in which are included Membraneous Lobules and Bags, and in theſe Bags *Veſiculæ* or Glandulous Bladders, very much like the Veſicular Subſtance of the Lungs. And theſe Glandular Bladders ſerve both for the Separation of the Medullary Oil from the Maſs of Blood, and for the Reception and Conſervation of it. In an Human Bone which he had preſerved till the Medullary Oil was wholly evaporated, he found theſe *Veſiculæ* remaining dry, but entire, and their Subſtance repreſenting, in a manner, a Sponge. They ſeem to have Pores or immediate Paſſages out of one into another (as have alſo the Bags) by which the Oil has a freer Courſe to the Joints and Subſtance of the Bone, for whoſe Benefit it was deſigned. By the Strict eſt Enquiry he could never find any thing like Ducts (as paſs from other Glandules) and indeed theſe are not here neceſſary, becauſe the Oil is not carried from the Glandular Veſſels to any large Receptacle, but flows out of the Superficies of the Marrow in as many Places as there are tranſverſe Pores in the internal Lamel. The *Medulla* ſerves to oil the Subſtance of every Bone, which the drier it were, the brittler it would be: It lubricates alſo their Articulations, and hinders their Ends from being worn or over-heated with Motion; and it moiſtens likewiſe the Ligaments, by which they are tied one to another. But in theſe two laſt Uſes it

is

is assisted by the Mucilage which is separated by the *Glandulæ Mucilaginosæ* (as he calls them) which he has observed in all the Articulations of the Bones, and are of the Conglomerate Kind, of which he speaks more in the next Chapter.

Now the manner of the Medullary Oyls insinuating it self through a Bone, and its being dispensed to all the Parts of it, is this: It first passes, being Liquid (as it all is while the Animal is alive) out of the Cavity, through the transverse Pores of the first Internal *Laminæ*, and not having Pores of the same kind directly subjacent in the next Place to transmit it towards the outside of the Bone, it flows into the Longitudinal ones formed between these two (the first and seoond) Plates, and being carried along in them till it find some transverse Pores in the second Plate, it passes through these, which when it has done, it is obliged again to alter its course, to run into and flow along the streight Pores between the second and third *Lamina*. Thus it passes through and between the Places successively, till it has made its way to the External Plate.

Thus the Medullary Oyl is dispensed in all the Bones to those Plates which are contiguous, and have no intermediate Cavities to entertain any Medullary Glands of their own: But where the Plates stand at some distance (as they do in such Bones as have not any great Cavity) there are the small Caverns (above-mention'd) which are capable of containing some Medullary Glands, from whence the Plates have more immediately, and without the former method of Conveyance, the benefit of the Marrow.

He divides the *Blood-Vessels* of the Bones into *Nutritious* and *Medullary*. The most considerable of the Nutritious enter at the ends of the Bone, *viz.* the Artery at one end, and the Veins at the other. The *Medullary* commonly enter the Sides of the Bones (and that obliquely, as the Ureters do the Bladder) both by one *Foramen*.

There are no *Nerves* that are inserted into them (except into the Teeth) but these only run through the *Periosteum* that invests them.

Some Bones have large *Cavities* in them, as *Os Humeri*, and *Femoris*, the *Ulna* and *Radius*, *Tibia* and *Fibula*, the Bones of the *Metacarpus* and *Metatarsus*, of the Fingers and Toes, and of the *Os Hyoides*; to which may be added, the lower Jaws; though the Cavity compared with the magnitude of the Bone, hardly deserves to be stiled large: Besides these large Cavities which are in the inside of the Bones, there are lesser Cells or Caverns in their Substance, which are found in all the Bones, even those which have a large Cavity. But of these before, when we spoke of the Distribution of the Marrow.

Besides the large Cavities and Cavarns in the Inside or Substance of the Bones, most have *Superficial Cavities* or Sinus's which Dr. *Havers* distinguishes into *Sulci* or Forrows (which are the long ones) and *Pits*, as he calls the shorter ones. And they have besides, *Holes* for the Nutritious and Medullary Vessels, as was but just now observed.

On the outside of the Bones there are also to be observed, their *Prominences* or *Protuberances*, of which there be two kinds; for it is either a continued part of the Bone jetting manifestly above its plain Superficies, for the more commodious insertion of the Muscles, *&c.* and is called *Apothysis*, a *Process*; or else it is like an additional Bone growing to another by simple and immediate Contiguity, (and generally softer and more porous than it) and is called *Epithysis*, an *Appendage*. If the Protuberance of the Bone be round, it is called its *Caput*; under which is the *Cervix*, as in the upper-end of the Thigh-bone: If it be flat, it is called *Condylus*; if sharpe, *Corone*, from the similitude they have to other things, as *Styloides*, *Coracoides*.

Their *Uses* are many; for they serve, 1. For the Firmitude and Sustentation of the Body, like Beams and Pillars in Houses. 2. For a Defence to some Parts; so the Skull defends the Brain, the Ribs the Parts contained in the Breast. 3. For Progression or Walking, of which they with the Muscles are the only Instruments. 4. They give Shape to the Parts of the Body. These are their *general* Uses; as to their *particular* Uses, those will be shewn as we describe them severally.

BONIS *non amovendis*, is the Writ to the Sheriff of *London*, &c. to charge him, that one concondemned by Judgment in a Nation, and prosecuting Writ of Error, be not suffered to remove his Goods until the Error be try'd.

BONNET, in Fortification, is a certain Work raised beyond the *Counterscarp*, having two Faces which form a Saliant Angle, and as it were a small *Ravelin* without any Trench. The Height of this Fortification is three Foot, and it is environ'd with a double Row of Pallisadoes, ten or twelve Paces distant from each other. It hath a Parapet three Foot high; and is like a little advanc'd *Corps du Guard*.

BONNET *a Prestre*, or *the Priest's Cap*, in Fortification, is an Out-work having at the Head three Saliant Angles, and two Inwards: It differs from the double Tenaille only in this, that its Sides instead of being Parallel are made like a Swallow's Tail, that is, narrowing or drawing close at the Gorge, and opening at the Head.

BONNETS, in a Ship are small Sails set on upon the Courses, or her Main-Sail and Fore-Sail; when they are too narrow or shallow to cloath the Mast. The words are, *Lace on the Bonner*, that is, fasten it to the Course; *Shake off the Bonnet*, that is, take it off the *Course*.

BOOM: That long piece of Timber with which the Clew of the Studding Sail is spread out, is called, the *Studding Sail-Boom*. A Boom is also used sometimes to spread or Boom out the *Clew* of the *Main* or *Fore-Sail*. The Seamen say *a Ship comes Booming* when she makes all the Sail she can. Also those Poles with Bushes or Baskets on the Top, which are placed to direct how to steer into a Channel, are called *Booms*, and by some *Beacons*.

BOOTES, the Name of a *Northern* Constellation of the fixed Stars; of which one in the Skirt of his Coat is called *Arcturus*, and is of the first Light on Magnitude. This Constellation is also called *Arctophylax*, and consists of 34 Stars.

BORBORYGM, a rumbling Noise in the Guts. *Blanchard.*

BORDLANDS, is the Demesns which Lords keep in their own Hands, for the maintainance of their Board or Table.

BORDURE, a Term in Heraldry, for an Ancient Difference in a Coat of Arms, whereby several Families of the same Name, or Persons bearing the same Coat are distinguished one from another. 'Tis a cutting off from within the Escutcheon all round it, about $\frac{1}{5}$ of the Field; and if the Line that constitutes the *Bordure* be strait, and

and the *Bordure* be plain, as they call it, then in Blazoning you muſt only name the Colour of the *Bordure*, as here, he beareth *Gules* a *Bordure Or*; without ſaying a *Plain Bordure*.

BORDURES, are ſometimes *Engrailed*, *Gobonated*, *Invected*, *Indented*, *Counter Compony*, *Vairy*, *Checky*: Which ſee under thoſe Words. If a *Bordure* be charged with any Parts of Plants or Flowers, they ſay *Verdoy of Trefoiles*, or whatever Flower it be. If the *Bordure* conſiſt of *Ermins*, *Vairy* or any of the Furs, the Term is *Purflew of Ermins*. If the *Bordure* be charged with *Martlets*, the Word is, charged with an *Enaly ron of Martlets*, &c.

BOREAL or *Northern Signs*, are the ſix firſt Signs of the *Zodiack* or thoſe on the *Northern* ſide of the *Equinoctial*.

BOROUGH *Engliſh* (a Term in Law) is a cuſtomary deſcent of Lands or Tenements in ſome Places, whereby they come to the youngeſt Son; or if the Owner have no Iſſue, to his youngeſt Brother.

BOROW or *Borough*, ſignifies with us a Corporate Town, that is not a City.

BOROG-HEAD or *Head-borough*, is the chief Man of the *Decury* or Hundred.

BOSPHORUS (in Geography is a long narrow Sea running in between two Lands, by which two Continents are ſeparated; and by which way a Gulf and a Sea, or two Seas have a Communication one with another, as the *Thracian Boſphorus*, now called the *Straits of Conſtantinople*.

BOTANICKS or *Botany*, is that part of the Art of *Medicine* which deſcribes and enumerates the ſeveral Virtues of Plants; and that part of *Natural Hiſtory* which teaches rightly to diſtinguiſh the ſeveral Kinds and ſubordinate Species of Plants, Trees, Shurbs, *&c.* one from another, and which gives juſt Deſcriptions of them. And he that is accurate in this Art is called a good

BOTANIST: See Schemes of the ſeveral kinds of Plants under the word *Plant*.

BOTHRION, the Name of a kind of hollow, narrow, and hard Ulcer in the Eyes. *Blanchard.*

BOTTONY, a Term in Heraldry for one of their Croſſes of this Figure, *Argent* a *Croſs Bottony Sable*, by the Name of *Winwood*.

BOW, of a Ship, is that part of her which begins at the *Loof* and *compaſſing* Ends of the *Stem*, and ends at the Sternmoſt part of the *Fore-Caſtle*. If a ſhip hath a Broad Bow, they call it a *Bold Bow*: If ſhe hath a *narrow thin Bow*, they ſay ſhe hath a *Lean Bow*. The Piece of Ordnance that lies in this place is called the *Bow Piece of Ordnance*; and the Anchors that hang here are called her *Great* or *Little Bower*.

BOW, a Mathematical Inſtrument made in Wood, formerly uſed by Seamen to take the Altitude of the Sun.

BOW, alſo, is a Beam of Wood or Braſs with three long Screws, that govern or direct a Lath of Wood or Steel to any Arch; uſed commonly to draw Draughts of Ships, Projection of the Sphere, or where-ever 'tis requiſite to draw large Arches.

BOW-SPRIT, is a kind of Maſt, reſting ſlopeways on the Head of the main Stem, and having its lower End faſtned to the *Partners* of the Fore-Maſt, and farther ſupported by the *Fore Stay*: It carries the *Sprit-ſail*, *Top-ſail*, and *Jack-ſtaff*; and its Length is the ſame with the Foremaſt.

BOWER, any Anchor carried at the Bow of a Ship is called her *Bower*: There are uſually carried 2 there, the firſt and ſecond *Bower*; but the greateſt Anchor is carried in the Hold.

BOWLING, or rather *Bow-Line*, is a Rope faſtned to the *Leach*, or middle part of the outſide of the Sail; it is faſtned in three or four parts of the Sail, which is called the *Bowling Bridle*; but the *Mizen Bowling* is faſtned to the lower end of the Yard. All Sails have it except Sprit-ſail, and Sprit-ſail Top-ſail, and therefore thoſe Sails cannot be uſed cloſe by a Wind; for the uſe of the Bowling is to make the Sails ſtand ſharp, or cloſe, or by a Wind: The Words belonging to it are theſe, *Sharp the Bowling*, *Hawl up the Bolwing*, *Set faſt the Bowling*, that is, pull it up hard, or hale it more, forward on; but when they ſay, *Eaſe the Bowling*, *check* or *run up the Bowling*; they mean, let it more ſlack.

BOWLING KNOT, is a Knot that will not ſlip, by which the *Bowling Bridle* is faſtned to the *Crengles*.

BOWSE, a Sea Term, ſignifying as much as *Hale* or *Pull*. Thus haling upon a Tack, is called *Bowſing upon the Tack*. And when they would have the Men pull all together they cry, *Bowſe away*.

BOX *and Needle*, is the application of a ſmall Compaſs to a Theodelite, and is uſed in *Surveying*, *&c.* to find out the Situation of Places, by the pointing of one end of the Magnetical Needle towards the *North*.

BOY, of an Anchor: See *Buoy*.

BOYAU, or *Branch of the Trenches*, in Fortification, is a particular Ditch ſeparated from the main Trench, which in winding about encloſeth different Spaces of Ground, and runs parallel with the Works and Fences of the Body of the Place; ſo that when two Attacks are made near one to another, the *Boyau* ſometimes makes a communication between the *Trenches*, and ſerves as a Line of Contravallation not only to hinder the Sallies of the Beſieged, but alſo to ſecure the Miners. But when 'tis a particular Cut that runs from the Trenches to cover ſome Spot of Ground, it is then drawn parallel to the Works of the Place, that it may not be *Enfiladed*; that is, that the Shot from the Town may not ſcoure along it.

BRACED, the Term in Heraldy for the intermingling of three *Chevronells*, thus;

Azure, a *Chief Or*, and three *Chevronells* Braced in the Baſe of the *Eſcutcheon*, by the Name of *Fitz-hugh*.

BRACES, are Ropes belonging to all the Yards of a Ship except the Mizen, two to each Yard; there is a Pendant ſeized to the Yard Arms, at whoſe other end there is a Block, through which the Brace is reeved, and their uſe is to *Square the Yard*, that is, to ſet it Square; to *Brace the Yard*, that is, to bring it to either ſide; to *Traverſe the Yard* that is,

is, to ſet it any way overthwart; and to *Right the Yard*, that is, to bring it ſo that it ſhall ſtand at Right Angles with the Length of the Ship. All *Braces* come afterward on, the *Main Brace* comes to the *Poop*, the *Main Top-ſail Brace* to the *Mizen top*, and thence to the *Main Shrouds*; the *Fore* and *Fore-top-ſail Braces* come down by the *Main* and *Main-top-ſail Stays*; and ſo of all the reſt. But the *Mizen Bowling* ſerves for a *Brace* to that Yard, and the *Croſs-Jack Braces* are brought forwards to the *Main Shrouds* whenever a Ship ſails cloſe by a Wind.

BRACHIÆUS *Externus*, is a Muſcle of the Cubit, which ſeems to be the third beginning of the *Gemellus*; its Origination is continued from above the middle of the inferiour and back part of the *Os Humeri* to its Cavity, which receives the *Olecranium* Extenſion of the Cubit, where joining with the Tendinous Outſide of the *Gemellus*, it is inſerted with it as aboveſaid.

BRACHIÆUS *Internus*, is a Muſcle of the Cubit, which derives its Name from its Situation, lying partly under the *Biceps*: It ariſeth fleſhy from the Internal Part of the *Os Humeri*, at the Inſertion of the *Deltoides* and *Coracobrachialis* Muſcles, and deſcending over the Juncture of the *Cubit* with the Arm-bone, it's inſerted partly Fleſhy and partly Tendinous to the Superior and Forepart of the *Ulna*: Its uſe is to help bend the *Cubit*.

BRACHIOLUM, is a kind of Index or Label put upon Aſtrolabes and other Projections of the Sphere; and by ſome *Engliſh* Writers is called a *Creeping Index*.

BRACHYCATALECTICK *Verſe*: See *Depoſition*.

BRACHYGRAPHY, is the Art of Short-hand.

BRACKETS (in a Ship) are ſmall Knees ſerving to ſupport the Galleries; and ſo thoſe Timbers are called that ſupport the *Gratings* in the Head.

BRADYPEPSY, is ſlow Digeſtion, proceeding from a depraved Diſpoſition of the Acid Ferment in the Stomach. *Blanchard*.

BRAILS, are ſmall Ropes reeved thro' Blocks which are ſeized on either ſide the Ties, a little diſtance off, upon the Yard; ſo that they come down before the Sails of a Ship, and are faſtned at the Skirt of the Sail to the Crengles. Their uſe is, when the Sail is furled a-croſs, to hale up its Bunt, that it may the more readily be taken up or let fall. Theſe Brails belong only to the two Courſes and to the Mizen Sail. The word is, *Hale up the Brails*, or which is all one, *Brail up the Sails*; for the meaning is, that the Sail ſhould be haled up, in order to be furled, or bound cloſe to the Yard.

BRAIN (ſee *Cerebrum* and *Cerebellum*) in the general Senſe of the Word, is taken for all the ſoft Subſtance which is contained within the whole Skull, and which the *Greeks* comprehended under the Word ἐγκέφαλος. It is the general Organ of Senſe, in which the Soul, the Governour of the Body, perceives and judgeth of the Senſations of all the Sentient Parts; and *out of which*, as out of a Fountain, it communicateth the Animal Spirits (bred in the Brain) by the Ducts and Rivulets of the Nerves to all the Sentient Parts of the Body; and thereby endows them with the Faculty of performing Animal Actions.

The Brain being of ſo looſe a Subſtance, and the Skull wherein it is incloſed ſo hard that the Saw or Chizel are neceſſary to break through it, the Brain muſt needs be very much ſhattred or concuſſed thereby; and after the Skull is divided, in the very pulling of it off, the vaſcular Connection or the *Dura Mater*, and it with the *Pia Mater* and *Brain* (and that alſo of the one with the other) being torn in ſunder, the Parts into which Veſſels are inſerted, are neceſſarily much violated: And laſtly, after the Covers are removed, ſeveral parts of the Brain being of ſuch difficult acceſs, that others muſt be quite ſpoiled, before one can come to a view of them, and theſe alſo thereby in part violated: Upon all theſe accounts a true Anatomy of the Brain, as to its Contiguities, Connections, Cavities or Venticles, *&c.* muſt be very difficult; ſo that 'tis no wonder the Obſervation of Anatomiſts are ſo different, and ſo oppoſite to one another. But this by the bye, let us next diſcourſe of the Brain more generally.

If by *Brain* we underſtand the whole Ἐγκέφαλος (or all that which is contained within the Skull) it is not of one *Subſtance*, but divers; and is diſtinguiſhed by the particular Names of the *Cerebrum*, (in ſpecial) the *Cerebellum* and the *Medulla oblongata*. Nor is the *Cerebrum* (*properly* ſo called) it ſelf of a like Subſtance, but conſiſting of a Cortical and Medullar Part (called *Corpus Calloſum* and theſe differ in their Nature, Colour and Conſiſtence. Which difference *Malpighius* thus deſcribes: The *Cortex* (being of an Aſh-colour) he ſays, is Glandulous: The outſide of the Glands is covered with the *Pia Mater*, and its Blood-Veſſels, which penetrate deep into their Subſtance; (each Gland having a Twig of both an Artery and a Vein:) Their inner ſide ſends forth a white Nervous Fibre, like a proper Veſſel, as it were, ſo far as their Brightneſs and Whiteneſs permit one to diſcover. Theſe Fibres make up all the *Pith* (or *Corpus Calloſum*) which is of a more cloſe and ſolid Subſtance than the *Cortex*. They are flattiſhly round, and are not unlike thoſe white Bodies, or *Inteſtinula*, which the Teſticles are made up of; and in the Venticles of the Brains of Fiſh they are ſo apparent, that if you hold them betwixt you and the Light, they repreſent the ſmall Teeth of an Ivory Comb. He ſaith, they are inſerted by their Ends into (or rather ariſe out of) the *Cortex* or Aſh-coloured outer part of the Brain, and ſeem all of them to have their egreſs out of (or rather ingreſs into) the Trunk of the Spinal Marrow within the Skull.

Whether they be hollow or not, or whether as they are collected into a Bundle, they have not Pores and Interſtices ariſing therefrom, which tranſmit a peculiar Juice into the Nerves continued to them, he leaves undetermined; becauſe they neither admit of Ligature, nor can Senſe make any diſcovery thereof. Dr. *Ridley* (from *Lewenhoeck*) offers at a yet finer Deſcription of theſe two Parts of the Brain, which the curious Reader may find in his *Anatomy of the Brain*, P. 89, *&c.* For the other Parts of the *Encephales*, viz. the *Cerebel* and *Medulla oblongata*. See theſe words.

The *Brain* receives Blood by *Arteries* derived from the *Carotides* and *Cervical*, whoſe Capillaries are diſperſed chiefly through its Cortical Part. Theſe Arteries are ſo large and numerous, that a third part, at leaſt, of the whole Maſs of Blood is conveyed hither by them; which ſeeing through the ſmallneſs of the Brain it cannot be conſumed in its Nutrition, *Malpighius* thinks it probable, that the Coagulative (or Concreſcible) *Serum* is filtred as it were in the *Cortex*, (or Glandulous Part) of the Brain from the Arterial Blood, and that the Fibres of the *Cortex Calloſum*, as ſo many Roots implanted into the ſaid *Cortex*, imbibe this *Serum* and convey it to the *Medulla Oblongata* as the Trunk from

from whence it is derived into the Nerves as the Branches, and is derived and is there the *Succus Nervo*, if not the Animal Spirit it ſelf. Part nouriſhes the Brain it ſelf, and what is ſuperfluous to both theſe uſes, is partly reſumed by the *Veins* of the *Meninges* (whoſe Twigs reach all the ſeveral Glands of the *Cortex*) and partly repoſited in the *Sinu's* of the *Dura Mater*, by the Arteries themſelves, out of which it is reſorbed by the Internal Branches of the Jugulars, and thereby conveyed back to the Heart. The Arteries inoſculate one with another (*i. e.* the Right *Carotides* with the Left) and ſo do the Veins alſo; but not the Arteries with the Veins. It is from the Pulſe of the Arteries altogether, that the beating (or *Syſtole* and *Diaſtole* as it were) of the Brain proceedeth.

A Man of all living Creatures hath the *biggeſt Brain*; for it weigheth four or five Pound in ſome, and is as big again as an Ox's Brain.

The outer Surface is full of Windings, like thoſe of the Guts, which are ſeverally inveſted with the *Pia Mater*, as alſo tied together by it. The whole Brain is much of the ſame *Shape* with the Head, *viz.* roundiſh, but with bunchings out towards the Forehead.

BRANCH *of the Trenches*: See *Boyan*.

BREACH, in Fortification, is the Ruins which are made in any part of the Works of a Town, *&c.* either by playing Cannon, or ſpringing Mines, in order to ſtorm the Place, or take it by Aſſaults. They ſay, Make good the Breach, Fortifie the Breach with *Chevaux de Friſe*, Make a Lodgment on the Breach; Clear the Breach, or move away the Rubbiſh of it, *&c.*

BREAK *Ground*, in Fortification, ſignifies to begin the Works for carrying on the Siege about a Town or Fort.

BREAMING, of a Ship: See *Erooming*.

BREAST-FAST, a Rope in a Ship made faſt to ſome part of her forward-on, to hold faſt her Head to a Warp, or the like.

BREAST-HOOKS, in a Ship, are the *Compaſſing Timbers* before, which help to ſtrengthen her *Stem*, and all her *Fore-part*.

BREAST-ROPES, in a Ship, are thoſe which faſten the Parrels to the Yards.

BREAST-WORKS, the ſame with *Parapet*.

BREDWITE (in Law) ſeems to have been that Impoſition of Fines or Amerciaments for Defaults in the Aſſize of Bread.

BREECHINGS; ſo the Seamen call thoſe Ropes with which they *laſh faſt*, or faſten their great Guns to the Ship-ſides.

BREEZE, a ſhifting Wind, blowing from the Sea or Land for ſome certain Hours of the Day or Night.

BREGMA or *Pregma*, is the Fore-head Bone, according to ſome Writers, but its rather the *Sinciput*.

BREVE, the ſame with *Brief*.

BREVE *Perquirere*, to purchaſe a Writ or Licence of Trial in the King's-Court, by the Plaintiff, *qui* breve *perquiſivit*. Hence the preſent uſage of paying 6 *s.* and 1 *d.* where the Debt is 40 *l.* and 18 *s.* where the Debt is 100 *l.* and ſo upward in Suits of Money due upon Bond.

BREVE *Recto*, a Writ of Right, or Licence for a Perſon ejected, to Sue for the Poſſeſſion of an Eſtate detained from him.

BREVE-VAS, a ſhort Vein paſſing from the Stomach to the Veiny Branch of the Spleen. 'Tis commonly called the *Vas Breve*.

BREVIBUS *& Rotulis liberandis*, is a Writ or Mandate to a Sheriff, to deliver unto the new Sheriff, choſen in his room, the County with the appurtenances, *una cum Rotulis Brevibus*; and all other things belonging to that Office.

BREVIS, alſo is the Name for one of the Muſcles of the *Radius*, ſerving to turn the Palm of the Hand upwards.

BRIBORS (a *French* Law term) ſignifying one that pilfereth another Man's Goods.

BRICOLS, are by ſome ſaid to be Engines, formerly uſed to batter the Walls of the Towns or Caſtles.

BRIDGE *Flying*, a Term in Fortification: See *Pont Volant*.

BRIEF (or *Breve*) a Term in Law, ſignifying Proceſs that Iſſues out of the Chancery or other Courts, commanding the Sheirff to ſummon or attack *A*, to anſwer to the Suit of *B*, *&c.* But more largely it is taken for any precept of the King in Writing under Seal, iſſuing out of any Court, whereby he commands any thing to be done for the furtherance of Juſtice and good Order.

BRIGADE, is a Party or Diviſion of a Body of Soldiers, whether Horſe or Foot. There are two ſorts of *Brigades* according to the *French* way of accounting. (1.) A *Brigade* of an Army, which is a Body of Horſe conſiſting of 10 or 12 Squadrons, or a Body of Foot of 5 or 6 Battalions: And this way an Army is ſometimes divided into eight Brigades, four of Horſe, and four of Foot. 2. A *Brigade* of a Company of Cavalry, is its third Part, when it conſiſts only of 50 Officers; but its ſixth Part when of 100. *Grand Dictionarie Francoiſe*.

BRIGADIER, is he that commands any *Brigade*.

BRIGANTINE, is a ſmall light Veſſel which can both Row and Sail well, and is either for Fighting or giving Chaſe: It hath about 12 or 15 Benches for the Rowers, one Man to a Bench; all the Hands aboard are Soldiers, and each one hath his Musket lying ready under his Oar. *Great Fr. Dict. of Arts and Sciences*.

BRISURE, a Term by ſome Writers of Fortification, for a Line extended in Length from four to five Fathom, which is allowed to the *Curtain* and *Orillon* to make a hollow Tower, or to cover the concealed *Flank*.

BRODE *Halpeny*, or *Broad Half-peny*, or *Boardhal-penny* (a Term in Law) ſignifying, to be quit of certain Cuſtoms exacted for ſetting up of Tables or Boards in Fairs or Markets; and thoſe that were freed by the King's Charter of this Cuſtom, had this Word put in their Letters Patents; by reaſon whereof, at this Day, the Freedom it ſelf, for brevity of Speech, is called *Broad Hal-peny*.

BROKEN *Ray*, or *Ray of Refraction*, in *Dioptricks*, is a Right Line, whereby the *Ray of Incidence* changeth its Rectitude, or is broken in traverſing the ſecond *Medium*, whether it be thicker or thinner.

BRONCHOCELE, is a Tumour in the Top or the middle Fiſtulous Part of the Wind-Pipe. *Blanchard*.

BRONCHOTOMY, is the Section of the Wind-Pipe in a Membraneous Part betwixt two of the Rings. It is uſed to prevent Suffocation in People troubled with a *Squinancy* or *Quinſy*.

BRONCHUS, is the Middle Fiſtulous Part of the Wind-Pipe, whoſe Fore Part is made up of ſo many little Rings; the upper Part is called *Larynx*,

and the under *Veſicularis*. It ſerves for the Modulation of the Voice, and in Reſpiration.

The Ramifications of the *Aſpera Arteria* or Wind-Pipe all over the Lungs, are called the *Bronchia* of the Lungs.

BROOMING, or *Breaming of a Ship*, is burning off the Filth ſhe hath contracted on her Sides, with Straw, Reeds, *&c.* when ſhe is on a Careen, or on the Ground; ſo that this is a kind of *Graving*.

BRUDGBOTE, or *Bridgebote*, a Law Term, ſignifying to be quit of giving Aid to the Repair of Bridges.

BRUMAL, is that which comes in Winter; as the *Brumal Solſtice*, as ſome call the Winter one.

BRUSK: See *Tenny*.

BUBO, is the Groin, or Place from the Bending of the Thigh to the Privy-Parts; alſo a Tumour in the Groins, proceeding from the Pox or Peſtilence. *Blanchard*.

BUBONOCELE, is a Rupture, when the Inteſtines fall into the Groin, or the outmoſt Skin of the *Scrotum*: Sometimes its taken for a Bubo or Swelling. *Blanchard*.

BUCCELLATION, by ſome Chymiſts, ſignifies a dividing into Gobbets.

BUCCINATOR, is the round circular Muſcle of the Cheeks, thin and membranous, interwoven with various Fibres, and inſeparably girt about with the Tunick of the Mouth. *Caſſerius* has obſerved a certain ſtrong Band that grows outwardly in the Center of this Muſcle, which ſpreading it ſelf about the Cheek-bone, is terminated in a little ſlender Muſcle directly oppoſite to that Part of the Face called *Bucca*: It ariſes from the Upper-Jaw-bone, and is faſtned in the Lower, at the Roots of the Gums. Its Uſe is to move the Cheeks with the Lips; and ſerves as a Hand to the Teeth, whilſt it toſſes the Meat too and fro, and throws it upon the Teeth, that it may be more exactly chewed. This Muſcle hath the Name of *Buccinator* from its forcing out the Breath of Trumpeters. Mr. *Cowper* ſaith, it ſprings not from the Ends of the Upper, nor Ends in that of the Under Jaw, nor is it of that Figure which vulgar Anatomiſts pretend, nor intermix'd with various Orders of Fibres; but that it ariſes broad and fleſhy from the Fore Part of the *Proceſſus Coronæ* of the lower Jaw, and from hence proceeding with direct Fibres, it adheres to the Gums of both the Jaws, and is ſo inſerted to the Angle of the Lips. Beſides its uſe in blowing the Trumpet, Horn, *&c.* it pulls the Mouth to one Side.

BUCOLICKS, are Paſtoral Songs or Poems, ſuch as the *Eclogues* of *Virgil*, and the *Idyls* of *Theocritus*.

BUDGE *Barrels*, are ſmall Barrels filled with Gun-powder, having a Purſe or Caſe of Leather made faſt over their Head to prevent the Powder's taking Fire; they are uſed to carry the Powder in a-board a Ship.

BULBOUS *Roots*, are ſuch as are deſcribed in the Word *Bulbus*.

BULBUS, in Botany, ſignifies the round Root of a Plant encompaſſed about with many Coats (like an Onion) one within another; or elſe ſet round thick with many ſmall Scales; and which ſends out many Strings or Fibres from the Bottom of the *Bulb*, or Baſe of the Root.

BULIMOS, or an Ox-like Appetite, that is, when the Hunger is ſomewhat greater than that which is called *Fames Canina*, or when the Stomach craves, but cannot receive, whereas in the other Caſe, the Eating is anſwerable to the Appetite. *Blanchard*.

BULK *of a Ship*, is her whole Content in the Hold for the Stowage of Goods.

BULK-HEADS, are Partitions made a-croſs a Ship with Boards of Timber, whereby one Part is divided from another. The *Bulk-head* afore is the Partition between the Fore-Caſtle and Grating in the Head, and in which are the *Chaſe Ports*.

BULLION, is taken for Gold or Silver in the Maſs or Billet; it is alſo the Place where Gold or Silver is brought to be tried and exchanged.

BULRUSH-BRIDGE, in Fortification, is a *Bridge* made of many Bundles of Bul-ruſhes bound together and covered with Planks, to ſecure a Paſſage over the Boggs, Marſhes, and Fenny Places.

BULWARK, much the ſame (anciently) with a *Baſtion* in Fortification: Which ſee.

BUNT *of a Sail*, is the middle Part of it, which is purpoſely formed into a kind of Bag or Cavity, that the Sail may receive the more Wind: It is chiefly uſed in Top-ſails; for Courſes are for the moſt part cut Square, or at leaſt with a ſmall Allowance for *Bunt* or Compaſs. They ſay the *Bunt holds much Leeward-Wind*, *i. e.* the *Bunt* hangs too much to Leeward.

BUNT-LINES, are ſmall Lines made faſt to the Bottom of the Sails in the middle Part of the *Bolt-Rope* to the Crengle, and ſo are reaved thro' a ſmall Block ſeized to the Yard; their uſe is to trice up the Bunt of the Sail for the better furling of it up.

BUOY: A *Buoy* at Sea is a Piece of Wood or a Barrel faſtned ſo as to float directly over the Anchor, that ſo the Men that go in the Boat to weigh the Anchor may certainly know where it lies. The Term of Art is, *Stream the Buoy*, that is, let the Anchor fall while the Ship has *way*. From hence the word *Bouyant* ſignifies any thing that is floating or floatable.

To buoy up a Cable, is to faſten ſome Piece of Wood or Barrel, *&c.* to the Cable near the Anchor, that the Cable may not touch the Ground when they ſuſpect the Ground to be foul (that is, Rocky) leaſt the Cable ſhould be fretted and cut off.

BUOYS, are alſo uſed at Sea to diſcover Rocks and Shelves, by being faſtned over them.

BURBREACH (a Term in Law) is to be quit of Treſpaſſes committed againſt the Peace in City or Borough.

BURGAGE, is a Tenure proper to Cities, Boroughs and Towns, whereby the Burghers, Citizens or Townſmen, hold their Lands or Tenements of the King, or other Lords, for a certain Rent.

BURGMOTE, is a Court of a Borough or City.

BURGHBOTE, is a Contribution towards the Building or Repairing of ſome Caſtles or Walls of Defence, or towards the Building of a Borough or City: From which Duty ſeveral Perſons had obtained an Exemption by the Ancient Charters of our *Saxon* Kings; whence the Word is often taken for the Liberty or Exemption from ſuch Cuſtomary Service.

BURGLARY, naturally ſignifies the Robbing of a Houſe, but in a Legal Senſe is a Felonious entring

tring into another Man's Dwelling; wherein ſome Perſon is, or into a Church in the Night-time, to the End to commit ſome Felony, or to Kill ſome Man, or to Steal ſomewhat thence, or do ſome other Felonious Act, albeit he executes not the ſame.

BURNING-GLASS. One M. *Villete* made a Metalline Burning Conclave at *Lyons* in *France*, of a round Figure, 30 Inches Diameter, and of about 100 *lb.* weight. The *Focus* or burning Point being diſtant from the Conclave about 3 Foot; and its Bigneſs, that of ½ of a *Louis D'Or*: It would melt Iron in 40 Seconds, Silver in 24, Copper in 42; and turn'd Quarry Stone into Glaſs in 45, and Mortar in 53 Seconds: It melted a piece of Watch Spring of Steel in 9 Seconds. *Phil. Tranſ.* N. 6.

After that *Villette* made another of 34 Inches Diameter, which would melt all ſorts of Metals of the thickneſs of a Crown Piece in leſs than a Minute, and vitrifie Brick in the ſame time. *Phil. Tranſact.* N. 49.

Francis Smithwick, Eſq; F. R. S. produced before the Royal Society, *Feb.* 27. 166⅔, 2 Burning Concave Glaſſes, of a Figure not Spherical; one of 6 Inches Diameter, and its *Focus* 3 Inches diſtant from the Center; the other of the ſame Diameter but leſs Concave, and its *Focus* 10 Inches diſtant. Thoſe when approached to a large Candle lighted, did ſomewhat warm the Faces of ſuch as were 4 or 5 Foot diſtant at leaſt; and when held to the Fire, burned Gloves and Garments at 3 Foot diſtance from the Fire: He did alſo with the deeper of them, in the preſence of Biſhop *Ward*, turn a Piece of Wood into Flame in 10 Seconds of Time, and with the ſhallower in 5 Seconds, in *Autumn*, about 9 in the Morning, and the Weather gloomy. *Phil. Tranſact. N.* 33.

BURNING-ZONE: See *Zone*.

BURSALIS: *Vid. Marſupialis*.

BURTON, on Board a Ship, is a ſmall Tackle to be faſtned any where at pleaſure, conſiſting of two ſingle Pulleys: Its uſe is to hoiſt ſmall things in or out: and this will purchaſe more than a ſingle Tackle with two Blocks.

BUST, is a Term in Sculpture, ſignifying a *Figure* or *Statue* of but one half of a Human Body; the Head, Shoulders and Breaſts appear, but no Arms, and it is made tapering from the Breaſt downwards.

BUSTROPE, *i. e. Boum Verſatio*, the turning of Oxen when they Plow the Ground: This (as *Marius Victorinus* tells us) was the Antient manner of Writing among the *Romans*, who at firſt writ as it were in Furrows, the firſt Line beginning at the Left-hand went to the Right, and then the ſecond beginning at the Right-hand was continued back to the Left; and ſo it lookt like the Furrows of Land Plowed by Oxen.

BUTT, in the Sea Language, is the End of any Plank which joins to another on the outſide of a Ship under Water; and therefore when a Plank is looſe at one end, they call it *Springing a Butt*; to prevent which, Ships are uſually bolted at the *Butt Heads*, that is, at the Planks End.

BUTTER *of Antimony*, or as ſome call it, *the Ice Oyl* of that Mineral is a great *Cauſtick* made by uniting the Acid Spirits of Sublimate Corroſive with Regulus of Antimony, thus,

Six Ounces of Regulus is mix'd with a Pound of Sublimate, both powdered, and then the matter is put into a Glaſs Retort, whoſe half muſt be empty; Diſtill in Sand with a ſmall Fire at firſt, a little clear Oyl; then encreaſe the Fire, and a white thick Liquor like Butter will come forth; which if a Pan of Coals be not applyed to melt it, will choak up, and it may be, break the Neck of the Receiver; continue the Fire till the Red Vapours come. Then unlute the Receiver, and if you have a mind to recover the Mercury, apply another filled with Water in its room, the Quickſilver will run over into the Water. This *Butter of Antimony* is uſed to eat Proud Fleſh, and to cleanſe Ulcers.

BUTTER *of Tin*, is made after the ſame manner, of one part of Tin in Powder and three parts of Sublimate Corroſive; and what is very ſtrange of this Jovial Butter, it is continually emitting Fumes, or Smoaking.

BUTTOCK *of a Ship*, is that part of her which is her Breadth right a Stern from the Tack upwards; according as a Ship is built broad or narrow at the Tranſom, ſhe is ſaid to have a broad or a narrow *Buttock*.

BUTTRESS, is an Arch or Maſs of Stone ſerving to ſupport the ſides of a Building, Wall, *&c.* on the outſide: They are chiefly uſed in ſuch Buildings as are of the *Gothick* manner.

BY-LANDER, See *Belandre*.

BY-LAWS, are Orders made in Court-Leets or Court-Barons by common conſent, for the good of thoſe that exact them, and which extends farther than the Publick Law binds. *Blunt*.

BYQUARTILE, the ſame with *Biquartile*.

CABALLINE *Alloes*, is a courſer ſort, which being generally uſed by Farriers to purge Horſes, is called by this Name of *Caballine Alloes*.

CABLE *of a Ship*, is (as is well known) a great Rope of 3 *Strands*, which being faſtened to the Anchor holdeth the Ship faſt when ſhe rides. The Sea Terms about it are, 1. *The Cable is well laid*, that is, is well wrought or made. 2. *Serve the Cable*, or *Plat the Cable*, that is, bind it about with Ropes, Clouts, *&c.* to keep it from galling in the Hawſe. 3. *To ſplice a Cable*, is to make two Pieces faſt together, by working the ſeveral Strands of the Rope one into another. 4. *To Quoile the Cable*, is to roll it up round in a Ring, of which the ſeveral Rolls one upon another are called *Cable Tire*. 5. They ſay, *Pay more Cable*, that is, let it more out from the Ship, that the Boat which carries the Anchor may the more eaſily drop it into the Sea; and ſometimes they ſay *Pay cheap the Cable* (*i. e.*) put or hand it out apace. In the ſame Senſe, as *Pay more Cable*, they ſay alſo *Veer more Cable*, that is, hand or let more out. When two Cables are ſpliced together, 'tis called *A Shott of a Cable*.

CABOSED (*Spaniſh*) the Term in Heraldry for the Head of any Beaſts, being cut off-juſt behind the Ears by a Section parallel to the Face, or by a perpendicular Section; whereas *Couping* is uſually expreſſed by an Horizontal one, and is never ſo cloſe to the Ears as *Caboſing*.

CABURNS (in a Ship) are Lines uſed to bind Cables withal; they are uſually made of *Rope Yarn* or *Spun Yarn*.

CACATORIA *Febris*, is an intermittent Fever (ſo called by the famous *Sylvius*) accompanied with a violent Purging, which is ſometimes griping and very painful, extreamly afflicting and weakning to the Patient.

CACHECTICUS, is one that has an ill Habit of Body.

CACHEXY, is an ill Habit of Body, proceeding from a bad Diſpoſition of the Fluids and Humours; whence lingring Fevers, Conſumptions and Dropſies are contracted: In this Diſeaſe the Face is often Pale and Diſcoloured, and the Body big and ſwoln. *Cachexia*, taken alſo in a large Senſe, is oppoſite to *Δεξία*, and as a good Habit of Body is common to all ſound Parts, ſo an ill one is propagated by all the ill Parts. Strictly, *Cachexy* is only taken for an ill Diſpoſition of the Habit of the Body; and *Euexia*, on the contrary, for a good Diſpoſition of the Humours, or Blood, and Body. *Blanchard*.

CACOCHYMY, is the abundance of ill Humours in the Blood; and it is either Ulcerous, Bilious, Pituitous, Melancholick, Acid, Salt or Sharp. *Blanchard*.

CACOETHES, *Chironium Ulcus*, or *Telephium*; is a Diſeaſe or Ulcer beyond Cure, which is called *a Malignant Ulcer*; this happens when an Ulcer is Callous or Sinuous, under which there ſometimes lie little putrified Bones that have fallen down. *Blanchard*.

CADENCE, or *Cloſe*, in Muſick, is a kinds of Concluſion of the Tune, which is made of all the Parts together in divers Places of any Key.

CADUCUS *Morbus*, or the *Epilepſy*, is a Convulſive Motion of all the Parts of the Body, more eſpecially in the Hands and Feet, accompanied with a Deprivation of the Inward and Outward Senſes.

CÆCUM *Inteſtinum*, the Blind Gut, ſo called becauſe one End of it is ſhut up inſomuch that *Fæces* and *Chyle* both come in and go out at the ſame Orifice. Its Uſe in Man is obſcure, as being very ſmall and commonly empty.

CÆSAREAN *Section*, the cutting open of a Woman's Belly or Womb, to make way for the Child to be taken out.

CÆSURA, in Grammar, is when in a Latin or Greek Verſe there remains a Syllable after a Foot, and that Syllable ends the Word. Of this they reckon four ſorts, *Triemimeris*, *Penthemiris*, *Hepthemimeris* and *Ennemimeris*: Which ſee.

If it were not for this *Cæſura*, few Verſes could be made to run well; as is plain in theſe two, where there is no *Cæſura* at all,

Aurea Carmina, Juli, ſcribis, maxime vatum
Urbem fortem cæpit nuper fortitor Hoſtis.

CAISSON, or Superficial *Fourneau*, is a Wooden Caſe or Cheſt, into which 3, 4, 5, or 6 Bombs, according to the Execution they are to do, or as the Ground is firmer or looſer (ſometimes the Cheſt is, only filled with Powder) when the Beſiged diſpute every Foot of Ground, this *Caiſſon* is buried under ſome Work the Enemy intends to poſſeſs himſelf of, and when he is Maſter of it, they fire it by a Train conveyed in a Pipe, and ſo blow them up. Thus they ſay after the Mine had deſtroyed the Bonnet, *A* Caiſſon *was buried under the Ground thrown up, and the Enemy advancing to make a Lodgment on the Ruins of the Bonnet, the* Caiſſon *was fired, and blew up the Poſt the ſecond time*.

CAISSON, is alſo a covered Waggon to carry Bread or Ammunition.

CALAMUS *Scriptorius*, is a certain Delatation in or about the 4th Venticle of the Brain, whoſe lower Part is inſerted into the *Medulla Oblongata*, making there a Cavity in Shape of a Pen; whence it was anciently called *Calamus Scriptorius*.

CALCANEUS, or *Os Calcis*, the *Heel Bone*, is a Bone of the *Tarſus*; it lies under the *Aſtragalius*, to which it is articulated by the *Ginglymus*. Behind it has a large Protuberance which makes the Heel, and into which the *Tendo Achillis* is inſerted; and before it has a Cavity which receives a Part of the *Os Cubiforme*.

CALHOIDEA, are three little Bones in the Foot, which, with others, make up that Part of the Foot ſucceeding the Ankle; and *Fallopius* calls them *Cuneiformia*, becauſe they are made like Wedges.

CALCINATION, is the Solution of a mix'd Body into Powder by Fire, or any corroding things, as *Mercury*, *Aquafortis*, *&c.* and when Horns, Bones, Hoofs, *&c.* are hanged over boiling Water (or other Liquor) till they have loſt their Mulcilage and will eaſily be powdered, this by ſome Chymiſts, is called *Calcination Phyloſophical*.

CAL-

CALCINATION *of Copper*: See *Æs Uſtum.*

CALCINATION *of Flints*, or of *Chryſtal*, *Pebbles*, *&c.* is made by heating them red hot, and then caſting them, whilſt ſo, into cold Water or Vinegar; for after this is done 4 or 5 times, they will be very friable, and eaſily powdered, for which end they are calcined.

CALCINATION *of Lead*, melt the Mettle in an Earthern Pan unglazed, keep it ſtirred over the Fire with a *Spatula*, till it be reduced into a Powder. This is what they call *Calx of Lead*, and by this Means the Metal is made more open and fit to be wrought upon by Acids. *Lead*, as well as *Tin*, ſenſibly encreaſes its Weight in Calcination.

CALCINATION *of Tin*. Put *Engliſh* Tin into a large Earthen Pan unglazed in a great Fire, and then the *Tin* will melt; continue the Fire very ſtrong for 36 Hours, ſtirring the Matter with an Iron *Spatula* from time to time; then take it off the Fire and let it cool, and you will have the *Calx of Tin*. The *Tin* will encreaſe its Weight in this Operation, for 32 *Ounces* of Metal will yield 34 *Ounces* of *Calx*.

CALCINATION *of Vitriol*, is uſually of the Green ſort; 'tis put over the Fire in an Earthen unglazed Pan; the *Vitriol* will diſſolve into a kind of Water; then 'tis boiled till the Moiſture be conſumed, or till it return into a greyiſh Maſs. This is called *Vitriol Calcined to Whiteneſs*. Then if it were kept long over a ſtrong Fire, it would turn *Red*, and is then called *Colcothar*.

CALCIS: See *Calcaneus*.

CALCULATION *of Clock and Watch-work*: See *Clock* and *Watch-work*.

CALCULUS *Differentialis*, is the Arithmetick of the infinitely ſmall Differences between variable Quantities: This, in *England*, we call the *Arithmetick of Fluxions*: See *Fluxions*.

CALCULUS *Integralis*, is the Method of finding the proper flowing Quantity of any given *Fluxion*; and is the Reverſe of the *Calculus Differentialis*, which finds the Fluxion from the flowing Quantity.

CALENDAR, or *Almanack*, is a Political Diſtribution of Time accommodated to Uſe, and taken from the Motions of the Heavenly Bodies: Of this kind are thoſe Annual Books wherein the Days of the Month, the Feſtivals, the Sign the Sun is in, the Sun's Riſing and Setting, the Changes of the Moon, *&c.* are exhibited; which we alſo call *Almanacks*. But the Word *Calender* ſeems to come from the *Calendæ*, which, amongſt the *Romans*, were the firſt Days of every Month.

There have been many Corrections and Reformations of the *Calendar*. The firſt was made by *Numa Pompilius*; and this afterwards was much improved by *Julius Cæſar*, and was by him called the *Julian Account*, which, in our Nation, and ſome other Places, is ſtill retained, and is called *Old Style*.

Pope *Gregory* the XIIIth pretended to reform it again, and ordered his Account to be currant, as it ſtill is in all the *Roman Catholick Countries*, where 'tis called the *Gregorian Calendar*; and with us *New Stile*: It now begins eleven Days before ours.

A particular Account of the Nature of the *Julian* and *Gregorian Account*, ſee in a Book called, *The* Julian *and* Gregorian *Year*: And how both are pretended to be reform'd, ſee in a ſtitcht Pamphlet called, *The Reformed Calendar*: *Printed for* Sam. Manſhip, *at the Ship near the* Royal-Exchange Cornhill, 1701.

CALENDAR *Aſtronomical*: See *Aſtronomical Calendar*.

CALENDS; ſo the *Romans* call'd the firſt Days of every Month, from the Greek Word καλέω, *voco*, *to call*; becauſe anciently counting their Months by the Motion of the Moon, there was a Prieſt appointed to obſerve the Times of the New Moon; who having ſeen it, gave Notice to the Preſident over the Sacrifices, and he called the People together, and declared unto them how they muſt reckon the Days until the *Nones*, pronouncing 5 times the Word καλέω, if the *Nones* happened on the 5th Day, or 7 times if they happened on the 7th Day of the Month.

CALIBRE, or *Caliper*, is the Bigneſs, or rather Diameter of a Piece of Cannon, or any Fire Arms, at the Mouth.

CALIPERS, is an Inſtrument made like a Sliding-Rule, to embrace the two Heads of any Cask, to find the Length. There is alſo the Gunners *Calipers* or *Compaſſes* for finding the Diameter of the Ball, and Bore of the Gun.

CALIPER *Compaſſes*, are Compaſſes uſed by Gunners, with crooked or bowing Legs, to meaſure the Diameters of Bullets and Cylinders of Guns.

CALKING or *Cauking of a Ship*, is driving in Oakam, or ſomething of that kind, into the Seams of the Planks, to prevent the Ship's Leaking.

CALLICREAS: See *Pancreas*.

CALLIPICK *Period*, was an Improvement of the *Cycle of Meton* of 19 Years, which *Callipus*, a famous *Grecian* Aſtronomer, finding in reality to contain 19 of *Nabonaſſor*'s Years, 4 Days and $\frac{331}{499}$ he, to avoid Fractions, quadrupled the *Golden Number*, and by that Means made a new *Cycle* or *Period* of 76 Years; which time being expired, he ſuppoſed the Lunations or Changes of the Moon would all happen on the ſame Day of the Month, and Hour of the Day, that they were on 76 Years before.

CALLOUS: A Swelling is ſaid to grow *Callous*, when 'tis hardened, as ſometimes the Lips of a Wound. This is derived from

CALLUS, which is a kind of Swelling without Pain, like Skin contracted by too much Labour. *Blanchard*.

CALTHROPS: See *Chauſe-trapps* or *Cows-feet*.

CALVA, the Hairy Scalp, or upper Part of the Head, which either by Diſeaſe or Old Age grows Bald firſt.

CALX, in Chymiſtry, is that which is produced by Burning or Calcination (which ſee) of any Metal or Mineral in a Crucible, *&c.*

CALX, is the ſecond Bone in that Part of the Foot which ſucceeds the Ancle, bigger and ſtronger than the reſt; oblong and grows backward, that a Man may ſtand more ſtrongly upon it, and not fall ſo eaſily backward.

CALX alſo is that which by *Calcining* is either turned into *Alcoal*, as *Calx Saturni*, or at leaſt is made friable, as *Hart's-Horn* burnt.

CALX *of Antimony*: See *Antimonium Diaphoreticum*.

CALX *of Gold*: Though it hath been look'd upon as a thing of great Difficulty, yet the Noble Mr. *Boyle* tells us, that if you grind well together a thick *Amalgama* of Gold and Mercury, with at leaſt

leaſt an equal Weight of finely powdered Sulphur, and then put the Mixture to ſublime in a proper Glaſs, there will riſe, by Degrees of Fire, a Cinnabar; and this will leave behind it a finer *Calx of Gold* than is to be had by ſome far more difficult Proceſſes. See the *Mechan. Product of Volatility.*

CALYX, in Botany, ſignifies the Cup which contains or encloſes the Flower in any Plant; and ſometimes 'tis uſed for the Flower it ſelf when its Figure is like that of a Roſe, and not yet having its Leaves Expanded.

CAMBRING, the Sea-man ſay a Deck lies *Cambring* when it doth not lie Level, but higher in the Middle than at either End. Alſo if her Keel is bent in the Middle upwards (which may happen from her lying a-ground on a place where neither her Aft nor Fore-part do touch it, and from many other Reaſons taken from her make) they ſay ſhe is *Chamber-keel'd.*

CAMERA *Obſcura*: See *Obſcura Camera.*

CAMPAIGN, is a Military Term, ſignifying the Space of Time during which Armies are maintain'd every Year in the Field. So a Man is ſaid to have made twenty Campaigns, when he hath ſpent ſo many Years in War-like Service in the Field.

CAMP *Flying*, is a ſtrong Body of Horſe and Foot commanded uſually by a Lieutenant General, which is always in Motion, both to cover our own Garriſons, and to keep the Adverſe Army in continual Alarm.

CANAL, is a Word frequently uſed by Anatomical Writers, to ſignify a Channel or Paſſage, thro' which any Juices or Fluids of the Body do flow.

CANALICULUS *Arterioſus*, is a Veſſel betwixt the Arterious Vein in the Lungs, and the great Artery in the *Fœtus*; for its obliterated in Adult Perſons: It's Uſe in *Fœtus*'s is, that the Blood may be diſcharged by this *Ductus* out of the Arterious Vein, into the great Artery, becauſe that the Blood is not accended in the Lungs, for want of Reſpiration in the Womb.

CANCER, one of the 12 Signs of the *Zodaick*, drawn on the Globe in the form of a Crab, and thus marked ♋. Thro' the beginning of this Sign paſſes a Circle parallel to the Equinoctial, called the *Tropick of Cancer*, or the *Northern Tropick*; to which Circle, when the Sun comes, it makes the *Summer Solſtice*, and is turning his Courſe back again towards the Equinoctial.

CANCER, an Ulcerous Diſeaſe: See *Carcinoma.*

CANICULA, the ſame with *Canis Minor.*

CANINA *Fames*, or *Dogs-Appetite*, is an inordinate Hunger attended with a Vomiting and a Looſeneſs, which proceeds from a depraved Action of the Stomach, craving Food in a greater Meaſure than Nature requires.

CANINI, are two Teeth in each Jaw, one on each ſide of the *Inciſivi*; they are pretty thick, and round, and they end in a ſharp Point; they have each one Root which is longer than the Roots of the *Inciſivi*; their proper uſe is to pierce the harder kinds of Meat.

CANINUS, a Muſcle of the Lip, ſerving to put the Lips upwards.

CANIS *Major & Minor*, the greater and leſſer Dog, are two Conſtellations of Stars drawn upon the Globe in Figure of this Animal; and the greater of them hath in his Mouth that vaſt Star called

CANICULUS, or the *Dog-ſtar*, which riſing and ſetting with the *Sun* from about the 24th of *July* to the 28th of *Auguſt*, gives occaſion to that time which is uſually very Hot and Sultry, to be called the *Canicular* or *Dog-days.*

CANNA *Major*: See *Tibia.*

CANNA *Minor*: See *Fibula.*

CANNON *Royal*, is a Piece of Ordnance 8 Inches Diameter in the Bore, 12 Foot long, weighs 8000 *lb.* its Charge 32 *lb.* of Powder; its Ball of 48 *lb.* weight, and 7 Inches $\frac{1}{2}$ in Diameter, ſhoots point blank 185 Paces. This is the ſame with a Cannon of Eight.

CANNON, a Piece of Ordnance: See *Ordnance.*

CANON, in Mathematicks, is a Rule to ſolve all things of the ſame Nature with the preſent Enquiry: Thus every laſt ſtep of an Equation in *Algebra* is ſuch a *Canon*, and if turned into Words is a Rule to ſolve all Queſtions of the ſame Nature with that propoſed. *Canon* alſo is the Word for the Tables of *Logarithms*, *Artificial Sines*, *Tangents*, and *Secants*, which are of admirable uſe in *Trigonometry*. 'Tis alſo the Name of a Surgeon's Inſtrument, which they make uſe of when they ſew up Wounds.

CANONICAL *Equations*: See *Quadratick Equations.*

CANON-LAW, is a Collection of Eccleſiaſtical Rules, Definitions and Conſtitutions taken from the Ancient, General and Provincial Councils, the Writings and Reſolutions of the Fathers of the Church, and the Reſcrips of Popes. This Law is modelled according to the Form of the *Civil*, and is reduced into 3 Volumes. The firſt is called the *Decrees of Gratian*, and is compoſed of the Ancient Canons, and Collected from the Ancient Councils and Writings of the Fathers.

The 2d Volume is called the *Decretals*; and doth contain the *Decretal Epiſtles* or *Reſcripts* of Popes, and chiefly from *Alexander* III. to *Gregory* IX. by whoſe Authority it was compiled.

The 3d Volume is called *Sextum*; and contains the Reſcripts of the Popes from *Gregory* IX. to *Boniface* the VIII. by whoſe Authority it was Collected. To the End of this Volume are added the *Clementina*, which are the *Conſtitutions* of *Clement* V. enacted in the Council of *Vienna*, as alſo the *Extravagants*, which are ſome Reſcripts of Pope *John* XXII. and ſome other Popes. They were called *Extravagants*, becauſe not contained in the Body of the *Canon Law*; which is compoſed of the three lately mentioned Volumes.

CANTHUS or *Hircus*, is the Angle or Corner of the Eye; which is either the greater or the Internal, or the leſs, or External.

CANTON, an Ordinary in Heraldry, framed of two ſtrait Lines, one drawn perpendicularly from the *Chief*, and the other ſo from the Side of the Eſcutcheon. This is always leſs than a Quarter of the Field; and if drawn from the Left Corner of the Eſcutcheon, is called a *Canton Siniſter*. Its Form is thus; He beareth *Ermin*, a *Canton Argent* charged with a *Cheveron Gules*, by the Name of *Middleton.*

CANVAS-BAGS, or *Earth-Bags*, *Sacs a Terre*, as the *French* call them, are Bags holding about a Cubick

Cubick Foot of Earth, and are uſed to raiſe a Parapet in haſt, or to repair one that is beaten down: They are chiefly uſed when the Ground is Rocky and affords no Earth to carry on the Approaches; then are theſe Bags of Earth very neceſſary, which can be filled at another place and removed at pleaſure: Theſe Bags are ſometimes upon occaſion filled with Powder, of which they hold about 50 Pound.

CAP, *in a Ship*, is a Square Piece of Timber, put over the Head or upper End of any Maſt, having a round Hole to receive a Maſt. By theſe *Caps* the Top-Maſts and Top-Gallant-Maſts are kept ſteady and firm in the *Treſſel-Trees*, where their Feet ſtand, as thoſe of the lower Maſts do in the *Steps*. They call alſo that Piece of Lead which is put over the Touch-hole of a great Gun to keep the Prime from being waſted or ſpilt, the *Cap* of the Gun.

CAP-SQUARES, are broad Pieces of Iron on each Side of the Carriage of a great Gun, and lock'd over the Trunnions of the Piece with an Iron Pin: Their uſe is to keep the Piece from flying out of the Carriage, when 'tis ſhot off with its Mouth lying very low, or as they call it, under *Metal*.

CAPACITY (in Law) ſignifies the Ability of a Man, or Body Politick, to give or take Lands or other things, or ſue Actions.

CAPACITY, in Geometry, is the ſolid Contents of any Body: Alſo our Hollow Meaſures for Wine, Beer, Corn, Salt, *&c.* are called *Meaſures of Capacity*.

CAPE, is a Writ Judicial, touching Plea of Lands or Tenements; and divided into *Grand-Cape* and *Petit-Cape*, both which takes hold of things immoveable, and ſeem to differ in this, that the *Grand-Cape* lieth before Appearance, and *Petit-Cape* afterwards.

CAPE, or *Promontory* is any high Land running out with a Point into the Sea, as *Cape Verde*, *Cape-Horn*, the *Cape of Good Hope*, &c.

CAPE *Parvum*, is a Writ that lieth in caſe where the Tenant is ſummoned in Plea of Land, and cometh at the Summons, and his Appearance is of Record; and after he maketh Default at the Day that is given to him, then this Writ ſhall go for the King.

CAPE *ad Valentiam*, is a Writ of Execution or a *Species* of *Grand Cape*, ſo called of the End whereunto it tendeth: In the *Old Nat. Brev.* it is thus deſcribed; This Writ lieth, where any impleaded of certain Lands, and he vouches to warrant another, againſt whom the Summons *ad Warrantizandum* hath been awarded, and the Vouchee comes not at the Day given; then if the Demandant recover againſt the Tenant, he ſhall have his Writ againſt the Vouchee, and ſhall recover ſo much in Value of the Vouchee's Land, if he have ſo much; and if he have not ſo much, then the Tenant ſhall have Execution by this Writ, of ſuch Lands and Tenements as deſcend to him in Fee-ſimple; or if he purchaſe afterwards, the Tenant ſhall have againſt him a Re-ſummons, and if he can ſay nothing, he ſhall recover the Value.

Note, *This Writ lies before Appearance.*

CAPELLE, a bright fixed Star in the Left Shoulder of *Auriga*, whoſe *Longitude* is 77 *Deg.* 16 *Min.* *Latitude* 22 *Deg.* 50 *Min.* *Right Aſcenſion* 73°. 7'.

CAPIAS, is a Writ of two ſorts, one before Judgment, called *Capias ad Reſpandendum*, in an Action Perſonal, when the Sheriff upon the firſt Writ of Diſtreſs, returns *nihil habet in ballivâ noſtra*; and the other is a Writ of Execution after Judgment, which are of divers kinds, as theſe following.

CAPIAS *conductos ad proficiſcendum*, is a Writ for taking up ſuch as having received Preſt Money to ſerve the King, ſlink away, and come not in at the time: This is an Original Writ directed to the Serjeant at Arms, to arreſt and bring them in, having included a Clauſe of Aſſiſtance.

CAPIAS *pro fine*, is, where one being by Judgment fined unto the King, upon the ſame Offence committed againſt a Statute, doth not diſcharge it according to the Judgment, for by this is his Body taken and committed to Priſon, until he content the King for his Fine.

CAPIAS *ad Satisfaciendum*, is a Writ of Execution after Judgment, lying where a Man recovers in an Action Perſonal, as Debts, or Damages, or *Detinue* in the King's Court; and he againſt whom the Debt is recovered, and hath no Lands nor Tenements, nor ſufficient Goods, whereof the Debt may be levy'd: For in this Caſe he that recovereth ſhall have this Writ to the Sheriff, commanding him, that he take the Body of him againſt whom the Debt is recovered, and he ſhall be put in Priſon until Satisfaction made.

CAPIAS *utlegatum*, is a Writ of Execution which lieth againſt him that is out-law'd upon any Suit, by which the Sheriff, upon the Receipt thereof, apprehendeth the Party out-lawed for not appearing upon the *Exigent*, and keepeth him in ſafe Cuſtody till the return of the Writ, then bringeth him into Court, there further to be ordered for his Contempt.

CAPIAS *utlegatum & Inquiras de bonis & catallis*, is a Writ all one with the former, but it gives a farther Power to the Sheriff, beſides the Apprehenſion of his Body, to enquire of his Goods and Chattels.

CAPIAS *in Withernamium de homine*, is a Writ that lieth for a Servant in *Withernam*.

CAPIAS *in Withernam de Averiis*, is a Writ that lieth for Cattle in *Withernam*.

CAPILLAMENTS, *Capillamenta*, are thoſe ſmall Threads or Hairs (whence the Word) which grow up in the middle of a Flower, and are adorned with little Knops at the Top: Thoſe Knops are called the *Apices* of a Flower; and theſe *Capillaments* are called the *Stamina*.

CAPILLARY *Plants*, are ſuch as have no main Stalk or Stem, but grow to the Ground, as Hairs to one's Head, and which bear their Seeds in little Tuffs, Bunches or Protuberances on the Back-ſide of their Leaves, whence by ſome they are called *Dorſiparæ* and *Tergifætæ*. And theſe are either with an

Undivided Leaf, as the *Hæmionitis* and the *Phyllitis*; or with a

Singly divided Leaf; and theſe have the Leaf either cut or jagged in, but not divided into *Pinnæ* clear home to the main Rib; as *Polypodium*, *Lonchitis*, *Scolopendria*, *Adianthum*, *Acroſtichon Thal.*

Or elſe divided quite home to the Rib, and hanging like *Pinnæ*; as the *Chamæfelix Marina* and the *Trichomanes*. Others have the Leaf

Doubly divided, or at leaſt once ſubdivided; the firſt Diviſion being into *Branches*, and the 2d into

Pinnæ;

Pinnæ; as the *Hemionites Multifida*, the *Filix mas*, the *Filix Paluſtris*, *Filix Saxatilis*, the *Adiantum Album*, and *Nigrum*. And others have the Leaf

Trebly divided, or twice ſubdivided, *viz.* firſt into Branches, then into little Twigs, and after this into *Pinnæ*; and theſe are the *Filix Scandens* of *Braſile*, the *Filix Florida* or *Oſmunda Regalis*, the *Filix mas Ramoſa*, the *Filix Femina Vulgaris*, the *Adiantum, album Floridum*, and the *Dryopteris Nigra*. Ray's *Hiſtoria Plantarum*.

CAPILLARY *Veſſels*, ſmall Veins and Arteries, like Thread or Hairs.

CAPILLATION, according to ſome Writers, is a Fracture in the Skull, ſo ſmall that it can ſcarce be found, which yet often proves mortal.

CAPITATÆ *Plantæ*, in Botany, are ſuch Plants whoſe Flowers are compoſed of many edged and hollow little Flowers; and Mr. *Ray* calls them by this Name, becauſe their Scaly Calyx (or Cup of the Flower) moſt uſually ſwells out into a large and round Belly, containing within it the Pappous Seed; as *Carduus*, *Centaury*, *Knapweed*, *Cinara*, *Cirſium*, *Lappa maj. Cyanus*, &c.

CAPITAL *of a Baſtion*, in Fortification, is a Line drawn from the Angle of the Polygon to the Point of the Baſtion, or from the Point of the Baſtion to the Middle of the Gorge. Theſe *Capitals* are from 35 to 40 Fathom long, that is to ſay, from the Point of the Baſtion to the Place where the two Demigorges meet.

CAPITAL *Line*: See *Line*.

CAPITAL, or *Chapital*, or *Chapiter*, ſignifies in Architecture the Top of a Pillar; and this is different, according to the different Orders.

CAPITE, is a Tenure that holds immediately of the King, as of his Crown, be it by Knight-ſervice or Soccage, and not of any Honour, Caſtle or Mannor.

CAPITULUM, in Botanicks, is the Head or Flowring Top of any Plant, being compoſed of many Flowers and Threads (or *Stamina*) cloſely connected in a Globous, Circular or Diſcous Figure; as the Flowers of *Blew-bottles*, *Scabious*, *Carduus*, &c.

CAPONNIERE, in Fortification, is a covered Lodgment of about 4 or 5 Foot broad, encompaſſed with a little Parapet of above two Foot high, which ſerves to ſupport the diverſe Planks laden with Earth.

This Lodgment is large enough to contain 15 or 20 Soldiers, and is uſually placed upon the Extremity of the Counterſcarp, having ſometimes ſeveral little Embraſures made therein, commonly called *Mardreſſes*. They are generally on the Glacis, or in dry Moats.

CARPÆ *Saltantes*, is the Term for a fiery Meteor or Exhalation which ſometimes appears in the Atmoſphere, and is not fired in a ſtrait Line, but with Inflexions or Windings in and out.

CAPEOLARIA *Vaſa*, in an Animal Body, are ſuch as twine about like the *Capreoli* or Tendrils of Vines.

CAPREOLUS, in Botany, is the Claſp or Tendril, by which the Vines and ſuch like creeping Plants faſten themſelves to thoſe things which are deſigned to ſupport them.

CAPREOLATÆ *Plantæ*, are ſuch Plants as turn, wind and climb along the Surface of the Ground, by Means of their *Capreoli* or Tendrils; as *Gourds*, *Melons*, *Cucumbers*, &c.

CAPRICORN, the Goat, one of the Zodiacal Signs marked thus, ♑: Through the firſt Degree of it, the Southern Tropick, or the Tropick of *Capricorn* paſſes at 23°. 30'. Diſtance from the Equator.

CAPSTAN, or as the *French* write it *Cabeſtan*, others *Capſtand*, of a Ship, is of two kinds, the *Main Capſtan*, and the *Jeer Capſtan*.

The *Main Capſtan* is that piece of Timber which is placed next behind the Main-Maſt, its *Foot* or lower End ſtandeth in a *Step*, on the lower Deck; and its Head is between the two upper Decks. Its ſeveral Parts are thus called; the ſmalleſt Part of it the *Spindle*; the Brackets ſet unto the Body of the *Capſtan* cloſe under the *Barrs*, they call the *Whelps*. The main Subſtance or Poſt of the whole Piece is the *Barrel*, through which the Barrs go. The *Pawl* is a Piece of Iron, bolted to one End of the Beams of the Deck, cloſe to the Body of the *Capſtan*, to ſtop the *Capſtan* from turning back; and this Stoppage they call *Pawling the Capſtan*. The uſe of the *Capſtan* is to weigh the Anchors, to *hoiſe up*, or *ſtrike down* Top-Maſts, to heave any weighty thing, or to ſtrain any Rope that requireth main force.

The *Jeer Capſtan* is placed in the ſame manner as the *Main Capſtan*, between the Main-Maſt and the Fore-Maſt, and its Uſe is chiefly to heave upon the *Jeer Rope* (which ſee) or to heave upon the Viol, and to hold off by when the Anchor is weighing.

The Terms belonging to the Uſe of the *Capſtans* are, *Come up Capſtan*, that is, ſlack the Cable which you heave by; in which Senſe alſo they ſay, *Launch out the Capſtan*; *Pawl the Capſtan*, is, ſtop'd it from going back, as was above hinted.

CAPSULA *Communis*, of *Gliſſon*, is a Membrane proceeding from the *Peritonæum*, and including both the *Porus Bilarius* and the *Vena Portæ* in the Liver.

CAPSULA *Seminalis*, in Botany, is the *Caſe* or *Huſk* that holds the Seed of any Plant.

CAPSULÆ *Atrabilariæ*, the ſame with the *Renes Succentuariati*: Which ſee.

CAPSULÆ *Seminales*, in Anatomy, are the extreme Cavities of the Veſſels which convey the *Semen* in an Animal Body; they are dilated like little Coffers, which by two ſmall Holes emit the *Semen* received from the Teſticles into the little Seminary Bladders, that it may either be preſerved there againſt the time of Coition, or be reduced into Blood by the Lymphetick Veſſels. *Blanchard*: See *Teſtes* and *Teſticle*.

CAPTION, when a Commiſſion is executed, and the Commiſſioners Names ſubſcribed, and returned, that is called the *Caption*.

CAPUT *Mortuum*, is that thick dry Matter that remains after Diſtillation of any thing, but of Minerals eſpecially; and very commonly it denotes only that which remains of Vitriol in its Diſtillation, which they call *Colcothar Vitrioli*: See *Earth* and *Terra Damnata*. This *Caput Mortuum*, though in ſome Caſes there be but little, if any, Active Principle left in it, yet is never pure, and the *Colcothar Vitrioli*, if expoſed to the Air, will turn into *Vitriol* again.

CARAT: A *Carat* of Gold is properly the Weight of 24 Grains or one Scruple; ſo that 24 Carats make an Ounce.

If an Ounce of Gold be ſo pure, that in its Purification (with Antimony, or otherwiſe) it loſes nothing at all; 'tis then ſaid to be Gold of 24 *Carats*: If it loſe one Caret, 'tis then Gold of 23 *Carats*; and if it loſe two Carats in its Purification, 'tis called Gold of 22 *Carats*, *&c.* But perhaps there is no ſuch thing as Gold of 24 *Carats*, for it will retain ſome ſmall Portion of Silver or Copper, putrify it as long as you will.

A CARAT *of Diamonds, Pearls, or Precious Stones*, is the Weight of four Grains only.

CARBUNCULATION, is the blaſting of the new ſprouted *Buds* of Trees or Plants, either by exceſſive Heat, whereby the Texture of the Fibres of the Vegetable are ſo diſſolved, that its Pores become wholly changed; or elſe by exceſſive Cold, which compreſſes its Fibres ſo, that the Pores thereby are ſhut up, and leave no Paſſage for the Alimentary Juice.

CARBUNCULUS, the ſame with *Anthrax*.

CARCUS, is an Iron Caſe or hollow Capacity about the Bigneſs of a Bomb, ſometimes made all of Iron (except two or three Holes through which the Fire is to blaze) and ſometimes made only of Iron Bars or Hoops, and then covered over with Pitched Cloth, Hemp, *&c.* and filled with ſeveral kinds of Materials for firing of Houſes: They are thrown out of Mortar-Pieces, like Bombs, into Beſieged Places, *&c.*

CARCINODES, a Tumour reſembling a *Cancer*. *Blanchard*.

CARCINOMA, *Carcinus*, or *Cancer*, is a Tumour that ariſes round, hard, livid, painful; at the Beginning as big as a Pea, but afterwards its ſurrounded with great ſwelling Veins, which reſemble the Feet of a Crab (though not always) whence the Name. *Blanchard*.

CARD: See *Chard*.

CARDIACA, is a Suffocation of the Heart from a Polypus or coagulated Blood. *Blanchard*.

CARDIADICUM, a *Cordial*, is a Medicine which (as they formerly thought) corroborates the Heart; but it rather only puts the Blood into a fine gentle Fermentation, whereby the Spirits formerly decayed, are repaired and invigorated, ſo that the Blood, by conſequence, circulates more eaſily and briskly.

CARDIACUS *Plexus*, is a Branch of the eighth Pair of Nerves or the *Par Vagum*, which about the firſt or ſecond Rib, is ſent from its deſcending Trunks, and is beſtowed upon the Heart and its *Appendage*.

CARDIALGIA, is a gnawing Pain ſometimes felt in the *Scrobiculus Cordis*; or, as *Blanchard* ſaith.

CARDIALGIA and *Cardiogmos*, the Heart-burning, is a Gnawing or Contraction of the Nerve, called *Par Vagum*, and the intercoſtal implanted in the Stomach, proceeding from a pungent vellicating Matter in the Ventricle; ſo that the Heart being ſtraitned and contracted by Conſent with the Stomach, occaſions ſometimes a Swooning away.

CARDINAL *Winds* or *Points*, are the *South*, *Weſt*, *North* and *Eaſt* Points of the Compaſs; and alſo the Equinoctial and Solſtitial Points of the Ecliptick, are called the 4 *Cardinal Points*.

CARDINAL *Signs*, are thoſe Signs of the Zodiack called *Aries*, *Libra*, *Cancer* and *Capricorn*,

CARDIOGMOS, the ſame with *Cardialgia*.

CAREEN: A Ship is ſaid to be brought to a *Careen*, when the moſt Part of her Lading, *&c.* being taken out, there is laid by her Side another Ship or Veſſel lower than her, unto which ſhe is haled down as low as Occaſion requires, as to the 4th or 5th Strake, and there kept by the Weight of Ballaſt, Ordinance, *&c.* as well as by Ropes, leſt it ſhould ſtrain her Maſts too much. 'Tis done with a Deſign to trim her Sides or Bottom, to caulk her Seams, or to mend any thing that is at fault under Water: And from hence if a Ship lie on one Side when ſhe Sails, they ſay, *She Sails on the Careen*

CARIATIDES: See *Caryatides*.

CARIES, is the Corruption of a Bone from the continual Afflux of vicious Humours, or from their Acrimony and Malignity, or from a Bruiſe that ſome way affects the Bones, or from ſharp Medicines, *&c.* *Blanchard*.

CARINA, is a Term uſed both by the Anatomiſts for the firſt Rudiments of the entire *Vertebræ*, as they appear in a Chicken's Embryo while 'tis in the Shell, becauſe it is crooked in the Form of the Keel of a Ship. And alſo the Botaniſts for the ſame Reaſon uſe the Word *Carina*, to expreſs the lower *Petalum* of a *Papillionaceous* Flower. The Leaves alſo of the *Aſphodelus* they ſay are *Carinated*.

CARLING *Knees*, are thoſe Timbers which go athwart the Ship, from her Sides to the Hatchway, and which bear up the Deck on both Sides.

CARLINGS, are Timbers in a Ship lying Fore and Aft along, from one Beam to another; on theſe the Ledges reſt, on which the Planks of the Deck are made faſt. All the *Carlings* have their Ends let into the Beams, which is called *Culvertail*.

CARMINATIVE *Medicines*, are Remedies that diſpel or diſcuſs Wind, either by appeaſing the Fermentations that occaſion it, or by making it thin, and opening the Pores that it may be expelled. *Blanchard*.

CARNATION, is a Term in Painting, ſignifying ſuch Parts of an Human Body as are drawn naked, without any Drapery, or which expreſs the bare Fleſh; and when this is done Natural, Bold and Strong, and is well coloured, they ſay of the Painter, that his *Carnation* is very good.

CARNEL, the Building of Ships firſt with their Timber and Beams, and after bringing on their Planks, is called *Carnel-Work*, to diſtinguiſh it from *Clinch-Work*. Thoſe Veſſels alſo which go with *Mizen-Sails* inſtead of *Main-Sails*, are by ſome called *Carnels*.

CARNIVEROUS *Animals*, are ſuch as feed on Fleſh wholly or chiefly.

CARNOSITY, is a more than ordinary Fleſhineſs in any Part of the Body.

CARNOUS, Fleſhy; whence the *Membrana Carnoſa* or *Panniculus Carnoſus* takes its Name, which is a Fleſhy Membrane covering the whole Body.

CARO, the Fleſh of an Animal Body, is by Anatomiſts defined to be a Similar and Fibrous Part, ſoft and thick: They account it Five-fold; 1. *Muſcular*, *Fiſtular* or *Fibrous*, as is the Subſtance of the Heart and other Muſcles. 2. *Parenchymous*, as the Lungs, Liver and Spleen were thought to be by the Accidents: But ſince the uſe of Glaſſes, 'tis plainly diſcovered, that there is no ſuch thing as a *Parenchyma*, properly ſpeaking, but that all the *Viſcera*, as well as other Parts of the Body, are *Vaſcular*, and nothing but a *Plexus* or Net-work of ſmall Veſſels and Canals. They call the Fleſh of the Stomach and Guts. 3. *Viſcerous*; and they reckon a Fourth ſort, which they call *Glandulous*; as is

that of the Pancreas, the Tonſils, the Breaſts, *&c.* And, 5. They call the Fleſh of the Lips, Gums, of the Glans of the Penis, *&c. Spurious*, as being of a different Conſtitution from all the reſt.

CARO, a Botanick Word for the *Pulp*, *Fleſh* or ſoft Subſtance contained within any Plant, or its Fruit, ſuch as the Pulp of *Caſſia*, *Tamarinds*, *Prunes*, *&c.*

CAROTIDES, are Arteries in an Animal Body ſo called; they ſpring from the aſcending Trunk of the *Aorta* or great Artery at the ſame Place, nearly where the Subclavian Arteries ariſe; here the Trunk begins to be divided into two Branches, which are theſe *Carotides*; they aſcend directly upwards (though the Right ſometimes ariſes from the right *Subclavian*) and at their riſe are ſuſtained by the *Thymus*; then having beſtowed Twigs on the Larynx, Tongue, the Muſcles of the *Os Hyoides*, and the adjacent Glands, they paſs up on each Side by the Sides of the Wind-Pipe to the *Faucet*, together with the Internal Jugular Vein, and there are ſubdivided into the *External* and *Internal* Branches.

The *External* is ſmaller, and is diſperſed into all the Muſcles of the Cheeks, Forehead, Temples, Lips, and in general, through all the outer Parts of the Head and Face.

The *Internal*, which is larger, ſends firſt ſome more Twigs to the *Larynx*, Tongue, and ſo alſo to the Glands behind the Ears, and the ſpongy Parts of the Palate and Noſe: Then it entreth the upper Jaw, and beſtows a ſmall ſlip on the Root of each Tooth (as the *External* did on the Roots of the Teeth of the lower Jaw) whereby ſharp Humours flowing in upon them, ſometimes cauſe a very painful Tooth-ach. The remainder of it climbs upon the Skull, being about its *Baſis* divided into two Branches; the *leſs* and hinder whereof having ſent one ſlip to the inner Muſcles of the Neck, and another through the Hole of the uppermoſt *Ventebra* into the Membrane that inveſts the Spinal Marrow, aſcending further, enters the Skull at the Hole by which the ſixth Pair of Nerves (commonly called) comes out, and creeping along the *Dura Mater*, ends near its *Sinus* (which yet ſome ſay it enters.) The *larger* Branch, tending upwards, is carried through the bony Channel in the Wedge-like Bone, with a winding Duct to the *Sella Equina*; at whoſe *Baſis*, after it hath ſent out a Twig on each Side into the *Dura Mater*, it opens it ſelf into many ſmall Slips, which being interwoven with thoſe of the Cervical Artery (abovementioned) make the *Rete Mirabile*, which is more obſerveable in Beaſts than in Men, yet it is not all ſpent on the ſaid Slips, but perforating the *Dura Mater*, it enters the *Pia Mater*, with two notable Branches, which being divided into very ſmall Twiggs, are mingled with thoſe of the Cervical Artery, with which thhy paſs out of the Skull, and accompany the Spinal Marrow even to the Loins. Afterwards it ſends a ſmall Branch thro' the ſecond Hole of the Wedge-like Bone with the Optick Nerve, out of the Skull to the Eye: And yet ſtill ſupplying more Twigs to the Subſtance of the Brain and *Pia Mater*, and being united with ſome other Twigs of the Cervical Artery, it makes the *Plexus Choroides*.

CARPIA, is a Tent that is put into a Wound or Ulcer to cleanſe it.

CARPUS, commonly *Brachiale*, the firſt Part of the Palm of the Hand: *Heſchyus* calls it that Part of the Arm which is betwixt the lowermoſt Part of the Cubit and the Hand, or the Wriſt; it conſiſts of eight ſmall Bones, with which the Cubit is joined to the Hand. *Blanchard.*

CARRIAGE *of a great Gun*, is the Frame of Timber on which a Piece of Ordnance is laid, fixed and mounted. The common Proportion is 1 $\frac{1}{2}$ of the Length of the Gun for the Carriage, the Wheels $\frac{1}{2}$ of the Length of the Piece in Height, and 4 times the Diameter of the Bore of the Gun, gives the Depth of the Planks at the Fore-end, in the Middle $3\frac{1}{11}$.

CARTILAGE, is a white Part, drier and harder than a *Ligament*, and ſofter than a Bone; it is by ſome ſaid to be a Similar and Spermatick Part, but falſly; for it's no more made of Seed, than any other Parts; it renders Articulation more eaſy, and defends ſeveral Parts from the Injuries from abroad. In aged Perſons the Cartilages commonly grow Bony.

They have a Membrane juſt like the *Perioſteum*, and 'tis indeed but a Continuation of it.

CARTOUCHE; the ſame with *Cartridge*.

CARTRIDGES, or *Cartbyages*, are Caſes of Paper, or as they now are uſually made for the King's Ships, to prevent Danger from Fire in a Gun not well ſpunged, of Parchment; fitted exactly to the Bore of a Piece of Ordnance, and containing its due Charge of Powder. There are alſo Tin Cartridges, in which the Paper or Parchment ones are both formed and carried.

CARUNCULÆ *Myrtiformes*, are the Wrinklings of the Orifice of the *Vagina*, or Membranous Inequalities, not to be reckoned in any certain Number, which in Women with Child, and after Child-birth are ſo obliterated, that they are altogether imperceptible; there are for the moſt part four of them. *Blanchard.*

CARUNCULÆ *Oculi*, are Glandules placed at each great Corner of the Eye, which ſeparate Moiſture for moiſtening the Eyes, the ſame with Tears, which afterwards by the *Puncta Lachrymalia*, placed in the Bone of the Noſe, are diſcharged into the Noſtrils. Theſe are called *Caruncuſæ Lachrymales* by ſome.

CARUNCULÆ *Papillares*, are Ten little Bodies that are in the Reins and Kidneys; they are properly little Bundles, which ariſe from the centring together of a great many ſmall Channels, which the Reins are in a great meaſure made up of; and thoſe receive the *Serum* from the little *Ductus's*, and convey it into the *Plevis*. *Blanchard.*

CARUS, is a Sleep, wherein the Perſon affected being pulled, pinched and called, ſcarce ſhews any ſign of either hearing or feeling; it is without a Fever, greater than a Lethargy, and leſs than an Apoplexy. *Blanchard.*

CARYATIDES, an Order of Pillars in Architecture, in the Form of the Bodies of Women with their Arms cut off, and cloathed in a Garment down to their Feet: Theſe Figures do ſupport the *Entablature*. There are ſome Columns of this Order in the *famous Building at* Bourdeaux, called the *Tutelles*; and in the Great Hall of the *Swiſs* Guards at the *Louvre* in *Paris*; where four *Caryatides* ſupport a Gallery enriched with Ornaments very well cut.

The riſe of this order of Pillars was this; The Inhabitants of *Carya* in *Peloponneſus* did once treacherouſly join with the *Perſians* againſt their own Country,; but the *Græcians* got the Battle, and put

put all the Male Inhabitants of *Carya* to the Sword, reducing the City to Aſhes. The Women they took Captives, and carried in Triumph: And the more to perpetuate the Memory of this baſe Action, they would not permit theſe Women ever to put off their Triumphal Veſtments; but ordered the Architects of thoſe times to expreſs them in that dreſs, as ſupporting the heavy Weight of their Edifices, inſtead of uſual *Columns*.

The *Perſick Order* of Pillars had much the ſame Original: *Which ſee. Vitruv. lib.* 2. *c.* 1.

CASCABELL, is the hindermoſt round Knob or the utmoſt part of the Breech of a Piece of Ordnance.

CASCADE, an *Italian* Word, ſignifying a fall of Water, whether Natural or Artificial.

CASCAN, in Fortification, is a certain Hole or hollow Place in Form of a Well, from whence a Gallery dug in like manner under Ground is convey'd, to give Air to the Enemy's Mine. Some of theſe *Caſcans* are more hollow than others, being uſually made in the Retrenchment of the Platform near the Wall.

CASEMATE, in Fortification, ſometimes is the Well with its ſeveral Subteraneous Branches or Paſſages dug in the Paſſage of the Baſtion till the Miner is heard at work, and Air given to the Mine.

Alſo a certain Vault made of Maſon's Work, in that Part of the Flank of a Baſtion which is next the Curtain, on purpoſe to fire upon the Enemy, and to defend the Face of the oppoſite Baſtion of the Moat.

Sometimes it conſiſts of 3 Plat-forms one above another, the *Terreplan* of the Baſtion being the higheſt. Behind the Parapet, which fronts along the Line of the Flank, there are Guns placed laden with Cartridges of ſmall Shot to ſcour along the Ditch; and theſe are covered from the Enemy's Batteries by Earth-works Faced or Lined with Wall, and are called *Orillons* or *Epaulments*. This is the beſt Defence a Place can have.

CASERN, in Fortification, is a little Room, or Lodgment, or Building, erected between the Rampart and the Houſes of Fortified Towns, to ſerve as Apartments or Lodgings for the Soldiers of the Garriſon, to eaſe the Garriſon: There are uſually 2 Beds in each *Caſern* for ſix Soldiers to lie 3 and 3; but the third part being always on the Guard, there are but 4 left in the *Caſern*, 2 in a Bed.

CASE-SHOT, is when Musket-Bullets, Stones, old Pieces of Iron, *&c.* are put up into Caſes and ſo ſhot out of great Guns. 'Tis chiefly uſed at Sea to clear the Enemy's Decks when they are full of Men.

CASKETS (in a Ship) are ſmall Strings made of Sinnet, and faſtened to the upper Part of the Yards in little Rings (which they call *Grommets.*) Their uſe is to faſten the Sail to its Yard when 'tis to be furl'd up. The biggeſt and longeſt of theſe is in the middle of the Yard, juſt between *Tyes*, and is called the *Breaſt Casket*.

CASSIOPEA, or *Caſſiopœia*, the Name of one of the Conſtellations of the fix'd Stars in the *Northern* Hemiſphere, conſiſting of 25 Stars, and is placed oppoſite to the *Great Bear* on the other ſide the *Pole Star*.

CAST *a Point of Traverſe*, in Navigation, ſignifies to prick down on a *Chart* the Point of the Compaſs any Land bears from you, or to find on what Point the Ship bears at any inſtant, or what Way the Ship has made.

CASTOR, a fix'd Star of the ſecond Magnitude in *Gemini*, whoſe *Longitude* is 105°. 41′. *Latitude* 10°, 2′.

CASTOR *and Pollux*, are two *Meteors* which ſometimes in a great Storm at Sea appear ſticking to ſome part of the Ship, in the ſhape of Balls of Fire. Sometimes one is ſeen, and then 'tis call'd *Helena*; both of them are by ſome call'd *Tyndarides*.

CASTOR *and Pollux*, a Conſtellation of the fix'd Stars; the ſame with *Gemini*, being one of the 12 Signs of the *Zodiack*.

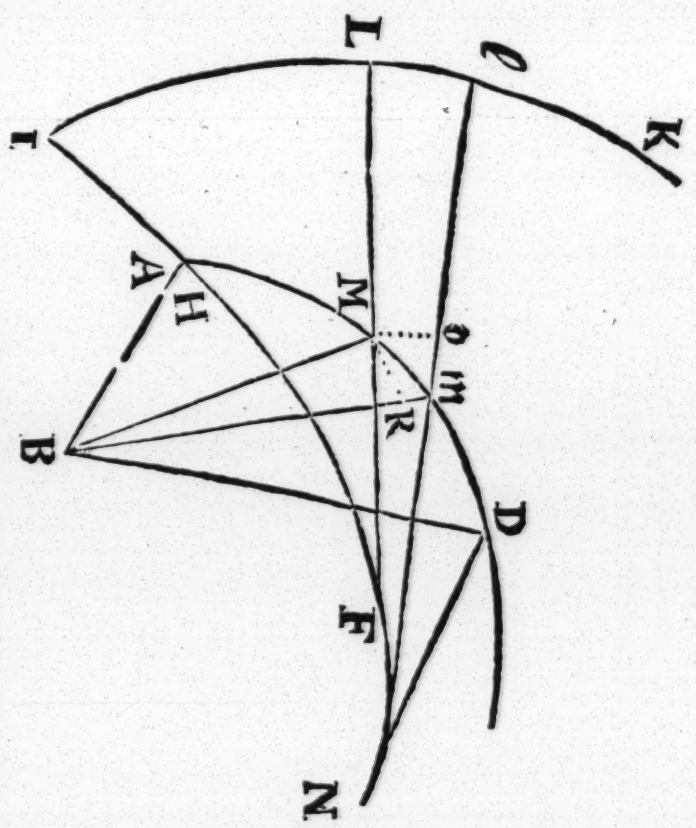
CASU *Conſimili*, is a Writ of Entry, granted where the Tenant by Curteſy, or Tenant by term of Life, or for the Life of another, doth alien in Fee, or in Tail, or for the Term of another's Life.

CASU *Proviſo*, is a Writ of Entry given by the Statute of *Glouceſter*, in caſe where a Tenant in Dower alieneth in Fee, or for Term of Life, or in Taile, and lieth for him in Reverſion againſt the Alienance.

CATABIBAZON, the *Dragon's Tail* is ſo call'd becauſe it goes exactly againſt the *Dragon's Head*.

CATACATHARTICKS, are Medicines that purge downwards.

CATACAUSTICKS, or *Cauſticks by Reflection*.



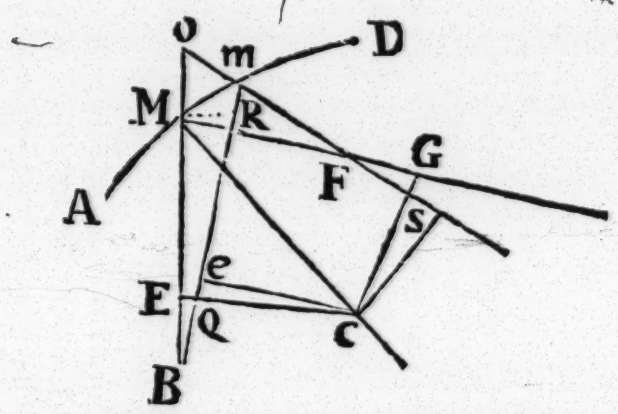
Suppoſe an infinite number of Rays as *BA*, *BM*, *BD*, proceeding from the radiating Point *B*, and reflected at the Curve *AMD*, ſo that the Angles of Incidence be ſtill equal to thoſe of Reflection; the Curve *HFN* to which the reflected Rays are Tangents continually (or which continually touches the Productions of them *AH*, *MF*, *DN*) is called the *Cauſtick by Reflection*. Or it will amount to the ſame thing, if one ſays, that the *Catacauſtick Curve* is that which is formed by joining the Points of Concourſe of the ſeveral reflected Rays. Let the reflected Ray *HA* be produced to *I*, and take *AI*=*AB*, and ſuppoſe the Curve *ILK* deſcribed by the *Evolution* (ſee the Word *Evolution*) of the *Cauſtick HFN*, beginning at the Point *I*. Again, ſuppoſing the incident and reflected Rays *BM*, *mF* infinitely near to the incident and reflected *BM*, *MF*; and drawing out *FM*

to *l*, on the Centers *F*, *B*, let the little Arches *MO*, *MR* be deſcribed. Theſe things promiſed, 'tis evident,

1. That the little Triangles *MOm*, *MRm* are always ſimilar and equal. For the Angles at *O* and *R* are Right ones; and the Angle *RmM*, *FmD* are equal from the Suppoſition of the Angles of Incidence and Reflection, and *FmD* = *OmM*, as being vertically oppoſite; and the Hypothenuſe *Mm* is alſo common to both Triangles: therefore they are ſimilar and equal, and *Om* always = *Rm*.

2. 'Tis clear that *Om* is the Increment of *LM*, and *Rm* the Increment of *BM*, and theſe Increments are perpetually equal to one another. Therefore their reſpective Sums are ſo too; but the Sum of all *Om* (for the Portion *AM* of the reflecting Curve *AMD*) is *ML* — *IA*, and the Sum of all *RM* (for the ſame Portion of the Curve *AM*) is *BM* — *BA*, which are therefore equal to one another.

3. From the Nature of *Evolution*, the Tangent of the *Cauſtick*, *FL* is = the Portion of the Curve *FH* + the Right-line *HI*, that is *FM* + *ML* = *AH* + *HF* + *IA*, and *ML* — *IA* = *AH* + *HF* — *MF*; but *ML* — *IA* = *BM* — *BA*, and therefore the Portion of the *Cauſtick* *HF* = *BM* — *BA* + *MF* — *AH*, perpetually. That is, the Portion of the *Cauſtick* *HF* formed from the reflected Rays of the Curve *AM*, is equal to the Difference of the incident Rays *BM*, *BA*, added to the Difference of the reflected Rays *MF*, *AH*. Or, taking any two incident Rays, as *BA*, *BM*, that Portion of the *Cauſtick* which is *evolved* while the Ray *BA* approached to a Coincidence with *BM*, is = to the Difference of theſe Incidents + the Difference of their reflected Rays. Now knowing how to determine the *Evoluta* of any given Curve, the Invention of the *Catacauſtick* from thence is eaſy.



Let the Point *C* be at the *Evoluta* of the reflecting Curve *AMD*, or which is all one, let *MC* be the Radius of the Concavity for the Point *M*; and ſuppoſing the Arch *Mm* infinitely ſmall, let *Bm*, *Cm*, *Fm* be drawn. Farther, upon the Centers *B*, *F*, let the little Arches *MR*, *MO* be deſcribed; and from the Point *C*, the Perpendiculars *CE*, *Ce*, *CG*, *Cg*, to the incident and reflected Rays. The Triangles *MRm*, *MOm* are ſimilar and equal, as was ſhewn before, and *MR* = *MO*. Alſo the Triangles *CEM* and *CGM* are ſimilar and equal, and ſo are *Cem* and *Cgm*; for the Angles at *E*, *e*, *G*, *g* are right, and *MC*, *mC* are common, and *EMC* = *GMC*, and *emC* = *gmC* (becauſe *MC*, *mC* are *Normals* to the Curve by ſuppoſition of the *Evoluta*, and the Angles of Incidence and Reflection are equal) therefore *CE* = *GC*, and *Ce* = *gC*, and conſequently *CE* — *Ce* = *CG* — *Cg*, that is, *EQ* = *SG*. Laſtly, the Triangles *BMR* and *BEQ* are ſimilar, and ſo are *FMO*, *FGS*. Now let *BM* = *y*, *ME* = *MG* = *a*; therefore *BM* + *BE* = 2*y* — *a*; let *RM* = *OM* = *x*, and *FM* = *z*, wherefore *FG* = *a* — *z*, and let it be required to find *z*, which determines the Point *F* in the *Cauſtick*. Then $EQ = \frac{\dot{y}x - a\dot{x}}{y}$, and $EQ + MR = \frac{2\dot{y}x - a\dot{x}}{y}$, alſo $SG = \frac{a\dot{x} - z\dot{x}}{z}$, and $SG + MO = \frac{a\dot{x}}{z}$: But by what was ſhewn before *RM* = *MO*, and *SG* = *QE*; therefore $EQ + RM = SG + MO$, *viz.* $\frac{2\dot{y}x - a\dot{x}}{y} = \frac{a\dot{x}}{z}$, and $2yz - za = ya$, and $z\ (= MF) = \frac{ay}{2y - a}$. *Q. E. I.*

Corol. 1. If the incident Rays are parallel, then $z = \frac{1}{2}a$. For *y* in this Caſe is infinite, and therefore 2*y* — *a* = 2*y*, the Quantity *a* vaniſhing if compared with *y*.

Corol. 2. If the incident Ray *BM* touches the Curve *AMD* in *M*, then *a* (= *ME*) is = 0; and therefore *z* (= *MF* = 0) alſo: From whence it follows, that the given Curve *AMD*, and the *Cauſtick* touch one another at the Point *M*.

Corol. 3. If the *Radius* of Concavity *MC* be = 0, then again *a* = 0, and *z* = 0; from whence it follows, that the Curve *AMD* and the *Cauſtick* do cut one another at the Point *M*, and make an Angle equal to the Angle of Incidence.

Corol. 4. If *CM* be infinite, then *a* (= *ME*) is infinite likewiſe, and *z* (= *MF*) = — *y*; and in this Caſe of the infinite Diſtance of the Point *C*, the Arch *Mm* becomes a Right-line.

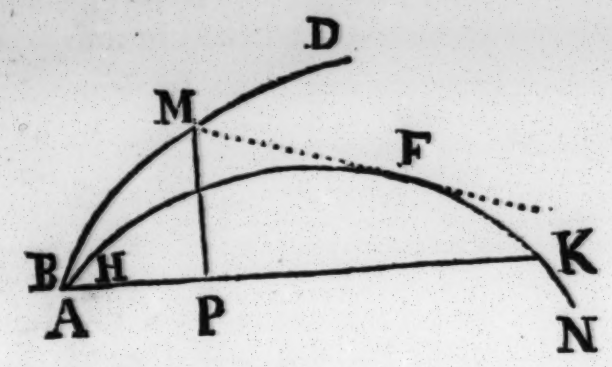
Corol. 5. 'Tis eaſy to apply all this that has been ſaid, when the Curve *AMD* is convex to the Radiating Point *B* (in which Caſe we ſhall have $z = \frac{ay}{2y + a}$) and to ſhew when the reflected Rays will come converging or diverging.

Corol. 6. When the Curve *AMD* is a Geometrick Curve, the *Cauſtick* will be ſo too; for if *AMD* be a Geometrick Curve, the *Evoluta* will be ſo too; that is, all the Points *C* may be Geometrically determined, and from the *Evoluta*, the Points *F* of the *Cauſtick* may be Geometrically determined alſo. But farther, the *Cauſtick* upon this Suppoſition ſhall always be rectifiable too, for Right-lines may always be found equal to any Portions of it.

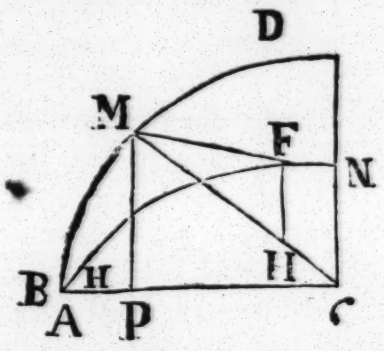
Corol. 7. 'Tis plain, that giving any 2 of the 3 Points *E*, *C*, *F*, that is, the *Radiating Point*, the *Point of the Evoluta*, and the *Point of the Cauſtick*, the 3d Point may be determined.

By this general *Theorem* and its *Corollaries*, the *Cauſticks* of particular Curves are eaſily determined, however the Rays go, Converging, Diverging or Parallel; but we will ſuppoſe the ſimpler Caſe of parallel Rays. Thus in the common *Parabola*, if the incident Rays are parallel, and cut the Ax at Right-angles, that is, are co-incident with the Ordinates to that Ax, then we have $z = \frac{1}{2}a$; ſo that taking in each reflected Ray the Length of $\frac{1}{2}a$ (*a* being the reflected Ray intercepted between

tween the Point of Incidence, and the Point where the *Normal* from the *Evoluta* meets that reflected Ray) by this Means the ſeveral Points of the *Cauſtick* will be determined. The Length of the *Cauſtick* Curve alſo taken from the *Vertex* of the *Parabola* (where it begins) to any other Point, is equal to the Sum of the Incident and reflected Rays.



As ſuppoſe *AMD* were the *Parabola*, whoſe Vertex *A*, and Ax *AK*, and *AHF* were the *Cauſtick*, beginning at the ſame Point; now becauſe the incident and reflected Rays at the Vertex are equal to nothing; that is, $AB=o$, and $AH=o$, therefore the Curve AHF ($=PM-BA+MF-AH$ by what was ſhewn before) $=PM+MF$.



In the Circle the Rays *PM* being (as before) parallel to each other, and *Normal* to the Diameter *AC*, we have alſo $z=\frac{1}{2}a$. But ſince the *Evoluta* of the Circle is contracted into the Center; the Radius *MC* being biſſected in *H*, a perpendicnlar *HF* to the reflected Ray *MF* gives the point *F* in the *Cauſtick*. The reflected *MF* is alſo equal to $\frac{1}{2}$ the Incident *BM* perpetually; for *MC* being $=r$, and $MP=y$, we have from the ſimilar Taiangles *MPC*, *MFH*, $r:y::\frac{r}{2}:z=\frac{y}{2}$. From hence 'tis clear, that the *Cauſtick* terminates at the point *K*, biſſecting the Radius *CB* at Right Angles to *AC*. Again, the Portion of the *Cauſtick* $AF=3MF$, becauſe $AF=PM+MF=y+z=y+\frac{1}{2}y$. But theſe hints of Examples may ſuffice, without deſcending to thoſe of other Curves, which are to be done after the ſame manner from the general *Theorems* that theſe were, and the Conſtructions likewiſe to be deduc'ed. 'Twould be no difficult matter to ſhew alſo what Curves theſe *Cauſticks* are in every Example: As in the laſt caſe of the Circle, that the *Cauſtick* is a Cycloid formed by the Revolution of the Circle deſcrib'd upon the Diameter *HM*, along the Quadrant deſcrib'd with the Radius *CH*. That the *Cauſtick* of the vulgar Semi-cycloid when the Rays are parallel to the Ax of it, is alſo a vulgar Cycloid, deſcrib'd by the Revolution of a Cyrcle upon the ſame Baſe. That the *Cauſtick* of a Logarithm Spiral, is the ſame Curve, but only ſet in a different Poſition; and the like others.

CATACHRESIS, is a Trope in Rhetorick, by which Liberty is given to borrow the Name of a thing, though quite contrary to what it ſhould be, becauſe it cannot be otherways Expreſs'd; as when we ſay *a Silver Ink-horn*; here Reaſon demurs at the Expreſſion; yet Neceſſity obliges us to make uſe of it. But perhaps *Ink-horn* is corrupted from *Inkern* or *Inker*.

CATACLIDA, is the Rib called the *Subclavian*.

CATACOUSTICKS, or *Cataphonicks*, is the Science of Reflected Sounds, or which teaches the Doctrine and Properties of *Echoes*.

CATADIOPTRICAL *Teleſcope*, or *Reflecting Teleſcope*: See *Teleſcope*.

CATAGMA, is a breaking of Bones, or a Separation of the *Continuum* in the hard parts of the Body; which is affected with ſome hard Inſtrument forcibly impreſſed upon the part; whoſe Differences are taken from the Form, the Part, and ſeveral Accidents. *Blanchard*.

CATAGMATICK *Medicines*, are ſuch as are uſed to help to Conſolidate Broken Bones.

CATALEPSIS, or *Catochus*, is a Diſeaſe almoſt like an Apoplexy, being an Abolition of all the Animal Functions; except that the Reſpiration remains entire, and the Patient preſerves the ſame Habit of Body that he had before he fell ſick. *Blanchard*.

CATALEPTICK *Verſe*: See *Diſpoſition*.

CATALLIS *Captis*, *Nomine Diſtrictionis*, is a Writ that lieth within a Borough, or within a Houſe, for Rent going out of the ſame, and warranteth a Man to take the Doors, Windows, or Gates for Rent.

CATALLIS *Reddendis*, is a Writ which lyeth where Goods being delivered by any Man to keep unto a certain Day, and be not upon demand delivered at a Day; and is otherwiſe called, *a Writ of detinue*.

CATAPASMA, a fragrant Powder which is ſometimes applied to the *Scrobiculum Cordis*, to ſtrengthen the Stomach.

CATAPHORA, is the ſame with *Coma*; they only differ in this, that *Cataphora* is taken as the Genus to all ſorts of Stupors that are not attended with a Fever. *Blanchard*.

CATAPLASM, is a topical Medicine of the conſiſtence of a Pultiſe; it is uſualy deſcrib'd two ways, either boiled, or without it; the former is more frequent, the latter of more efficacy: In the former, they are to take ſuch Vegerables as are proper, as Roots, Herbs, Seeds, Flowers, Fruits, *&c.* adding proper Meals, or omitting them; all which are boiled up in a convenient quantity of Liquor, *v. g.* Water, Beer, Milk, Honey, *&c.* to the conſiſtence of a Pultiſe: The latter is prepared commonly of Vegetables ſhred ſmall with the infuſion of ſo much Liquor only as may make it of the former Conſiſtence. You may add here Meal, Crums of Bread, Oyls, Ointments, as in the former ſort of *Cataplaſms*. *Blanchard*.

CATAPTOSIS, is one Symptome of an Epilepſie, when Men fall ſuddenly to the Ground. *Blanchard*.

CATARACT, a Diſeaſe in the Eyes, and is twofold, either *beginning*, as a *Suffuſion* only, or confirmed, as a *Cataract*, proper ſo call'd; the *Incipient* is but a Suffuſion of the Eye when little Clouds, Motes, and Flies ſeem to fly before the Eyes; but the confirmed *Cataract*, is when the Pupil of the Eye is either wholly or in part covered, and ſhut up with a little thin Skin; ſo that the Sun-beams have not due admittance to the Eye. *Blanchard*.

CATARACT, is a Precipiece in the Channel of a River, cauſed by Rocks, or other Obſtacle ſtopping the Courſe of its Stream, from whence the Water falls with a great noiſe and impetuoſity; as

as the *Cataracts* of *Nile*, *Danube*, *Rhine*, &c.

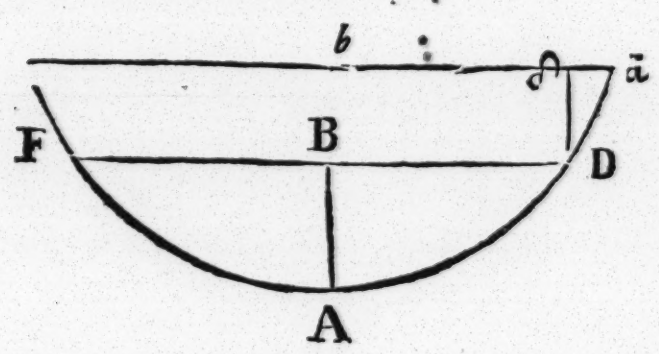
CATARRHUS, is a Defluxion of Humours from the Head towards the Parts under it, as the Noſtrils, Mouth, Lungs, *&c.* Some diſtinguiſh it by the Name of *Loryza*, when it falls on the Noſtrils, by that of *Bronchus* when on the Jaws; and by the Word *Rhume*, when it falls on the Breaſt.

CATCHES, are thoſe parts of a Clock that hold by hooking and catching hold of.

CATEGORIA and CATEGCREMA } the ſame with *Prædicamentum* in Logick: See *Prædicament.*

CATENARIA, is the Curve Line which a Rope hanging freely between two Points of Suſpenſion forms it ſelf into. What the Nature of this Curve is, was enquired amongſt the Geometers in *Galilæus*'s time, but I don't find any thing was done towards a Diſcovery till in the Year 1690, *James Bernouli* publiſhed it as a Problem; which, about two Months after, *Leibnitz* declared he had found out, and would communicate within the Year: In *December*, 1690, *John* the Brother of *James Bernoulli* communicated an Inveſtigation of it to the Editors of the *Acta Eruditorum*, which was publiſh'd afterwards *June* 1691. This *Catenary* or *Funicular* he ſaith he found not to be truly *Geometrical*, but of the *Mechanical Kind*, becauſe its Nature cannot be expreſſed by a determinate Algebraick Equation; but *Leibnitz* gives its Conſtruction Geometrically. In the Year 1697, the Month of *Auguſt*, Dr. *Gregory* publiſhed a Method of Inveſtigatioh of the former and ſome other new Properties of this Curve which you will find there, from whence this Method of finding the general Property of the *Cataneria* is taken.

1. Suppoſe a Line heavy and flexible, the two Extreams of which *F* and *D* are firmly fixed in thoſe Points; by its weight it is bent into a certain Curve *FAD*, which is call'd the *Catenaria*.



2. Let *BD* and *bd* be parallel to the Horizon, *AB* perpendicular to *BD*, and *Dδ* parallel to *AB*, and the Points *Bb* infinitely near to each other. From the Laws of Mechanicks any 3 Powers *in Æquilibrio* are to one another, as the Lines parallel to the Lines of their direction (or inclined in any given Angle) and terminated by their mutual Concourſes. Hence if *Dd* expreſſes the abſolute Gravity of the Particle *Dd* (as it will if we allow the Chain to be every way uniform) then *Dδ* will expreſs that Part of the Gravity that acts perpendicularly upon *Dd*, and by the Means of which this Particle endeavours to reduce it ſelf to a Vertical Poſition; ſo that if this Lineola *dδ* be conſtant, the perpendicular Action of Gravity upon the Parts of the Chain will be conſtant too, and may therefore be expreſſed by any given Right Line *a*. Father, the Lineola *Dδ* will expreſs the Force which acts againſt that *Conatus* of the Particle *Dd*) by which it endeavours to reſtore it ſelf into a Poſition perpendicular to the Horizon) and hinders it from doing ſo: This Force proceeds from the ponerous Line *DA* drawing according to the Direction *Dd*: and is (*cæteris paribus*) proportional to the Line *DA*, which is the Cauſe of it. Suppoſing the Curve *FAD*; therefore as before, whoſe Vertex (the loweſt Point of the *Catena*) *A*, *ax* is *AB*, Ordinate *BD*, Fluxion of the Ax *Dδ=Bb*, Fluxion of the Ordinate *dδ*, the Relation of theſe two Fluxions is thus, *viz.* *dδ* : *Dd* :: *a* : *DA* Curve; which is the Fundamental Property of the Curve, and may be thus expreſſed (putting *AB=x*, and *BD=y*, and *AD=c*)

$$y = \frac{ax}{c}.$$

CATHARPINGS, are ſmall Ropes in a Ship running in little Blocks, from one Side of the Shrouds to the other near the Deck, they belong only to the Main-Shrouds and Fore-Shrouds: Their uſeis uſe to force the Shrouds taught, for the eaſe and ſafety of the Maſts when the Ship rowls; they are alſo at the ſetting on of the Puttocks of the Shrouds, but there they do not run in Blocks, but are made faſt.

CATHARTICK, is a purging Medicine which cleanſes the Stomach, the Guts, and whatſoever is vitious and *heterogeneous* in the Blood, and throws it into the Common-Shore of the Guts. *Blanchard.* See *Purgatio & Vomitorium.*

CATHEMERINA *Febris*, the ſame with a *Quocidian.*

CATHETER, is a Fiſtulous Inſtrument which is thruſt up the Yard into the Bladder, to provoke Urine when its ſuppreſſed by the Stone; or into whoſe Cavity an Inſtrument called *Itinerarium* is thruſt to find out the Stone in the Bladder, that then the *Sphincter* of the Bladder may be ſhown, and an Inciſion be made in the *Perinæum.*

CATHETERISMUS, is the Adminiſtration or Operation of injecting any thing into the Bladder be a *Catheter* or a *Syringe.*

CATHETI, in a Right-angled Triangle, and the Sides including the Right-angle. If it be in the Singular Number, *Cathetus.*

CATHETUS, it ſignifies the Perpendicular only, the other Leg being called the Baſe. Alſo *Cathetus*, in *Catoptricks*, ſignifies a Line drawn from the Point of Reflection perpendicular to the Plane of the Glaſs.

CATHETUS, in Architecture, is taken for a Line ſuppoſed directly to traverſe the Middle of a Cylindrical Body, as of a *Balliſter* or Column. In the *Ionick* Chapiter it is alſo a Line falling perpendicularly, and paſſing through the Center or Eye of the *Voluta.*

CATHETUS *of Incidence*, is a Right Line drawn from a Point of the Object, perpendicular to the Reflecting Line.

CATHETUS *of Reflection*, or *Cathetus of the Eye*, is a Right Line drawn from the Eye perpendicular to the *Reflecting Line.*

CATHYPNIA, a deep or profound Sleep; ſuch as Men are in by taking Opitates, or by Lethargy, *&c.*

CATO-CATHARTICK *Medicines*, are ſuch as work downwards, and purge by Stool only: Theſe are called alſo *Catoreticks.*

CATOCHE, the ſame with *Catalepſis.*

CATOPSIS, the ſame with *Myopia.*

CATOPTRICKS, is that Part of the Science of *Opticks* which treats of *Reflex-viſion*, and explains the

the Laws and Properties of *Reflexion*.

CATORETICKS, the ſame with *Catherticks*.

CATT, or *Catt-Head*, a large piece of Timber ſo called in a Ship; 'tis faſtened aloft over the *Hawſe*, having at one end two *Shivers*, in which is reeved a Rope with a Block, and at the end of the Rope a large Hook, which is called the *Catt-Hook*: Its Uſe is to triſe up the Anchor from the *Hawſe* to the Top of the *Fore-Cuſtle*, where there is faſtened a *Stopper* (*i. e.* a piece of Rope ſpliced into it) at the Anchor, which ſerves to hitch the Hook of this *Catt-Rope* into the Ring of the Anchor.

CATT-HOLES, in a Ship, are Holes in her Stern above the Gun-Room Port, and through them, by means of a *Stem-faſt* (that is, ſome Faſtenings behind the Stern) to which a *Cable* or *Hawſer* is brought, a Ship (upon Occaſion) is heaved a Stern.

CAVALIER, in Fortification is a Heap or Maſs of Earth raiſed in a Fortreſs, to lodge the Cannon for ſcouring the Field, or oppoſing a Commanding Work. Theſe *Cavaliers* are ſometimes of a Round, ſometimes of a Square Figure, the Top being bordered with a Parapet to cover the Cannon therein mounted. There muſt be 12 Foot between Cannon and Cannon; and if they are raiſed on the Encloſure of any Place, whether in the Middle of the Curtin, or in the Gorge or Baſtion, are generally 15 or 18 Foot high above the Terre-plan of the Rampart.

A *Cavalier* is ſometimes called a *Double Baſtion*, and is deſigned to overlook the Enemy's Batteries, and to ſcour their Trenches.

CAVA VENA; the greateſt Vein in the Body deſcends from the Heart; ſo called from its great Cavity, and into it, as into a common Channel, do all the leſſer Veins, except the *Pulmonaris*, empty themſelves. Its Root may very properly be ſaid to be in the Liver; for by its Capillaries it receives the Blood that is tranſcolated through the Glandulous *Parenchyma* of the Liver, from the Capillaries of the *Porta*, and by its aſcending Trunk conveys it to the Heart. Theſe Capillaries emptying all the Blood exhauſted out of the Liver into the *Cava*, it is preſently divided into the *Aſcending* and *Deſcending Trunk*. The *Aſcending* enters the *Diaphragm* and goes to the *Thorax*. The *Deſcending Trunk* is ſomewhat narrower than the *Aſcending*, and paſſes down along with the great Artery, continuing undivided till the fourth *Vertebra* of the Loins. But in the mean time ſends forth divers Branches from its Trunk, as the *Venæ Adipoſæ*, *Emulgents*, *Spermaticks*, *Lumbares*; All theſe Veins being ſent forth of the Trunk, by the time it is come to the fourth *Vertebra* of the Loins where it turns to behind the *Arteria Magna*, above or before which it had thus deſcended, and is then divided into equal Branches, called *Iliaci*, becauſe they paſs over the *Os Ilion*, &c. as they go down to the Thighs.

This Vein carries nothing to the Liver, but receives the Blood from thence, carrying it, and what it receives from its other Branches into the Right Ventricle of the Heart, that it may be there anewimproved and inſpirited.

CAUDA *Lucida*, the *Lion's Tail*, a fixed Star of the firſt Magnitude, whoſe *Longitude* is 167°. 53′, *Latitude* 12°. 16′. *Right Aſcenſion* 173°. 9′.

CAVIN, in Fortification, is a hollow Place proper to favour the Approaches to a Fortreſs, ſo that one may advance therein under Covert towards the Enemy's, as it were in a Trench. If it be within Musket-ſhot, 'tis a Place of Arms ready madeto Hand; and a Convenience for opening the Trenches out of Fear of the Enemy's Shot.

CAULEDON, is the breaking of Bones acroſe, when the Parts of the Bones are ſo ſeperate that they will not lye direct.

CAULIFEROUS *Herbs* or *Plants*, amongſt the Botaniſts, are ſuch as have a true *Caulis* or Stalk, as a great many have not.

CAULIS, is in Botany, the Stalk of any Herb, or the Stem or Trunk of a Tree.

CAUSA *Matrimonii prælocuti*, is a Writ which lieth in Caſe where a Woman giveth Lands to a Man in Fee-ſimple, to the Intent he ſhall Marry her, and refuſeth ſo to do in reaſonable time, being required thereuntò by the Woman.

CAUSAL *Propoſitions*, are thoſe that contain two Propoſitions joined together by Conjunction of the Cauſe (*becauſe*, or *to the end that*) as, *Woe to the Rich, becauſe they have their Felicity in this World. The Wicked are advanced, to the end, that falling from on high, their fall may be the greater.*

CASUALITY, is the Action or Power of a Cauſe in producing its Effect.

CAUSAM *nobis ſignifices*, is a Writ which lyeth to the Mayor of the Town, or City, *&c.* that formerly by the King's Writ, being commanded to give Seiſin unto the King's Grantee of any Lands or Tenements, doth delay ſo to do, willing him to ſhew Cauſe why he ſo delayeth the Performance of his Charge.

CAUSODES, the ſame with *Cauſus*: Which ſee.

CAUSTICK *Curves*: See *Cata-cauſticks* and *Dia-cauſticks*.

CAUSTICK *Stones* or *Cauteries*, are thus made of Lime and Gravelled Aſhes: Put into a large Earthen Pan one Part of Quick-line, and two of Gravelled Aſhes, or of Calcined Tartar, both powdered and mix'd; on theſe pour good ſtore of hot Water, and then leave the Matter to infuſe 5 or 6 Hours, then boil it a little: Then filtrate through Cap-paper, and evaporating the Liquor that paſſed the Filtre, a Salt will remain at the Bottom. Put this Salt into a Crucible, and melt and boil it till all the Humidity which came from the Water is exhauſted. The Matter will ſtill remain fluid; and when by trying ſome of it on the End of a Spatula, you find it of a due Conſiſtence and that it looks like Oil in the Bottom of the Crucible, caſt it into a Baſon, and cut it, and form it into Pieces while it is warm; put them quickly into a ſtrong Glaſs Bottle, with a ground Stopple of the ſame Metal, for they will diſſolve and be ſpoiled if the Air come to them. Theſe are the ſtrongeſt *Cauteries* that can be made, and are ſoon and eaſily prepared.

CAUSTICKS, or *Eſcharoticks*, are thoſe things which burn the Skin and Fleſh into an hard Cruſt, as burned Braſs, unquenched Lime, ſublimated Mercury, and hot Iron, *&c.*

CAUSUS, or *a burning Fever*, is that which is attended with a greater Heat than other continued Fevers, an intolerable Thirſt, and other Symptoms, which argue an extraordinary Accenſion of the Blood. *Blanchard.*

CAUTERISATION, is an Artificial Burning made by a *Cautery*.

CAUTERIUM, is a Chyrurgeon's Inſtrument made of Iron, Silver or Gold, which after it's heated, has an actual Power of Burning into any thing; they differ in Bulk and Form.

It is ſometimes taken for a *Potential Cautery*, prepared of *Lixiviums*, or Lime and Soap.

CAUTIONE *Admittenda*, is a Writ that lieth againſt a Biſhop holding an Excommunicate Perſon in Priſon for his Contempt, notwithſtanding that he offereth ſufficient Caution or Pledge to obey the Commandments and Orders of the Holy Church from henceforth.

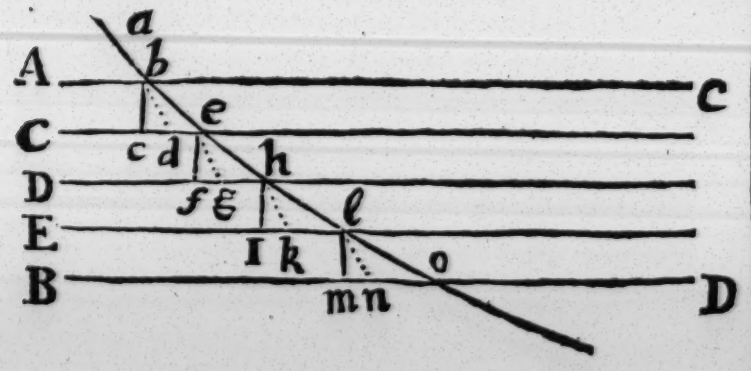
CAZEMATE, a Term in Fortification: See *Caſemate*.

CEGINUS, a fixed Star of the 3 Magnitude in the left Shoulder of *Bootes*, whoſe *Longitude* is 194°. 5'. *Latitude* 49°. 33'. *Right Aſcenſion* 215°. 39'. *Declination* 29°. 27'.

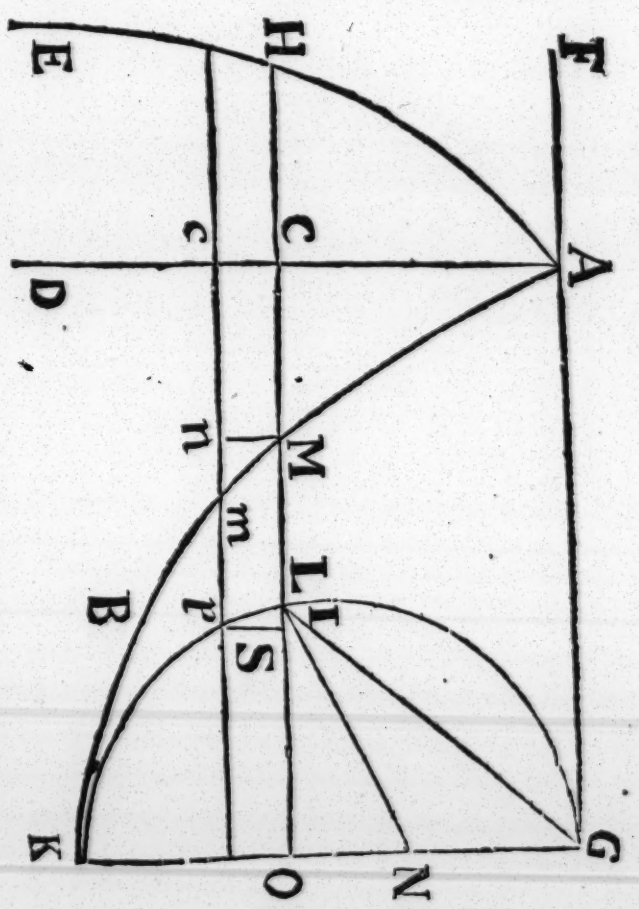
CELE, is a Tumour or Swelling in any Part of the Body.

CELERITY, is the Velocity or Swiftneſs of any Body in Motion; and it is defined to be an Affection of Motion by which any Moveable runs through a given Space in a given Time.

CELERRIMI *Deſcenſus Linea*, the Curve of the ſwifteſt Deſcent of any Body; or that in which an heavy Body deſcending by its own Gravity ſhould move from one given Point to another in the ſhorteſt Time. This was propoſed as a Problem by that excellent Mathematician M. *John Bernouli*, Profeſſor of Mathematicks at *Groningen*; and he did afterwards ſhew that this Curve was the ſame with that which a Ray or Particle of Light deſcribes in *Mediums* which are not uniform; for in ſuch a Rarity effects the Ray after the ſame manner, as the Acceleration of Velocity doth the heavy Body in its Deſcent. For if any heavy Body deſcend from any given Point, and deſcribe a Curve, and hath its Velocity in a Subduplicate Ratio of the Altitude: And if a Particle of Light coming from a given Point, and paſs through a *Medium* whoſe Rarity increaſes in a Subduplicate Ratio of the Altitude or Depth, then will the Velocity of the Particle or Ray of Light, be in a Subduplicate Ratio of ſuch Heighth or Depth; and conſequently, ſince the Velocity becomes the ſame whether produced by the uniform Action of Gravity, or by the Rariety of the *Medium*, the Line of Deſcent or Motion, or the Curve deſcribed will be in both Caſes the ſame. There have been publiſhed many Methods of Inveſtigating the Nature of this Curve; and the following one (which is ſhort, plain and eaſy) recommends it ſelf to us with this Advantage, that two Noble Problems in two diſtinct Sciences, are ſolved at one and the ſame time, the one an Optical one, the other a Mechanical.



Let us imagine the Medium *A B C D* to be made up of Fluids of ſeveral different Degrees of Denſities, but the Denſities (proceeding through the ſeveral Intervals of the Parallels *A C*, *C e*, *D b*, *E l*, *B o*, to encreaſe or diminiſh in a certain Law. In this Example we'll ſuppoſe the Degrees of Rarity in the Fluids to increaſe as we go from *A* towards *B*; ſo that the Ray *a b* is turned by the Refraction into *b e*, and *b e* into *e h*, and *e h* into *h l*, &c. from the Perpendicular *b c*, *e f*, *h i*, &c. at the Points of Incidence, *b*, *e*, *h*, &c. the prick'd Lines being the ſeveral Incident Rays produced. The refracted Ray intercepted between the Points *b* and *o*, *viz. b e h l o*, is a Polygon made up of all the Refracted Rays *b e*, *e h*, &c. which deflect from one another by the Angles of Refraction made at the ſeveral Points *b*, *e*, &c. Now if the Diſtances of the Parallels are leſſen'd infinitely, the Polygon *b e h l o* becomes a Curve Line; but alſo the Curve Ray in its Paſſage through the ſeveral Mediums, is ſuppoſed to take ſuch a Courſe, that it comes from the Radiating Point to the Point to be enlightned in the ſhorteſt time, 'tis evident (ſince 'tis every where ſo throughout the Polygon *b e h l o*) that the Curve into which that Polygon degenerates (being the Curve which the Ray by the continual Refraction is bent into) is the Curve of ſwifteſt Motion, or that by which the Light paſſes from the Point *b* to the Point *o* in the ſhorteſt Time. And ſince the Sines of the refracted Angles *c b e*, *f e h*, &c. are ſtill as the Rarities of the Mediums in thoſe ſeveral Points, that is, as the Velocities of the Globule of Light in thoſe Places; and ſince alſo thoſe refracted Angles are the Angles of the Inclination of the Lines *b e*, *e h*, &c. to the Perpendiculars *b c*, *e f*, &c. 'tis clear that the Curve muſt have this Property, that the Lines of the Inclinations to a Perpendicular muſt be every where in the Ratio of the Celerities.



Now let the Law of the Rarity or Denſity of the Medium be what it will, we may thus in general proceed to determine the Curve. Let the Medium *F G D K* be determined by the Horizontal Line *F G* to which *A D* is perpendicular, and is the Ax of the Curve *A H E*, whoſe Ordinate is *H C*; and let the Ordinate *H C* ſtill repreſent the Rarities of the Medium in the Depths *A C*, or which is all one, the Velocities of the Globule of Light in the Points of the Curve *M*. The incurved

ved Ray, or the *Semeta* of the Globule is the Curve *AMB*, the Nature of which is to be enquired into. The Lines *HCM* and *cnm* are parallel to *FG*, and *Mn* parallel to *AD*. Let $AC = x$, $Cc = Mn = \dot{x}$ $CM = y$, $nm = \dot{y}$, $AM = z$, $Mm = \dot{z}$, $HC = v$; and a a ſtable quantity taken at Liberty. If we put Mm for Radius, 'tis plain that nm is the Sine of the refracted Angle (or of the Curve's Inclination to the Vertical Line Mn at the Point M) therefore ſince the Sines of thoſe Angles are (as was ſaid before) always as the Celerities, then $\frac{m\,n}{HC}$ is a conſtant Ratio, that is, $\frac{\dot{y}}{v}$ is a conſtant Ratio; ſo that $\frac{\dot{y}}{v} = \frac{\dot{z}}{a}$ (for the Fluxions $\dot{z}$ being taken equal, as they may then $\frac{\dot{z}}{a}$ is alſo a ſtable Ratio) and $a\dot{y} = v\dot{x}$, and $a\,a\dot{y}\dot{y} = v\,v\dot{z}\dot{z}$, but $\dot{z}\dot{z} = \dot{y}\dot{y} + \dot{x}\dot{x}$ therefore $a\,a\dot{y}\dot{y} = v\,v\dot{y}\dot{y} + v\,v\dot{x}\dot{x}$, and $\dot{y} = \frac{a\dot{x}}{\sqrt{aa - v\,v}}$, which is the general Equation in Fluxions for the Curve *AMB*. Now 'tis all one whether we conſider the Increments of the Velocity as depending upon the Medium more or leſs reſiſting the Globule, or whether abſtracting from all Conſideration of a Medium, we ſuppoſe them to be the Effects of another Cauſe, but acting according to the ſame Law that was obſerved on the former, ſince on both Sides the Curve is ſuppoſed to be run in the ſhorteſt Time. Now if we imagine the Globule to be a heavy Body, and Gravity to be the Cauſe of the Acceleration; then the Curve *AHE* will be the common Parabola, ſince *HC* or v repreſents the Celerity for the Space x or *AC*; and in this Curve v is as $x^{\frac{1}{2}}$. The conſtant Line a being the Parameter, and ſo $v = \sqrt{a\,x}$; ſubſtituting this in the Room of v in the general Equation, we have $y = \sqrt{:\frac{x}{a-x}} \times \dot{x}$. From hence it follows, that the Curve of ſwifteſt Deſcent, *viz.* *AMD*, is the vulgar Cyloid, the Diameter of whoſe generating Circle *GLK* is $= a$, and whoſe Baſe is *AG*, and Vertex *K*, *GK* being Perpendicular to *AG*. Two things ſet this in the cleareſt Light: 1. To prove that *CM* is $= arc\,GL - LO$; And 2, from thence that *ML* is $= arc\,LK$, which is the known Property of the Cycloid. That $CM = arc\,GL = LO$ is certain, in that the Fluxions of them are perpetually equal in all Points of the Curve. Let $LO = s$, and the $arc\,GL = c$, and its Fluxion $Lp = \dot{c}$; then ſince $s = ax - xx$, we have $\dot{s} = \frac{a\dot{x} - 2\dot{x}\dot{x}}{2\sqrt{ax - xx}}$. Again, $\dot{c} = \frac{\frac{1}{2}a\dot{x}}{s} = \frac{a\dot{x}}{2s} = \frac{a\dot{x}}{2\sqrt{ax - xx}}$; therefore $\dot{c} - \dot{s} = \frac{2\dot{x}\dot{x}}{2\sqrt{ax - xx}}$ $= \frac{\dot{x}\dot{x}}{\sqrt{ax - xx}} = \sqrt{:\frac{x}{a-x}} \times \dot{x} = \dot{y}$, wherefore $c = s = y$, and $c - s - y$, viz. $CM =$ Arch $GL - LO$. Now if $CM = GL - LO$, then MO, which is $= CO - CM$, is $= CO - GL = LO$: But $CO = \frac{1}{2}$ Circle $GLK = GL + LK$; therefore MO, which is $= CO - GL + LO$, is $= GL + LK - GL + LO$; that is, MO is $= LK + LO$, and taking away LO, $ML = LK$: So that 'tis clear the Curve is the Cycloid above deſcribed. *Q. E. I.*

CELESTIAL *Globe*: See *Globe*.

CELLULÆ *Inteſtini Coli*; the little Cavities of the Gut *Colon*, are where the Excrements lodge ſome while, that they may refreſh ſome adjacent Part with their Heat, and digeſt and ferment any Crudities. *Blanchard.*

CEMENT, is both the Name of a Paſt with which Plates of Gold being ſtratified are purified, and according to *Helmont* and many others, is any *Lute* by which the Necks of Veſſels in Diſtillation are joined, or as we commonly ſay, *cemented together*. And alſo *Cement* is the ſame as,

CEMENTATION, which is one of the Ways of purifying of Gold, and as ſome ſay, of Silver; and 'tis thus done, Stratify in a Crucible thin Plates of Gold and *Cement*, *i.e.* the Paſt of that Name which is made of one Part of *Sal Armoniack*, two Parts of *Sal Gemmæ*, and four Parts of Potter's Earth or powder'd Brick, and covering the Crucible, make a violent Fire round about it, to calcine the Matter for 10 or 12 Hours, that the corroding Salts may carry off the Impurities of the Gold. But this Purification is by no means ſo good as that made with *Antimony* (which ſee under the Word *Purification*) for theſe Salts do ſometimes leave other Metals remaining with the Gold, and beſides, do often eat away the very Gold it ſelf.

CENCHRIAS, is a ſort of ſpreading Inflamation, running like Wild-fire; called alſo *Herpes Miliaris*, from the Reſemblance it bears to the Seed of the ſmall Grain called *Millet* or *Hyrſe*. *Blanchard.*

CENCRIAS, a ſpreading Ulcer, the ſame with *Harpes Miliaris*.

CENEANGIA, is, with ſome, the ſame as *Phlebotomy* or Blood-letting.

CENTAURE, a Southern Conſtellation, conſiſting of 40 Stars.

CENTESM, is the Hundredth Part of any thing, and is commonly mention'd in our new Decimal Diviſions of *Degrees*, *Feet*, &c.

CENTRAL-RULE, is a Rule found out and eſtabliſhed by our Famous Mr. *Tho. Baker*, late Rector of *Nympton* in *Com. Devon.* whereby he finds the Center of a Circle deſigned to cut the *Parabola* in as many Points as an Equation to be conſtructed hath real Root. How by this Means he conſtructed all Equations as far as Biquadraticks, you will find under the Word *Conſtruction of Equations*: And the Demonſtration of his *Central Rule*, I give here by it ſelf.

The Rules of Mr. *Baker* are theſe,

1. $\frac{L}{2} + \frac{q}{8L} = b = CD.$

2. $\frac{p}{4} + \frac{ppp}{6LL} \pm \frac{pq}{4LL} + \frac{r}{2LL} = d = DE.$

Or by Contraction, becauſe $L = 1$, as is ſuppoſed, to avoid Fractions.

1. $\frac{1}{2} + \frac{pp}{8} + \frac{q}{2} = b = CD.$

2. $\frac{1}{4}p + \frac{1}{8}ppp + \frac{1}{4}pq + \frac{1}{2}r = d = ED.$

To discover the Reason of which Rules,

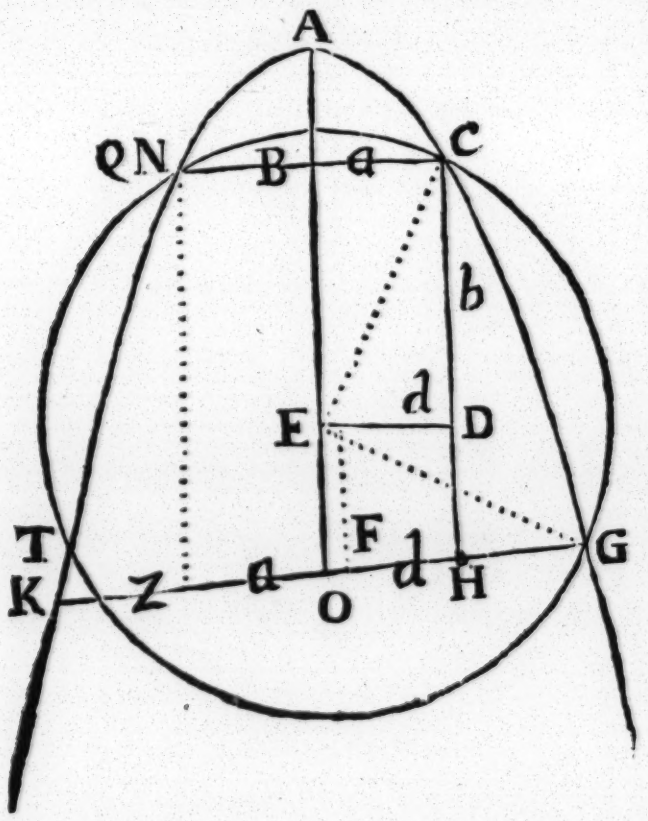
Suppose any *Parabola* drawn as in the following Figure: Then this *Lemma* may be premised; That the Line KG being an entire Ordinate, and cutting the Diameter CH consequently at Right Angles in the Point H; 'tis plain by Mr. *Baker*'s Property of the *Parabola*, That $L : HK$ (the Sum of the two Ordinates $GO + OH$, or BC) :: As HG, the Difference of these Ordinates: Is to HC the *Abscissa*. Wherefore the Rectangle under L the *Latus Rectum* or Parameter, and CH the *Abscissa*, is equal to that under KH and HG, or to the Rectangle KHG.

Suppose then Mr. *Baker*'s **L.** the *Parameter* or *Latus Rectum* belonging to this *Parabola* $= p$.

Let $CD = b$, $CB = a$.
$DE = d = FH$.
$GH = z$, the Root sought; Then will
$FG = z + d$, and
$HK = 2a + z$.

And consequently by the *Lemma*,

p (or L) $\times^{d}$. by $CH = 2az + zz$.



Wherefore $CH = \frac{2az + zz}{p}$, and $EF = DH = \frac{2az + zz}{p} - b$. But $EFq + FGq = CEq = CDq + EDq$; that is, $\frac{4aazz + 4az^3 + z^4}{pp} - \frac{4baz + 2bzz}{pp} + bb + zz + 2zd + dd = bb + dd$.

Expunge $bb + dd$, and there will remain $\frac{4aazz + 4az^3 + z^4}{pp} - \frac{4ba - 2bzz}{p} + zz + 2dz = 0$.

Then if you first multiply all that Equation by pp, and divide it afterwards by z, you will bring it to this, $4aaz + 4azz + z^3 - 4pba - 2pbz + ppz + 2ppd = 0$.

Or to reduce it to a more regular Form,

$$Z^3 + 4azz + ppz - 4pba + 4aaz + 2ppd - 2pbz = 0$$

Or if you had called the whole Line CQ by the Name of a (as *Baker* calls it p) the Equation would stand thus;

$$Z^3 + 2azz + ppz - 2bpa + aaz + 2pba - 2bpz = 0$$

Now compare this Equation Member by Member with one given to be solved in the usual Form; as suppose $Z^3 + mzz + rz + S = 0$.

Drawing any *Parabola*, take $QC = \frac{1}{2}m$ (because $2a = m$) and apply it into the *Parabola* at Right Angles to the Ax AO. Next comparing the Coeficients in the two next correspondent Terms, you have $pp + aa - 2pb = r$, or $pp + \frac{1}{4}mm - 2pb = r$: And consequently, $b = \frac{pp + \frac{1}{4}mm - r}{2p} = \frac{1}{2} + \frac{mm}{8p} - \frac{\frac{1}{2}r}{p}$.

Which is the Rule to find CD, or to determine the Point D, nearly the same (changing only the Letters) with *Baker*'s *first Rule*.

Then again, compare the next two corresponding Terms in both Equations together, and you have $2ppd - 2bpa = S$; wherefore $d = \frac{S + 2dpa}{2pp}$.

Which being all a known Quantity, the Line ED is known, and consequentaly the Centrical Point E of the Circle to be described, whose *Radius* will be EC or EG, and which will cut the *Parabola* so as to give you the Points G, T and N; from whence letting fall Perpendiculars to the Diameter CH, they shall be the three real Roots of this Cubick Equation $zzz + mzz + rz + S = 0$.

And which are Negative, and which are Affirmative, you will find in the *Construction* of these Equations by the *Parabola*: Which see.

If the Equation had been a Biquadratick, as suppose,

$$Z + mz - nzz + rz - S = 0.$$

Then the Circle would not have passed through the Vertex of the Diameter, but through another Point to be found according to the Rules mentioned in *Des Cartes*'s Construction of Equations; which is, to let $\surd : \frac{S}{pp}$ (if S represent the absolute Number or fifth Term in such an Equation, and have a Negative Sign) at Right Angles to EC, on the Vertex of the Diameter; but if it be $+S$, then that Line $\surd : \frac{S}{pp}$ must be inscribed in another Semicircle made on the Line EC; which being set from the Vertex of the Diameter C, will give in the Periphery of that Semicircle on EC, a Point through which the Intersecting Circle required shall pass. See the Manner how the *Central Rule* is investigated in the last Term of a Biquadratick, according to this Method of Mr. *Baker*, under the Word *Construction*.

From which appears.

The *Analytick* Method by which Mr. *Baker* found this Rule; for a *Parabola* being described, and a *Point* in its *Plain* given in *Position*, he expresses two ways, the *Radius* of a *Circle* passing through

thro' the *Vertex* of any *Diameter*; that is, by Poſition of the given *Center*; And Application of this new *Property*, (*That the Rectangle made of the Parameter and Difference of the Abſciſſa, is equal to the Rectangle made of the Sum of the two Ordinates into their Differences* (to expreſs the *Ratio* of the *Radius* to the given Line of the *Parabola*; ſo having an *Equation* of four *Dimenſions*, and rejecting the Equals on both Sides, he depreſſes it to a *Cubick*; but adjoining to it a Quantity for the *Homogeneum Comparationis*, thereby making the Whole equal to nothing, the *Equation* ſubſiſts in a *Biquadratick*, having all its *Terms*: If the *Circle* be ſuppoſed to paſs not thro' the *Vertex* of the *Diameter*, but thro' a *Point*, which being joined with the *Vertex* and the *Center*, may *terminate* a *Right-angled Triangle*.

This *Equation* he compares with another like it, and equal to it; then by *equating* the *Co-efficients* of theſe two *Equations*, he preſently diſcovers the *Central Rule*; whoſe univerſal Extent appears in *Biquadratick Equations*, affected under all *Parodick Degrees*; for all the other *Caſes* where any other Terms are wanting, are but *Corollaries*, or more compendious Conſtructions derived from the general Rule. So that the Invention of the *Rule* ſeems as much due to the laſt *Equation* of the *Co-efficient*, as to the aforeſaid Properties, which is demonſtrated by *Archimedes* in the *Section* of a *Parabolick Conoid* by a *Plane* parallel to the *Axis*, and is particularly uſed by *Sluſius* in his *Analyticks*, who thereby conſtructs a *Biquadratick Equation*, keeping all its Terms. But then the *Analyſis* of *Sluſius* by breaking the *Equation* into two others to find two Places, is very different from that whereby our Author found his *Central Rule*; than which nothing can be expected more eaſy, ſimple or univerſal, ſeeing any *Parabola* being once for all deſcribed, will give all the Roots, true or falſe, of any *Equation*, without Reduction or any Alteration whatſoever.

CENTRE *of a Circle*, or of a *Sphere*, is that Point from whence all Right Lines drawn to the Circumference or Surface are equal. To find the *Centre of a Circle*, ſee *Chord*.

CENTRE *of a Dyal*, is that Point where the Axis of the World interſects the Plane of the Dyal; and from thence, in thoſe Dyals that have Centres, all the Hour-Lines are drawn. If the Plane of the Dyal be parallel to the Axis of the World, it can have no Centre at all, but all the Hour-Lines will be parallel to the Style, and to one another.

CENTRE *of an Ellipſis* or *Oval*, is that Point where the two Diameters, the Tranſverſe and the Conjugate interſect each other.

CENTRE *of the Equant*, in Aſtronomy, is a Point in the Line of the *Aphelion*, being exactly diſtant ſo far from the *Centre of the Eccentrique* towards the *Aphelion*, as the *Sun* is from the *Centre of the Eccentrique* towards the *Perihelion*.

CENTRE *of Gravity*, of any Body, is a Point on which a Body being ſupported, or from it ſuſpended, all its Parts will be in *Æquilibrio* to one another.

CENTRE *(common) of the Gravity of two Bodies*, is a Point in a Right-line connecting their Centres; and ſo poſited in that Line, that their diſtances from it ſhall be reciprocally as the weight of theſe Bodies: And if another Body be placed in the ſame Right-line, ſo that its diſtance from any Point in it be reciprocally as the weight of both the former Bodies taken together, that Point ſhall be the common Centre of Gravity of all 3, *&c.*

CENTRE *of heavy Bodies*, is in our Globe the ſame as the *Centre of the Earth*, towards which all heavy Bodies do as it were naturally tend.

CENTRE *of an Hyperbola*, is a Point in the middle of the Tranſverſe Axis; and conſequently, is without the Figure, and common to the oppoſite Section.

CENTRE *of Magnitude*, of any Body, is that Point which is equally remote from its extream Parts.

CENTRE *of Motion*, of any Body, is that Point about which any Body moves when faſtned any way to it, or made to revolve round it.

CENTRE *of Oſcillation*, ſee *Oſcillation*.

CENTRE *of a Regular Polygon* or *Regular Body*, is the ſame with that of the inſcribed Circle or Sphere.

CENTRIFUGAL *Force*, is that Force by which all Bodies which move round any other Body in a Circle or an *Ellipſis* do endeavour to fly off from the Axis of their Motion in a Tangent to the Periphery of it. And this *Force*, as Mr. *Hugens* demonſtrates is always proportional to the Circumference of the Curve in which the Revolving Body is carried round.

The *Centrifugal Force* of any Body to the *Centripetal*, is as the Square of the Arch which the Body deſcribes in a given Time, divided by the Diameter, to the Space thro' which an heavy Body moves in falling from a Place where it was at reſt in the ſame time.

If any Body ſwim in a *Medium* heavier than it ſelf, (and in one lighter it cannot do ſo) the *Centrifugal Force* is the difference between the Specifick Weight of the *Medium* and the Floating Body.

What the *Centrifugal Force* in the Planets is, or the *Conatus Recedendi ab Axe motus*, the endeavour to recede from the Axis of the Motion; you will find explained under *Planets*; where the Reaſon of all their Motion is expounded.

CENTRIPETAL *Force*, is that *Force* by which any Body moving round another is drawn down, or tends towards the Centre of its Orbit; and is much the ſame with Gravity: See *Vis Centripeta*.

If a Body, being ſpecifically heavier than any *Medium*, ſinks in it, the exceſs of that Body's Gravity above the Gravity of the *Medium*, is the *Centripetal Force* of the Body downwards.

CENTROBARYCAL, is what relates to the *Centre of Gravity*.

CEPHALA, is an obſtinate Head-ach.

CEPHALÆA, an old obſtinate Head-ach.

CEPHALALGIA ſignifies in general, any pain of the Head, but is more eſpecially taken for a new Head-ach.

CEPHALALGICA are Medicines which purge the Head. *Blanchard*.

CEPHALICA, a Vein which creeps along the Arm, between the Skin and the Muſcles; it divides into two Branches. The External Branch goes down to the Wriſt, where it joins the *Baſilica*, and turns up the Back of the Hand, where it gives a Branch which makes the *Salvitella*, between the Ring-finger and the Little-finger. The Ancients uſed to open this Vein in Diſeaſes of the Head, but ſince the knowledge of the Circulation of the Blood, there is no difference whether one be blooded in the *Cephalica*, *Mediana* or *Beſilica*.

CEPHALICK *Medicines*, are Spirituous and Volatile ones, uſed in Diſtempers of the Head. Alſo the outermoſt Vein in the Arm is called *Cephalica*, becauſe it uſed formerly to be opened in Diſeaſes of the Head rather than any other.

CEPHALOPHARYNGÆI, ſignifies the firſt Pair of Muſcles of the upper Part of the Gullet, which proceed from beſide the Head and Neck, and are ſpread more largely upon the *Tunick* of the Gullet. *Blanchard.*

CEPHALOPHARYNGÆUM, is a Muſcle that ariſeth from that part where the Head is joined to the firſt *Vertebra* of the Neck; from thence marching down, it is ſpread about the *Pharynx* with a large *Plexus* of Fibres, and ſeemeth to make its Membrane. This ſtraightens the Throat in ſwallowing.

CEPHALOPHONIA, is a Pain or Heavineſs in the Head.

CEPHEUS, a Conſtellation in the Northern Hemiſphere, conſiſting of 17 Stars.

CEPI *Corpus*, in the Common-Law, is a Return made by the Sheriff, that upon a *Capias Exigent*, or other Proceſs, he hath taken the Body of the Party.

CERATIAS, according to ſome Writers, is a Horned Comet, ſometimes appearing Bearded, and ſometimes with a Tail or Train. Some Comets of this kind they will have to reſemble the Figure of a New Moon; others that are Tailed, have a crooked Tail, bending either upward or downward; and others have their Tail of an equal Breadth or Thickneſs.

CERATODES, the ſame with *Cornea Tunica.*

CERATOGLOSSUM, is the proper Pair of *Muſcles* belonging to the Tongue, proceeding from the Horns of the Bone called *Hyoides*, and joined to the ſides of the Tongue: Their uſe is to move or draw the Tongue ſtraight into the Mouth, when they act joyntly; but if either the one or the other be contracted ſingly, they move it to the Right or Left-ſide.

CERATUM or *Cerecloath*, is a Medicine applied outwardly, made of Wax, Oyls, and ſometimes Duſt intermixed, thicker than an Ointment, and ſofter than a Plaiſter.

CERCHNOS, is a certain *Aſperity* of the *Larynx*, which to touch feels like a Collection of Juniper-berries, whence proceeds a little dry Cough. *Blanchard.*

CERCIS, is the ſecond Bone of the Cubit, called *Radius*, becauſe it's like the Spoke of a Wheel. *Blanchard.*

CEREA, are the Horns of the Womb in Brutes, wherein the *Fœtus* is uſually formed.

CEREBELLUM, is the hinder part of the Brain, conſiſting like the Brain it ſelf, of an Aſhy or Barkiſh Subſtance and a white Marrowy one, wherein the Animal Spirits which perform involuntary and meer Natural Actions, are ſuppoſed to be generated in Man; but not ſo in Beaſts; it ſeems to conſiſt of a great many thin Plates that lay upon one another.

CEREBRUM, the Brain, is ſtrictly taken for the foremoſt part of the Subſtance, which is within the Skull; and it is a Subſtance of a ſort peculiar to it ſelf. Outwardly it is covered with the Skin called *Pia Mater*. It is wrought with many Turnings and Windings. Its exteriour Subſtance is Aſhy, wherein the Animal Spirits are thought to be generated: The Interior is white, which receives the Animal Spirits from the former, and diſcharges them by the *Corpus Calloſum*, and the *Medulla Oblongata* into the Nerves, upon which voluntary Actions do chiefly depend. Likewiſe the Brain is the Subject of Imagination, Judgment, Memory, and Reminiſcence; for the Ideas or Species of things being received from the Organs of the External Senſes, are carried to the common Senſory, or the Beginning of the *Medulla Oblongata*, and then by the *Corpora Striata*, and the *Corpus Calloſum*, there the Judgment and Imagination are probably formed; but the Seat of the Memory is ſaid to be in the Cortical Part of the Brain; and if the Idea's after ſome time chance to be called for out of the Place of the Memory, then it's properly ſaid to be *Reminiſcence* or Remembring. Sleep is likewiſe tranſacted in the Brain; concerning which ſee in its proper Place. *Blanchard*: See *Brain.*

CERTIFICATE (in Law) is uſed for a Writing made in any Court, to give Notice to another Court of any thing done therein.

CERTIFICATION *of Aſſize of Novel Diſſeiſin, &c.* is a Writ granted for the re-examining, or Review of a Matter paſſed by Aſſize before any Juſtices, and is called *Certification of new Diſcoveries.*

CERTIFICANDO *de Recognitione Stapulæ*, is a Writ directed to the Mayor of the Staple, *&c.* commanding him to certify the Chancellor of a Statute of the Staple, taken before between ſuch and ſuch, in Caſe where the Party himſelf detaineth it, and refuſeth to bring it in.

CERTIORARI, is a Writ out of the *Chancery* to an Inferiour Court, to call up the Records of a Cauſe therein depending, that conſcionable Juſtice may be therein adminiſtred, upon complaint made by Bill, that the Party which ſeeketh the ſaid Writ, hath received hard *Dealing* in the ſaid *Court.*

CERVICAL or *Vertebral Veſſels*, are the Arteries and Veins that paſs thro' the *Vertebræ* and Muſcles of the Neck up to the Skull.

CERVICALIS *Vena: Vid. Vertebralis.*

CERUMINA, is the Filth or Wax of the Ear, which ſeems to be ſweat out from the Cartilages: Others think it comes from the Glandules which border upon the Ears. It ſerves to hinder Duſt, Motes or little Animals from getting into the Ear.

CERUSSE, or *White-Lead*, is Lead turned into a white Form by the Means of the Smoak or Vapours of boiling Vinegar.

CÆSARIAN *Section* or *Operation*, is the cutting open the Womb of the Mother to preſerve the Child: And the

CÆSARIAN *Birth*, is that of a Child which is born this way; and thoſe that were ſo, as *Cæſar, Scipio Africanus, Manlius, &c.* were called *Cæſares*, and *Cæſones*; a *Cæſo matris utere.*

CESSAVIT, is a Writ that lieth upon this general Ground, that he againſt whom it is brought hath neglected to pay ſuch Rents, or to perform ſuch Service as he is tied to by his Tenure, and hath not upon his Land or Tenement ſufficient Goods or Chattels to be diſtrained.

CETUS, the *Whale*, a Southern Conſtellation conſiſting of 23 Stars.

CHACONNE (in Muſick) is a kind of *Sarabrand*, whoſe Meaſure is always Triple Time.

CHAFE, Seamen ſay a Rope chafes, when it galls or frets by rubbing againſt any rough and hard thing. Thus they ſay *the Cable is chafed in the*

the Hawſe, when it is fretted or begun to be worn out there.

CHAIN, is an Inſtrument uſed in *Surveying*, to meaſure Land withall; of which there are ſeveral ſorts, as,

1. A *Chain* of 100 *Foot* long, each *Link* being *one Foot* in length, and at each 10 *Foot* there is a *Plate* of Braſs, with a Figure engraven thereon, to ſhew readily how many Feet are from the beginning of the *Chain*: And for more eaſe in accounting, there is, or ſhould be, a *Braſs Ring* at every five Links, that is, one between every two *Plates*.

This *Chain* is moſt commodious for meaſuring of large *Diſtances* or *Lengths*.

2. A *Chain* of 16 *Foot* and a half in Length, and made ſo as to contain 100 *Links*, with *Rings* at every 10th *Length*.

This *Chain* will be good to meaſure ſmall *Garden-Grounds* or *Orchards* by *Perch* or *Pole Meaſure*.

3. A *Chain* of *Four Pole* or *Perches* in *Length*, which is 66 Foot. or 22 Yards, for each *Perch* contains 16½ Foot. This whole Chain is divided into 100 equal Parts or *Links*, whereof 25 are a juſt *Pole* or *Perch*; and for ready accounting, there is uſually a remarkable Diſtinction by ſome Plate or large Ring at the End of every 25 *Links*: Alſo at the End of every 10th *Link*, 'tis uſual to faſten a Plate of Braſs with Notches therein, denoting how many *Links* are from the Beginning of the *Chain*.

This *Chain* of all others is the moſt commodious for *Land-meaſure*.

When you are to meaſure any Line by the *Chain*, you need to regard no other Denomination, but only *Chains* and *Links* ſet down with a Prick of your Pen betwixt them: Thus if you found the Side of a *Cloſe* to be 6 *Chains* and 35 *Links* long, it muſt be put down thus, 6. 35.

But if the *Links* be under 10, a Cypher muſt be prefixed; ſo 7 *Chains* and 9 *Links* muſt be thus ſet, 7. 09.

How to caſt up the Content of a Figure, the Lines being given in Chains *and* Links.

Having multiplied Length by Breadth or Baſe by the half Perpendicular, *&c.* according to the Rules for finding the Content of Figures under the Word *Area*.

Rule 1. From the Product cut off 5 Figures towards the Right-hand with a Daſh of your Pen, ſo ſhall thoſe to the Left-hand again ſignify *Acres*.

2. If theſe five cut off to the Right-hand were not all Cyphers, multiply them by 4, and cutting off 5 Figures toward the Right-hand again, the reſt will be *Roods* or Quarters.

3. Alſo, if amongſt theſe five Figures cut off at the ſecond Multiplication, there be any Figures beſides Cyphers, then multiply all the five by 40, cutting off five again with a Daſh, and thoſe on the Left-hand ſignify Square *Perches* or *Poles*. As for Inſtance.

Having a *Square Field* given, whoſe Sides are each of them 7 *Chains*, 25 *Links*, the Content of this *Square* is required in *Acres*, *Roods*, and *Perches*.

```
Length 7. 25
Breadth 7. 25
-------------
        3625
       1450
      5075
-------------
Acres 525625
          4
-------------
Rood 1|02500
         40
-------------
Perch 2 00000
```

Anſw. 5 Acres, 1 Rood, and 1 Perch.

The Reaſon of this practical Rule is plain, if you conſider that 5 *Chains* (or 20 *Perches*) in Length, and 2 *Chains* (or 8 *Perches*) in Breadth make an Acre (or 160 Square Perches;) alſo 5 *Chains* multiplied by 2, is the ſame with 500 *Links*, by 200, which makes 100000 Square *Links*.

Wherefore 'tis evident, that 525625 Square *Links*, (*i. e.* the Product of 7, 25) by 7, 25) divided by 100000, that is, by cutting off 5 Figures on the Right-hand, leaves 5 *Acres* and 25625 Square *Links* over.

Alſo, if 25625 Square *Links*, do contain any Quarter or Quarters of an *Acre*; then 'tis but multiplying by 4, and dividing by 100000 (*i. e.* five cut off from the Products) they will contain ſo many *Acres* as now they do Quarters or Roods, for any number of Quarters multiplied by 4, produce the like number of Integers, and only Diviſion reduces them to the right Denomination: So that 25625 multiplied by 4, gives 1 02500, which divided by 100000, leaves 1 *Acre*, and 2500 Quarters of Square *Links* over.

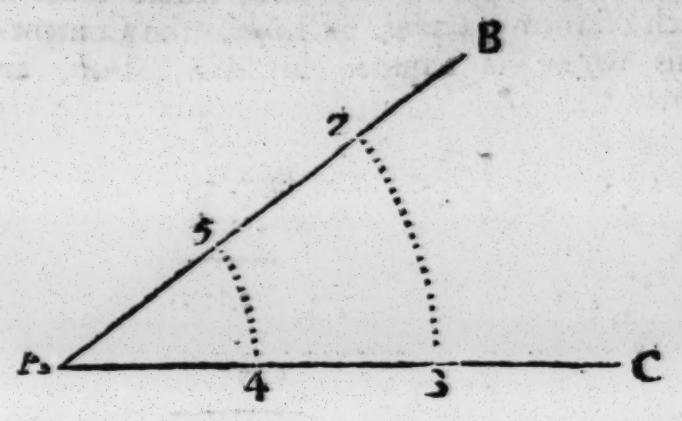
This laſt Remainder 2500 (being the true number of Square Links multiplied by 4) if multiplied by 40 (which is ¼ of 160) it muſt as often contain 100000 ſquare *Links*, as the ¼ of 2500, *i. e.* 625, containeth the ſquare Perches.

Thus, 100000 divided by 160 gives 625, as anſwering to 1 Perch: Alſo 2500 multiplied by 40, gives 100000, or 1 *Acre* (after Diviſion) or five Figures cut off.

How by the Chain *to take an* Angle *in the Field.*

Firſt, meaſure along the Hedge *AB* any ſmall Diſtance, as *A* 2, two *Chains*: Alſo meaſure along the Hedge *AC* what number of *Chains* you pleaſe, no matter whether they be equal to the former or not, as *A* 3, two *Chains*: Then meaſure the Diſtance 2, 3, ſuppoſe it be 1 *Chain* 68 *Links*.

To



To plot which, draw the Line *A B* at pleaſure, and ſet off 2 *Chains* from *A* to 2; then take in your Compaſſes the Diſtance *A* 3, 2 *Chains*, ſetting one Foot in *A*, deſcribe the Arch 2, 3; take alſo in your Compaſſes 1 *Chain*, 68 *Links*, ſet it from 2 to 3, and through the Point 3 draw *A C*, ſo you have the Angle *B A C* of the Field truly plotted.

The ſame may be otherwiſe performed thus;

Set a Stick in the Angle, and putting the Ring at one End of the *Chain* over it, take the other End in your Hand, and ſtretch out the *Chain* along the Hedge *A B*, and where it ends at 5; ſet a Stick; then ſtretch the *Chain* along the Hedge *A C*, and at the End thereof ſet another Sick, as at 4, then let looſe the *Chain* from *A*, and meaſure the Diſtance 5, 4, which ſuppoſe 74 *Links*. Then *plot* it as before.

By this Means you may *Survey* a *Field* by going round the ſame with the *Chain* only, by taking all the Angles, and meaſuring the Sides. The ſame may be plotted by Direction given under the Word *Surveying*.

CHAIN-SHOT, is two Bullets, or rather half Bullets, with a Chain between them; their uſe is at Sea to ſhoot down Yards or Maſts, or cut the Shrouds or any Rigging of a Ship.

CHAIN-WALLS, in a Ship, are the broad Timbers which are made jutting out of her Sides; to which with Chains the Shrouds are faſtned, and by them ſpread out, the better to ſupport the Maſts.

CHAINS, in a Ship, are thoſe Irons to which the Shrouds of the Maſts are made faſt to the *Chain-Walls* at the Ship's Sides,

CHALASTICK *Medicines*, are ſuch as by their temperate and moderate Heat do comfort and ſtrengthen the Parts to which they are applied.

CHALAZA, the Treadle of an Egg; every Egg has two of them, one in the obtuſe, and the other in the acute End: There is more of them in the White, yea they ſtick cloſer to the Yolk, and are faſtned to its Membrance. They are ſomething long Bodies, more concrete than the White, and whiter, knotty, have ſome ſort of Light, as Hail, whence they have their Name; for each *Chalaza* conſiſts, as it were, of ſo many Hail-ſtones ſeparated from each other by that White; one of them is bigger than the other, and further from the Yolk; is extended towards the obtuſe End of the Egg; the other is leſs, and extends it ſelf from the Yolk towards the acute End of the Egg. The Greater is made up of two or three Knots, like ſo many Hail-ſtones, which are moderately diſtant from each other, the leſs in order to ſucceed the greater.

It is alſo a Diſeaſe incident to Swine *Elanchard*.

CHALZIA, is a little Swelling in the Eyelids like a little Hail-ſtone.

CHALCANTHUM *Rubefactum*, is only Vitrol calcined to Redneſs.

CHALLENGE (in Common-Law) ſignifies an Exception againſt Perſons or Things; as a Priſoner may except againſt the partial impannelling of a Jury, or againſt the Inſufficiency of the Jurors.

CHALOUP: See *Shallop*.

CHALYBEAT, is that which partakes of the Nature of Steel; thus *Chalybeat Medicines* are a Preparation of Steel or Iron, or a Compoſition in which Steel or Iron is an Ingredient.

CHALYBEAT *Chryſtals of Tar*: See *Cream of Tartar*.

CHAMADE, is a Signal made by the Enemy, either by Beat of Drum or Sound of Trumpet, when they have any Matter to propound; as when they ſound or beat a *Parley*.

CHAMBER, that Part of the Cavity of a great Gun where her Charge lies, is called the *Chamber*: Thoſe Pieces which at Sea they call *Murtherers*, have *Chambers* which are put in at their Breeches.

CHAMBRANLE, an Ornament in Maſonry and Joyner's Work, bordering the three Sides of Doors, Windows and Chimneys. It is different according to the ſeveral Orders, and conſiſts of three Parts, *viz.* the Top, called the *Traverſe*, and the two Sides the *Aſcendants*.

CHAMPARTY (in Common-Law) ſignifies a Maintenance of any Man in his Suit depending upon Condition to have Part of the things (be it Lands or Goods) when recovered.

CHANCE-MEDLEY (ſignifies in Law) the caſual killing of a Man, not altogether without the Killer's Fault, though without an evil Intent.

CHANDELIERS, in Fortification, are Wooden Parapets made of two upright Stakes ſix Foot high, which ſupport divers Planks laid acroſs one another, or Bavins filled with Earth. They are made uſe of in Approaches, Galleries and Mines to cover the Workmen, and to hinder the Beſieged from forcing them to quit their Labours. The only Difference between *Chandeliers* and *Blinds*, is, that the Former ſerve to cover the Pioneers before, and the Latter to cover them over Head.

CHANEL, in the *Ionick Capital*, is a Part which is ſomewhat hollow under the *Abacus* after the *Liſtel*, and lies upon the *Echinus*, having its Contours or Turnings on each Side to make the *Voluta's*.

CHAOS: The ancient *Ethnick* Philoſophers ſuppoſe the World to be formed at firſt out of a *Chaos*, that is a datk kind of turbulent Atmoſphere, or a diſorderly Syſtem of Mixture of all ſorts of Particles together, without any Regularity in any Reſpect. This the Greeks called Πυρὸν ἄερ & ζοφώδης, and the Latins *Rudis Indigeſtaque Moles*——. It is probable enough that the Notion came from *Moſes*, who ſays, the Earth *was without Form and void, and that Darkneſs was upon the Face of the Abyſs*: Though he gives no farther Deſcription of it, nor tells us whence it took its Original, and came into ſuch a confuſed State.

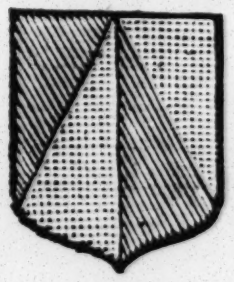
Mr. *Whiſton* in his late *new Theory of the Earth*, ſuppoſes the ancient *Chaos*, the Origin of our Earth, to have been the Atmoſphere of a Comet; for

which new, though indeed all things considered, not improbable Assertion, he endeavours to make out by many Arguments, drawn from the Agreement which appears to be between them: *See his Theory*, P. 69. So that according to him every *Planet* is a *Comet* formed into a regular and lasting Constitution, and placed at a proper distance from the *Sun*, revolving in a nearly Circular Orbit: And a *Comet* is a *Planet* either beginning to be destroyed or remade, that is, a *Chaos* or a *Planet* unformed, or in its Primeval State, and placed as yet in an Orbit very excentrical.

CHAPEAU, in Heraldry, is a Cap of Dignity used to be worn by Dukes; 'tis of a Scarlet Colour, lined with Ermines, and on it, as on a *Wreath*, the *Crest* of Noblemens Coats of Arms is born, and by it parted from the *Helmet*, which no *Crest* much touch immediately.

CHAPITERS (in Law) signifies a Summary or Content of such Matters as are to be enquired of, or presented before Justices in Eyre, Justices of Assize, or of Peace in their Sessions.

CHAPITERS, in Architecture, are the Crowns or upper Parts of a Pillar: Those that are destitute of Ornaments, are called *Chapiters with Mouldings*, such as the *Tuscan* and *Dorick*; the first whereof is the most simple, having its *Abacus* Square without any Mouldings; but the *Abacus* of the other is crowned with an *Astragal* and three *Annulets* under the *Echinus*. All those that have Leaves and carv'd Ornaments, are term'd *Chapiters* with Sculptures, and the finest of them is the *Corinthian*, which is adorned with two Rows of Leaves, as also eight greater, and as many lesser *Voluta's* placed under a Body called a *Tympanum*. These are called usually *Capitals*.



CHAPPE, the Herald's Term for the Partition of an Escutcheon of this Figure; and they Blazon it thus, *Chappe Or*, and *Vert*.

CHARACTERISTICK *of a Logarithm*: See *Index* or *Exponent*.

CHARACTERS, are *Marks*, *Signs*, or *Symbols* of things invented by Artists, and peculiar to several Sciences, by which the Knowledge of the Things themselves is always more expeditiously and most times more clearly conveyed to the Learner; especially after he hath a little enured himself to them.

Characters used by *Mathematicians*, are chiefly in *Geometry*, *Trigonometry* and *Algebra*, and are as followeth:

= Is the *Mark of Equality*, though *D. Cartes*, I know not why, instead of it useth ∞, in which he is scarcely followed by any Body; and this (=) mark with him, or his Commentators, signifies the Difference of two Quantities when 'tis not known which is the greatest; which now a-days we mark thus ∞. But now this Sign = is universally used for *Equal to*; and if you should see $a = 2b$, you must read it, *a* is equal to twice *b*.

\+ Is in *Algebra* a Sign of real Existence in the Quantity it stands before, and therefore all Quantities that have no Signs are always supposed to have this Sign + before them. 'Tis called the *Affirmative* and *Positive Sign*, because it implies the Quantity to be of a Positive and Real Nature; and is directly contrary to the following Sign —.

This Sign + is also the Mark of *Addition*, and when you see $a + b$, you must read it *a* added to *b*; or as the way usually is, *a more b*; and you are to suppose it to be the Sum of those two Quantities *a* and *b*.

— Is the Note of *Negation*, *Negative*, *Existence*, or *Non Entity* in *Algebra*. And whenever it stands singly before any Quantity, it shews that Quantity to be no real one, but less than nothing; and therefore such Quantities are called *Negative*. Thus — 3 is a *Negative* 3, or 3 less than Nothing. And though such Quantities as these are only Imaginary, they have yet very great use in *Algebra*. And any one may have a distinct Idea of such a Negative Quantity, if he consider a Man to have in Cash, or be worth but 1000 Pounds, and yet to owe to 1500; for then that Man is certainly 500 *l.* worse than nothing; which Quantity of 500 *l.* in respect to him, will properly be expressed by putting this Negative Sign before it; for its truly to that Man — 500 *l.* or 500 *l.* less than, or worse than nothing.

This *Character* is also the Note of *Substraction*, and when you see $a - b$, you must read it, *a*, *substracting* or *abating*, or as the usual way is now, *a less b*; implying, that the Quantity is the *Difference* between *a* and *b*, or the *Remainder*, when *b* the lesser is substracted from *a* the greater. Therefore this Note (as also doth the foregoing) always belongs to the Quantity following it.

∽ Is the *Character* expressing the *Difference* between any two Quantities when 'is not yet discovered which is the greater: And therefore the Sign — cannot be used, because it always supposes the Quantity following to be less than what precedes it.

× Is the *Character* of *Multiplication*, implying the Quantities on each Side the *Sign*, are to be multiplied one into another. Thus $a \times b$ is to be read *a* multiplied by *b*; or the *Rectangle between*, or *Product* of *a* and *b*. But this Sign in *Algebra* is usually omitted, and the Quantities are put down like Letters in a Word. Thus *ab* signifies the Product of *a* multiplied by *b*. In compound Quantities the *Sign* is most times used, as $a + b \times c + d - e$.

÷ Is the Mark of *Division*. Thus $a \div b$ signifies that the Quantity *a* is to be divided by *b*. But most times in *Algebra* the Quotient is expressed Fraction-ways; as $\frac{a}{b}$ signifies the Quotient of *a* divided by *b*. Some Writers express it thus, $b) a$ (, as in the common Division.

Ꝺ Is the *Character* of *Involution*, as they call it, that is, of producing the Square of any Quantity, or of multiplying any Quantity into it self. In *Branker* and *Pell's Algebra*, and since that, in *Ward's* and others, 'tis placed in the Margin, and shews that the *Step* of the Equation against which it stands is to be multiplied by it self, or squared, or if it be a Square already, then to be raised up to that Power, which the *Index* set after the *Character* expresses, *v. gr.*

|1|Ꝺ.3|4|aaa + 3aab + 3bba + bbb| shews that the first *Step* of that Equation, which (was $a + b$) was, in the 4th Step, multiplied Cubically, or raised up to the 3d Power.

ɯ Is the *Character* of *Evolution*; that is, of *Extraction of Roots out of the several Powers*; and is is the Reverse of the foregoing Sign Ꝺ.

: : Is the Mark of *Geometrical Proportion disjunct*, and is usually placed between two Pairs of Proportionals, as in the *Golden Rule*; thus 4 : 6 :: 8 : 12; and shews, that 4 hath the same Ratio to 6 that 8 hath to 12.

∴ Is the Mark of *Geometrical Proportion continued*, and implies the Ratio to be still carried on without any Interruption, as, 2, 4, 8, 16, 32, 64, 128 ∴. Some *French* Writers use this Mark for *Arithmetical Proportion*.

√ : Is the Sign of *Radicality*, and shews (according to the Index of the Power that is set over or after it) that the Square Cube or other Root is extracted, or is to be so, out of any Quantity; as √ : 25, or $\sqrt[2]{}$ 25, or √ (2) 25, finifies the Square Root of 25; and $\sqrt[3]{}$ 25, or √ : (3) 25, finifies the Cube Root of Twenty five. Sometimes this *Radical Sign* belongs to as many of the following Quantities as have a Line drawn over them; as, √ : $\overline{b + d}$ signifies the Square Root of the Sum of b and d added together: And √ (3) $\overline{f + c - g} - 3$ signifies the Cube Root of the Sum of f and c, after g is subtracted from that Sum; and that after this, 3 is to be taken from the said Cube Root.

⌞ or ⌝ Is the *Character* of *Greater*, and

⌟ or ⌞ The Sign of the *Lesser* of any two Quantities.

|| Is the Mark for Parallel, and implies, that 2 Lines or Planes are equidistant one from another.

△ Triangle.

□ Square.

▯ ▭ Rectangle.

⊙ Circle, or *Sol* the Sun.

∠ Equi-angular or Similar.

⏤ Equilateral.

∠ Angle.

∟ Right-Angle.

⊥ Perpendicular.

: : : Is the Mark for Arithmetical Proportion.

$\dot{y}$, $\dot{x}$, $\dot{z}$. Any Letters with Points so over their Heads, denote the Fluxions of variable Quantities: And if they have 2, 3 or 4 Points, they denote Second, Third or Fourth Fluxions: See *Fluxions*.

— 1, — 2, — 3, — 4, *&c.* are the *Exponents* of a Series of Fractions in a Geometrical Progression.

$\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, are the *Exponents* of √ : x. $\sqrt[3]{}$: x. $\sqrt[4]{}$ x. which therefore in the new Notations are written thus, $x^{\frac{1}{2}}$, $x^{\frac{1}{3}}$, $x^{\frac{1}{4}}$, &c. Also

$x^{\frac{4}{5}}$, stands for $\sqrt[5]{x^4}$; and in Fractions,

x^{-1}. x^{-2}. x^{-3}. stand for $\frac{1}{x}\ \frac{2}{x}\ \frac{3}{x}$, *&c.* Also $x^{\frac{1}{2}} + \frac{1}{3}$ expresses the Product of $x^{\frac{1}{2}}$ into $x^{\frac{1}{3}}$, and $x - \frac{1}{3} - \frac{1}{3}$ (or $x - \frac{2}{3}$) is the Product of $x - \frac{1}{3}$, into its self, or Square of $x - \frac{1}{3}$.

$x^{\frac{1}{2}} - \frac{1}{3}$ (or $x^{\frac{1}{6}}$ is the Exponent of the Quotient of $x^{\frac{1}{2}}$ by $x^{\frac{1}{4}}$.

$\overline{a + b}^{-1}$ Expresses an Unite divided by $a + b$.

$\overline{a + b}^{-3}$ Is an Unite divided by the Cube of $\overline{a + b}$.

$\overline{a + b}^{\frac{2}{4}}$ Is the Biquadratick Root of the Cube of $a + b$.

CHARGE, in Heraldry, ſignifies whatever thing is born in the Field of a Coat of Arms; whether Animal, Vegetable, or any other Repreſentation or Figure. *Proper Charges* are called *Ordinaries*: Which ſee. Thus *Guillim*, but *Bloom* calls thoſe *Charges* on which Rewards and Additions of Honour are often placed in a Coat of Arms, ſuch as *Cantons*, *Quarters*, *Gyrons*, *Flasks*, &c.

CHARGE, the Seamen call a Ship, *a Ship of Charge*, when ſhe draws much Water, or ſwims deep in the Sea; and ſometimes it's uſed for an unweildy Ship that will not ware nor ſteer, for ſuch a one they ſay alſo is a *Ship of Charge*.

CHARLES's WAIN, ſeven Stars in the Conſtellation called *Urſa Major*.

CHART, is a Draught projected for the uſe of Seamen, Diſcovering the Sea-coaſts, Sands, Rocks; and is ſometime taken for the *Nautrical Compaſs*.

CHARTA *Pardonationis ſe defendendo*, is the Form of a Pardon ſlaying another Man in his own Defence.

CHARTA *Pardonationis utlagariæ*, is the Form of a Pardon for a Man that is outlawed.

CHARTER-PARTY, is an Indenture of Covenants and Agreements made between Merchants or between Owners of Ships and the Maſters and Sea-faring Men, touching their Affairs, or Commanders.

CHARTIS *Reddendis*, is a Writ which lies againſt him that hath Charters of Feoffment, delivered him to keep, and refuſeth to deliver them.

CHASE, to *Chaſe* is to purſue a Ship at Sea, which is called *Giving Chaſe*. *A Stern Chaſe* is when the Chaſer follows the Chaſed a-ſtern, directly upon the ſame Point of the Compaſs: To *lie with a Ship's Fore-foot in a Caſe*, is to ſail and meet with her by the neareſt diſtance, and ſo to croſs her in her way, or *to come acroſs her Fore-foot*. A Ship is ſaid to have *a good Chaſe*, when ſhe is ſo built forward on, or a-ſtern, that ſhe can carry many Guns to ſhoot forwards or backwards, and ſo hath either *a good Forward*, or *a good Stern-Chaſe*.

CHASE-GUNS, are ſuch whoſe Ports are either in the Head (and then they are uſed in *chaſing of others*) or in the Stern, which are only uſeful when they are purſued or chaſed by any Ship or Ship.

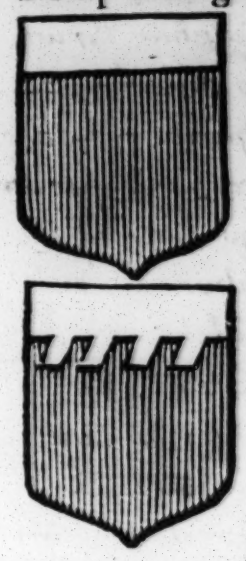
CHASE *of a Gun*, is its whole Length.

CHAUSE-TRAPPES, or *Coltrops*, in *Fortification*, are Iron Inſtruments with four Spikes about 4 Inches long, made after ſuch a manner, that whatſoever way they fall, one Point will always lie uppermoſt like a Nail. They are uſually ſcatter'd and thrown into Moats and Breaches to gall the Horſes Feet, and to ſtop the haſty approach of the Enemy.

CHECKY, the Herald's Term for a Bordure or Ordinary that hath more than two Rows of Checkers; for if it hath only own, they call it *Countercomponed*.

CHEEKS, are (in a Ship) two Pieces of Timber fitted on each Side of the Maſt at the Top, ſerving to ſtrengthen the Maſt there; and alſo having Holes in them (which are called *Hounds*) through which the *Ties* run to *hoiſt* the *Yards*.

Alſo the uppermoſt Rail or Piece of Timber in the Beak of a Ship; and thoſe on each Side the *Trail Board*, are called *the upper and lower Cheek*. The Knees alſo which faſten the Beak-Head to the Bows of a Ship are called *Cheeks*; and ſo are the Sides of any Block, as alſo the Sides of a Ship-Carriage for a Piece of Ordnance.



CHIEF, one of the Eight Honourable Ordinaries in Heraldry, containing a Third Part of the Field, and determined by one Line, either ſtreight or crooked, that is, *Invected*, *Engrailed*, &c. drawn through the *Chief Point* of the Eſcutcheon. Thus the Field is *Gules*, a *Chief*, *Argent*. He beareth *Gules*, a *Chief Crenele*, or *Embatteled*, *Argent*.

Sometimes one *Chief* is born upon another, which is called *Surmounting*, and it is uſually expreſſed by a Line drawn along the upper part of the *Chief*; for if the Line be drawn along the lower Part of the *Chief*, it is called a *Fillet*. The former of theſe is an Addition, the Latter a Diminution of Honour. *Chief Point*: See *Eſchutcheon*.

CHEMIN *de Ronds*, in Fortification, is the way of the Rounds, or a Space between the Rampart and the low Parapet under it for the Rounds to go about. The ſame with the *Fauſſe Bray*.

CHEMISE, in Fortification, is a Wall with which a Baſtion, or any other Bulwark of Earth is lined for its greater Support and Strength; or it is the Solidity of the Wall from the *Talus* to the Stone Row.

CHEMOSIS, is the Tumour of the *Albugineous Tunick* that maketh the Black of the Eye appear Concave, being a very great Inflammation of the Eyes with vehement Pain, both the Eye-lids being turned the Inſide out, ſo that the Eyes can ſcarcely be covered with them, whilſt the White of the Eye ſtands higher, and the Red runs over moſt Part of the *Iris*.

CHERSONESUS, a Term in Geography, being the ſame with *Peninſula*, and ſignifies a Part of the Land encloſed all round about with Water, except one narrow Neck, by which it joins to the Main Land; and that Neck is called *an Iſthmus*.

CHESSE-TREES, are two ſmall Pieces of Timber with a Hole in them, on each Side of the Ship, a little before her *Loof*, for the Main Tack to run through, and to which it is haled down.

CHEVAUX *de Friſe*, or *Friſeland Horſe*, in Fortification, is a large Joiſt or Piece of Timber about a Foot in Diameter, and ten or twelve in Length; into the ſix Sides thereof are driven a great number of Wooden Pins about ſix Foot long, croſſing one another, and having their Ends armed with Iron Points. Their chief Uſe is to ſtop up Breaches, or to ſecure the Avenues of a Camp from the Inroads both of Horſe and Foot. They are much the ſame with *Turn-pikes*.

CHEVILS, or *Kevils*, are ſmall Pieces of Timber nailed to the Inſide of a Ship to *belay* or faſten the *Sheets* and *Tacks*.

CHEVRON, one of the Honourable Ordinaries in Heraldry: It repreſents two Rafters of an Houſe ſet up as they ought to ſtand, and was anciently the Form of the Prieſteſſes Head Attire. It contains the Fifth Part of the Field, and is Figured thus:

He beareth *Gules*, a *Chevron Argent*, by the Name of *Fulford*. The *Chevron* is divided into the

CHEVERONEL, which is the Moiety of a *Chevron*; and a *Couple-Cloſe*, which is the fourth Part.

CHICANRY, is a trickiſh and guileful Practice of the Law.

CHILIADS; ſo the *Tables of Logarithms* are frequently named by many Authors.

CHILIOGON, a Regular Plane Figure of 1000 Sides and Angles; of which, though the Eye can form no diſtinct View, we may have a very clear Idea in the Mind; and can eaſily demonſtrate, that the Sum of all its Angles are equal to 1996 Right ones; for the internal Angles of every Plane Figure, are equal to twice as many Right Angles as the Figure hath Sides; except thoſe 4 which are about the Point in the Middle, from whence the Figure is reſolved into Triangles.

CHIMES *of any Clock*: How to calculate Numbers for them, and to fit and divide the *Chime-Barrel*: See in *Watch-Work*.

CHIRAGRA, is a ſort of Gout in the Hands only.

CHIROGRAPHER, is he that in the Common-Pleas, ingroſſes Fines acknowledged in that Court into a perpetual Record (after they are acknowledged and fully paſſed by thoſe Offices by whom they are firſt examin'd) and that Writes and delivers the Indentures, one for the Buyer, and another for him that ſells, and makes another indented Piece, containing alſo the Effect of the Fine, which he delivers over to the *Cuſtos Brevium*, which is called *the Foot of the Fine*. The *Chirographer* alſo, or his Deputy, proclaims all the Fines in the Court every Term, according to the Statutes, and then repairing to the Office of the *Cuſtos Brevium*, there endorſes the Proclamations upon the Back-ſide of the Foot thereof, and always keeps the Writ of Covenant, as alſo the Note of the Fine.

CHIROMANCY, the ſame with *Palmaſtry*, is a pretended way of Divination, telling of Forturities, preſaging Futurities, or diſcovering the Tempers and Conſtitutions of Perſons by a ridiculous Inſpection into the Hand, and Obſervation of Wrinkles and Strokes of the Skin.

CHIVES, is the Botanick Word by which our Mr. *Ray* renders the Latin *Apices*: *Which ſee*. But Dr. *Grew* calls the *Stæmina* on which the *Apices* are fixed, by this Name of *Chieves*.

CHLOROSIS, or *Morbus Virgineus* commonly *Iterus Albus*, or the *Green-ſickneſs*, ſeems to be a kind of Plhegmatick Pituitous Dropſy, ariſing from an Obſtruction of the Menſes, want of Fermentation in the Blood, and Detention or Depravation of the Ferment in the Womb; whereupon the

Muſcu-

Muſcular Fibres being obſtructed, they become Lazy and unfit for Action. *Blanchard.*

CHOANA, is a ſort of Cavity or Tunnel in the *Baſis* of the Brain, by which the ſerous Excrements are brought down from the Ventricles of the Brain to the *Pituitary Glandules*; alſo the *Pelvis* of the *Reins*, of which in its proper Place. *Blanchard.*

CHOLEDOCHUS *Ductus*, is the Communion of the *Ductus* or *Porus Bilarius* with the *Ductus Cyſticus*, into one Paſſage, and is thence called the *Ductus Communis Choledochus.* This goes obliquely to the lower End of the *Duodenum*, or the beginning of the *Jejunum*; and creeping obliquely between the Tunicks of the Inteſtine, hath the Return of the *Bile* hindred (as by a Valve) from coming into the *Ductus* again.

CHOLER: See *Bile.*

CHOLERA *Morbus*, is a depraved Motion of the Ventricle and the Guts, whereby the *Bilious Excrements* are diſcharged in great plenty upwards and downwards. *Blanchard.*

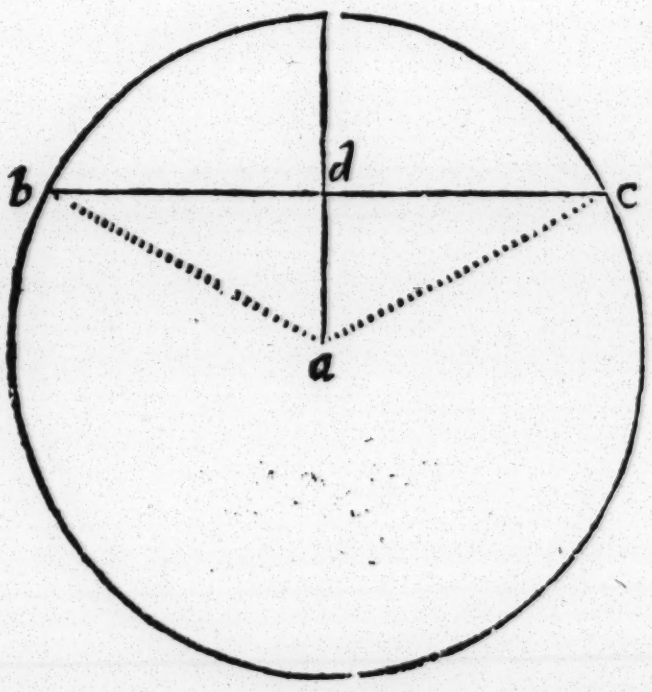
CHOLOGOGUES, are Medicines which purge Choler, Sulphureous and Bilous Humours; as *Rhubard*, *Senna*, *&c.* according to the old Notion.

CHONDROSYNDESMUS, the joyning or uniting of the Bones by a Cartilage placed betwixt them.

CHORD, in Geometry, is a Right Line connecting the Extremities of any Arch of a Circle, and is othewiſe called a *Subtenſe.*

Prop. I.

A *Chord (b c)* is biſſected by a Perpendicular *(d a)* drawn from *(a)* the Center.

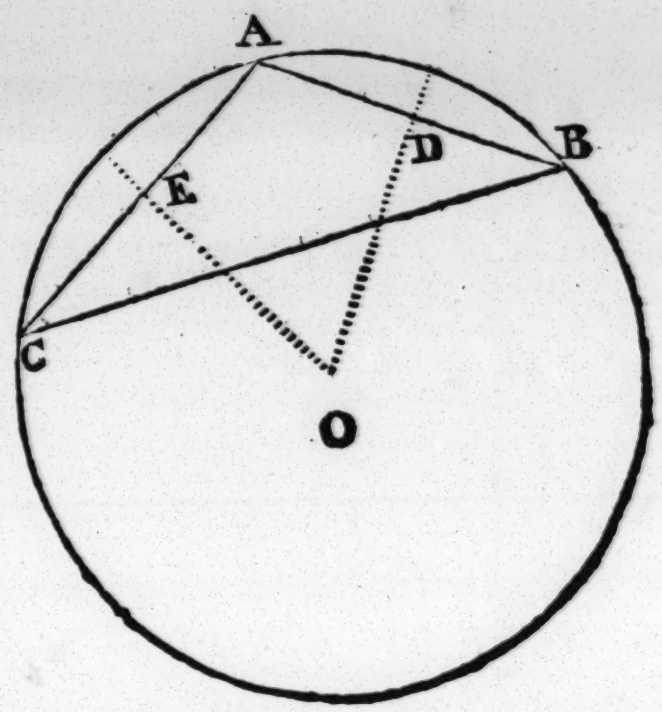


For the Triangle *a b c* is an *Iſoſceles*, (becauſe *a a* = *b a*) and therefore the Perpendicular *a d* biſſects the *Baſe* or *Chord b c* (10. *e.* 1. *Eucl.*) and conſequently the Ark *b c* is alſo by this Means biſſected. From whence are deducible and demonſtrable theſe

Problems.

1. To make a Circle paſs thro' any three Points given, nor lying in a Right Line.
2. To find the Center of any Circle.
3. To compleat a Circle from an Ark given.
4. To deſcribe a Circle about any Triangle given.

1. Let the three Points be *A B C*; join *A B* and *A C*, which biſſect in *D* and *E*, by drawing the Perpendiculars *D O* and *E O*: The Point *O*, where they croſs one another, muſt be the Center, becauſe they both paſs thro'-it by this Propoſition. With the Diſtance *A O* draw the Circle, and the Demonſtration will be plain.



2. If the Circle had been given, or any Part of it, as ſuppoſe the Ark *C A D*, and the Center of the Circle had been required: You need only mark out any three Points in the Circumference; as ſuppoſe *A*, *B*, *C*; then proceed as before, you'll find the Center *C.*

3. The ſame way alſo you may deſcribe a Circle about the Triangle *A B C*; for the Perpendiculars that biſſect any two Sides of the Triangle, will, where they croſs, find the Center *C*, from whence a Circle being drawn, it ſhall circumſcribe the Triangle *A B C.* The Demonſtration is the ſame with the former.

N. B. The Center of a Circle may very eaſily be found by the Square thus; Apply the Corner of the Square any where to the Circumference, as ſuppoſe at *A*; and draw *D R* between the Points where the Legs cut the

Circumference. The Line biſſected, ſhall give *C* the Center of the Circle; for the Angle *D A R* being a Right one, *D R* muſt be the Diameter, by 31. *e.* 3. *Eucl.* The half of which *D C* or *C R* muſt be the *Radius.*

CHORDA *Membranæ Tympani*, is a certain Nerve coming from the third Branch of the fifth Pair, extended above the Membrane of the *Tympanum* or Drum of the Ear, and which goes alſo to the Muſcles of the *Malleolus*, and then joins the *Portio Dura* before it comes out of the *Cranium*.

CHORDAPSUS, ſo *Celſus* names it, barbarouſly called *Miſerere me*, by others *Iliaca Paſſio*, by others *Volvulus*, commonly *Ileus*; is an Ejection of the Excrements at the Mouth only, becauſe the *Periſtaltick* or Vermicular Motion of the Guts, whereby the Excrements are excluded, becomes inverted. *Blanchard*.

CHOREA *Sancti Viti*, is a ſort of Madneſs, which formerly was very common amongſt ſome People, wherein the Perſon affected laid not down, but ran hither and thither dancing to the laſt Gaſp if they were not forcibly hindred. *Horſtius* ſays, That he hath ſpoke with ſome Women, who paying a Yearly Viſit to the Chapel of Saint *Vitus*, which is near the City *Ulme* in *Sweedland*, have been taken with ſuch a Violent fit of Dancing Night and Day, together with a ſort of Franticknes in the Mind, that they fall together like ſo many People in Extaſies; and are ſenſible of little or nothing for a Year together till next *May*, about which time they perceive themſelves ſo tormented with a Reſtleſſneſs in their Limbs, that they are forced to repair to the ſame place again about the Feaſt of Saint *Vitus* to Dance.

CHOREUS, vulgarly called *Trocheus*, is the Foot of a Latin Verſe, conſiſting of two Syllables, where the firſt is long, and the laſt ſhort, as *Annus*; ſo that this is the Reverſe of an *Iambus*.

CHORIAMBUS, is the Foot of a Latin Verſe compounded of a *Chorus* and an *Iambus*; it conſiſts of four Syllables, of which the firſt and laſt are long, and the middle ones ſhort; as *Hiſtoriæ*.

CHORION, is the outer Membrane involving the *Fœtus* in the Womb; 'tis pretty thick, ſmooth within, but rough without-ſide to which the *Placanta* adheres: It hath many Veſſels which ſpring from the *Placenta*, and from the Umbilical Veſſels. The former are diſperſed thro' it before the *Fœtus* is ſhaped (as *Diemerbroek* affirms) but the latter not till the Navel-Rope is grown out to a juſt length; at which time they enter in it, and are intermixt with the former, and from this Membrane are inſerted into the *Placenta* to which the *Chorion* adheres. This Membrane, the *Chorion*, is always ſingle, tho' the *Fœtus* be *Twins*, tho' then there is a double *Amnion*, treble, quadruple, *&c.* if the *Fœtus* are 3, 4, *&c.* Originally the *Chorion* did inveſt the *Ovum*, but when that is brought down into the Womb, and is become a Conception, this Membrane imbibes the Moiſture of that part very plentifully; for while the Conception lies looſe there, and is faſtned to no part by any Veſſels which go from it, or come to it, it ſeems to have its increaſe juſt as the Egg hath in the Body of the Hen; which whilſt it is in the *Racemus* or Knot, hath no other Subſtance but the Yelk; and when it drops off from thence, and deſcends thro' the *Infundibulum*, it receives no Alteration, but when it comes into the Cells of the Proceſs of the *Uterus*, it begins (ſaith *Harvey*) to gather a *White*, altho' it yet ſtick to no part of the *Uterus*, nor hath any Umbilical Veſſels: But juſt as the Eggs of Frogs and Fiſhes gather themſelves a *White* out of the Water, ſo doth there come out of the *Plicæ* or Wrinkles of the Womb an Albugineous Moiſture, whence the Yelk (by its vegetative and innate Heat) gathers and concocts its White. After this manner doth the *Chorion* imbibe that Albugineous Matter, which from the firſt Conception encreaſes daily in it (and which tranſudes thro' the *Amnion* in which the *Embryo* ſwims) till the Umbilical Veſſels and the *Placenta* are formed; from and thro' which the *Fœtus* may then receive its Nouriſhment. And the Liquor which this *Chorion* imbibes, Dr. *Gibſon* takes to be the Nutritious Juice which ouzes into the Cavity of the *Uterus* out of the Capillary Orifices of the Hypogaſtrick and Spermatick Arteries, and is of the ſame Nature with that which is afterwards ſeparated in the *Placenta*, and carried to the *Fœtus* by the Umbilical Vein, and with that alſo which abounds in the *Amnious*, even till the Birth: For the Plaſtick or Vegetative Vertue is only in the *Ovum* it ſelf, and the Augment that the firſt Lineaments of the *Fœtus* receives, is only by Appoſition of this Nutritious Juice. But the *Chorion* is grown ſo denſe and thick by that time the *Placenta* and Umbilical Veſſels are formed, that it is not capable of imbibing more, but that which in this time is in it, doth in a little while tranſude into the *Amnios*, and ſo it ſelf becomes empty, and gives way to the encreaſe of the *Allantoides* (which from hence begins to appear) and whoſe Liquor encreaſes daily as the *Fœtus* grows near to the Birth. This Opinion, which ſeems indeed very probable, the Learned Dr. *Gibſon* in his *Anatomy* (laſt Edition, *p.* 220.) propoſes only as a Conjecture, and ſubmits it to the Cenſure of the Learned.

CHOROGRAPHY, is a particular Deſcription of ſome Country, as of *England*, *France*, or any Shire or Province in them, *&c.*

CHOROIDES, is the folding of the *Carotidal Artery* in the Brain, wherein is the *Glandula Pinalis*: It is alſo the *Uvea Tunica*, which makes the Apple of the Eye.

CHROMATICK, a Term in Muſick, being the ſecond of the three kinds, which abounds in Semi-tones, and contains only the leaſt *Diatonical Degrees*. It is recorded in Hiſtory, that *Timotheus* the *Mileſian* firſt invented this ſort of Muſick, in the time of *Alexander the Great*, and the *Spartans* baniſhed him becauſe being accuſtomed only to the *Diatonick* kind, they judged the *Chromatick* to be too ſoft.

CHRONOLOGY, in the common Senſe of the Word now, is the Arithmetical computing of Time for Hiſtorical Uſes; ſo as thereby truly to date the Beginnings and Ends of Princes Reigns, the Revolutions of Empires and Kingdoms, Battles, Sieges, or any other Memorable Actions.

CHRONOMETRUM *Perpendiculum*, or *Chronoſcopium*, the ſame as *Pendulum*: Which ſee.

CHRONOSCOPE, the ſame with a *Pendulum* to meaſure Time: See *Pendulum*,

CHRYSOCERAUNIUS *Pulvis*, is the ſame with *Aurum Fulminans*: Which ſee.

CHRYSTAL *Mineral*: See *Sal Prunellæ*.

CHRYSTALS *of Copper*: See *Vitriol of Copper* or *Venus*.

CHRYSTALS *of Silver*, or *Vitriol of the Moon*, is an Operation in Chymiſtry, where by the Body of Silver is opened and reduced into the form of a Salt by Spirit of Nitre. 'Tis done thus; Diſſolve an Ounce or two of Silver in about three times the Weight of *Aqua Fortis*, or which is better, good Spirit of *Nitre*. Evaporate the Diſſolution in a Glaſs

Glaſs Cucurbite and over a Sand-heat till about ¾ of the Liquor is blown off, then let the Remainder ſtand without ſtirring it, and it will ſhoot into Chryſtals, which take out, and when they are dry, keep them in a Viol well ſtopt. Theſe *Chryſtals* are uſed to make an Eſchar, by touching any part with them. They are alſo given inwardly in Dropſies ſometimes, from two to ſix Grains, and they will purge gently. The Purgative Quality in theſe *Chryſtals* (there being no ſuch thing either in the Silver or the Spirit of Nitre) muſt ariſe from the new Texture and Conformation of the Parts of both, happening from this Union of the Parts of the Silver with thoſe of Spirit of Nitre.

Theſe *Chryſtals* may eaſily be *revived* into good Silver again, if you put them to diſſolve, as they will readily do in a Veſſel of hot Water, in the bottom of which you ſhall have laid a Plate of Copper; the Silver will precipitate down in a white Powder, which gather, waſh and dry, and then melt it in a Crucible with a little Salt Petre, 'twill run into good Silver of the ſame weight as at firſt.

CHRYSTALS *of Tarter*: See *Cream of Tarter*.

CHRYSTALLINE *Heavens*, in the *Ptolomaick Syſtem* were two. *One* ſerved them to explain the ſlow Motion of the fixed Stars, and cauſed them (as they thought) to move one Degree Eaſtward in about 70 Years.

The *Second* helped them out in ſolving a Motion, which they called *the Motion of Trepidation* or *Libration*; by which they imagined the Sphere to ſwag from Pole to Pole.

CHRYSTALLINE *Humour of the Eye*: See *Humours*.

CHRYSTALLIZATION, is and Operation in Chymiſtry, by which the Salts diſſolved in any Liquor are made to ſhoot into little prettily figured Lumps or Fragments, which they call *Chryſtals*, from their being pellucid or clear like Chryſtal. In order to bring the Salts duly to *Chryſtallize*, you muſt gently evaporate part of the Moiſture; for if there be too much Liquor in propotion to the Salt, it will not coagulate or chryſtallize at all; and if there be too little, the Salts will all run into one another, and not chryſtallize regularly. The general Rule to know when enough of the Moiſture is evaporated, is when a little Skin begins to be on the Surface of the Liquor.

CHYLE, is a white Juice in the Venticle and Inteſtines, proceeding from a light Diſſolution and Fermentation of the Victuals, eſpecially of their Sulphur and Salt with which Edible things abound, and which by the Invention of the *Acid* Humour in the *Ventricle* becomes white; for if you pour an *Acid* upon any Liquor that is impregnated with Sulphur and Volatile Salt, it preſently turns Milky, as is obvious in preparing Milk of Sulphur, or the Reſinous Extracts of Vegetables. Nay, *Spirit of Harts-horn* and of *Soot*, abounding with Volatile Salt, if it be mix'd with an Acid, or with but plain Water, grows to be of a Milky Colour: At laſt the *Chyle* after a Commixtion and Fermentation with the *Gall*, and the *Pancreatick Juice*, either Volatile or Acid, paſſing the *Lacteal Veins*, *&c.* is mixed with the Blood. It is called in Latin alſo *Chymus*. *Blanchard*. As to the manner how this *chyle* is firſt made and perfected, ſee

CHYLIFICATION, which is the Action of the Stomach, Guts, *&c.* in the making of *Chyle*, and 'tis done thus, as I find the Acurate Mr. *William Cowper*, Chyrurgeon, hath accounted for it in a Paper publiſhed in *Philoſ. Tranſactions*, N, 220.

The Aliment which is uſually taken down into the Stomach of Adult Perſons, is ſuch whoſe Groſsneſs of Parts requires *Maeſtication* or Chewing: In order to which, the *Dentes Inciſores* are ſometimes employed to divide it from the more Bulky Part, and to receive it into the Mouth; and then the lower Jaw being variouſly moved by its proper Muſcles Maſtication is begun, and carried on by the Aſſiſtance of the Tongue, Cheeks, and Lips, the two firſt ſtill applying the leſs divided Parts of the Aliment to the *Dentes Molares* till there is an equal Comminution of all its Parts; nor is the Action of Maſtication meerly performed for dividing the groſſer Parts of the Aliments, but divers of the Muſcles employed in the Motion of the lower Jaw, are at the ſame time alſo ſerviceable in haſtening the *Saliva* or Spittle, ſeparated from the Blood by the Parotid Glands, thoſe of the lower Jaw, and under the Tongue, into the Mouth; the Saliva Glands of the Cheeks and Lips alſo contributing their Juice, do altogether joyn with the Maſticated Aliments, before, or at the ſame time it's made fit to be ſwallowed; which Action is called *Deglutition*.

Deglutition is thus performed: The Aliment, as well what's fluid as that maſticated, being lodged on the Tongue, which does ſomewhat hollow it ſelf by means of its own proper Muſcular Fibres, for the more commodious entertaining the larger Quantity, its Tip and Sides are applied to the Indices of all the Teeth of the upper Jaw, (and *Gingivæ* or Gums of thoſe that want Teeth) the Tougue is ſuddenly drawn up by the *Muſculi Styloglooſſi* or *Myloglooſſus*, together with thoſe Muſcles which pull the *Os Hyoides* upwards; at the ſame time the *Fauces* are drawn up, and their Cavity enlarged by the *Muſculi Stylopharyngæi*; and about two thirds of the Tongue's ſuperiour Surface is adequately applied to the Roof of the Mouth; the *Epiglottis* from its Poſition being conſequently depreſſed, does thereby cover the *Glottis* or *Rimula* of the *Larynx*, and prevents any part of the Aliment from deſcending into the Wind-pipe: In this part of the Action of *Deglutition* the Glands under the Tongue, and excretory Ducts of thoſe of the lower Jaw are compreſs'd, and their ſeparated Liquors or Spittle voided by their *Papillæ*, ſituated at the lower part of the *Frænum* or Ligament of the Tongue; and this is done by the *Muſculus Mylo-Hyoidæus*; when the Aliment by the abovementioned Motion of the Tongue, is forced into the *Fauces* or upper part of the *Gula*; at the ſame time the *Gargareon*, together with the *Uvula* are drawn upwards by the *Muſculi Sphænoſtaphili*, by which means any part of the Aliment is hindred from aſcending into the *Foramina Narium*: The *Fauces* by the *Muſculus Perygopharyngæus* and *Oeſophagus* are contracted, whereby the Aliment is not only compreſs'd into the *Gula*, but the Matter ſeparated from the Blood by the Glands of the *Fauces*, eſpecially of thoſe large ones called *Tonſillæ*, is forced out of their Cells or Excretory Ducts, to join with it in its deſcent to the Stomach by *Gula*, through which the latter paſſes by the Action of its *Muſcular Fibres*.

The Aliment thus impregnated with *Saliva* in Maſtication and Deglutition being received into the Stomach, there meets with a Juice ſeparated from the Blood by the Glands of that Part whoſe Excretory Ducts open into the Cavity of the Stomach: By the commixture of theſe Liquors, whether of *Saliva* or the Juice of the Stomach a pro-

per

per *Menſtruum* is compoſed, by which the Parts of the Aliment are ſtill-more and more divided by its inſinuating into their Pores, and by which the Air before impriſoned in their leſs-divided Parts, is not only ſet more at liberty, but by the natural Heat, it muſt neceſſarily ſuffer ſuch a Rarefaction, as that thereby the whole Stomach becomes ſtill more and more diſtended; hence it is we have leſs Appetite ſometime after eating (when this Intumeſcency is made) than we had immmediately after; hence alſo ariſe thoſe frequent *Eructations* from divers Aliments, as old Peaſe, Cabbage, and divers other Vegetables we frequently eat; all which become very much deſturbing in depraved Appetites and weak Stomachs. Though we have not uſed the Word *Fermentation*, yet we do not ſuppoſe the Diſſolution of the Aliment within the Stomach can be done at leaſt without an Inteſtine Motion of its Particles with the *Menſtruum*; but we have omitted that Term, becauſe it may be apt to lead us into an Idea of a greater Conflict than in truth there really is.

At the ſame time this Intumeſcence an Agitation of the Matter is made in the Stomach, the Contents of the neighbouring excretory *Ductus*'s namely, the Bile in the Gall-Bladder and Liver-Ducts, and Pancreatick Juice in the *Ductus Pancreaticus*, are compreſs'd into the *Inteſtinum Duodenum*, through the Extenſion of the Stomach it ſelf; the refluent Blood of the Stomach at that inſtant being in ſome meaſure retarded, whereby the *Muſcular Fibres* are more liable to be contracted.

Nor can we conceive how the Liquor of the Stomach, after having joyned with the *Saliva* and Aliment, ſhould be ſtill ſo plentifully excreted from the Glands of that Part, as to irritate its Internal Membrane, and excite its *Muſcular Fibres* to contract, ſince the Muſcles of the *Abdomen* would, like as in Vomiting, be drawn into a Conſent of Co-operating, and the Aliment would be forcibly rejected by the Mouth: Beſides, ſhould the Liquor of the Stomach be ſo diſturbed in *Chyliſication*, what would it be ſo ſoon as all its Contents were diſcharged? The Irritation the Stomach undergoes in Hunger, we are firmly perſwaded does not ariſe but through an Accumulation of the *Saliva* in the Stomach, in conjunction with the Liquor of the Glands of that Part; whence it is we rather diſcharge the Spittle at that time by the Mouth, than to ſuffer any more of it to deſcend into the Ventricle: Hence proceeds what we call *the watering of the Mouth*; hence alſo, when the *Saliva* is vitiated, the Appetite is depraved.

The Stomach, by means of its *Muſcular Fibres* contracting it ſelf, does gradually diſcharge its Contents by the *Pylorus* into the *Duodenum*, in which Gut, after a ſmall *Semicircular* Deſcent, it meets with the Pancreatick Juice and Bile; both which joyning with it, renders ſome Part of the Aliment more fluid, by ſtill diſuniting the groſſer Parts from the more pure; and here *Chyliſication* is made perfect.

The Bile which abounds with Lixivial Salts, and apt to intangle with the groſſer Parts of the Concocted Aliment, ſtimulates the Guts, and deterges or cleanſes their Cavities of the *Mucous Matter*, ſeparated from the Blood by the Glands of the Guts, and lodged in their Cavities; which not only moiſtens the Inſides of the Guts, but defends the Mouths of the Lacteal Veſſels from being injured by *Alien Bodies* which often paſs that way.

The Contents of the Inteſtines moving ſtill on by means of the *Periſtaltick* or Worm-like Motion of the Guts, whilſt thoſe thinner Parts fitted for the Pores of the Lacteal Veſſel called *Chyle*, is abſorbed by them, the thicker move ſtill more ſlowly on, and by the many Stops they continually meet with by the *Connivent Valves*, all the *Chyle* or thin Parts are at length intirely abſorbed, the Remains being meerly Excrementitious, are only fit to be excluded by Stool.

The Analogous White Appearance of the *Chyle*, whether in the Stomach or Inteſtines, and always in the *Venæ Lacteæ* and *Thoracick Duct*, may be ſeen in the Commixtures of divers Liquids, which ſeparated exhibit no ſuch Appearance; nor is this *Phænomenon* any otherwiſe than a Tranſpoſition of Particles, whether by a *Menſtruum* inſinuating into them, dividing them into groſs Globules, as an Acid into Sulphur, as Vinegar with Oil, *&c.* or elſe by Precipitation, as when a Gummous or Refinous Body is diſſolved in a Spirituous *Menſtruum*, and mixed with a Phelgm; ſo Tincture of Myrrh and Benjamin, *&c.* make a milky Appearance in common Water,

The Longitudinal and Tranſverſe Order of the Fibres of the Guts, are the Inſtruments by which the Periſtaltick Motion of them is performed, which Motion is not only neceſſary for puniſhing their Contents forwards, but by reciprocal Contraction of the Muſcular Fibres of the Guts, and Appoſition of their *Connivent Valves*, the Mouths of the Lacteals are diſpoſed to recieve what is fitted for them; hence it is we can by no Means make any Fluid whatever paſs from the Cavity or the Guts into thoſe Lacteal Veſſels in a dead Animal.

A further uſe of this Contraction of the *Muſcular Fibres* of the Inteſtines, is to accelerate the *Chyle* in its Progreſs in the Lacteals, till the *Lympha* derived from the Extremities of the Arteries of the Guts joins with it; which Conjunction is made in the *Lacteals* before they leave the External Surface of the Inteſtines. By this Means the Progreſſion of the *Chyle* is made towards the Meſenterick Glands, into whoſe Cells it is received, where it again mixes with a Juice brought in by the Arteries of each Gland; which Juice or Lymphatick Liquor not only farther dilutes the *Chyle*, like that from the Arteries of the Inteſtines, but adds a freſh *Impetus*, by which its Motion is farther carried on through the *Vaſa Lactea ſecundi generis*; (ariſing out of each Meſenterick Gland, and diſcharging their Contents into the *Receptaculum Chyli.*) Here the *Chyle* meets and joins with the *Lympha* ſent through the *Lymphatick Ducts* from the inferiour Limbs and neighbouring Parts, whereby the *Chyle* is not only farther prepared, but its Aſcenſion is promoted in the Thoracick Ducts, whoſe ſeveral Diviſions and Inoſculations (like the Veins of the Teſticles) with its many Valves looking from below upwards, and advantagious Scituation between the great Artery and *Vertebræ* of the Back together with the Lympheducts, diſcharging their *Lympha* derived from the Lungs and neighbouring Parts of the Thorax, does demonſtrate the utmoſt Art ſtill uſed in order to its Aſcenſion towards the left Subclavian Vein, where meeting with the refluent Blood of the Superiour Parts, its paſſes with it through the deſcending

descending Trunk of the *Vena Cava*, and joins with the refluent Blood of the inferiour Parts in the Right Auricle of the Heart; whence its expelled by its Contraction into the Right Ventricle, when the Heart is in *Diastole*; but by the *Systole* or Contraction of the Heart, it's again driven out thence into the *Arteria Pulmonaris*, thro' whose Extremities, in conjunction with those of the *Vena Pulmonalis*, it passes to the Left Auricle and Ventricle of the Heart, from whence it's again expelled in the *Systole* (as above) into the *Aorta* or *Arteria Magna*, by whose Branches it's conveyed thro' the whole Field of the Body: The three tricuspid Valves in the Right, and two Mitral Valves in the left Ventricle of the Heart opposing its rrturn into the Veins, and the Semilunary Valves of the *Arteria Pulmonaris* and *Aorta* preventing its Ingress into the Ventricles, are sufficient (when rightly considered) to demonstrate the necessity of a Circulation of this grand Fluid called *Blood*. Thus *Sanguification* is begun, and as we have mentioned the divers Preparations of the Aliment before Chylification, so here may be observed the various Mixtures and Preparations of *Chyle* in order to Sanguination.

CHYLI *Receptaculum*: See *Receptaculum Chyli*.

CHYLIOSIS, the same with *Chylificatio*.

CHYMIA, or *Chemis*, is a Resolution of mix'd Bodies in their Elements; and again, when it can be done, *Co-agulation* or Redintegration of the same Elements into the Bodies which they constituted before: There are two Parts of it, *Solution* and *Co-agulation*; by the Addition of the *Arabick* Article it is called, *Alchymia*, or *Alkymia*; it is called also *Spagyria*, *Hermetica ars*, *ars perfecti Magisterii*, *ars Segregatoria*, *Separatoria* and *Destillatoria*. *Blanchard*.

CHYMICA, or *Chymicalia*, are Medicines which the *Chymists* prepare, that they may be taken in a less or more grateful Quantity. *Blanchard*..

CHYMISTRY, is variously defined, but the Design of the Art is to separate usefully the purer Parts of any mix'd Body, from the more Gross and Impure. It seems probably to be derived from the Greek Word, χυμὸς, which signifies a Juice, or the purer Substance of a mix'd Body; though some will have it to come from χέειν, *to melt*. It is also called *the Spagyrick*, *Hermetick*, and *Pyrotechnick Art*, as also by some *Alchymy*. The Reasons whereof you may see under those Words.

CHYMOSIS, or *Chemosis*, is a Distortion of the Eye-lids, arising from an Inflammation; also an Inflammation of the *Cornea Tunica* in the Eye. *Blanchard*.

CHYMUS, the same with *Chylus*.

CHYRONIA, is a great Ulcer, and of different Cure.

CHYRURGERY, or, as 'tis now a-days pronounced and written *Surgery*, is the Third Branch of the Curative Part of Medicine, and teacheth how sundry Diseases of the Body of Man may be cured by *Manual Operation*. Some divide it into these five Parts. 1. *Synthesis*, a setting together of things separate. 2. *Diæresis*, a separating of things that were continued before. 3. *Diorthosis*, a correcting of things squeezed together, and contorted. 4. *Exeresis*, a taking away of Superfluities. 5. *Anaplerosis*, a restoring of that which was deficient.

CICATRISANTIA, are such things as by drying, binding and contracting, fill up *Ulcers* with Flesh, and cover them with a Skin. *Blanchard*.

CICATRICULA, is that little whitish Speck in the Coat of the Yelk of an Egg, in which the first Changes towards the Formation of the Chick appear in an impregnated Egg: 'Tis commonly called the *Treddle*. The Chick lodged in the *Cicatricula* is nourished only by the White of the Egg, till 'tis grown of a competent Largeness; the Yelk seeming to be reserved by Providence for a more strong and solid sort of Aliment, which is fitter for the Animal when grown greater.

CICATRIX, *Cicatrices*, Scars or Marks which are left after great Wounds or Ulcers: Some are Simple, others are accompanied with *Cavities*, Diminution or Excrescence in the Parts affected.

CICATRINING *Medicines*: See *Cicatrisantia*.

CILIA and *Supercilia*, are the Eye-brows, hard Cartilaginous Bodies; but *Supercilia* properly the Hair upon the Eye-brows, at the Extremity of the Forehead.

CILIARE *Ligamentum*, or *Processus Ciliaris*, is a Collection of small slender Filaments which take their Rise from the inner Part of the *Tunica Uvea* in the Eye, and thence run towards the Prominent Part of the Chrystalline Humour, which they compass in and connect to the *Uvea*: Its use is to help, contract, or dilate the Figure of the Chrystalline Humour, and to draw it farther from, or bring it nearer to the *Uvea*, according as occasion serves.

CINCTURE, in Architecture, is that part which makes the middle of a Pillar; 'tis *Conge* in *French*; the Greeks called it ἀποφύγη, because that Part of the Pillar taking as it were, a Rise, seems to fly from the Basis: It is no more than the Rings of Ferrils formerly used to preserve Wooden Pillars from splitting, and which they afterwards imitated in Stone Work.

CINEFACTION, with some Chymists is used for *Calcination*.

CINERITIA, or *Substantia Corticalis*, is the External Substance of the *Cerebrum*; it is Soft, Glandulous, and of an Ashy Colour. *Blanchard*. See *Cortical*.

CINNABAR, is a Mixture of Sulphur and Quick-silver sublimed together; and is either *Natural*, when this Mixture is made in the Earth by Means of the Subterraneal Heat, and then 'tis called *Native Cinnabar*: Or else, 'tis *Artificial*, which is thus made, The Sulphur is melted in a great Earthen Pan, and then is put into it by Degrees, thrice its Weight of Mercury, and the Mixture is stirred about till all the Quick-silver disappears. After this the Mixture is cooled and powdered, and then *sublimed* in Pots with an open Fire, a hard red Mass will be raised, shaped like Needles. 'Tis brownish when in the Lump, but being powdered finely, is of a very high red, and is called *Vermillion*. The chief Design of this Operation is to make the Mercury Portable; which 'tis not safely, when in its natural Form, because of its great Weight and Fluidity.

Cinnabar is revived into Mercury, by mixing with it in Powder, three times as much Quicklime, and distilling in a Glass Retort, into a Receiver filled with Water, by Degrees of Fire; the Quick-silver will be found at the Bottom of the Receiver. You may receive Quik-silver also by mixing an equal

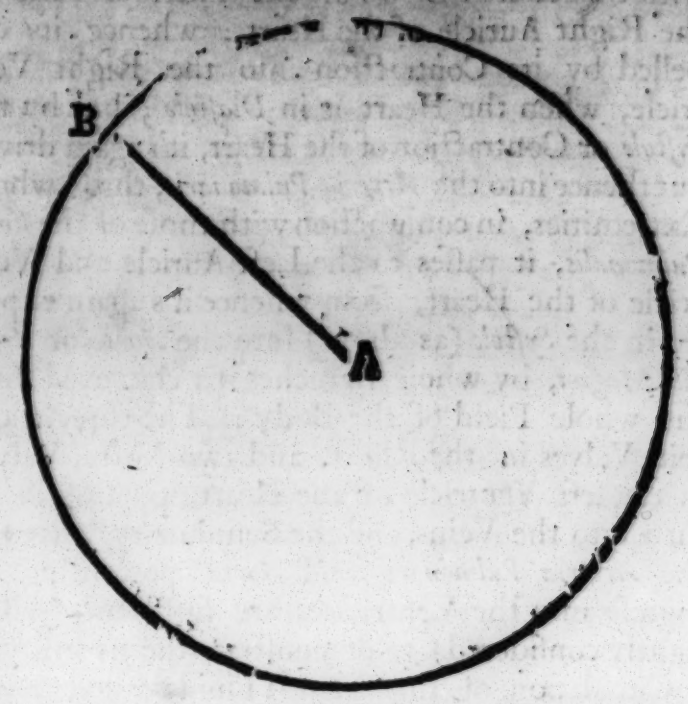
qual Quantity of Filings of Iron with the *Cinnabar*, and diſtilling as before.

CINNABAR *of Antimony*, is thus made: Fill a Retort half full of equal Parts of Powder of Antimony and Sublimate Corroſive; and ſetting the Veſſel in Sand, proceed at firſt as in the making of *Butter of Antimony*, which will alſo this way be made: But when, the Fire being encreaſed, you find red Vapours begin to ariſe, fit on another Receiver, but without luting the Junctures, and raiſe the Fire by degrees till the Retort be red hot, in which State it muſt be kept three or four Hours. Then the Veſſels being left to cool, break the Retort, and you will find, if the Operation ſucceed (which now and then it will not) the *Cinnabar* ſublimed and adhering to the Neck of the Retort. 'Tis accounted a good Medicine for Epileptick and Cephalick Diſtempers.

CION, *Columella, Gargareen, Gurgulio, Uva, Uvula, Uvigena, Uvigera, Epiglottis, Sublinguium*, is the Cover of the Wind-pipe; it hangs betwixt the two *Glandules*, called *Amygdalæ*, above the Chink of the *Larynx*, and is a Proceſs from a Subſtance, as one would think, Glandulous, Spungy, and red; which *Columbus* is of Opinion, ariſes from the *Tunick* of the Mouth, redoubled in that Place. But *Riolan* ſays, it proceeds from ſome *Muſcles* which are terminated there. It is of a Figure roundly oblong, in the upper Part thicker, and ending acutely. Its uſe is to attemperate the Coldneſs of the Air, and hinder the Drink from falling upon the Noſtrils: Sometimes this *Uvula* ſticks out too far, from the Humours that fall upon it, which cannot return by the *Lymphatick Veſſels*, whence proceeds the falling of the *Uvula*, which we call *Roof of the Mouth*. *Blanchard*.

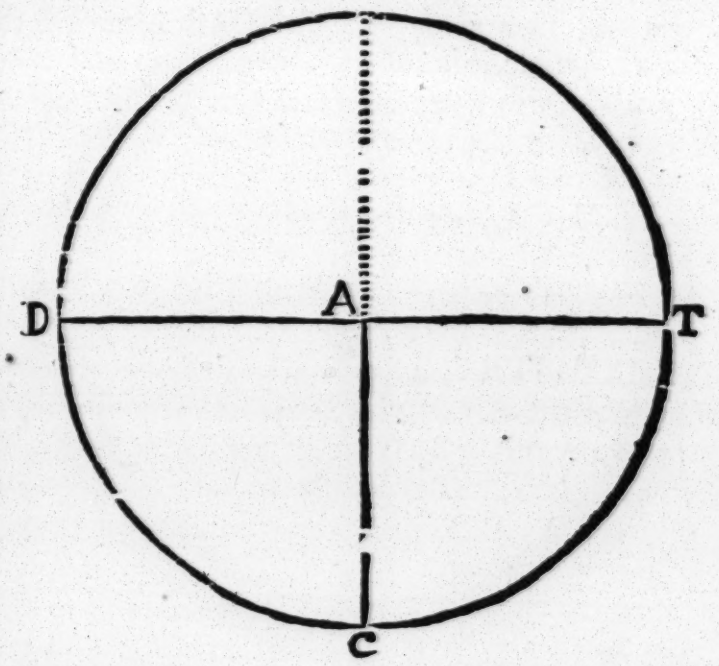
The *Uvula* is moved by two Pair of Muſcles, the *Pterigoſtaphilinus Externus*, and *Internus*; (which ſee) and the former of theſe draws the *Uvula* backwards, and the latter plucks it forwards, becauſe of the Pulley through which its Tendon paſſes, and which alters the Direction of its Motion; both which Motions are neceſſary for Deglutition, for the Articulation of the Voice, as well as to hinder any Drink, *&c.* from going into the Noſtrils.

CIRCLE, is a Plane Figure bounded with one only Line, and to which all the Right Lines that can be drawn from a Point in the Middle of it are equal to one another. And it may very well be ſuppoſed to be made thus; If you imagine the Line *A B* faſtned at one End to the Point at *A*, but yet ſo as to be moveable on *A* as a Center, till the End *B* arrive at the Place where it began; the Line *A B* in its Motion deſcribes a Figure, called a *Circle*, and the Point *B*, at the ſame time, deſcribes a *Curve Line*, called the *Circumference of a Circle*.



From which *Geneſis* 'tis plain, That all Right Lines drawn from the Point *A* (which is called the *Center*) to the *Circumference*, muſt be of equal length, or be equal to one another. And theſe Lines are called *Radius*, and by ſome *Semi-Diameter*.

The Line *D T* paſſing through the *Center*, and terminated at each End by the *Circumference*, is called the *Diameter*, and its half the *Semi-Diameter* or *Radius*.



Theſe *Diameters* are all equal to one another, and do divide the *Circle* into two equal Parts which are called *Semicircles*.

Any Part of the *Circumference* of a *Circle* is called an *Ark*, which Ark is the *Meaſure of any Angle*, whoſe Vertex or Angular Point is at the Centre of that *Circle*.

Every *Circle* is ſuppoſed to be divided into 360 equal Parts, which Parts are called *Degrees*; of theſe a *Semicircle* contains 180, and a *Quarter of a Circle* 90, which is called a *Quadrant*, as *C T*.

To find the Superficial Content of any *Circle*, ſee *Area* and *Polygon*; where the Ground of the Practice is demonſtrated. And ſince 'tis there proved from *Archimedes*, that a *Circle* is equal to a *Rectangle Triangle*, one of whoſe Sides is the *Radius*, and the other the *Periphery* (or a Line equal to it.) Let the *Radius* be called $\frac{1}{2}d$ (ſuppoſing d to be the *Diameter*) and whatever the unknown *Ratio* of the *Periphery* be to the *Diameter*, let it be expreſſed by r: Then will the *Periphery* be $r\,d$; and conſe-

conſequently the Perpendicular $r\,d$ being multiplied by half a *Radius*, that is, by $\frac{1}{4}\,d$, the Product will be $\frac{1}{4}\,r\,d$ = *Area* of the *Circle* (becauſe of the Triangle.)

From which way of Notation may it bepreſently proved, *That Circles are to one another as the Squares of their Diameters.*

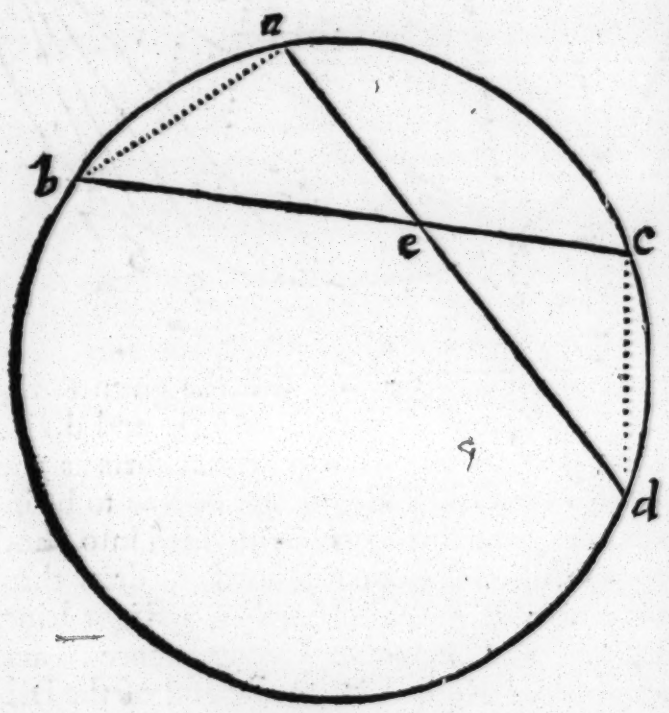
For let the Diameter of one *Circle* be d, and of the other D; then their *Areas* will be $\frac{1}{4}\,r\,d\,d$ and $\frac{1}{4}\,r\,D\,D$, where $\frac{1}{4}\,r$ being a common Efficient or Multiplicator, alters not the *Ratio*; for no doubt $\frac{1}{4}\,r\,d\,d : \frac{1}{4}\,r\,D\,D :: d\,d : D\,D$. *Q. E. D.*

Propoſition I.

The Parts of any two Chords cutting each other in a *Circle*, are Reciprocally Proportional.

That is, $a\,e : e\,b :: e\,c : e\,d$.

Draw $b\,a$ and $c\,d$.



Demonſtration.

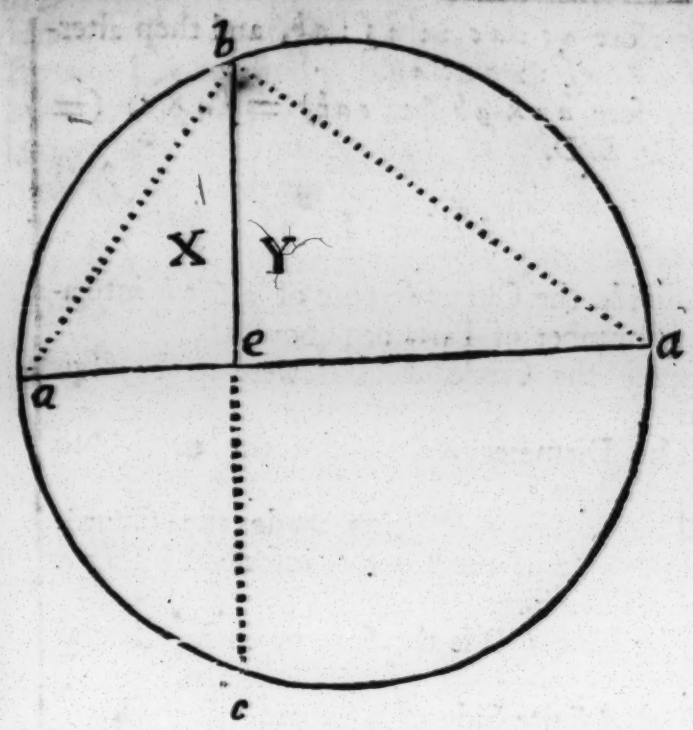
1. The Triangles $a\,e\,b$ and $c\,e\,d$ are ſimilar, becauſe the Angles at e are equal, and $a = c$, becauſe in the ſame Segment; therefore the Sides about the equal Angles are Proportional, that is, $a\,e : a\,b :: e\,c : e\,d$. *Q. E. D.*

Coroll. 1. Hence, if two Chords cut each other, the Product made by the Multiplication of the Parts of one Chord, is always equal to the Product of the Parts of the other:

That is, the □ of the Extreams $a\,e\,d$ = □ of the mean Terms $b\,e\,c$.

Coroll. 2. If one Chord $(a\,d)$ be a Diameter, and the other $(b\,c)$ cut it Perpendicularly; then is $b\,e$, or its equal $e\,c$, a mean Proportional between the Parts of the Diameter $a\,e$ and $e\,d$.

For if you imagine the Lines $a\,b$ and $b\,d$ to be drawn, the Triamgles x and y will be ſimilar, and therefore $a\,e : e\,b :: e\,b : e\,d$. And then the □ $a\,e\,d$ = □ $e\,b$.



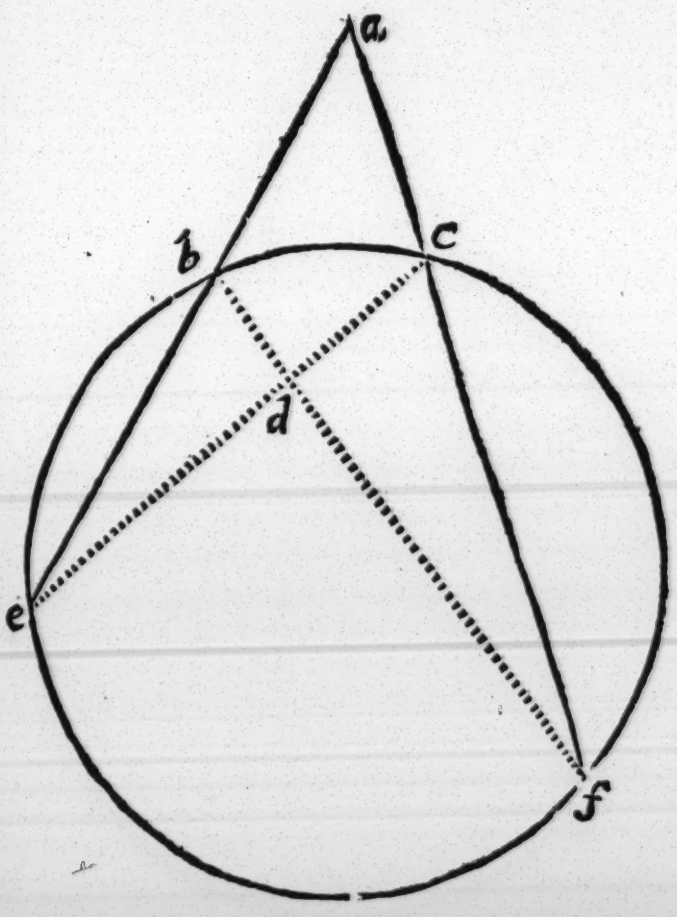
And this may be called *the General Property of the Circle ariſing from the Nature of the Curve.*

And if you call the Diameter of the Circle $2\,r$ (becauſe the *Radius* is $= r$) and conſider it as the Axis of a Conick Section; the Part $a\,e$ in the Figure, will be the *Abſciſſa* or intercepted Ax prope to the Ordinate $b\,e$, wherefore calling, as is uſual, the *Abſciſſa* x, and the Ordinate y, this general Property of the *Circle* will be thus expreſſed $2\,y\,x - x\,x = y\,y$; for $a\,e$ being x, $a\,d$ muſt be $2\,r - x$; and that multiplied by x, gives $2\,r\,x - x\,x$ which muſt be equal to □ $b\,a = y\,y$.

Propoſition II.

If two Lines (as $a\,f$ and $a\,e$) from a Point (a) without a *Circle*, be draw to its *Circumference* within (as to e and f) the Rectangles made by thoſe Lines and their External Parts ſhall be equal.

That is, □ $e\,a\,b$ = □ $f\,a\,c$. Or thoſe Lines are to each other reciprocal in a Proportion of their External Parts, *i. e.* $a\,e : a\,f :: a\,c : a\,b$.



Draw $b\,f$ and $e\,c$: Then are the Triangles $e\,a\,c$ and $a\,b\,f$ equiangular, for the ∟ f = ∟ e being in the ſame Segment, and a is common.

Therefore $ae : ac :: af : ab$, and then alternately $ae : af :: ac : ab$.

Therefore $ae \times ab\ (= eab) = fa \times ac\ (= fac.)$ *Q. E. D.*

Problem I.

To divide the Circumference of a *Circle* into any number of Parts not above 10.

Suppoſe the Circle *ABCD* were to be divided.

1. The Diameter *AC* divides the *Circle* into two equal Parts.

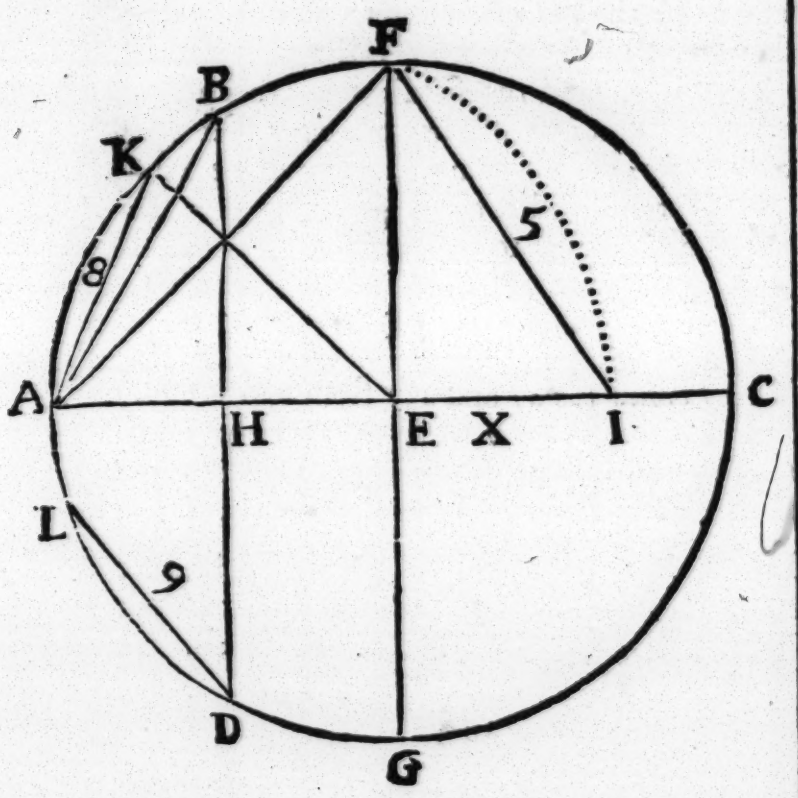
2. The *Radius AE* being made the Chord, *AB* is the Side of the *Hexagon* inſcribed by 15 *e.* 4. *Eucl.* Therefore.

3. The Line *BD* is the Side or an Equilateral Triangle.

4. And *AF* the Side of a Square inſcribed.

5. With the Diſtance *HF* deſcribe the Ark *FI*; the Right Line *FI* is the Side of a *Pantagon* inſcribed. 10 *e.* 13. *Eucl.*

6. The Line $BH = DH$ is the Side of the *Heptagon.*



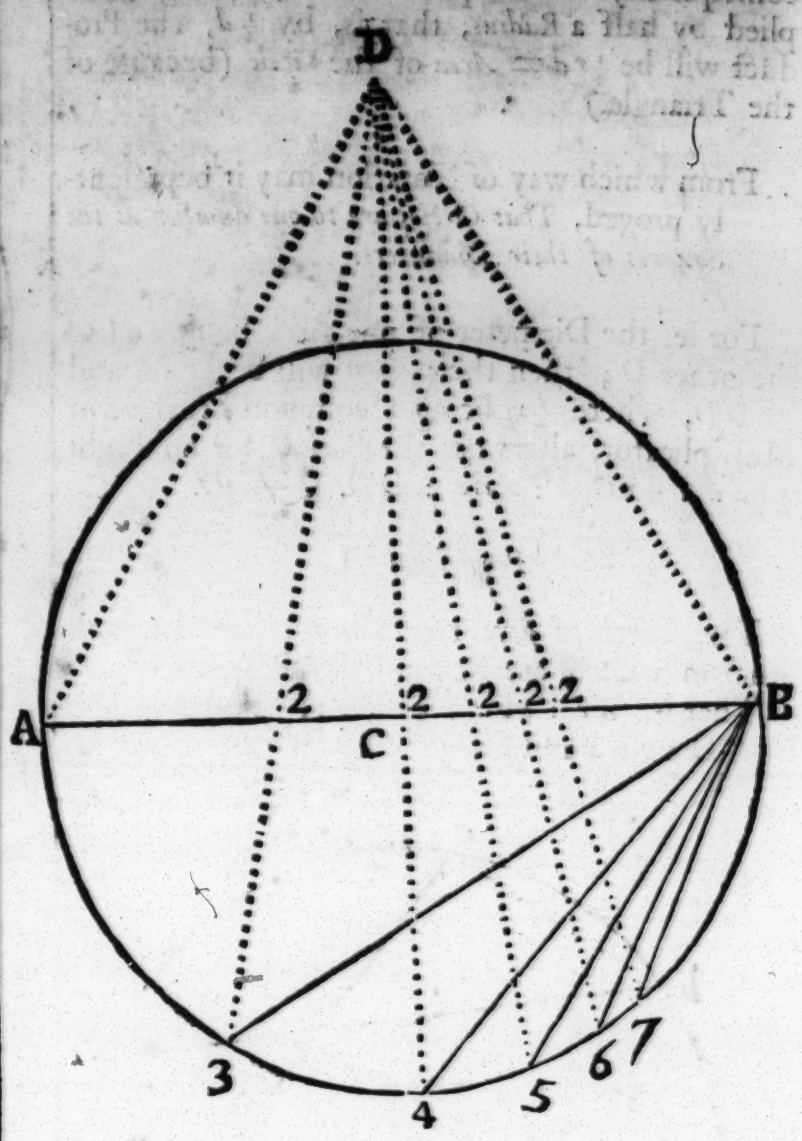
7. The Line *AK* (which is the Chord of half the Ark *AF*) is the Side of an *Octagon* inſcribed.

8. The Line *DL* (which is $\frac{1}{3}$ of the Arch *BAD*) is the Side of a *Nonagon*.

9. The Line *EI* is the Side of a *Decagon.*

Problem II.

To divide the Circumference of a *Circle* into any number of equal Parts.



Upon the Diameter *AB* (of the given *Circle*) make an Equilateral Triangle *ABD*, and divide the Diameter *AB* into as many equal Parts as you deſign there ſhall be Sides of the *Polygon* to be inſcribed, or as the *Circle* is to be divided into; and omitting two, *e. g.* from *B* toward *A*, draw thro' the beginning of the third from *D*, a Right Line, to the oppoſite Concave Circumference, and thence another Right-Line to the end of the Diameter *B*.

Thus, *e. g.* to Divide the Circumference into three equal Parts, Divide the Diameter *AB* into three equal Parts; and then omitting two of them through the beginning of the third, or thro' *B* 2 draw the Right Line *D* 3; and from 3 the Line 3 *B*, which laſt will be the Side of the Triangle to be inſcribed; ſo 4 *B* will be the Side of a Square, *B* 5 the Side of a *Pantagon*, *B* 7 of an *Heptagon*, &c.

The Plane of any Circle may be conſidered as made up of an infinite number of Concentrical Peripheries, encreaſing from the Center in Arithmetical Proportion; wherefore a Rank of ſuch Peripheries will be to a like Number equal to the greateſt, as 1 to 2. Wherefore the *Area* of a *Circle* is to the *Surface* of a Cylinder, whoſe Height is equal to the *Radius*, and its *Baſe* that *Circle*, as 1 to 2. And conſequently, if the Height of the Cylinder had been equal to the Diameter of the *Circle* (which is the caſe of the Cylinder circumſcribing a Sphere) the Curve Surface of the Cylinder would be equal to 4 times the Baſe of it (*i. e.*) the Surface of a Sphere is quadruple to the *Area* of one of its great Circle: for the Surface of the Sphere is equal to the Gurved Surface of ſuch a Cylinder; as is proved elſewhere. See *Cylinder.*

The Proportion of the Periphery of a *Circle* to its Diameter is leſs than $3\frac{10}{70}$, and greater than $3\frac{10}{71}$ to 1.

The *Area* of any *Circle* to the Square of its Dia-

Diameter :: is as $\frac{1}{4}$ of the Periphery to the ſaid Diameter, as is proved under *Cylinder*.

The *Area* of any *Circle* is incommenſurable to the Square of the Diameter; and ſo is alſo the Periphery to the Diameter: See *Sturmius*'s *Mathef. Enucleat. Prop.* 43.

CIRCLE *Equant*, in the *Ptolemaick* Aſtronomy, is a Circle deſcrib'd on the Center of the *Equant*; its chief uſe is to find the Variation of the firſt Inequality.

CIRCLE *of perpetual Apparition*, is one of the leſſer *Circles* parallel to the *Equator*, being deſcribed by any Point of the Celeſtial Sphere which toucheth the Northern Point of the *Horizon*, and carried about with the Diurnal Motion. All the Stars that are included within this *Circle* never ſet, but are always viſible above the *Horizon*: And the

CIRCLE *of perpetual Occultation*, is another *Circle* at a like diſtance from the *Equator*, and contains all thoſe Stars which never appear in our Hemiſphere. But the Stars ſituated between theſe *Circles* inceſſantly riſe and ſet at certain times.

CIRCLES *of Altitude*: See *Almicanters*.

CIRCLE *of Declination on the Globe*; So ſome Writers call the Meridians on which the *Declination* or Diſtance from the *Equator* of any Planet or Star is accounted.

CIRCLES *of Longitude*, on the Globe, are great *Circles* paſſing thro' the Star and the Pole of the Ecliptick, where they determine the Star's Longitude, reckon'd from the beginning of *Aries*. On theſe Circles are accounted the Latitudes of the Stars.

CIRCLES *of Poſition*, are *Circles* paſſing by the common Interſections of the *Horizon* and *Meridian*, and thro' any Degree of the Ecliptick, or the Center of any Star, or other Point in the *Heavens*; and are uſed for the finding out the Situation or Poſition of any Star, *&c.*

CIRCUITY *of Action* (in Law) ſignifies a longer courſe of proceeding than is needful, to recover the thing ſued for.

CIRCULAR *Numbers*, or *Spherical ones*, according to ſome, are ſuch whoſe Powers terminate in the Root themſelves.

As for Inſtance, 5 and 6, all whoſe Powers do end in 5 and 6, as the Square of 5 is 25, the Square of 6 is 36, *&c.*

CIRCULATE, *Circulation*, in Chymiſtry, ſignifies the giving a Motion to Liquors contained in a *double Veſſel* (that is, when the Necks of two Veſſels are excellently well luted one into another) excited by Fire and cauſing the Vapours to aſcend and deſcend to and fro; which Operation is intended either to *ſubtilize* the Liquors, or elſe to open ſome hard Body that is mingled with them. The circulating Veſſel is ſometimes called a *Pelicane*, or a blind *Alembick*.

CIRCULATION *of the Blood*, is that Motion of it which is produced by the continual Reciprocation of the Pulſe; whereby there is a conſtant Expulſion of the Blood from the Heart into the Arteries, and as conſtant and continual an Influx of Blood into it out of the *Cava*; and ſeeing the *Vena Cava*, from whence the Supply comes, is never drawn dry; nor on the other Hand, the Arteries which receive the Blood from the Heart continually, are unduly ſwell'd with it; it muſt neceſſarily follow (as our great *Harvey* firſt plainly proved) that this Motion proceeds circularly, and that the Blood is continually driven out of the Heart into the Arteries, and out of theſe into the Parts to be nouriſh'd; from whence it is reſorbed by the Capillary Veins, which carry it into the larger, and theſe into the *Cava*, from whence it returns to the Heart again. The Reaſons enforcing the Neceſſity of a *Circulation* of the Blood are theſe.

1. The great Quantity of Blood that is driven out of the Heart into the Arteries at every Pulſe. For tho' the Ancients who knew not this *Circulation*, imagin'd, that only a drop or two was expell'd by every *Syſtole*, which they were neceſſitated to ſuppoſe, to avoid the great Diſtention that the Arteries muſt be liable to, if any conſiderable Quantity iſſued into them; yet it is certain and demonſtrable, that there muſt needs an Ounce, or more, be driven into them each time: For (taking it for granted, that there is no other way for any Liquor to paſs from the Stomach to the Kidneys but thro' the Heart, along with the Blood) ſeeing if ſome Men at ſome times drink three Pints of Drink, they ſhall piſs it out again in half an Hour, yea more of *Tunbridge* Water in that ſpace: And ſeeing, *Secondly*, that there is commonly as much Blood as *Serum*, that flows to the Kidneys (the Blood returning back by the Emulgent Veins) it is clear, that by the two Emulgents (which are none of the largeſt Arteries) there muſt paſs in half an Hour 6 Pounds of Liquor, all which muſt come from the Heart; and how much more then may we conceive to be driven thro' all the other Arteries that run thro' the whole Body? This is moſt accurately evinced by Dr. *Lower*'s Experiment, which is this; "I cut aſunder *(ſays he)* "both the *Cervical Arteries* in a large Dog, and at "the ſame time thro' an Hole made in the left "ſide of his Breaſt over-againſt the Heart, I com-"preſs'd the Trunk of the *Aorta* below the Heart "with my Finger, to hinder any Blood from de-"ſcending by it; and, laſtly, I took care alſo to "ſtraiten the *Brachial Arteries* under the *Axillæ*, by "which means almoſt all the Blood was driven "out of the Heart thro' the *Cervicals* (beſides that "which was ſent into the *Vertebrals)* and which is "wonderful to be related, within the twentieth "part of an Hour the whole Maſs iſſued out; ſo "that it is not to be denied, but that all paſſes "thro' the Heart in that ſpace. And tho' it may be granted, that amidſt ſuch Wounds and Tortures the Heart does beat ſomewhat quicker than at other times; yea the ſame thing is partly evident from Wounds in the Limbs when ſome notable Artery is cut aſunder; for 'tis ſtrange in how ſmall a time a Man will bleed to Death even at that one great Artery: Yet we may give a gueſs how much Blood is ſent out of every Pulſe, even from ordinary opening of one Vein in the Arm, from whence a notable quantity of Blood will iſſue in a ſhort time, how much then may we ſuppoſe would flow out of all the Veins, if they were open'd at one time? Seeing then 'tis evident ſo great ſuch a quantity of Blood is expell'd out of the Heart at every *Syſtole*, and that for all that the Arteries are not unduly diſtended, nor any part ſwell'd by it, neither yet the *Cava* and other Veins emptied; 'tis certain that the Blood that is driven into the Arteries flows back to the Heart by the Veins in a conſtant *Circulation*.

2. A ſecond Argument to prove it, may be taken from the Valves in the Veins, which are ſo framed that Blood may freely flow thro' them out of the leſſer Veins into the greater (and ſo into the

Cava) but not on the contrary, out of the greater into the leſs. Yea, if one blow into the *Cava* thro' a Pipe, there will no Wind paſs into the ſmaller Veins; but on the contrary, if you blow up the leſſer Veins, the Wind will readily paſs to the larger, and ſo to the *Cava*.

3. And laſtly, the ſame thing is moſt clear by the Ligature in Blood-letting: For whether you let Blood in the Arm or Foot, you always tie the Fillet above where you intend to make the Orifice, and then the Vein below the Ligature will preſently fill and grow tumid, but above it will fall and almoſt diſappear; which muſt needs be from hence, for that the Blood being driven along the Arteries towards the extream parts, returns by the Veins, and aſcends upwards, which coming to the Ligature, and being ſtop'd there, ſwells the Vein below the Ligature, and ſpurts out as ſoon as the Orifice is made; but when the Fillet is looſed again, the Blood flows no longer out thereat, but holds on its wonted Channel, the Vein and the Orifice cloſes up again.

Having ſufficiently demonſtrated the Circulation of the Blood, we will ſhew two things farther; *Firſt*, How the Blood paſſes out of the Arteries into the Veins; and, *Secondly*, in what time it may be ſuppoſed to paſs thro' the Heart in its ordinary Circulation.

As to the *firſt*, it was the Opinion of *Riolanus*, that the Blood circulated only thro' the larger Veſſels, by Anaſtomoſis or Inoſculation of the Veins with the Arteries; and that that which run into the ſmaller, was all ſpent on the Nutrition of the Parts. But it is clear, that there muſt be a *Circulation* even in the ſmalleſt, from the great quantity of Blood that will flow out of the leaſt Artery in the Hand or Foot when it is cut; which it were very abſurd to imagine to be all ſpent on the nouriſhment of the reſpective Parts. Now there are but two ways whereby the Blood can be ſuppoſed to paſs out of the Arteries into the Veins, *viz.* either by the former's being continued to, or opening into the latter by Inoſculation, or elſe by the Capillary Arteries letting out their Blood into the Pores of the Subſtance of the Parts, on whoſe Nutrition part is ſpent, and the Remainder imbibed by the gaping Mouths of the Capillary Veins. That it is neceſſary to admit of this latter way, is evident, becauſe if part of the Arterial Blood did not iſſue into the Subſtance of the Parts, they could not be nouriſh'd by it; for while it is in the Veſſels, it may add Warmth indeed to the Parts thro' which it flows, but cannot nouriſh them, ſeeing even the Veſſels themſelves are not nouriſh'd by that Stream of Blood that glides along their Cavity, but by Capillaries running thro' their Coats; and if the Blood be driven into the Subſtance of the Parts, and that in a greater quantity than ſuffices for their Nouriſhment (as was juſt now ſhewn that it is) what is ſuperfluous muſt needs enter the Mouths of the Capillary Veins, from which it goes forward to the larger, and ſo to the Heart: But ſeeing this way of transfuſing the Blood thro' the Subſtance of the Parts, has ſeem'd to ſome not to anſwer to that haſty Circulation of it as above demonſtrated; they have thought it neceſſary alſo to admit of the *former* way, namely, Anaſtomoſes, by which the Veins are continued to the Arteries, and that not only in their larger Branches (as that notable one of the Splenick Artery with the Splenick Vein) but alſo in their ſmaller Twigs in the extreme Parts. But we muſt conſider, that in a living Body the ſolid Parts are infinitely more porous and permeable than in a dead; ſo that tho' the Anatomiſts find their Subſtance ſo denſe and cloſe, as to make it ſeem almoſt impoſſible they ſhould permit ſo quick a paſſage to the Blood thro' them, yet they ſhould rather believe it, than ſuppoſe ſuch Anaſtomoſes as they cannot diſcover (tho' it were not difficult to find them out if they had an Exiſtence;) for abating the ſingle one of the Splenick Artery with the *Ramus Splenicus* of the *Porta* (and perhaps ſome of the *Arteria* with the *Vena Pulmonaris* in the Lungs) none of the lateſt moſt accurate Anatomiſts have been able to find out any. And as for that mentioned, it ſeems rather to be of an Artery with an Artery (ſuch as are frequent in ſeveral Parts of the Body, as are alſo of one Vein with another) than of an Artery with a Vein; for the *Porta* from which this *Ramus* is propagated, is generally reputed rather an Artery than a Vein.

And, *Secondly*, as to the Space of Time in which the whole Maſs of Blood may ordinarily circulate thro' the Heart, it is probably much ſhorter than many have imagin'd. For ſuppoſing that the Heart makes 2000 Pulſes an Hour (which is the leaſt Number any ſpoke of, and ſome have told twice as many) and that at every Pulſe there is expelled an Ounce of Blood (which we may well ſuppoſe, ſeeing the Ventricles are wide enough to contain 2 Ounces; and that it is probable alſo, both that they are filled near full in the *Diaſtole*, and that they are near, if not quite emptied by the ſtrong Conſtriction of the Heart in the *Syſtole*) ſeeing the whole Maſs uſually exceeds not four and twenty Pound, it will be circulated ſix or ſeven times over thro' the Heart in the Space of an Hour. And by ſo much the oftner, by how much the Blood comes ſhort of the ſuppoſed Quantity, or the Pulſe either naturally, or by a Fever, Spirituous Liquors, or violent Motion is rendred more frequent. By which quick Motion the Blood it ſelf is kept from Coagulation and Putrefaction, and the Parts are cheriſh'd with vital Heat, which Heat of the Parts is much according to the Slowneſs or Rapidneſs of the Circulation: So when we ſit ſtill, and the Pulſe is ſlow or rare, we grow cold; but when upon running, or any other violent Exerciſe the Pulſe becomes more frequent and quick, we become hot.

CIRCULATORIUM, is a Glaſs Veſſel, wherein the Liquor infuſed by its aſcending and deſcending, rolls about as it were in a Circle: There are ſeveral ſorts of theſe Veſſels, but two eſpecially of moment and uſe, that called *Pelicanus*, and the other *Diota*: Which ſee; as alſo *Double Veſſel*.

CIRCULUS, is a round Inſtrument made of Iron, uſed by Chymiſts for the cutting off the Necks of Glaſs Veſſels; which is perform'd thus; The Inſtrument being heated is apply'd to the Glaſs Veſſel, and is there continued till it grow hot; then with ſome drops of cold Water, or a cold Blaſt upon it, it flies in pieces. This way they cut off the Necks of Retorts or Cucurbits.

CIRCUMAGENTES *Muſculi*, are certain oblique Muſcles of the Eyes, ſo called from their helping to wind and turn the Eyes round about.

CIRCUMAMBIENT: See *Ambient*.

CIRCUMFERENCE, is the outermoſt bounding Line of any Plane Figure, but it more properly belongs to the Perimeter of a Circle; as is apparent

parent from the Geneſis of a Circle. See *Circle.*

CIRCUMFERENTER, and Inſtrument uſed in Surveying, being the ſame with the *Theodolite*: Which ſee.

CIRCUMFLEX *Accent*, in Grammar, is compoſed both of the *Acute* and the *Grave*, and it's expreſſed thus (^).

CIRCUMGYRATION, is the wheeling Motion of any Body round a Center.

CIRCUM-POLAR *Stars*, are ſuch Stars as being pretty near our *North Pole*, do move round it, and in our Latitude never ſet, or go below the *Horizon.*

A TABLE of Circum-Polar Stars.

Magnitude.	Names.	Right Aſcenſion in Time under the Pole Star. H. M. S.	Difference in Time between the Pole-Star and the Pole. H. M. S.	Azimuth under the Pole-Star D. M. S.	Coaſtline.

N. B. □ *ſtands for* 4 *Stars in* Charles's Wain.

The Uſe of this Table.

1. *For the Hour of the Night.*

In a *North* Widow (or any convenient Place) hang up a fine String with a weighty Plummet, and placing your Eye at ſome diſtance (backward) mark when any Star in the Table comes to your String, ſo that it cut both it and the *Pole-Star* together; then from *that Star*'s *Right Aſcenſion* (in the Table) take the *Right Aſcenſion of the Sun* (adding 24 Hours to the Star's (if need be) the Remainder is the exact Time of the Night.

N. B. The Stars mark'd with *W.* in the laſt Column, come under the Pole after they have been in the Vertical of the *Pole-Star*, when they are *Weſt* of the Pole.

2. *To find a true Meridian.*

Place a ſecond Line and Plummet behind the former (which was for the Hour) and having by the former obſerved when any Star in the Table comes to a Perpendicular with the *Pole-Star*, then count (by a Pendulum Clock or Watch) the difference in Time expreſſed in the ſecond Column, and belonging to the Star you obſerve; then at the Moment when the Account is up, bring the two Strings and the Star all in a Right-Line, and then your two Strings are in the *Meridian.*

The two laſt Columns ſerve for the ſame uſe.

For when any of theſe Stars are under the *Pole-Star*, making the two Strings cut both the *Pole-Star* and the other; theſe two Strings hang ſo far out of the *Meridian Line*, as is the *Azimuth* expreſs'd in the *Table*; which *Azimuth* is ſhewn to be *Eaſt* or *Weſt*, as in the laſt Column.

N. B. There are 3 Stars in the Table, which being under the *Pole-Star*, are inſenſibly near the Meridian, *viz. Caſſiopeia*'s *Hip*, *Cor Caroli*, and *Alioth*; ſo that when they are under the *Pole-Star*, a Meridian may be found (very near) by one Thread.

Obſerve alſo, That there is juſt four Hours (wanting only one Second) between the coming of *Cor Caroli* and the 24th Star of *Draco* (in *Tycho*'s Catalogue) under the *Pole-Star.*

CIRCUMSCRIBED; in Geometry a Figure is ſaid to be *Circumſcribed*, when either the Angles, Sides or Planes of the outward Figure, touch all the Angles of the Figure that is inſcribed.

CIRCUMSCRIPTION, in Natnral Philoſophy, is the Termination or certain Bounds or Limits of any Natural Body. They make it either *Internal*, which belongs to the Eſſence and Quantity of every Body, whereby it hath a certain determinate Extenſion, Bounds and Figure: Or *External*, which they call alſo *Local*, becauſe it is referred to the Place within which any Body is confined; for a Body is ſaid to be *Circumſcribed Locally*, or to be in a Place *Circumſcriptively*, when it hath a certain and determinate *Ubi* or Place, in reſpect of the *Circum-Ambient* Bodies.

CIRCUMVALLATION, or *the Line of Circumvallation*, in Fortification, is a Trench bordered with a Parapet, dug round about the Beſieger's Camp, within Cannon-ſhot of the Place, to hinder the Relief of the Beſieged, and to ſtop Deſerters: It is uſually flank'd at the Diſtance of a Musket-ſhot with *Redoubts* and other ſmall Works, or with Field Forts raiſed upon the moſt eminent Poſts: Care muſt be taken never to draw a *Line of Circumvallation* at the Bottom of a riſing Ground, leſt the Enemy, having ſeized on the Station, ſhould plant Cannon there, and by that Means command the Line. This Line is uſually about ſeven Foot deep, and twelve broad.

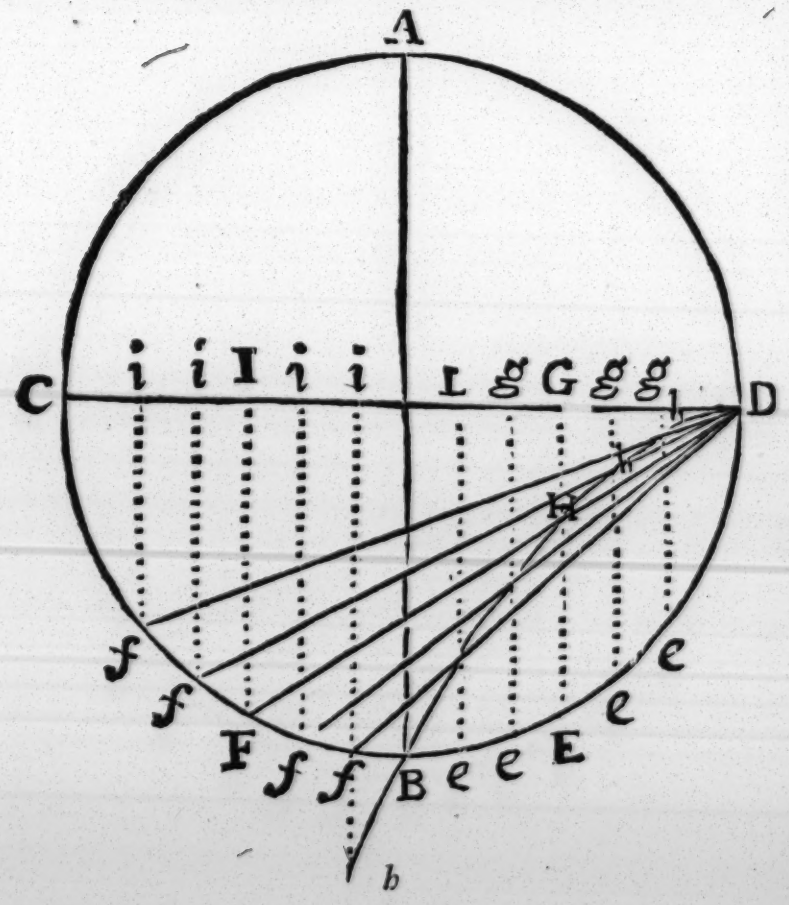
CIRRI, in Botany, are thoſe fine Strings or Hairs by which ſome Plants faſten themſelves in order to their Support in their creeping, as Ivy, *&c.*

CIRSOCELE, is a Swelling of the preparing Veſſels about the Teſticles, ſo that they ſometimes look like a Third Teſticle. *Blanchard.*

CIRCOS or *Varix*, is a Dilatation and Swelling of the Veins, crooking or winding, and ariſing in one or more Parts of the Body, inſomuch as the Veins threaten a Rupture. *Blanchard.*

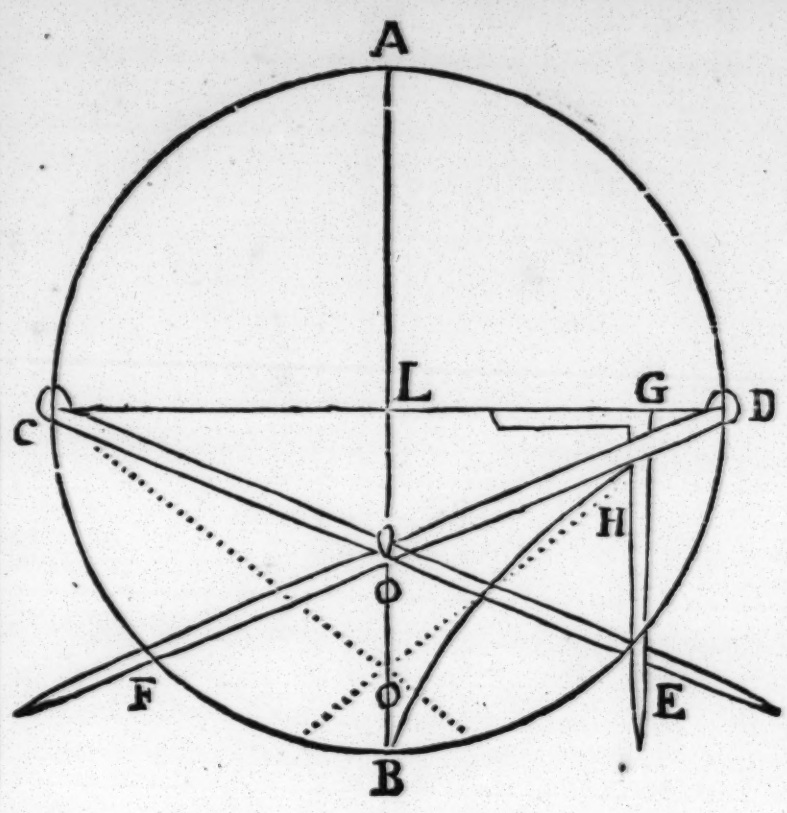
CISSOID, the Name of a Curve Line invented by *Diocles*, and thus produced or generated.

Let there be two Diameters of a Circle *A B* and *C D* cutting one another at Right Angles.



From *B* take equal Arks, as *Be* and *Bf* or *B E* and *B F*; and then from *e* or *E*, *&c.* erect the Perpendiculars *e g* or *Eg*. Then draw the Tranſverſe Lines *D f* and *D F*, *&c.* cutting thoſe Perpendiculars in *H* and *h*, *&c.* by which Means you may find as many Points as you pleaſe in thoſe Perpendiculars, through which to draw the Curve *D h Ah B b* (which may be continued below the Circle if you pleaſe.) And this is called the *Ciſſoid.*

A Way to deſcribe which Curve Organically the Second Figure repreſents.



Where two Rulers being faſtened at *C* and *D*, and moveable upon thoſe Points, interſect one another, as at *O*, or in *B*; and then a Square, as *L G E*, being ſo placed that *G E* and *L B* are coincident; as alſo the three Points *O*, *B* and *E*, if the two Rulers be moved upwards, ſo then the interſecting Point *O* begins to aſcend, and the Square at the ſame time moves upwards alſo, with its upper Leg *L G* always parallel to *C D*, the Interſection of the Point *H*, or Angle of the Square with the Rule *F D* ſhall, in its Aſcent, deſcribe the Curve *B H D*, which is the true *Ciſſoid.*

Propoſition.

If from any Point of the Diameter C D *(See* Fig. I. *above) as from* G, *you draw a Perpendicular, as* G E, *through the* Ciſſoid, *the Lines* C G, G E, G D *and* G H *will be continually proportionable.*

Demonſtration.

The Lines *G E* and *I F* being Right Sines, and alſo *G D* and *I C* being verſed Sines of equal Arks, will be equal; wherefore becauſe of the Circle, *D I : I F* (*i. e. C G : G E*) *: : I F : I C*; *i, e. G E : G D.* But by Similar Triangles, *D G : G H; : D I : I F* (that is, as *C G : G E*;) ſo is *C G, G E : : G E, G D : : G D, G H*; that is, thoſe Lines are all in continual Proportion. *Q. E. D.*

How by the Help of his Curve to find two mean Proportionals; ſee *Sturm. Math. Enucleat. Prop.* 21. *of Book* 2. *and Conſ.* 1.

CITADEL, is a Fort of 4, 5 or 6 Baſtions, built ſomewhere near a City, that it may command it in Caſe of a Rebellion; ſo that the City is not fortify'd on that Part againſt the *Citadel*, tho' the *Citadel* is againſt the City. The moſt uſual Form

Form for *Citadels* is that of a Pentagon, a Square being too weak, and an Hexagon too big.

CITTA, or *Pica*, is a depraved Appetite, when People long for those things which are not fit to be, nor never are eat, as Lime, Coals, Shells, Cloth, Hides, Sand, *&c.* *Blanchard.*

CIVIL-DAY: See *Day.*

CIVIL-LAW, is properly the peculiar Law of each State, Country or City: But what we usually mean by the *Civil-Law*, is a Body of Laws composed out of the best of the *Roman* and *Grecian* Laws, and which was in the main received and observed throughout all the *Roman* Dominions for above Twelve Hundred Years. The *Romans* took the first Grounds of this Law from the Twelve Tables, which were Abridgements of the Laws of *Solon* at *Athens*, and of other Cities in *Greece*, famous for Knowledge and Wisdom, to which they added their own ancient Customs of the City of *Rome*. These written Laws were subject to various Interpretations, whence Controversies arising, they were determined by the Judgment of the Learned; and these Determinations were what they first called *Jus Civile*, after their several *Cases* were composed, which, lest the People should make them at pleasure, were fixed certain and solemn; and this Part of their Law they called *Actiones Juris*, *Cases at Law*: And by the bye, the *Romans* had also their *Plebiscita*, which were Laws made by the Commons without the Authority of the Senate. The *Jus Honorarium*, which was an Edict of some particular Magistrate; the *Senatus Consultum*, which was an Ordinance made by the sole Authority of the Senate; and the *Principalis Constitutio*, which was Enacted by the Prince or Emperor. These Laws grew by degrees to a vast number of Volumes; and therefore the Emperor *Justinian* commanded his Chancellor *Tribonian*, with the Assistance of the other Eminent Lawyers of that Time, to reduce it to a perfect Body. *Suidas*, and some others reflect on *Tribonian*'s Learning and Integrity in this great Work; but no one can excuse his Haste and want of Care, for he did that in Three Years time, which the Emperor saith (in the Constitutions) he could not have imagin'd would be effected in less than Ten. For this Law had now been in practce above 1000 Years, and the Volumes of it were swelled to the prodigious Number of 2000, which 'twas impossible for *Tribonian* to read over in that time, much less to compare and digest them well. However this Body of Law is called the *Digests* or *Pandects*.

This Body of the *Civil-Law* is divided into three Volumes, which are still remaining; *viz.* the *Pandects* or *Digests*, the *Code*, and the *Institutes*: Which see. Afterwards to these were added the *Authenticks*, or *Constitutions of Justinian*, called also *Novellæ*: Which see, also under the Word *Authenticks.*

CIVIL-YEAR, is the Legal Year, or Annual Account of Time, which every Government appoints to be used within its own Dominions; and 'tis so called in contradistinction to the *Natural Year*, which is measured exactly by the Revolution of the Heavenly Bodies.

CLAMEA *admittenda in Itinere Atturnatum*, is a Writ whereby the King commands the Justices in *Eyre* to admit of one's Claim by *Attorney* that is employed in the King's Service, and cannot come in his own Person.

CLAMPS, in a Ship, are those thick Timbers which lie fore and aft, under the Beams of the first *Orlope*, bearing them up at either End; and are the same that the *Risings* are to the *Deck.*

CLARETUM, amongst the foreign Writers of Pharmacy, is an Aromatick Wine, impregnated with an Infusion, and sweetned with Sugar; it is otherwise called *Vinum Hippocraticum*, *Hippocras Wine*; also *medicated Wine*: It is so called because it's percolated and purified by a Wine Sack or Bag, through which it is drained from its Dregs. And this Bag is called *Manica Hippocratis.*

CLARIFICATION, is the way to make Juices or thick Decoctions become clearer and finer, which is done three ways; by letting the Dregs subside of themselves, by Fermentation, or by the Addition of Vinegar, White of an Egg, or Milk, *&c.* either to precipitate the Dregs to the Bottom, or gather them in a Skum.

CLARICATIO, so the *Civilians* call *Arestо facto super bonis mercatorium alienigenorum*: Which see.

CLARION, a bearing in Heraldry of the following Figure; *Ruby* 3 *Clarions Topaz*, being the Arms of the Earl of *Bath*, by the Name of *Greenvile*. *Guillim* takes these *Clarions* to be a kind of old fashioned Trumpet; but others think they rather represent the *Rudder* of a Ship; or as some say, the *Rest* for a *Lance.*

CLASPERS, the twisted Ligaments or Threads with which certain Herbs or Shrubs, such as *Briony* and *Vines* takes hold of Trees or Plants that grow about them.

These *Claspers* are of a Compound Nature, between that of a Root and a Trunk. Their Use is sometimes for *Support* only, as in the *Claspers* of *Vines*, *Briony*, &c. whose Branches being long, slender and fragile, would fall by their own and their Fruits Weight; but these *Claspers* taking hold of any thing which is at Hand (which they do by a Natural Circumvolution which they have, those of *Briony* have a Retrograde Motion about every third Circle in the Form of a double Clasp, so that if they miss one way, they may catch the other). Sometimes the Use of *Claspers* is also for *Supply*, as in the *Trunk Roots* of *Ivy*; which being a Plant that mounts very high, and being of a closer and more compact Substance than that of *Vines*, the Sap would not be sufficiently supplied to the upper Sprouts, unless these assisted the Mother Root; but these serve also for Support too. Sometimes they serve for *Stabiliment*, *Propagation*, *and Shade*; for the *first* of these serve the *Claspers* of Cucumbers; for the *second*, those, or rather the *Trunk Roots of* Chamæmil; and for all *three*, the Trunk Roots of Strawberries, which mightily seem to delight in Shade.

CLAUDENT *Muscles*, otherwise called *Semicircular*, are those that shut the Eye-lids; being placed between the *Inner Membrane* of that Part, and the *Fleshy Membrane*. These two *Muscles* being cantracted, shut up the Eye, the greater drawing down the upper Eye-lid, and the less pulling up the lower, which falls down again through its own Gravity, and the Relaxation of its Fibres.

CLAVICULÆ, or *Channel Bones*, are two little ones which are situated at the Basis of the Neck above the Breast, on each Side one: They

are

are pretty long and ſmall, and at one End are joined to the Production of the *Scapulæ*, called *Acromion*, by a peculiar Arciculation, which they call *Synchondroſis*; at the other End they are joined to the upper Part of the *Sternum*, by an *Articulation* which they call *Arthrodia*. They are in the Shape of a long (*ſ*) for the Paſſage of the Veſſels which paſs under them, and to facilitate the Motion of the Arms: Their Uſe is to ſuſtain the *Scapulæ*, to which the Arms are articulated; and becauſe the Pectoral Muſcle which pulls the Arm a-croſs the Breaſt, is inſerted near the upper End of the Shoulder-Bone; if the *Claviculæ* did not keep the *Scapulæ* to which the Head of the *Humerus* is always joined at an equal Diſtance from the *Sternum*, the upper Part of the Arm only, and not the Hand, muſt have been pulled forwards.

CLAVUS, is a Pain in a ſmall Part of the Head, commonly above the Eye in the Eye-brow, and ſeems as if that Part of the Head were bor'd through with a little *Augur* or Whimble. Dr. *Sydenham* calls ſuch a Pain in the Top of the Head of Hyſterical Perſons, *Clavus Hyſtericus*.

CLAUSUM *Fregit*, ſignifies as much as an Action of Treſpaſs; and is ſo called, becauſe in the Writ ſuch a one is ſummoned to anſwer, *Quare clauſum fregit*? that is, Why he did ſuch a Treſpaſs?

CLAYES or *Watles*, a Term in Fortification: See *Hurdles*.

CLEAR *Viſion*: See *Viſion*.

CLEAT, is a Piece of Wood faſtned to the Yard-Arm of a Ship, to keep the Ropes from ſlipping off the Yard.

CLECHE, a Term in Heraldry for any Ordinary being pierced through with the ſame Figure, as here. He beareth *Gules*, a *Saltier Cleche*, that is, one pierced through with another.

CLEIDION, the ſame with *Clavicula*.

CLEPSYDRA, an Inſtrument anciently uſed, eſpecially among the *Egyptians*, to meaſure Time, by the running of Water out of one Veſſel into another: Firſt invented by *Scipio Manſica*, or at leaſt brought firſt by him to *Rome*; for *Pierius* in his *Hieroglyphicks* tells us, The Prieſts of *Acanta*, a Town beyond the River *Nile* in *Egypt*, did uſe every Day to pour Water into a Veſſel, by the dropping of which through a ſmall Hole, they meaſured Time.

There were many kinds of them, but all had this in common, that the Water ran gently thro' a narrow Paſſage from one Veſſel into another; and in the lower was a Piece of Cork or light Wood, which as the Veſſel filled, roſe up by degrees, and ſo ſhewed the Hour.

Plutarch obſerves one Inconvenience in theſe *Water-Cocks*, *i. e.* that the Air, according to its different Temperature, as to Heat, Cold, Denſity or Rarity, had an Influence on the running of the Water, ſo that it muſt meaſure Time unequally. And another greater there was, which a good while was unheeded, *viz.* that the Water always ran ſlower out, according as its Quantity and Preſſure in the Veſſel abated; to remedy this, the *Orontes* invented a *Clepſydra* in the Form of a ſmall Ship floating on the Water, and which emptied it ſelf by Means of a Syphon, placed in the Middle of it; but which way the Hours by this Means were made equal, I cannot find, the Deſcriptions given of the thing being very obſcure.

Some of theſe *Clepſydræ* were ſo made, as that without changing the Dial, the Hours were ſometimes longer, and ſometimes ſhorter, by Means of an Inequality in the Index, or Hand, and which *Vitruvius* ſays, depended on the Management of the Water: for in the long Days they made the Hole narrower, and ſo the Water ran proportionably ſlower; and in the Winter, when the Days were ſhort, the Hole was made larger, which made the Water flow the faſter, and ſo the Index turned round alſo the faſter.

CLERICO *admittendo*, is a Writ directed to the Biſhop, for the admitting of a Clerk to a Benefice upon a *ne admittas*, tried and found for the Party that procureth the Writ.

CLERICO *capto per Statuum Mercatorum*, *&c.* is a Writ directed to the Biſhop, for the Delivery of a Clerk out of Priſon, that is in Cuſtody upon the Breach of a *Statute Merchant*.

CLERICO *convicto commiſſo Eccleſiæ in defectu Ordinarii deliberando*, *&c.* is a Writ for the Delivery of a Clerk to his Ordinary that formerly was convicted of Felony, by reaſon his Ordinary did not challenge him according to the Privileges of a Clerk.

CLERICO *infra Sacros Ordines conſtitutio non elegendo in Officium*, is a Writ directed to the Bayliffs, *&c.* that have thruſt a Bailiwick or Beadleſhip upon one in Holy Orders, charging them to releaſe him again.

CLERK *Controuler of the King's Houſe* (whereof there be two) is an Officer in Court, that hath Place and Seat in the *Counting-houſe*, and Authority to allow or diſallow the Charges or Demands of Purſuivants, and Meſſengers of the *Green-Cloth*, Purveyers or the like: He hath alſo the over-ſight and controuling of all Defaults, Defects and Miſcarriages of any of the Inferiour Officers; and ſits in the *Counting-Houſe* with the Superiour Officers, *viz.* the Lord *Steward*, *Treaſurer*, *Controuler* and *Cofferor*, either for correcting or bettering things out of Order, with ſeveral other Matters.

CLERK *of the Acts*, is an Officer of the Navy, who receives and enters the Commiſſions and Warrants of the Lord-Admiral, and regiſters the Acts and Orders of the Commiſſioners of the Navy.

CLERK *of Aſſize*, is he that writeth all things judicially done by the Juſtices of *Aſſize* in their Circuits.

CLERK *of the Check*, is an Officer in Court, ſo called, becauſe he hath the *Check* and *Controulment* of the Yeomen of the Guard, and all other ordinary Yeomen or Uſhers belonging either to the King, or Queen, or Prince, either giving leave, or allowing their Abſences or Defects, in Attendance, or diminiſhing their Wages for the ſame.

CLERK *of the Crown*, is a Clerk or Officer in the King's-Bench, whoſe Buſineſs is to read, frame and record all Indictments againſt Traitors, Felons and other Offenders there arraigned upon any publick Crime. He is otherwiſe called *Clerk of the Crown-Office*, or *Clerk of the Crown in the King's-Bench*.

CLERK *of the Crown in Chancery*, is an Officer there, that by himſelf or his Deputy, is continually

ally to attend the Lord-Chancellor, or Lord-Keeper, for ſpecial Matters of State, by Commiſſion or the like, either immediately from his Majeſty, or by Order of his Council, as well ordinary as extraordinary: Alſo all general Pardons upon Grants of them at the King's Coronation, or at a Parliament, the Writs of Parliament, with the Names of Knights and Burgeſſes, are returned into this Office. He hath alſo the making of ſpecial Pardons, and Writs of Execution upon Bonds of *Statute Staple* forfeited.

CLERK *of the Errors*, in the Court of Common-Pleas, does tranſcribe and certify into the King's-Bench, the Tenor of the Records of the Cauſe or Action, upon which the Writ of Error (made by the *Curſitor*) is brought there to be judged and determined.

CLERK *of the Errors* in the King's-Bench, does likewiſe tranſcribe and certify the Records of ſuch Cauſes in that Court into the *Exchequer*, if the Cauſe or Action were by Bill.

CLERK *of the Errors* in the Exchequer, does tranſcribe the Records certified thither out of the King's-Bench, and prepares them for Judgment in the Court of *Exchequer*, to be given by the Juſtice of the Common-Pleas and Barons there.

CLERK *of the Eſſoigns*, is an Officer belonging to the Court of *Common-Pleas*, who only keepeth the *Eſſoign-Roll*, and hath for entring every *Eſſoign* Six-pence, and for every *Exception* to bar the *Eſſoign*, in Caſe where the Party hath omitted his Time, Six-pence. He hath alſo the providing of Parchment, and cutting it into Rolls, and making the Number upon them, and Delivery out of all the Rolls to every Officer, and receiving them again when they be written.

CLERK *of the Eſtreats*, belongs to the *Exchequer*, and every Term receiveth the *Eſtreats* out of the Lord Treaſurer's Remembrancer's Office, and writeth them out to be levyed for the King: He alſo maketh Schedules of ſuch Sums *eſtreated* as are to be diſcharged.

CLERK *of the Hamper*, or *Hanaper*, or *Warden of the Hamper*, is an Officer in the Chancery, whoſe Buſineſs is to receive all Money due to the King's Majeſty for the Seals of Charters, Patents, Commiſſions and Writs; as alſo Fees due to the Officers for Enrolling and Examining the ſame. He is obliged to attend on the Lord *Chancellor* or the Lord *Keeper* daily in Term time, and at all times of Sealing.

CLERK *of the Juries*, or *Curata Writs*, is an Officer belonging to the Court of Common-Pleas, which maketh out the Writs called *Habeas Corpora*, and *Diſtringas*, for the Appearance of the Jury either in Court or at Aſſizes, after that the Jury or Pannel is returned upon the *venire facias*.

CLERK *of the King's Great Wardrobe*, is an Officer of the King's Houſe, that keepeth an Account or Inventory in Writing of all things belonging to the King's *Wardrobe*.

CLERK *of the King's Silver*, is an Officer belonging to the Common-Pleas, to whom every Fine is brought, after it has been with the *Cuſtos Brevium*, and by whom the Effect of the Writ of Covenant is entred into a Paper-Book, and according to that Note, all the Fines of that Term are alſo Recorded in the Rolls of the Court.

CLERK *of the Market*, is an Officer of the King's Houſe, whoſe Duty is to take Charge of the King's Meaſures, and to keep the Standards of them; that is, Examples of all the Meaſures that ought to be through the Land.

CLERK *Marſhal of the King's Houſe*, ſeems to be an Officer that attends the Marſhal in his Court, and Recordeth all his Proceedings.

CLERK *of the Nichils* or *Nihils*, is an Officer in the *Exchequer*, that maketh a Roll of all ſuch Sums as are *nihiled* by the Sheriff upon their *Eſtreats of Green Wax*, and delivereth the ſame into the *Lord Treaſurer's Remembrancer's Office*, to have Execution done upon them for the King.

CLERK *of the Outlawries*, is an Officer belonging to the Court of *Common-Pleas*, being a Deputy to the King's *Attorney-General*, for making out the Writs of *Capias utlegatum* after *Outlawry*; and the King's *Attorney*'s Name is to every one of thoſe Writs. And whereas Seven-pence is paid for the Seal of every other Writ betwixt Party and Party, there is but a Penny paid for the Seal of this, becauſe it goes out of the King's Suit.

CLERK *of the Parliament*, is he that recordeth all things done in the High Court of Parliament, and engroſſeth them fairly into Parchment Rolls, for their better keeping to Poſterity. Of theſe there be two, one of the Higher, the other of the Lower, or Houſe of Commons.

CLERK *of the Peace*, is an Officer belonging to the Seſſions of the Peace; his Duty is at the Seſſions to read the Indictments, to enroll the Acts, and draw the Proceſs, to enroll Proclamations of Rates for Servant's Wages, to enroll the Diſcharge of Apprentices, to keep the Counterpart of the Indenture of Armour, *&c.* alſo to certify in the King's-Bench, Tranſcripts of Indictments, Outlawries, Attainders and Convictions had before the Juſtices of the Peace within the time limited by Statute.

CLEKK *of the Pell*, belongs to the *Exchequer*, whoſe Buſineſs it is to enter Teller's Bills into a Parchment-Roll, called *Pellis receptorum*, and alſo to make another Roll of Payment, called *Pellis exituum* wherein he ſetteth down by what Warrant the Money was paid.

CLERK *of the Petty Bag*, is an Officer in *Chancery*, whereof there are three, and the Maſter of the Rolls their Chief: Their Office is to Record the Return of all Inquiſitions out of every Shire, all Liveries granted in the Court of Wards, all *Oſter les marnes*, to make all Patents of Cuſtomers, Gaugers, Controulers and Aulnagers, Summons of the Nobility, Clergy and Burgeſſes to the Parliament; Commiſſions directed to Knights and others of every Shire for ſeiſing of Subſidies; Writs for Nomination of Collectors for the Fifteenths, and all Traverſes upon any Office, Bill, or otherwiſe, and to receive the Money due to the King for the ſame.

CLERK *of the Pipe*, belongs to the *Exchequer*, who having all Accounts and Debts due to the King, delivered and drawn out of the Remembrancer's Office, chargeth them down into the great Roll; who alſo writeth Summons to the Sheriff to levy the ſaid Debts upon the Goods and Chattels of the ſaid Debtors; and if they have no Goods, then doth he draw them down to the Lord Treaſurer's Remembrancer, to write Eſtreats againſt their Lands.

CLERK *of the Pleas*, is an Officer in the *Exchequer*, in whoſe Office the Officers of the Court upon ſpecial Privileges belonging to them, ought to ſue, or be ſued upon any Action.

CLERK *of the Privy-Seal* (whereof there be four) that attendeth the *Lord-Keeper of the Privy-Seal*; or if there be none ſuch, upon the Principal Secretary, writing or making out all things that be ſent by Warrant from the Signet to the *Privy-Seal*, and are to be paſs'd to the *Great-Seal*; as alſo to make out *Privy-Seals* upon any ſpecial occaſion of his Majeſty's Affairs; as for Loan of Money, and ſuch like.

CLERK *of the Sewers*, is an Officer belonging to the Commiſſioners of the *Sewers*, writing all things that they do by vertue of their Commiſſion: See *Sewers*.

CLERK *of the Signet*, is an Officer continually attending upon his Majeſty's Principal Secretary, who always hath Cuſtody of the *Privy-Signet*, as well for Sealing his Majeſty's Private Letters, as alſo ſuch Grants as paſs his Majeſty's Hand by Bills ſigned. Of theſe there be four that attend in their courſe, and have their Diet at the Secretary's Table.

CLERK *of the Treaſury*, belongs to the *Common-Pleas*, and hath the charge of keeping the Records of *Niſi prius*, hath the Fees due for all Searches, and hath the certifying of all Records into the *King's-Bench*, when a Writ of Error is brought, and maketh out all Writs of *Superſedeas de non moleſtendo*, which are granted for the Defendants, while the Writ of Error hangeth. Alſo he maketh all Exemplifications of Records being in the *Treaſury*.

CLERK *of the Warrants*, is an Officer belonging to the Court of *Common-Pleas*, which entreth all *Warrants* of Attorney for Plaintiff and Defendant, and enrolleth all Deeds of Indentures of Bargain and Sale, which are acknowledged in Court, or before any Judges out of the Court.

CLEW, of the Sail of a Ship, is the lower Corner of it which reaches down to that Earing, where the *Tackles* and *Sheets* are faſtned; ſo that when a Sail is made *goaring*, or ſloping by degrees, ſhe is ſaid to have a *great Clew*: And a Ship is ſaid to *ſpread a great Clew*, when ſhe hath a very long Yard, and ſo hath much Canvaſe in her Sails.

CLEW-GARNET, is a Rope faſtned to the Clew of the Sail, and from thence runs in a Block ſeized to the middle of the *Main* and *Fore-yard*; its Uſe is to hale up the Clew of the Sail cloſe to the middle of the Yard, in order to its being furled.

CLEW-LINE, is the ſame to the *Top-ſails*, *Top-gallant-ſails*, and *Sprit-ſails*, that the *Clew-garnet* is to the *Main-ſail* and *Fore-ſail*, and has the very ſame uſe. In a guſt of Wind, when a *Top-ſail* is to be taken in, firſt hale home the *Lee Clew-Line*, and then the Sail will be taken in the eaſier.

CLIFF or *Cleff*, a Term in Muſick, ſignifying a certain Mark from the Poſition whereof the proper Places of all other Notes in any Song or Leſſon are underſtood, by proving the ſaid Notes from thence according to the Scale of the *Gamut*; wherein are contained three Septenaries of Letters, *viz.* *G*, *A*, *B*, *C*, *D*, *E*, *F*; which ſeven Letters of the Alphabet ſet at the beginning of every Rule and Space repreſents as many *Cliffs*; But of theſe four are only uſed, and generally placed at the beginning of the Staves of every Leſſon, either Vocal or Inſtrumental.

The Firſt is called *F-a-ut Cliff*, and appropriated only to the *Baſs* or loweſt Part.

The Second is *C-ſol-fa-ut Cliff*, peculiar to the inner Parts, as the *Tenor* and *Counter-Tenor*.

The Third is *G-ſol-re-ut Cliff*, which is only ſet for the *Treble* or higheſt Part.

The Fourth is *B-Cliff*, or *B-fa-b-mi Cliff*, which is proper to all Parts, and ſerves for the *Flatting* and *Sharping* of *Notes*.

CLIMACTERICAL *Years*, are certain obſervable Years, which are ſuppoſed to be attended with ſome grand Mutation of Life or Fortune; as the 7th Year, the 21ſt, (made up of three times ſeven) the 49th (made of 7 times 7) the 63d, (being 9 times 7) and the 81ſt, (which is 9 times 9) which two laſt are called *the Grand Climacterick*. *Aulus Gellius* ſaith, This Whim came from the *Chaldeans* firſt, and 'tis probable *Pythagoras* had it from them, who uſed to talk much of the Efficacy of the Number 7, with which he was mightily in love.

CLIMATE, is a Space on the Terreſtrial Globe comprehended between two Circles parallel to the Equator, ſo that from the beginning of the *Climate* to that of another next to it, there is half an Hours difference in the longeſt *Summer-day*. Each *Climate* alſo is divided into two half *Climates* by a parallel Circle, which half *Climate* is call'd a *Parallel*; wherefore theſe Parellels muſt differ from one another $\frac{1}{4}$ of an Hour in the longeſt Days.

CLINCH (of a Cable) is that part of it which is bended about the Ring of the Anchor, and then ſeiz'd or made faſt.

CLINCHING, is a kind of ſlight Calking uſed at Sea, in a Proſpect of foul Weather, about the Ports; which is, to drive a little *Oakam* into their Seams, that the Water may not come in at them.

CLINOIDES, are four Proceſſes in the inſide of the *Os Sphenoides*, forming a Cavity called *Cella Turſica*, in the middle of that Bone, in which lies the *Glandula Pituitaria*.

CLITORIS, is a Part in the *Pudendum Muliebre* ſeated before; 'tis a long round Body naturally about the bigneſs of the *Uvula*: It lies within the Skin, nor doth any part of it appear outwardly, but juſt its Extremity; which is covered with a folding of the Skin made by the union of the *Nymphæ*, and is called its *Præputium*. The Subſtance of it conſiſts of two ſpongy Bodies like thoſe of the *Penis*. They riſe at two different places, in the lower Part of the *Os Pubis*, and approaching on to the Body of the *Clitoris*, whoſe Extremity, which is of an exquiſite Senſe, is called its *Glans*. The two ſpongy Bodies before they unite are called by ſome the *Crura Clitoridis*, and they are twice as long as the Body of the *Clitoris*. It hath two Muſcles ariſing from the Protuberance of the *Iſchium*, and are inſerted in its ſpongious Bodies; they are called *Erectores Clitoridis*, becauſe they have the ſame Uſe as the *Erectores Penis*. The *Clitoris* hath Veins and Arteries from the Hæmorrhoidal Veſſels and the *Pudenda*, and Nerves from the Intercoſtal Pair.

CLOATHED, the Seamen ſay a Maſt is cloathed, when the Sail is ſo long as to reach down to the Gratings of the Hatches, ſo that no Wind can blow below the Sail; and they ſay a Ship ſpreads much Cloth, when ſhe hath broad Sails.

CLOCKS and *Clock-work*: How to calculate all the Numbers and Proportions for any Movement, *&c.* ſee under *Watch-work*.

CLOSE, in Muſick: See *Cadence*.

CLOSE, when any Bird is drawn in a Coat of Arms with its Wings close down about it (*i. e.* not displayed) and in a standing posture, they Blazon it by this word *Close*; but if it be *Flying* they call it *Volant*.

CLOSETT, a Term in Heraldry, signifying the half of a Barr, and the Barr ought to contain one fifth part of the Escutcheon, as the *Fesse* doth the third: See *Fesse*.

CLOUDS, are a Congeries of (chiefly) watery Particles, drawn or sent out of the Earth in Vapour; which, when these Particles are very nearly placed to one another, appear dense and thick; but when they are more remote, are clear and bright, and sometimes almost transparent.

It hath been frequently Matter of dispute amongst Naturalists, how these *olouds* are suspended in a *Medium* which must be lighter specifically than themselves. But 'tis easy to conceive that the Parts which compose *Clouds* are so many little Bubbles, having a watery Skin over a little Sphere of fluid Matter lighter than Air, and therefore may easily, like the Bubbles of Soap and Water which the Children blow up with a little Pipe, be supported by the Air: but whenever they are broken by the violent Agitation of Winds, or are driven against the sides of Hills, *&c.* they must change their form of Bubbles and fall down in Rain: See the word *Vapour*.

Mr. *Boyle* saith, An excellent Astronomer assured him, That tho' he had many times accurately measured the Height of the *Clouds*, yet he could never find any (even white ones) to be $\frac{3}{4}$ of a Mile high, and few did exceed $\frac{1}{2}$ a Mile.

CLOYED; the Seamen say, when any thing is got into the Touch-hole of a Great Gun, so that they cannot with a *Priming-Iron* make way for the Powder to be put in to prime her, they say *the Touch-hole is cloyed*; wherefore when Guns are *nailed*, &c. they say they are *Cloyed*.

CLYDON, is a Fluctuation of the Ventricle.

CLYPEAL *Cartilage*: See *Thyroides*

CLYPEI-FORMIS, a sort of Comets resembling a Shield: See *Discus*.

CLYSMA, the same with *Clyster*.

CLYSSUS, among some Chymists, is a long Digestion and Union of Oily Spirits (especially Mineral ones) together, in order to make a Composition or accurate Mixture of them. Sometimes 'tis taken for an Extraction and Union of the more subtle Parts of any Plant, *Vid. Rolfink. Chym. Lib.* 3. *Sect.* 2. *Schroder. Lib.* 3. *c.* 17. Sometimes for a Medicine made of the most active and energetical Parts of any Ingredients.

COACERVATE *Vacuum*: See *Vacuum*.

COACH, the Council-Chamber on board a Flagg-ship.

COAGULATE, signifies in Chymistry to give a Consistence to Liquors by evaporating some part of them over the Fire, or else by mixing Liquors together, which are of different Natures, to effect the same thing; by either of which, and many other ways a *Coagulation* may be effected.

COALITION, is the gathering together and uniting into sensible Masses the minute Corpuscles which compose any Concrete or Natural Body. *Coalescency* is commonly taken for the same.

COAMINGS, aboard a Ship, are those Planks or that Frame which raises up the *Hatches* higher than the rest of the Deck, in which Loop-holes for *Muskets* to shoot out at are usually made, in order to clear the Deck of the Enemy when a Ship is Boarded.

COASTING, is that Part of Navigation where the Places assign'd are not far distant, so that a Ship may Sail in sight of Land, or within Soundings between them.

For the Performance of which there is only required good Knowledge of the Land, the Use of the Compass, and Lead or *Sounding-Line*; such are the Voyages on the Narrow or *British* Seas, between *England*, *Holland* and *France*, also all about the *Baltick* Seas, and those in the *Mediteranean* are little else.

COAT, by Anatomists, is taken for a Membranous Cover of any part of the Body; as the Coats of the Eye, Nerves, Arteries, *&c.*

COATS, in a Ship, are pieces of tarr'd Canvase which are put about the Masts at the Partners; they are also put about the Pumps at the Decks, that no Water may go down there; and these are also used at the Rudders's Head.

COCCYGIS OS, is a Cartilaginous kind of Bone joined to the Extremity of the *Os Sacrum*; it is composed of 3 or 4 Bones, of which the lower is still less than the upper, till the last end in a small Cartilage, and it resembles a little Tail turn'd inwards: Its Use is to sustain the *Rectum Intestinum*; it yields to the pressure of the *Fœtus* in Women in Travail, and therefore Midwives use to thrust it backwards; but sometimes they do it so rudely and violently, that it occasions very great Pain, several bad Effects. It's called *Os Coccygis*, and because it is in shape something like a *Cuckow's* Bill; its Bones are spongy and soft, and have neither Process nor Cavity, for the Spinal Marrow descends no farther than the bottom of the *Os Sacrum*, which terminates in the first Bone of the *Os Coccygis*.

COCCYX, the same with the *Coccygis Os*: Which see.

COCHLEA, is a Cavity of the inner part of the Ear, so called from its Windings and Turnings, for it has 3 or 4 Rings which mutually succeed one another; it is girt about with a very soft and thin Membrane: See *Ear*.

COCKPIT, in a Man of War, is a place on the lower Floor or Deck abaft the main Capstan, lying between the Platform or Orlop and the Steward's Room, where are Subdivisions or Partitions for the Purser, the Surgeon, and his Mates.

COCK-SWAIN or *Cockson*, is an Officer aboard a Man of War who hath the care of the Barge or Shallop, and all things belonging to it, to be always ready with his Boat's Gang or Crew, and to Man the Boat on all occasions: He sits in the Stern of the Boat and Steers; and he hath a Whistle to call and to encourage his Men.

CONCOCTION or *Digestion*, is the Fermentation of the smallest Particles which our Nourishment consists of, that they may be made fit and proper for the Nourishment and Increase of a living Body; the first *Concoction* is made in the Stomach by a kind of Ferment, as most suppose, which partly remains there, from the Relicks of the former Meats, and partly flows thither from the *Cœliack Arteries*: The second is made in the Guts by the Gall and *Pancreatick Juice*; the third is in the *Glandules* of the *Mesentery* from the *Lympha* or Water which mixes it self with the *Chyle*: the fourth is in the Lungs, from the mixing the Air in some measure with the Blood there: The fifth is in the Vessels and Bowels, as in the Spleen, Liver, Testicles, *&c.*

CODE; from the Latin word *Caudex*, the Trunk or Timber of a Tree, comes *Codex*, which ſignifies a Volume or Book, becauſe anciently their Books were made of Wood, and the Leaves were almoſt like thoſe of our preſent Table-Books. The Emperor *Juſtinian* collecting together all the Pleas and Anſwers of the ancient Lawyers, (which in thoſe Days were in looſe Scroles or Sheets of Parchment or Paper) compiled them into a Book, which therefore he called *Codex*; and this Book of the Empeperor hath ever ſince, by way of Eminence, been called the *Code*; which is accounted the *Second Volume* of the *Civil Law*, and contains Twelve Books; the Matter of which is nearly the ſame with that of the *Digeſt*, eſpecially the firſt Eight Books; but it differs from it in this, that its Stile is by no Means ſo pure, nor its Method ſo accurate as that of the *Digeſt*; and that it determines Matters of daily uſe, whereas the *Digeſt* diſcuſſes the more abſtruſe and ſubtil Queſtions of the Law, giving you the various Opinions of the Ancient Lawyers thereupon; and therefore hath more of polite, fine and witty Arguing in it, than things of benefit and uſe to the generallity of Mankind.

The *Code* is compiled from the Anſwers and Determinations of 56 Emperors and their Councils, whereof many Perſons were learned and skilful Lawyers; as the famous *Papinian* and ſome others, eſpecially from the Time of *Adrian* to *Juſtinian* himſelf. And the Reaſon why this Emperor gave himſelf this new trouble was, becauſe he found the *Digeſt* in many Places too fine and ſubtile for common uſe, and alſo very imperfect in that reſpect, as by no means deciding abundance of Caſes that do every Day occur: Theſe Defects he deſign'd to Remedy by ſetting our the *Code*, where abundance of things before omitted, or too briefly handled, are there fully and diſtinctly determined.

There is another *Code* called the *Theodoſian Code*, of good uſe to this Day, for there is no underſtanding the former *Code* without its help; and this was formerly of ſuch Authority, that as Mr. *Selden* and others tell us, it was for ſeveral hundred Years in uſe in the Weſtern parts of *Europe*, when that Law was in manner diſuſed and forgotten. But now the *Theodoſian Cude* as a much antiquated.

CODIA, are the tops of Poppies, of which they make Syrup; whence the word *Diacodium* or *Syrupus de Meconio*.

COECUM *Inteſtinum*, the Blind Gut, is the 4th in order from the Stomach, and the firſt of the *Inteſtina Craſſa* or Thick Guts: In Children new born, and in Quadrupeds its found full of Excrements; but in adult and ſound Perſons its Cavity often diſappears, and it only hangs like a Worm; and 'tis in ſuch about the bigneſs, and half the length of a large Earth-worm; its Mouth which opens into the *Colon* is pretty large: It takes its Original rather from the *Colon* than the *Ilium*, to the former of which it ſeems to be a kind of Appendage. It is larger in Children than in Men: 'Tis not tied to the Meſentery at all, but being placed in the Cavity of the *Os Ilium*, by its End it is joined to the right Kidney, the *Peritonæum* coming between. In Apes it is pretty large, but larger in Dogs; and in Conies, Squirrils, and Rats largeſt of all, in proportion to the bulk of their Bodies. It's uſe in dult Perſons very much undiſcovered; but in the *Fœtus*, or an Infant newly born, in which 'tis found full of Excrement, it ſeems to be a kind of Receptacle for the *Fæces* of the Inteſtines before the Birth or during the time that the *Fœtus* doth not exonerate *per Alvum*. Dr. *Gliſſon* thinks alſo that it ſerves in ſuch Animals as have it large, for a kind of ſecond Ventricle or Bag, wherein the prepared Aliments may be ſtored up, and ſo long retained, till a richer, thicker, and more nutritious Juice may be drawn from them. Others ſay, it contains a Ferment; and others the Flatuoſity of the Inteſtines; and others, that it ſeparates a Liquor by ſome Glands which are in its Cavity, which Liquor ſerves to harden the Excrements as they paſs through the *Colon*.

CO-EFFICIENT *of any generating Term in Fluxions*, is the Quantity which ariſes by dividing that Term by the generated Quantity.

CO-EFFICIENTS *in Algebra*, are ſuch Numbers as are prefixed before any Letters or Species, into which Letters they are ſuppoſed to be multiplied, and therefore with ſuch Letters, or with the Quantities repreſented by them, do make a Rectangle or Product, (*conficiunt Productum*) whence they take their name. Thus *C b* implies that the Quantity repreſented by *a b* is multiplied into the *Co-efficient C*, and that out of theſe two the Rectangle or Product *C b* is formed. If a Letter have no Number prefixed, 'tis always ſuppoſed to have to *Co-efficient* 1, becauſe every thing is once it ſelf.

The *Co-efficient* in a Quadratick Equation is, according to its Sign, either the Sum or Difference of the two Roots. And in any Equation of an higher nature, the *Co-efficient* of the ſecond Term is always the *Aggregate of all the Roots*, retaining their proper Signs; ſo that if all the Negatives be equal to all the Affirmatives, the ſecond Term will vaniſh; and where the ſecond Term is thus wanting, 'tis a ſign that the Quantities under contrary Signs were thus equal.

The *Co-efficient* of the Third Term is the *Aggregate of all the Rectangles*, ariſing by the Multiplication of every two of the Roots, how many ways ſoever thoſe Combinations of Two's can be had, as three times in a Cubick, ſix in a Biquatick Equation, *&c.*

The *Co-efficient* of the Fourth Term is the *Aggregate of all the Solids* made by the continual Multiplication of every 3 of the Roots, how often ſoever ſuch a Tenary can be had, as there can 4 be had in a Biquadratick, Ten in an Equation of Five Dimenſions, *&c*, And thus it will go on infinitely, *&c.*

COELIA, κοιλία τὸ κοῖλον, in an Anatomical Senſe ſignifies any kind of Organical Cavity in an Animal Body; and hence Diſeaſes ſeated in the Venters or Cavities of the Body are ſometimes called *Cæliack Affections*: See *Cæliack*.

COELIACK *Artery*, that which ariſes from the Trunk of the great Artery after it enters the *Abdomen*, and ſpreads into two Branches; the firſt on the Right-hand is the *Gaſtrica Dextra*, which goes to the Stomach, the *Ciſtica* to the Gall-Bladder, the *Epiplois Dextra* to the *Omentum*, the *Inteſtinalis* to the *Inteſtinum Duodenum*, and to a part of the *Jejunum*, the *Gaſtro-Epiplois* to the Stomach, to the *Omentum*, and ſome Branches to the Liver, which enter the *Capſula Communis* to accompany the Branches of the *Porta*.

The left Branch of the *Cæliack Artery* (which is called by ſome *Splenica*, becauſe is goes toward the

the Spleen) on its upper ſide ſends forth the *Gaſtrica Major*, which dividing into two parts after it hath ſent a little Twig to the Stomach, makes the *Coronaria Stomachica* and the *Gaſtrica Siniſtra*. And out of its loweſt ſide ſpring the *Epiplois Poſtica*. which runs to the hinder Leaf of the *Omentum* and the *Colon* annexed to it, and the *Epiplois Siniſtra* which goes to the loweſt and left ſide of he *Omentum*.

COELIACK *Paſſion* or *Affection*, is a kind of Flux or *Diarrhæa*, wherein the Aliments either wholly changed, or only in part, paſs by Stool without any Chylification, and it is two-fold; the firſt, in which the Meat is only digeſted in the Stomach; the other when Concoction or Fermentation is performed in the Stomach and Inteſtines both at once; but by reaſon that the *Lacteal Veſſels*, or little Seats of the Guts, are obliterated through long faſting, a *Parulent Dyſentary*, or the like, the *Chyle* is not diſtributed. *Blanchard*. 'Tis called alſo *Lienteria*.

COELONIA, is a hollow and round Ulcer in the *Horny Tunick* of the Eye.

COELUM, is the Cavity of the Eye towards the Corners. The Palate is alſo called *Cælum* by ſome. *Blanchard*.

COFFER, in Fortification, is a hollow Lodgment athwart a dry Moat from ſix to ſeven Foot deep, and from ſixteen to eighteen broad, the upper part being made of pieces of Timber raiſed two Foot above the level of that Moat; which little Elevation hath Hurdle laden with Earth for its covering, and ſerves as a Parapet with Embraſures. The Beſieged generally make uſe of theſe *Coffers* to repulſe the Beſiegers when they endeavour to paſs the Ditch, and they are diſtinguiſhed only by their length from the *Caponniers* which are likewiſe ſomewhat leſs in breadth: And it differs from the *Traverſe* and *Gallery*, in that theſe are made by the *Beſiegers*, and the *Coffer* by the *Beſieged*.

To ſave themſelves from the Fire of theſe *Coffers*, the Beſiegers *Epaule* or throw up the Earth on that ſide towards the *Coffer*.

COFFRE, is alſo ſometimes uſed for *Caiſſors*: Which ſee.

COGITATION, properly is the Action of Thinking; but the *Carteſians* underſtand by it whatever we experience in our ſelves, and whereof we are conſcious, as all the Operations of our Underſtanding, Will, Imagination and Senſes.

COGNATION: See *Agnation*.

COGNATIONE: See *Coſenage*.

COGNIZANCE, in Heraldry, is the ſame with the *Creſt*, which in any Atchievement helps to adorn and marſhal a Coat of Arms;

Alſo a Badge on a Serving-man, or Waterman's Sleeve.

In the Law, 'tis the Acknowledgement of a Fine, or Confeſſion of a thing done; as alſo a Power or Juriſdiction: Thus *Cognizance of Pleas* is an Ability to call or cauſe a Plea out of another Court; which no one can do but the King, unleſs he can ſhew a particular Charter for it.

COGNISEE or *Connuſee*, is he to whom the Fine is acknowledged.

COGNISOR or *Connuſor*, is he that paſſeth or acknowledgeth a Fine of Lands and Tenements to another.

COGNITIONIBUS *Mittendis*, is a Writ to a Juſtice or other that hath power to take a Fine, who having taken acknowledgment thereof, deferreth to certify it into the Court of *Common-Pleas*, commanding him to certify it.

COGITCAL *Line*: See *Line*.

COHESION *of the Parts of Matter*, is that Quality, from whenceſoever ariſing, by which the Parts of all ſolid Bodies ſtick or adhere to one another. Some will have this to be effected by a certain Glue or Cement; others by the Particles being hooked and branchy, and ſo to catch hold of one another: Others will have it to be occaſion'd by an imaginary Funiculus or inviſible Rope or String which holds the Parts together; others by bare Reſt only; all which the famous *James Bernoulli* in his Book *de Gravitate Ætheris*, endeavours to refute, and thinks 'tis occaſion'd by the Preſſure of the incumbent Air or Æther, and near the Earth of the whole Atmoſphere. This ſeems to be confirmed by the known Experiment of the *Cohesion* of two well poſited Marbles together, which yet will eaſily and ſpeedily fall aſunder, when put into the exhauſted Receiver, where the external Preſſure of the Air is taken off; and *Bernoulli* ſuppoſes the whole Body of the Æther, as well as of the lower Air to gravitate continually upon the Earth, and by that means to keep all its Parts together: See *Vol.* II.

COHOBATE, a Term in Chymiſtry, implying a repeating the Diſtillation of the ſame Liquor, having poured it again on the Matter which remains in the Veſſel. This Operation is uſed to open Bodies, or to volatilize the Spirits, and is called *Cohobation*.

COILE: See *Quoile*.

COINDICATIONS, are Signs which do not indicate by themſelves alone, but together with other Things, Circumſtances, *&c.* help the Phyſician to form a Judgment.

COINS or *Quoins*, belonging to a Great Gun, are thoſe Wedge-like pieces of Wood which ſerve to raiſe or lower her Breech on occaſion.

There are alſo a ſort of *Coins* called *Canoique Coins*, which are ſhort, and having three Edges, they are uſed in a Ship to put between Casks and to keep them from rowling one againſt another in the Hold: For the ſame uſe almoſt ſerve a third ſort of *Coins* called *Standing Coins*, which are made of Barrel Boards, and are about 4 Inches broad, and of a fit length to be driven in between the Ends of the Cask about two or three Hoops from the Chine-hoops, to keep the Butts from jogging.

COINS. I thought it would be very uſeful to give the Reader a *Table* of the Ancient and Modern *Coins* uſed in moſt Countries, which as I had opportunity I collected, and are as followeth:

I. The *Hebrew* or *Jewiſh Coins*, their Weight and Value according to Dr. *Cumberland*.

	Value.
Shekel, was $\frac{1}{2}$ Oz. Averdupois,	2 *s.* 4 *d.* 1 *q.* $\frac{1}{3}$
Bakah, was $\frac{1}{2}$ a *Shekel*.	
Zuza, was $\frac{1}{4}$ *Shekel*. This is mention'd by the *Talmudiſts*.	
Gerah, *Lgurah*, or *Keſhitah* is the $\frac{1}{20}$ *Shekel*.	
Talent, was in Weight 3000 *Shekels*.	
Valued, if { Silver	353 *l.* 11 *s.* 10 *d.* $\frac{1}{2}$.
{ Gold	5064 3 10
Manah, in Weight 100 *Shekels*, value 60 *Shekels*.	
The *Perſian Darchmons*, or *Golden Daries*, were equal to 12 *Gerahs*.	

The

The *Roman Silver Denarius* was $7\frac{1}{4}$ *d.*
The *Roman Gold Denarius*'s were double in weight.
The *Roman Brazen As* weighed $\frac{1}{2}$ Ounce; valued 3 *Farth.* $\frac{1}{10}$.
The *Assarium* was $\frac{1}{2}$ of the *As*.
Quadrans $\frac{1}{4}$ part.
The *Mitre* was $\frac{1}{8}$ of the *As*, or about $\frac{1}{2}$ of our Farthing.

Sestertius (mark'd thus IIS) was 2 *Asses*, and $\frac{1}{2}$ of the *As*, in Value 7 Farthings and $\frac{1}{10}$ of a Farthing.
Denarius (mark'd thus, X) was 10 times the *As*, and therefore was of our Money 7 Pence 3 Farthings.
Sestertium was 8 *l.* 1 *s.* 5 *d.* 2 *f.*

An Account of the Hebrew Coins *from Mr.* Jeak's Arithmetick.

				l.	*s.*	*d.*
Hebrew. Money. Silver.	(a) *Shekel*, of the *Sanctuary*, in	Weight $\frac{1}{2}$ *Oz. Troy*		00	02	06
		Value to Sterling Money				
	(b) *King's Shekel*, half the *Sanctuary Shekel*, called *Bekah*			00	01	03

		Silver	60 *Shekels* 30 *Oz. Troy*	07	10	00
	(i) *Chichar* or *Talent* in Weight	3000 *Shekels* 123 *lb. Troy*	valuable in Gold	4500	00	00
			Silver	375	00	00

(a) This piece of *Coin* is often mentioned in Sacred Writ, and looks like the Standard of all the reſt. On the one Side was ſhew'd the Veſſel in which the *Manna* was, inſcribed in this Perigraph *Shekel Iſrael*; on the other Side the Rod of *Aaron* that budded, with this Inſcription, *Jeruſalem Kodſhaſh*, in *Engliſh*, *The Holy Jeruſalem*, called *Shekel* from *Shakal* to weigh: For Money, at the firſt, ſeems to be a Merchandiſe, exchanged or given for other Commodities, as *Gen.* 23. 16. after the *Chaldee* called *Silgha*, and commonly with the *Hebrews*, *Keſeph*, *i. e.* Silver; and being put abſolutely, rendered a *Silverling* or Piece of Silver, by Expoſitors, as uſually as a *Shekel*, when the Quality is not mentioned, is taken for a Silver *Shekel*.

(b) Firſt mentioned, *Gen.* 24. 22. paid by all as a Yearly Tribute, *Exodus* 30. 13, 15. 2 *Chron.* 24. 6, 9. towards the Repair of the Tabernacle firſt, and after of the Temple. Between this and the *Sanctuary Shekel* ſome mentioned a third ſort of *Shekel*, called the *Common Shekel*, valued at 20 *d.* of our Money, of which I find nothing but uncertainty.

(c) In *Nehem.* 10. 32. noted as a Yearly Tribute given to the *Jews* by a Civil Decree to the Second Temple.

(d) 1 *Sam.* 9. 8. ſpoken of and equal to the old *Attick Dram* and *Roman Penny*, as ſeveral ſay, and by ſome called *Zuz*, *Zuza*, *Zur* and *Zura*.

(e) *Agurah*, render'd *Gerah* by the *Chaldee* Paraphraſe, and alſo *Megna* or *Megha* in that Tongue; by the *Arabians*, *Mega*; *Greeks*, *Obolus*; and in *Engliſh*, *a Piece of Silver*, 1 Sam. 2. 36. called alſo in the *Hebrew*, *Keſhitah*, becauſe Signed with the Image of a Lamb; ſee *Gen.* 33. 19. *Joſhua* 24. 32. Twenty of theſe made a *Shekel*, *Exod.* 30. 13.

(f) The *Zahab*, and Golden *Shekel* in *Rider*'s *Dictionary* undervalued at 15 *s.* for tho' *Hunt* in his *Handmaid to Arithmetick* out of *Breerwood de Nummis*, mentioneth the Weight but two *Attick Drams*, yet he valueth it at 30 Shill. *Alſted* in his *Encyclopædia* of *Arithmetick* makes it 4 Drams, which accounted $\frac{1}{4}$ *Ounce Troy*, muſt yield double the Value of 15 Shill. And moſt Authors agree that the Gold *Shekel* was equal in Weight with the Silver *Shekel*, ſo the Difference muſt be only in the Value of the Metal. Some to keep up the Credit of differing Authors, conceive there were two ſorts of *Golden Shekels* as well as *Silver*, the one double to the other.

(g) Theſe Golden *Adarkons* and *Drackmons* ſeem to be *Perſian*, or Coins of ſome other *Nations*, and Current, not Coined in *Judea*, nor read of till after the *Captivity*; for tho' the Word be uſed 1 *Chron.* 29. 7. yet both Books of the *Chronicles*, as moſt take it, were penn'd by *Ezra* after his return from *Babylon*, in whoſe Book mention is made thereof, as in *Ezra* 2. 69. and 8. 27, *&c.* in *Greek* called *Drachme*, and in *Engliſh* rendred *Drams*. *Alſted*, in his *Encyclopædia* of *Arithmetick*, makes the Value equal to a Ducat of *Hungary*: But *Hunt*, who throughout his Book hath much loſt himſelf in valuing 2 *Attick Drams* in the *Zahab* at 30 *ſh.* and 2 *Attick Drams* in the *Adarkon* (which he ſaith is the Weight thereof) at 15 *s.*

(h) The *Maneh* in Gold, by comparing 1 *King.* 10. 17. with 2 *Chron.* 9. 16. is found to be 100 *Shekels*, which *Buxtorf* and others underſtand not of the *Holy* but the *Royal Shekel*. The *Maneh* in *Ezek.* 45. 12. ſeems to be 60 *Shekels*, and hereto ſeveral agree, but ſome think it was now encreaſed 19 *Shekels* more than of old, and call it *the new Maneh*, valued nevertheleſs with moſt after the *Holy Shekel*, in Silver at 7 *l.* 10 *s.* *Buxtorf* tells us alſo of a *Maneh* of 25 *Holy Shekels*. The *Aſſembly*'s *Annotations* on *Ezek.* 45. 12. make 3 ſorts of *Manehs*, *viz. Common* 15, the *King*'s 20, and the *Holy* 25 *Shekels*; but the Word *Maneh* is Singular and not Plural in the *Hebrew* Text there, as noting all thoſe Diviſions to make but one *Maneh*.

(i) The

(i) The *Chichar*, by ſome wrote *Kichar*, and commonly tranſlated *Talent*, contained 3000 *Shekels*, as may be collected from *Exodus* 38. 25, 26. where the Silver collected is expreſſed to be 100 Talents, and 1775 Shekels, *v.g.* and the Perſons that paid it at half a Shekel a Piece, *v.* 26. numbred to be 603550, whereof the Half is 301775, which divided by 3000, the Shekles in one Talent, makes 100 Talents, and leaves the odd Shekels remaining 30) 1775 (100

3 000

The *Talent* thus valued after the *Holy Shekels*, makes the number of Talents mentioned in ſome Texts of Scripture, eſpecially 1 *Chron.* 22. and 29 *Chapters*, amount to ſuch Maſſy Sums, that ſome think the Talents are to reckoned at the Rate of the other Shekel; and others, not improbably, that the *Jews* had a Piece of Money or Plate of Gold of ſmall Value (as may be obſerved anciently in *Homer Iliad lib.* 23.) called a *Talent*. And *Fuller* in his *Piſgah ſight of Paleſtine*, *Book* 3. *P.* 356, 357. ſhews whereon ſuch an Opinion may be ſtrengthned; and that the Talent mentioned in ſome Scriptures may be rather this than the other.

The Account both of the Hebrew Weight *and* Money, *with their Value in* Sterling-Money *and* Troy-Weight, *is Contracted into the following Table.*

Hebrew Gold and Weights.

Chichar or *Talent*	1	*Month.*				
Maneh or *Pound*	*Old* 60	*New* 50	1 *New*	*Old*	*Zahab.*	
Zahab or *Shekel*	3000	60	50	1		*Adark.*
Adarkon or *Dram*	6000	120	100	2		1
Troy-Weight	125 *l.*	2½ *l.*	1 *l.* 13⅓	½ *Oz.*		¼ *Oz.*
Sterling-Money	4500	90 *l.*	75 *l.*	1 *l.* 10 *s.*		15 *s.*

Hebrew Silver and Weights.

| *Chichar* or *Talent.* | 1 | | | |

** *Bes*, is the Mark Weight, two Thirds of the Pound, *Malines*, P. 24. aforesaid, makes the *Bes* or Old Mark of the *Romans* to be divided into

16 *Loos*, or *Tetradrams*.
23⅓ *Tridrams*.
32 *Didrams*.
64 *Drams*.
96 *Obolos*, or *Treobolus*.
128 *Triobulos*.
384 *Obolos*.
768 *Miobolos*.
3840 *Moments*.

b. *Semiuncia*, or the Half Ounce, is sometimes called *Assarion* and *Assarius*; and by *Alsted*, *Lotho*, answering to a *German* Weight of that Name.

c. *Duella*, being double the Weight of the *Sextula*, is sometimes called *Binæ Sextulæ*.

d. *Sicilicum*, or *Silicus*, and by Abreviation *Siclus*, is ¼ of an Ounce.

e. *Sextula*, used promiscuously with *Sextans* and understood, by import of the Name, to be the Sixth Part.

f. *Denarius*, a Penny Weight, the seventh Part of the Ounce, whether used to Weigh any thing but Money as the other Divisions thereof, somewhat questionable, see among the Money, *Alsted* compares the *Drachmal Denarius* to the *German* Weight *Quintlein*.

g. *Quinar*, was half the Penny Weight, and a Piece of Money set afterward among the *Roman* Coins.

*, Between the *Quinar* and *Scruple* some mention a Weight called *Termissis*, containing 32 Grains, being the 18th Part of an Ounce.

h, *Quadrane*, here, is ¼ of the Penny Weight; and so called *Quadrans Denarii*, to distinguish it from *Quadrans Libræ*, which was 3 *Ounces*.

i. *Sextans*, called *Sextans Denarii* to difference it from *Sextans Libræ*, was the sixth Part of the Penny-Weight, and sometimes called *Sextula*.

k. *Obolus*, or half a *Scruple*, called sometimes *Simplium*, weigheth 12 Grains. If there be another *Obolus*, as some say, which was the Third Part of a *Quinar*, it seems to be a Piece of Coin, and must weigh 13⅓ Grains, and so is all one with the *Sextans*, according to the *Tabulary* Divisions; yet this sort of *Obolus* they make to contain but 10 Grains.

Between the *Obolus* and the *Siliqua* some mention a *Cerates*, which they say contains 6 Grains, and so is ⅓ the *Obolus*, or ¼ of the *Scruple*.

The Braſs *Unica*, miſprinted in *Rider*, at $\frac{1}{10}$ *Aſſis*; for $\frac{1}{10}$ Part of three Farthings, cannot be $\frac{1}{10}$ of our Penny, counting 4 *Cees* to a Farthing as they do.

So alſo is *As*, as *ob. q.* for *ob. qa.* for *As* being the 10th Part of the *Denarius*, muſt be 3 Farthings, 10 times 3 making 30 Farthings, which is 7 $\frac{1}{2}$ *d.* the Value of the *Denarius*. To the Braſs *As* was the Silver *Libella* equal in Value.

Obolus, being $\frac{1}{8}$ of the *Roman* Penny, is called by *Celſus*, *Sextans*.

Seſtertius, Engliſh'd a *Seſtertian*, was $\frac{1}{4}$ of the *Roman* Penny, and being of the *Maſculine Gender*, was differenced from the other being of the *Neuter Gender*, and in Numbring by theſe *Seſtertias*'s, theſe 3 Rules are to be obſerved.

1. If the Numeral Noun agree in *Caſe*, *Gender* and *Number* with the *Seſtertian*, it ſignifieth barely juſt ſo much as was pronounced, as *Decem Seſtertii* is 10 *Seſtertians*.

2. If the Numeral Noun of another *Caſe* be joined with the *Genetive Caſe Plural* of *Seſtertius*, it noteth ſo many Thouſands, as *Decem Seſtertium* (for *Seſtertiorum*) is Ten Thouſand *Seſtertians*.

3. If an *Adverb* be put without any Numeral joined, as *Decies*, *Vigeſies*, &c. or joyned with *Seſtertium* the *Genitive Caſe Plural*, there is underſtood by it ſo many Hundred Thouſand, as *Decies Seſtertium* is Ten Hundred Thouſand *Seſtertians*, Alſted *delivers it thus*;

From 1 *Seſtertian* to 1000 in the *Maſculine Gender*, as *Unus Seſtertius*, *Decem Seſtertii*, &c. is 1 Seſtertian, 10 Seſtertians, *&c.*

From 1000 to 100000 in the *Neuter Gender* and *Plural Number*, as *Singula Siſtertia* 1000 Seſtertians, *Bina Seſtertia*, 20 Seſtertians, *&c.*

From 100000 upward, all expreſſed adverbially and in the *Genitive Plurul*, as *Semel Seſtertium* 100000, *Decies Seſtertium* 1000000, *&c.*

Victoriatus was ſo called, becauſe ſtamped with the Image of *Victory*; and *Quinarius*, becauſe equal in Value to 5 Braſs *Aſſes*, or half the *Denarius*.

Bigatus, ſome call *Quadratus*, had the Print of a *Cart* or *Chariot* on it, and was of Value equal with *Denarius*.

Denarius, q. d. *Dena æris*, becauſe it containeth 10 *Aſſes*, rendred a Penny. *Mat.* 18. 28. and 22. 19. at the Old Rate was $\frac{1}{7}$ of an Ounce, and at the new $\frac{1}{8}$, and at this Rate all the other Coins are valued in the Table. This is ſometimes called the *Drachmal Denary* for Diſtinction ſake. Some make 3 ſorts of Pence, the heavier weigheth $1\frac{1}{3}$ *Attick Dram*, the Mean of one *Dram*, and the leaſt lighter than 1 *Dram* by $\frac{1}{24}$ of an Ounce, or thereabouts. Some ſay one was $\frac{1}{7}$ of the *Roman Unica*, the Mean $\frac{1}{7\frac{1}{2}}$, and the Lighter $\frac{1}{8}$. *Budeus* makes the *Attick* Dram and *Roman* Penny of the ſame Weight and Worth, wherewith moſt agree, and accordingly each in the foregoing Tables are valued at $7\frac{1}{2}$ *d.* after 5 Shillings the Ounce.

The Golden *Denaris* mentioned in *Holyoke* at 2 *s.* $4\frac{1}{2}$ *d. Sterling*, I have omitted, as not ſatisfied in the Weight, nor certain of ſuch a Coin.

The Golden *Amient* ſeems the Eldeſt and Greateſt, a Piece Coined by the *Conſuls*, therefore called *Conſularis*, weighed $2\frac{1}{7}$ Drams.

The *Imperatorius*, or Piece of the Emperor's Coin 2 Drams.

The *Drachmal* 1 Dram, and the *Triens* of the *Imperatorius*.

After *Conſtantine* removed his Seat to *Bizantium*, now called *Conſtantinople*, a City after his own Name, we read of *Follis* in *Euſebius*, a Braſs Piece, as *Lampridius*, or of *Iron*, as *Euſtathius* ſaith, ſo called becauſe it repreſenteth a Leaf, in Latin *Folium*, and was $\frac{1}{72}$ of the Silver ſimple *Siliqua*.

The Silver *Siliqua* or *Ceratium* was double: The Simple $\frac{1}{3}$ of the *Millieriſium*, value 5 *d.* The Great called *Cerates*, 1 Dram equal to the Penny $7\frac{1}{2}$ *d.*

Milliariſium, weighed 2 Drams.

Conſtantine's Piece of Gold was called *Romanus Solidus*, at the Proportion of 7 *s.* 5 *d.* for a Dram of Gold muſt weigh $1\frac{1}{2}$ Dram.

Theſe continued currant till *Valentinian*, who made his Coin ſomewhat heavier.

Valentinian's Piece of Gold by ſome is called *Sextula*. and being valued at 10 *s.* Sterling, muſt weigh $1\frac{1}{3}$ Dram.

Of which the { *Semiſſis* / *Tremiſſis*, or *Triens* / *Scruple.* } being { $\frac{1}{2}$ / $\frac{1}{3}$ / $\frac{1}{4}$ } was { $\frac{12}{24}$ / $\frac{8}{24}$ / $\frac{6}{24}$ } of a Dram.

Sportula, ſay ſome, was a Lawyer's Fee, or an Alms diſtributed by Princes among the People. See *Selden's Hiſtory of Tythes*, Chap. 4. P 37, 38.

Accounts of Exchange of Money at ſeveral Places.

2. 11. *A Leppo*, the Exchange is made by *Sultanies* of 120 *Aſpers*, or *Dollars* of 80 *Aſpers*, every *Aſper* 10 *Marcherines*.

3. 1. *Alexandria*, they account by *Ducats*, either *Ducat de Pargo*, of 120 Maids, Ducat of *Venice* of 40 Maids, or *Italian* Ducat of 35 *Maids*.

1. 7. *Ancona*, Exchange is made on the Ducat of 21 Groſs (which is in Specie 23 Groſs) which Ducat alſo is 14 *Carlina*, and every *Carlina* 6 *Bollidini*; ſo in the Ducat of 84 *Bollidini*.

1. 4. *Arragon*, the Rial or Ryal of the Plate is 23 *Dinero's* (*Hunt* ſaith 13) and the Ducat is 12 Ryals, whereon they make Exchange; and they account by Pounds of 20 *s.* and 12 *d.* And the Ducat of 12 Ryals, every Ryal of 1 *ſh.* or 12 *d.*

1. 8. *Artois*, and in ſeveral other Places they Account and Exchange by Pounds or *Livres*, *Tournois* of 20 Stivers, or 40 Pence *Flemiſh*, whereof 6 called *Guilders* or *Florins* makes the Pound *Flemiſh* in all the 17 Provinces of the *Netherlands*; which Pound is divided into 20 *s.* and every Shilling into into 12 *d. &c.*

Some reckon by the Pound *Paris*, which is but 20 Pence, whereof 12 make 1 Pound *Flemiſh*, but their Accounts, as alſo the Finances of the Princes, are kept by Pounds *Tournois*, and both Pounds divided in 20 *s.* and every Shilling into 12 Pence, admitting alſo the Subdiviſions of Obolo's, Maille, Heller, Hallnick, Corte, Mites, Points, Engevin, Poot, and ſuch like Copper Monies.

Alſted mentions the *Florin* in *Germany* to be 15 Batz, every Batz 2 Albes, every Albe 8 Oboli or Nummos: ſo ſhall the *Florin* be 30 Albes or 240 Oboli.

1. 4. *Auguſta* or *Ausburgh*, Accounts on the Dollar Coined at 65 Creutzers, riſen ſince to 72. Exchange is made on the imaginary Rate of 65 Creutzers.

A Creutzer is ſometimes called a *Schreikenborger*, and in Latin *Crucigerus* and *Cruciatus*, being Pieces ſtamped with a Croſs: Their Groſs make 12 Creutzers; their Lyon Piece half a Creutzer. They have their Snubourgh, Blaphart or Bohemico's of 3 and $3\frac{1}{3}$ Creutzers. The Rix or Rycks Doller is 30 Albes of 8 *d.* every Albe, or 72 Creutzers every Dollar as before. See the following Table, and afterwards in *Germany*.

	Groſs.	*Batz.*	*Albes.*	*Creutzers.*	*Lyon.*	*Pence.*	*Black-pennies.*
Dollar	6	18	30	72	144	240	288
		3	5	17	24	40	48
		Batz.	$1\frac{3}{5}$	4	8	$13\frac{1}{3}$	16
			Albes.	$2\frac{3}{5}$	$4\frac{4}{5}$	8	$9\frac{3}{5}$
				Creutzers.	2	$3\frac{1}{5}$	4
					Lyons.	$1\frac{2}{3}$	2
						Penny.	$1\frac{1}{5}$

3. 2. *Barbary*,

3. 2. *Barbary*, generally Accounts are kept, and Commodities sold by Ducats of 10 *Oz.* each Ounce divided into 8 Parts, which 8 Part is in Value 12 *d.* Sterling.

1. 14. *Barcelona*, as at *Arragon*.

1. 4. *Bavaria*, Accounts and Exchanges both are by Guilders of 7 *s.* and 30 *d.* to the Shilling.

1. 4. *Bohemia*, as in *Germany*, generally by the Dollar of 24 Behemico's, called also *White Grosi*, each of 3 Creutzers: Other Divisions see in the Table following.

Scoc.	Marks.	Dollars.	Angsters.	Bohemico's.	Creutzers.	Pence.
1½	2½	1⅔	12	2	3	10
1	2	1⅓	8	1⅓	2	6⅔
¾	1½	1	6	1	1½	5
½	1	⅔	4	⅔	1	3⅓
⅜	¾	½	3	½	¾	2½
¼	½	⅓	2	⅓	½	1⅔
1/12	1/6	1/9	⅔	1/9	1/6	½

1. 7. *Bologna*, they account by Piastra or Pounds (called also Piastri) each containing 20 Bolognesi; and exchange on the Ducat of 4 Piastri.

1. 8. *Brabant*, and in most Places of the *Low Countries* Monies are accounted by the Pound *Flemish*, containing 20 *s. Flemish*, and every Shillings 12 *d.* or Deniers, called single Stivers, two of which make one double Stiver. See *Flanders*.

1. 4. *Breshaw*, they reckon by Marks of 32 Grosi of 12 Hellers to the Grosi; and exchange by 30 Florins, to have at *Norenborgh* 32 Florins, and at *Vienna* 34 Florins.

1. 7. *Calabria*, Exchanges are made by the *Naples* Ducat of 10 Carlini.

1. 14. *Castile*, Exchanges are made on the Ducat of 375 *Marvedies*, which they call in the Bill of Exchange *Ducadas d'oro*, or *de Peso*: to be paid out of the Bank is better by 6 or 8 *pro Miliar*. See *Spain*.

1. 14. *Cataloni*a, as at *Arragon*.

1. 4. { *Cleves*, / *Collen*, } both Accounts and Exchanges are made by Dollars of 72 *Creutzers*.

Their *Guilders* is

Marks.	Morkens.	White Pennies	Shillings, or Stivers.
4	12	24	48
Mark.	3	6	12
	Morken.	2	4
		White Penny.	2

1. 5. *Constantinople*, as *Aleppo*.

1. 9. *Dantzick*, they account by *Polish* Guilders of 30 Grosi, every Grosi 18 *d.* They buy with the great Mark of 60 Grosi, or the little Mark of 15 Grosi; also by the Scoc. of 3 great Marks: And exchange upon the *Florin Polish*, or the Pound *Flemish*. They have Dollars of 35 Grosi of 3 Shillings, and new Dollars of 24, 26 or 30 Grosi. Their Gilden is 80 Grosi, so is

Scoc.	Gilden.	Great Marks.	Dollars.	Guilders.	Little Marks.	Grosi.	Pence.
2¼	1⅔	3	5⅓	6	12	180	3240
1½	1	2	3⅓	4	8	120	2160

¼	⅓	½	7½
1/12	1/9	⅙	2½

1. 1. *Denmark*, they account by Marks of 20 Shillings, and exchange upon the Dollar.

1. 6. *Dublin* See *Ireland*.

1. 12. *Edinburgh*: See *Scotland*.

1. 4. *Embden*, they reckon by Gilders, and exchange on the Rix-Dollar, but from *London* hither and thither, upon the Pound *Sterling*.

1. 8. *Flanders*, as before in *Brabant*. See a more particular Division of the *Flemish* Money in the following Table.

Flemish Pound.	Guilders.	Shillings.	Pound.	Double Stivers	Single Stiver.	Groats.	Ortgens.	Negen-Manneken.	Copper Mites. Pence.
0	20	60	120	240	480	960	1920	2880

2	4	6
	2	3
		1½

Five single Stivers are currant in several Places of the *Low Countries* for six Pence *Sterling*; Ort-

kens in ſome Places are called Duyts; Mites in ſome Places of *Flanders* are called Cortes, Engcuni, Points, Pites, Poots.

1. 7. *Florence*, they account by Crowns of 20 *s.* 12 *d.* to the Shilling; and exchange by a Ducat called *Largo*, or *Scripto in Banco*. A Florin there is 24 Quatrini.

1. 3. *France* generally they uſe Livres, Sols, and Deniers, and commonly account by them, as the *Engliſh* by Pounds, Shillings and Pence; but by an Edict made 1577, their Accounts are to be kept in *French* Crowns of 60 Sols to the Crown, or 3 Livres, that is, Pounds *Tournois*; and Exchange is made thereupon, unleſs for ſome Places in *Italy*, where they exchange for number, to have ſo many Ducats for ſo many Crowns of the Sum, not *in ſpecie*, but imaginary, yet repeating the Value or Par. See further in the Table and Notes thereupon.

	Livres.	*Sols.*	*Liarts.*	*Doubles.*	*Deniers.*
French Crown A	3	60	240	360	720
	Livre.	20	8	120	240
B		*Sols.*	4	6	12
C			*Liart.*	1½	3
D				*Double.*	2
E					

There are alſo Petit Deniers and Mailles, but not conſiderable. *A*. This Crown here to make exchange by is equivalent to the Silver Coins of *Lewis* 13th and 14th, called *Lewiſes*, and imaginary, and not to be accounted for the *French Gold* Crown, which is a real Coin and of great Value now, being worth about 8 *s. Sterling*. The Account and Exchange agreed in reality 10 Sols then, and yea commonly reckoned for an *Engliſh* Shilling. Of this Gold Crown was the Cardecue a Quarter, and ſo valued in *Sterling* Money at 18 *d.* and ſhould be wrote *Quartid eſcue*, *Eſcue* being *French* for a *Crown*.

B and *C*, the Livres (or Pounds, ſometimes called Franks) and Sols (wrote ſometimes Soulx) derived from the *Latin*, *Solidus*, as *Livre* from *Libra*, are different. Thoſe commonly uſed are called *Tournois*, and valued with *Sterling* Money as above. Of the Sols *Barrois* 14 make 20 Sols *Tournois*. The Sols *Mauſais* is 2 Sols *Turnois*: The Sols *Paris* is 1¼ Sols *Tournois*. The Sols *Bourdelois* is half the Sols *Paris*, and ſo accordingly is the Livre to be accounted.

D and *E*; neither the Liarts nor Doubles, though both Copper Coins, are uſed in common Accounts.

1. 4. *Franckfort*, their Guilder or Florin by which they reckon is 60 Creutzers divided by 20 *s.* and every Shilling in 12 Hellers according to the Pound. But they exchange by the Dollar of 65 Creutzers, payable in the two Yearly Fairs or Marts, one the Week before *Eaſter*, and the other all the Month of *September*.

1. 7. *Genoa*, all Accounts and Exchanges are made by Crowns of 60 *s.* divided into 20 *s.* and every Shilling into 12 Pence.

1. 4. *Germany*, every Batz, by which generally they keep Accounts, is 4 Creutzers: They exchange on the Dollar, imaginary at 65 Creutzers, and ſo coined, as was noted before at *Auguſta*, though riſen to 72 in Value.

They have Pieces of 3, 6, and 12 Creutzers, and by them and their Batz they value their own and *Exotick* Coins; as the *Hungarian* Ducat is 27 Batz; the Gold Guilder is 18 Batz; the *Poliſh* Guilder or Dollar is 15 Batz; *Teſton* 5 Batz, *&c.* A Guilder was the Name the ancient *Romans* gave to an Ounce, and 8 Ounces made a Mark, and 12 Ounces of Guilders a Pound; and there were coined Pieces called *Nummi Dragmi* or *Groſſen*, the 8th Part of a Dollar. *Anno* 1520 was the Gold Guilder coined for a general Coin, and valued in *Holland* at 28 Stivers, but now in *Specie* at double the Price: Nevertheleſs Corn brought from *Poland* and the *Eaſt Countries*, is bought and ſold by the ſame at the old Value of 28 Stivers.

Angelicies was the ſixth Part of a Dollar, making 3 Batz or 12 Creutzers. Theſe Angelici becoming Tribute Pennies were allayed, and ſo being made worſe, did obtain the Name of Batz or Bats (ſometimes wrote Batſes) *quaſi* Baſe: And in *Thuringia* they are called Gulielmi, and in *Bohemia*, Bohemici, whereof they have alſo 12 Pieces dividedly for for 12 Pence, which Penny is 2 Hellers in Account all over *Germany*.

2. 6. *Goa*, their common Account is by their ordinary Silver Coin a *Pardaune Xeraſin*, having the Image of St. *Sebaſtian* on one Side, and 3 or 4 Arrows bound together at the other, which is worth 3 Teſtons, or 300 Res of *Portugal*, but varieth as the Exchange riſeth or falleth; and accordingly their other Coins and Accounts, of which ſome are imaginary and ſome real. They have alſo ſome good and ſome bad Monies; for 4 good Tanga's or 5 bad Tanga's are reckoned to value 1 Pardaune Xerafin, and 1 Tanga is 75 Baſarves. Of theſe Baſarves 375 make 1 Pardaune Xerafin, and 15 good Barſarves are valued with 18 bad, which are made of bad Tin. By theſe other Country Coins are rated, as the *Larin* of *Perſia* is worth 105, and 108 Baſarves, as the Exchange goes. A Pardaune of *Larins*, is 5 *Larins*, and the Crowns of *Venice* or *Turkey* are almoſt worth 2 Pardaune Xerafins. They have alſo a *Pagod*, or Gold Crown, on which is the Figure of their *Idol*, worth about 8 Tanga's; and Gold Crowns of St. *Thomas* with his Image on them, eſteemed at 7 or 8 Tanga's.

1. 1. *Hamborough*, their Dollar was firſt coined at 31 Shillings Lups, and many Years currant for 33, is now haunced to 54 *s.* Lups, of 3 white Penny, and every Shilling is 12 *d.* and every Penny 2 Hellers. They account by Marks of 16 *s Lubiſh*, and 12 *d.* to the Shilling; but exchange for *London* upon the Pound *Sterling*, and for other Places on the Rix Dollar of 33 *s.* now by them inhaunced to 54 *s. Lubiſh*, or ſo many Stivers *Flemiſh*.

1. 8 *Henault*, as *Antois*.

1. 4. *Hungaria*, account by Guilders of 10 Shillings, of 33 *d.* to the Shilling: and exchange on the Ducat and Rix-Dollar, worth 8 Shillings, formerly but 7 *s.* 6 *d.*

1. 6. *Ireland*, they, as the *Engliſh*, account by Pounds of 20 Shillings *Sterling*, and Pence of 12 to the Shilling; only their Harper, valued in *England* but 9 *d.* was with them counted 1 *s.* ſo as their Pound is but ¾ of ours, or 15 *s. Sterling*; and thereon Exchanges are made.

1. 4. *Leipſick*, as *Breſla*.

1. 10. *Lisbon*: See *Portugal*.

1. 8. *Low Countries*, generally as before at *Brabant*.

1. 2. *London*, Exchanges are generally made for *Germany* and the *Low Countries* on the Pound *Sterling*; for *France* on the *French* Crown of 60 Sols *Tournois*; for *Italy*, *Spain* and other Places on the Ducat, Dollar or Florin, according to the Cuſtom of the Place.

1. 7. *Luca*,

17. *Luca*, for divers Places in *Italy*, and *Lyons* in *France*, Exchanges are made on the Ducat.

l. 3. *Lyons*, as before in *France*.

l. 14. *Madrid*: See *Spain*.

l. 7. *Milan*, Accounts are kept by Ducats Imperial, divided by 20 *s.* and 12 *d.* to the Shilling, and Exchanges made on the ſame, accounting 80 *s.* to the Ducat Imperial; but they buy by a Ducat currant of 120 *s.*

l. 7. *Naples*, they account by Ducats, Taries and Grains. The Ducat is 10 Carlini or 5 Taries, for the Tary is 2 Carlini or Royals; and hereupon Exchanges are made for moſt Places of *Italy*; but for *Lyons* they exchange by Number, as 125 Ducats for 100 Crowns.

l. 5. *Norembourgh*, the Exchange is made on the Dollar of 65 Creutzers, and many times on the Guilder of *Florin*, of 60 Creutzers, which they alſo divide into 20 *s.* and every Shilling into 12 *d.* to keep Accounts by; and ſome ſay the Creutzer is 4 *d.* every Penny is 2 Hellers, and 5 *d.* is called a *Fynfer* or 5 Pennick.

l. 7. *Palermo*, the Ducat is 13 Taries, 1 Tary 2 Carlini, 5 Ryals of *Spain* are 6 Taries. They account by Ounces of 30 Taries, to 20 Grains every Tary, and every Grain 6 Piccolie. And their Exchanges are made upon *Florins* of 6 Taries or Tarii.

l. 3. *Paris*, as before in *France*.

l. 9. *Poland*, they account by Marks, and exchange on the Dollar, and alſo on the Florin of 48 *s.* The Mark is one Third Part of it.

l. 4. *Pomerania*, they divide their Money as in the Next Table following, account by Marks of 16 Snudens, and Exchange upon the Rix-Dollar of 32 *s.* or 2 Marks Snudens, ſo called to diſtinguiſh them from Marks-Lups and Shillings-Lups.

	Marks-Snudens.	*Lups-Shillings.*	*Shillings. Snudens.*	*Pence.*	*Hellers.*
Rix-Dollar, *Mark-Lups.*	2	16	32	384	768
Mark-Snuden.		8	16	192	384
	Shilling-Lups.		2	24	84
		Shilling-Snuden.		21	24
			Penny		2

l. 10. *Portugal*, they account by *Milrais*, Ducats or Cruſado's, *&c.* as in the Table following, and exchange by the ſame Ducat of 400 Rais.

	Ducats, or *Cruſado's.*	*Teſtons.*	*Rials.*	*Vintaines*, or *Half Rial.*	*Raies.*
Mil-Raies.	2½	10	25	50	1000
Ducat, or *Cruſado.*	4	10	20	400	
	Teſton.	2½	5	100	
		Rial.	2	40	
			Vintaine, or *Half Rial.*	20	

Of theſe Ducats, Rials (or Royals) and Raies (wrote alſo Reas, Reyſe and Res) are moſt in uſe for Account. They have Teſtons alſo of 4 Vintaines; 40 Raies are commonly accounted for ſix Pence *Sterling*, and ſo accordingly were the other Coins valued till the late Advance, whereby the Teſton of 100 Raies were ſtamped and made currant for 120 Raies, and ſo rated at 1 *s.* 6 *d.* *Sterling*, when before but 1 *s.* 3 *d.*

l. 7. *Puglia*, as *Calabria*.

l. 9. *Riga*, they buy by Dollars or Florins *Poliſh* of 18 Farthings, whereof 11 make 10 Dollars, but they exchange upon the Rix-Dollar.

l. 3. *Roan*, as before in *France*.

l. 7. *Roan* Accounts and Exchanges are performed by Ducats *di Cameri*, of 13 July or *Guili*, every Ducat; which they divide into 20 *s.* and every Shilling into 12 *d.*

l. 11. } 2. 10. } *Ruſſia*, they have ſmall Coin of 11 *Oz.* 2 Penny Weight fine, called *Dengen*, whereof 320 Pieces weigh but a Mark of 8 *Oz.* They exchange upon the Dollar of *Germany*; but for *London* upon their Rubble, which is valued as a double Ducat, formerly accounted to a Mark *Sterling*, or 13 *s.* 4 *d.*

l. 14. *Saragoſſa*, as *Arragon*.

l. 12. *Scotland*, they account by Pounds, Shillings and Pence as in *England*, but one Pound *Scotch* is but 20 *d.* *Engliſh*. Their Mark is 13⅓ *s.* *Scotch*, currant in *England* at 13½ *d.* Their Noble or half Mark with them 6⅔ *s.* with us 6¼ *d.* their half Noble and third Part of their Noble proportionably. They have alſo Turnoners, Pence and Half-pence; and baſe Money of Bodles, Achiſons, Babees, Placks, *&c.* accounting 6 Bodles to 1 *d.* *Sterling*, or 12 *d.* *Scotch*; 4 Bodles to 1 *Achiſon*, 3 to 1 Babee, and 2 to 1 Plack; but they exchange upon their Mark.

l. 14. *Spain*, as in *Madrid*, *Sevil*, and other Places their Accounts are kept by *Malvedies*, or *Marvedies* (wrote alſo *Merveides* and *Meravides*) whereof 375 are eſteemed to make a Ducat of 11 Rials, tho' really every Rial is 34 *Marveides*, and ſo maketh but 374, as in the Table following; and ſo others keep Accounts accordingly. Exchange is made on this imaginary Ducat of 375 *Marveides*, to be paid in Bank with 5 on the 1000, which is the Salary of the Banker; or without the Bank to be paid without the ſame.

	Pieces of Eight.	*Rials.*	*Quartilio's.*	*Marveides.*	*Carnado's.*
Ducat.	1⅜	11	44	374	2244
Piece of Eight.		8	32	272	1632
	Rial.		4	34	204
		Quartilio.		8½	51
			Marveid		6

A Rial is about 6½ *d.* *Sterling*.

l. 4. *Strasborough* or *Strausburgh*, they have Blapharts, Groſs, Behemico's, all currant for 3 Creutzers apiece, 1 Creutzer at 2 *d.* one Penny at 2 Hellers, and 1 Heller at 2 Orthings.

l. 15. *Sweden*, they rekon by Marks, whereof 8 make a Dollar, whereupon they exchange: And 2 Marks make a Clipping of 9½ Stivers.

l. 4. *Tirol*, the Dollar is 72 Creutzers, and the Creutzer 5 Fynfers or *Hellars*.

2. 11. *Tripoli*, as *Aleppo*.

l. 14. *Valentia*, as *Arragon*.

l. 7. *Venice*, Thirty Bats make 1 Souldey, and 20 Souldeys 1 *Livre* of *Venice*. Their Gold Ducat is valued equal to 40 Maides of *Alexandria*. They have alſo Copper Money, 1 Seſſini make 2 Quatrini, and 1 Quatrine, 4 Bagatini, and ſo 3 Quatrini, or 12 Bagatini make an Half-penny *Sterling*, or thereabouts.

They account by Pounds *Flemiſh* of 10 Ducats of 20 Shillings, and divide the Ducat into 24 Groſs, and the Shilling into 12 *d.* and alſo by the Ducat 124 *s.* called *Ducato di Banco*, or Currant, and thereupon Exchanges are made.

2. 7. *Verona*,

1. 7. *Verona*, their Accounts are kept by 20 *s.* and 12 *d.* to the Shillings; and they exchange upon the Ducat of 93 *s.*

1. 4. *Vienna*, both Accounts and Exchanges are kept and made by *Guilders* or *Florins* of 8 *s.* a piece, 30 *d.* to the Shilling, and 2 Hellers to the Penny.

They esteem the Rix-Dollars at 8 *s.* and the Ducat at 12 *s.*

1. 4. *Ulm*, they reckon by Pounds of 20 *s.* and 12 Hellers to the Shilling; and exchange on the Dollar of 60 Creutzers.

COITION, is a Word ſometimes uſed for that mutual Attraction or Tendency towards each other, which is found between Iron and the Magnet.

COLATURE, is that, which after boiling or infuſion of any Ingredients, is *percolated* or ſtrained through a Sieve or Cloth; or through *Hippocrates*'s *Sleeve*, as the Chymiſts ſpeak.

COLCOTHAR, is the dry Subſtance red as Blood which remains after Diſtillation of Vitriol, commonly called *Caput Mortuum*; though when Vitriol is calcined a good while in a ſtrong Fire, it will turn red, and is alſo called *Colcothar*.

COLD, is one of thoſe Qualities of Bodies which they call *Primary*, and is nothing but the arriving of the minute and inſenſible Parts of any Body at ſuch a State, as that they are more ſlowly or faintly agitated than thoſe of our Fingers or other Organs of Feeling; for from this Effect we pronounce any Body to be cold.

Mr. *Hobbs* thought the Cauſe of Cold to be only a *Wind* taking the condenſed or frozen Body.

Whether *Cold* be barely a Privation of Heat, or rather a ſtop put to that violent tumultary Motion of the inſenſible Particles of Bodies, as the *Carteſians* aſſert; or whether *Cold* be introduced by the Entrance of adventitious Particles actually cold themſelves, and therefore called *Frigoriſick Particles*, according to the Opinion of the Learned and Ingenious *Gaſſendus*, is a Controverſy not ſo eaſy to be determined as at firſt Sight it may appear. For though the *conſiderable Encreaſe of the Dimenſions* of the ſame Quantity of Water when turned into Ice, and the *prodigious Force of Freezing*, by which Water may be made to lift up vaſt Weights, and to break to Pieces ſome of the ſtrongeſt Bodies that are; and alſo ſince it is true, that a briſk, nay a furious Agitation of the ſmall Parts of a Mixture may be produced, and yet on the Conflict the Mixture ſhall become not only *not Hot*, but ſenſibly and conſiderably *Cold*; though, I ſay, theſe ſeem to bid very fair for a Proof of *Gaſſendus*'s Opinion; yet, on the other Hand, 'tis certain, that a *bare Privation of Motion* will produce, or rather occaſion, Effects as conſiderable as any of thoſe of Cold, as the Excellent Mr. *Boyle* largely ſhews in his Dialogue about the *Poſitive* or *Privative* Nature of Cold: And alſo, if it ſhould be ask'd how the Frigorifick Particles themſelves become cold? What degree of Gravity or Levity they have? What kind of Structure in them is proper to produce ſuch an Effect? Whether ſuch a Structure be deſtructible or mutable, or not? Whether theſe Frigorifick Particles be primitive Bodies or not? And whether there was not Cold in the World till they were produced; If theſe or ſuch like Queries were made about the Nature and Circumſtances of the Frigorifick Particles, it would, I believe, puzzle the Maintainers of the Opinion of *Gaſſendus* to give ſatisfactory Anſwers to them and therefore the Deciſion of this Point muſt be ſuſpended further.

Mr. *Boyle* found, that though Water uſually *expands* it ſelf in Freezing, yet 'tis alway firſt *contracted* or *condenſed*; and that Spirit of Wine, common expreſt Oils, and Chymical Oil of Anniſeeds it ſelf, will be notably condenſed when expoſed to an intenſe Degree of Cold. And he found that no other Liquor but Water, or one in which there are ſtore of Watry Particles, will ever be expanded by Cold. The Reaſon of which perhaps may be, that Water contains more Air in its Pores than other Fluids; and 'tis not improbable, that from the Co-aleſcence of many of the Aereal Particles into one during the Action of

Freezing

Freezing, their Spring may by that Means be encreaſed, and ſo they may from thoſe numerous and large Bubbles we obſerve in Ice, which occaſions it to be ſpecifically lighter than Water.

The Expanſion of Water in Freezing is about $\frac{1}{10}$ Part of the Space more than it before took up.

The *Expanſive Force* of *Cold* is ſo great, that if the Barrel of a Gun be filled with Water, and then have its Muzzle and Touch-hole well ſtop'd, the Water within the Barrel, when either by Natural Cold or a Freezing Mixture it is turned into Ice, will break the Barrel in ſeveral Places, as Mr. *Boyle* and many others have tried.

That noble Philoſopher contrived ſeveral Experiments to eſtimate or meaſure the Quantity of this *Expanſive Force*, which were made with a Braſs Cylinder of two or three Inches in Diameter, into whoſe Cavity was put a Bladder filled with Water, and ſtrongly tyed about the Neck, and over it was put a Wooden Plug, to ſtop up the upper Orifice of the Cylinder; and on the Plug was put a broad flat Board, on which was laid as much Weight as one time amounted to above an Hundred Pound, another time an Hundred and Twenty Pounds, and another time to two Hundred fifty four Pounds; and yet in all the Experiments, when the Water in the Bladder was turned into Ice, it expanded ſo as to raiſe up all this Weight very conſpicuouſly, as appeared by a Circle deſignedly made on the Wooden Plug.

He tells us alſo, That by mingling together three Saline Bodies, each of them purified by the Fire, tho' there did ariſe a very great Commotion, Hiſſing and Exploſion, yet a very conſiderable Degree of Cold was thereby produced: And tho' he was under an Obligation of not diſcovering what theſe Ingredients were, yet he gives a *Succedaneum* to that Experiment, by telling us, that by putting good Salt of Tarter into Spirit of Vinegar, there was a Struggle, Commotion and Hiſſing produced, and yet inſtead of Heat, as is uſual in ſuch Caſes, a very ſenſible Degree of Cold was produced.

Sylvious alſo acquaints us with a Method of producing Cold, by mingling *Spirit of Vitriol* with another *Saline Spirit*.

If in 3 or 4 times its weight of Water, you put about half a pound of *Sal Almoniack* powdered, and ſtir it about to haſten the Diſſolution, ſo great a Degree of Cold will, even in the Heat of Summer be produced, as is very ſurpriſing; for if you nimbly ſhake it, or ſtir it about, it will produce actual Ice on the outſide of the Glaſs, if you purpoſely wet it with Water. This Noble Experiment Mr. *Boyle* firſt made, and thereby plainly proved the Mechanical Producibleneſs of the Quality of Cold; and the Experiment may be of great Uſe to cool Wine, *&c.* in the hot Months, or in ſuch Places where no good Cellerage is to be had. The *Sal Armoniack*, by evaporating the Water from it, may be recovered again, and will ſerve many times for the ſame Experiment.

That Honourable Virtuoſo found alſo, that by ſhaking Gunpowder in 4 or 5 times its Weight of common Water, a conſiderable ſenſible Coldneſs would be produced.

The Learned Dr. *Slare* produces a conſiderable Experiment *(in Philoſ. Tranſ. N.* 150.) whereby a conſiderable Degree of Cold is made with a very great Ebullition, as in the former Experiment it is produced without any. The Experiment is only to pour into any ſtrong Acid (he uſed moſtly Spirit of Verdigreaſe) a Quantity of the Volatile Spirit of Human Blood; by which Means he tells us, that he produced ſo much Cold, as that the Spirit of Wine in an immerſed Thermoſcope, deſcended within half an Inch of the Freezing Point even in Summer. And this he thinks, very ingeniouſly, may ſerve to Explain the Phænomenon of the Cold fits in Agues.

And ſince, if into this Mixture he poured a ſmall Quantity of Oil of Sulphur, the Matter would immediately grow ſenſibly Warm, he not improbably ſuggeſts, that ſomething like this may occaſion the coming of the Hot-fit afterwards, when the Animal Spirits come to be mixed with the Blood more copiouſly, than at firſt in an Ague Fit they can be.

Neither *our Senſes* nor common *Weather-Glaſſes*, can enable us to make an accurate Judgment of the Degree of *Cold*.

For as to *our Senſes*, the Organs of Feeling are in a continual State of Mutability, and that (in general) appears Cold to us, which hath its Parts leſs moved than thoſe of our Hands or Bodies; and therefore if one Hand be very Cold, and the other moderately Warm, the ſame Water, for inſtance, will appear *Warm* to the *Cold*, and *Cold* to the *Warm* Hand.

As to *Common Weather-Glaſſes*, ſome Part of the Liquor being contiguous to the open Air, the Weight and Preſſure of the Atmoſphere hath ſo great an Effect on them, that their riſing and falling depends more on that than on *Heat* and *Cold*, and therefore they will often miſ-inform us,

The *Coldneſs* of Places doth not ſolely nor principally depend on their nearneſs to the Poles.

For *Martinius*, in his *Atlas Chinenſis*, ſaith, that in *China*, whoſe Latitude is no where above 42 Degrees, the Rivers for four Months together (*viz.* from the Middle of *November* till the Beginning of *March*) are ſo Frozen up, that loaden Waggons do ſafely paſs on the Ice; and that the Ships and Veſſels are all Frozen up; and what is moſt remarkable, is, the Froſt is uſually the Reſult but of *one Day's time*, though it require many to thaw it again.

A *Dutch* Maſter of a Ship, that went within a Degree of the Pole, found the Sea open, and the Weather tolerable enough.

COLDNESS *Potential*: See *Potential Coldneſs*.

COLICK, is a Vehement Pain in the Abdomen or lower Belly, and takes its Name from the Part chiefly affected, *viz.* the Gut *Colon*, which is ſtretch'd, prick'd and corroded by Winds or Excrementious Humours, either remaining within its Cavity, or fix'd to its very Coat.

COLLAR *of a Ship*, is a Rope faſtned about her Beak-head, unto which the Dead-man's Eye is ſeized that holds her Main Stay. There is alſo a *Collar* or *Garland* about the Main-Maſt Head, which is a Rope wound about there to ſave the *Shrouds* from galling.

COLLATERAL *Aſſurance*, is a Bond that is made over and beſide the Deed it ſelf, for the performance of Covenants between Man and Man.

COLLATION, in a Logical Senſe, is the ſame as a comparing of one thing well with another; but now-a-days 'tis uſed for an *Handſome Treat* or *Entertainment*.

COL-

COLLATIONE *facta ani post mortem alterius*, is a Writ directed to the Juſtices of the *Common-Pleas*, commanding them to direct their Writ to a Biſhop, for the admitting a Clerk in the Place of another preſented by the King, who during the Suit between the King and the Biſhop's Clerk, is departed this Life. For Judgment once paſs'd for the King's Clerk, and he dying before admittance, the King may beſtow his Preſentation to another.

COLLATIONE *Heremitagii*, is a Writ whereby the King conferreth the keeping of an *Hermitage* upon a Clerk.

COLLICIÆ, are the joining of the *Puncta Lachrymalia* into one Paſſage on both Sides, which derive the Humour of the Eye-lids into the Cavity of the Noſtrils; the Holes that are made in the very Tops of the Eye-brows deſcend in little Channels, they ſpread themſelves into a larger Channel, and are continued to the Tunick of the Noſtrils. The ſame Holes or Openings in Hares, Calves, Rabbits, are not found in the very Eye-brows, but a little more Inward; and moſt of all in Birds, where they are larger than in any other Creatures; the *Membrane* which ſeparates the Holes here is very ſhort. *Blanchard.*

COLLIQUANS *Febris*, is one of the Nature of ordinary burning *Fevers*, but by its exceſſive Heat they ſay it ſuddenly melts the Fat, Fleſh and Subſtance of the ſolid Parts of the Patient's Body; nay ſometimes diſſolves the very Blood in the *Veins*, as ſome tell you, and diſchargeth the ſame by inſenſible Tranſpiration, as Sweat, Urine, or Stool, *&c.*

COLLIQUATION, or *melting of Metals*: Thus we ſay, Silver and Lead being melted or *Colliquated* together over a ſtrong Fire, will mingle *per minima*, that is, unite throughly together.

COLLISION, is the ſtriking of one hard Body againſt another.

COLLUSION, in Common-Law, is a deceitful Argument or Compact between two or more, for the one Party to bring an Action againſt another for ſome evil Purpoſe, as to defraud a Third Perſon of his Right, *&c.*

COLLUTIO, is a waſhing of the Mouth; as when 'tis done to clean or faſten bad or looſe Teeth, or free the Gums from Ulcers, *&c.*

COLLYRIUM, is an oblong or round *Tablet* or *Trochisk*, uſed formerly in Diſtempers of the Eyes, and was then called by the *Arabian* Name of *Seif* or *Sief*. It was diſſolved in a convenient *Vehicle*, that it might conveniently be applied; and from hence any Medicines, in a Liquid Form, deſigned to cure Diſeaſes in the Eyes, are called *Collyrium.*

COLOBOMA, is the growing together of either Lips or Eye-lids, or the adhering of the Ears to the Head preternaturally, *&c.*

COLON, is the ſecond of the great Guts, ariſing from the *Cæcum Intestinum* in the Right Flank, and adheres to the Right Kidney; thence it tends up unto the Liver, and ſometimes is annexed to the Gall-Bladder, which dies it of a Yellowiſh Clay-colour; thence it goes on tranſverſly under the Bottom of the Stomach, and on the Left Hand is faſtned to the Spleen; after which it is faſtned to the Left Kidney, winding and turning very obliquely there, but afterwards it deſcends almoſt in a Right Line. It is the wideſt and largeſt of all the Guts, and is uſually about 8 or 9 Hands Breadths long; it abounds with ſmall Cells, or little Cavities every where: It hath a Valve to hinder any thing from returning from the great Guts into the ſmall.

COLON, is a Point in Grammar mark'd thus, (:) and ſhews a Sentence to be perfect or entire, but yet the Senſe depending or continuing on; as in this of *Seneca*, *Ante omnia neceſſe eſt, ſeipſum eſtimare: Quia fere plus nobis videmur poſſe, quam poſſimus.*

COLOUR, may be conſidered two ways. 1. As it is a Quality reſiding in the Body that is ſaid to be ſo and ſo coloured, or which doth modify the Light after ſuch and ſuch a manner: Or, 2. As more properly the Light it ſelf, which ſo modified ſtrikes upon the Organ of Sight, and produces that Senſation which we call *Colour*.

The Peripateticks aſſert *Colours* to be real Qualities, and inherent in the coloured Bodies, and ſuppoſe that Light doth only diſcover them, but not any way Effect their Production.

Plato thought *Colour* to be a kind of Flame conſiſting of moſt minute Particles, very congruous to the Pores of the Eye, and darted againſt it from the Object. And ſome Moderns will have *Colour* to be a kind of internal Light of the more lucid Parts of the Object darkened, and conſequently altered by the various Mixtures of the leſs Luminous Parts.

Others, as did ſome of the ancient Atomiſts, maintain *Colour* not to be a lucid Stream, but a Corporeal Effluvium iſſuing out of the coloured Body.

Others account for all *Colours* out of the various Mixture of Light and Darkneſs: and the Chymiſts ſometimes will have it ariſe from the Sulphur, and ſometimes from the Salt that is in Bodies; and ſome alſo from the third Hypoſtatick Principle, *Mercury*.

The *Carteſians*, who make the Senſation of Light to be the Impulſe made on the Eye by certain ſolid, but very minute Globules, eaſily permeating the Pores of the Air and Diaphanous Bodies: Theſe, I ſay, derive *Colour* from the various Proportion of the direct Progreſs or Motion of theſe Globules, to their Circumrotation or Motion round their own Centres; by which Means they are qualified to ſtrike the Optick Nerve after diſtinct and divers Manners, and ſo do produce the Perception of various *Colours*.

Dr. *Hook*, in his *Micrographia* ſays, The Phantaſm of *Colour* is cauſed by the Senſation of the oblique or uneven *Pulſe* of Light; and that this is capable of no more Varieties than two, which ariſe from the two Sides of the oblique Pulſe; ſo that there is in reality but two ſimple *Colours*, Yellow and Blue; from the Mixture of which, and a due Proportion of Black and White (that is, Darkneſs and Light) all *Colours* may be produced.

The incomparable Sir *Iſ. Newton* found by two Experiments on Priſms, that there is a great Difformity in the Rays of Light, and that hereby the *Origin of Colours* may be unfolded. The Doctrine therefore of *Colours*, according to his Notion and Experiments, are contained in the follow-Propoſitions.

1. As the Rays of Light differ in degrees of Refrangibility, ſo they alſo differ in their Diſpoſition to exhibit this or that particular *Colour*.

Colours are not *Qualifications of Light*, derived from Refractions or Reflections of Natural Bodies (as 'tis generally believed) but *Original* and *Connate Properties*, which in divers Rays are divers. Some Rays are diſpoſed to exhibit a red *Colour*, and no other; ſome a Yellow, and no other; ſome a Green, and no other; and ſo of the reſt. Nor are there only Rays proper and particular to the more eminent *Colours*, but even to all their intermediate Gradations.

2. To the ſame Degree of Refrangibility, ever belongs the ſame *Colour*, and to the ſame *Colour* ever belongs the ſame Degree of Refrangibility. The *leaſt Refrangible Rays* are all diſpoſed to exhibit a *Red Colour*, and contrarily thoſe Rays which are diſpoſed to exhibit a *Red Colour*, are all the *leaſt Refrangible*; ſo the *moſt Refrangible Rays* are all diſpoſed to exhibit a deep *Violet Colour*; and contrarily, thoſe that are apt to exhibit ſuch a *Violet Colour*, are all the *moſt Refrangible*: And ſo all the intermediate *Colours* in a continued Series belong to intermediate Degrees of Refrangibility. And this Analogy 'twixt *Colours* and Refrangibility, is very preciſe and ſtrict; the Rays always either exactly agreeing in both, or proportionably diſagreeing in both.

3. The Species of *Colour*, and Degree of Refrangibility proper to any particular ſort of Rays is not mutable by Refraction, nor by Reflection from Natural Bodies, nor any other Cauſe that could be yet obſerved when any one ſort of Rays hath been well parted from thoſe of other kinds, it afterwards obſtinately retained its *Colour*, notwithſtanding all Endeavours to change it. Though refracted with Priſms, and reflected with Bodies, which in Day-light were of other *Colours*; having alſo intercepted it with the coloured Film of Air interceding two compreſſed Plates of Glaſs; tranſmitting it thro' other coloured *Mediums*, and thro' *Mediums* irradiated with other ſorts of Rays, and diverſly terminated it, and yet could never produce any new *Colour* out of it. It would by contracting or dilating become more brisk or faint, and by the loſs of many Rays, in ſome Caſes, very obſcure and dark; but could never be ſeen to change *in ſpecie*.

4. Yet ſeeming Tranſmutation of *Colours* may be made where there is any Mixture of divers ſorts of Rays; for in ſuch Mixtures the *Component Colours* appear not, but by their mutual allaying each other, conſtitute a middling *Colour*; and therefore, if by Refraction, or any other of the aforeſaid Cauſes, the difform Rays, latent in ſuch a Mixture, be ſeparated, there ſhall emerge *Colours* different from the *Colour* of the Compoſition: Which *Colours* are not new generated, but only made apparant by being parted; for if they be again entirely mix'd and blended together, they will again compoſe that *Colour* which they did before ſeparation. And for the ſame Reaſon Tranſmutation made by the conveneing of divers *Colours* are not real; for when the difform Rays are again ſevered, they will exhibit the very ſame *Colours* which they did before they entred the Compoſition; as you ſee *Blue* and *Yellow* Powders, when finely mix'd, appear to be naked Eye *Green*; and yet the *Colours* of the component Corpuſcles are not thereby really tranſmuted, but only blended, for when view'd with a good Microſcope, they ſtill appear *Blue* and *Yellow* interſperſedly.

5. There are therefore two ſorts of *Colours*, the one Original and Simple, the other compounded of theſe. The Original and Primary Colours are *Red*, *Yellow*, *Green*, *Blue*, and a *Violet Purple*, together with *Orange*, *Indico*, and an indefinite variety of intermediate Gradations.

6. The ſame Colours in *Specie* with theſe Primary ones may be alſo produced by Compoſition; for a mixture of *Yellow* and *Blue* makes *Green*; of *Red* and *Yellow* makes *Orange*; of *Orange* and *Yellowiſh Green* makes *Yellow*: And in general, if any two *Colours* be mixed, which in the Series of thoſe generated by the Priſm, are not too far diſtant one from another, they, by their mutual alloy, compound that Colour which in the ſaid Series appeareth in the Mid-way between them; but thoſe which are ſituated at too great a diſtance, do not ſo, *Orange* and *Indico* produce not the intermediate *Green*, nor *Scarlet* and *Green* the intermediate *Yellow*.

7. But the moſt ſurprizing and wonderful Compoſition was that of *Whiteneſs*. There is no one ſort of Rays alone which can exhibit this: 'Tis ever compounded, and to its Compoſition are requiſite all the aforeſaid Primary Colours mixed in a due Proportion; for all the Colours of the Priſm being made to converge, and thereby to be again mixed as they were in the Light before it was incident upon the Priſm, will produce Light intirely and perfectly White, and not at all ſenſibly differing from a *direct* Light of the *Sun*, unleſs when the Glaſſes are not ſufficiently clear.

8. Hence therefore it comes to paſs, that *Whiteneſs* is the uſual Colour of *Light*; for *Light is a confuſed aggregate of Rays indued with all ſorts of Colours, as they are promiſcuouſly darted from the various Parts of Luminous Bodies*. And of ſuch a confuſed Aggregate is generated *Whiteneſs*, if there be a due Proportion of the Ingredients; but if any one predominate, the Light muſt encline to that Colour, as it happens in the Blue Flame of Brimſtone; the *Yellow* Flame of a Candle; and the various Colours of the fixed Stars.

9. Theſe things conſidered, the *Manner* how *Colours* are produced by the Priſm is evident: For the Rays conſtituting the incident Light, ſince thoſe that differ in Colour proportionably differ in Refrangibility, *they*, by their unequal Refractions, muſt be ſevered and diſperſed into an oblong Form, in an orderly Succeſſion from the leaſt refracted Scarlet to the moſt refracted Violet. And for the ſame Reaſon it is, that Objects, when look'd upon through a Priſm, appear coloured: For the difform Rays, by their unequal Refractions, are made to diverge towards ſeveral Parts of the *Retina*, and there expreſs the Images of things coloured, as they do the Sun's Image upon a Wall. And by this Inequality of Refractions they become not only coloured, but alſo very confuſed and indiſtinct.

10. Why the Colours of the *Rainbow* appear in falling drops of Rain, is alſo from hence evident; for thoſe drops which refract the Rays diſpoſed to appear Purple in greateſt quantity to the Spectator's Eye, refract the Rays of other ſorts ſo much leſs, as to make them paſs beſide it; and ſuch are the Drops on the Inſide of the *Primary* Bow, and on the Outſide of the *Secondary* or exterior one: So theſe Drops which refract in greateſt Plenty the Rays, apt to appear Red towards the Spectator's Eye, refract thoſe of other ſorts ſo much more as to make them paſs beſide it; and ſuch are the Drops on the Exterior Part of the Primary, and Interior Part of the *Secondary* Bow. 11.

11. The odd Phænomenon of an Infuſion of *Lignum Nephriticum*, *Leaf-Gold*, *Fragments of Coloured Glaſs*, and ſome other tranſparently Coloured Bodies appearing in one Poſition of one Colour, and of another in another, are on theſe Grounds no longer Riddles; for thoſe are Subſtances apt to reflect one ſort of Light, and tranſmit another, as may be ſeen in a dark Room, by illuminating them with ſimilar or uncompounded Light: For then they appear of that Colour only with which they are illuminated, but yet in one Poſition more vivid and luminous than in another, accordingly as they are diſpoſed more or leſs to reflect to trnſmit the incident Colour.

12. From whence alſo is manifeſt the Reaſon of an unexpected Experiment, which Dr. *Hook* in his *Micrography* relates to have made with two Wedge-like tranſparent Veſſels, filled the one with a Red the other with a Blew Liquor; namely, that tho' they were ſeverally tranſparent enough, yet both together became opake; for if one tranſmitted only Red, and the other only Blue, no Rays could paſs through both.

13. That the *Colours* of all natural Bodies have no other Origin than this, that they are variouſly qualified to reflect one ſort of Light in greater plenty than another. And this was experimented in a dark Room, by illuminating thoſe Bodies with uncompounded Light of divers Colours; for by that means any Body may be made to appear of any Colour: They have there no appropriate Colour, but ever appear of the Colour of the Light caſt upon them, but yet with this Difference, that they are more briſk and vivid in the Light of their own Day-light Colour. *Minium* appeareth there of any Colour indifferently with which 'tis illuſtrated, but yet moſt luminous in *Red*; and ſo *Biſe* appeareth indifferently of any Colour with which 'tis illuſtrated, but yet moſt luminous in *Blue*; and therefore *Minium* reflecteth Rays of any Colour, but moſt copiouſly thoſe indeed with Red; and conſequently, when illuſtrated with Day-light, that is, with all ſorts of Rays promiſcuouſly blended, thoſe qualified with Red ſhall abound moſt in the reflected Light, and by their Prevalence cauſe it to appear of that Colour: And for the ſame Reaſon *Biſe* reflecting *Blue* moſt copiouſly, ſhall appear *Blue* by the exceſs of thoſe Rays in its reflected Light; and the like of other Bodies. And that this is the entire and adequate Cauſe of their Colours is manifeſt, becauſe they have no Power to change or alter in the Colours of any ſort of Rays incident apart, but put on all Colours indifferently with which they are enlightned.

Theſe things being ſo, it can be no longer diſputed, whether there be Colours in the Dark? Nor whether they be the Qualities of the Objects we ſee? no *nor*, perhaps, whether *Light* be a *Body*? For ſince Colours are the *Qualities of Light*, having its Rays for their entire and immediate Subject, how can we think thoſe Rays Qualities alſo, unleſs one Quality may be the Subject of and ſuſtain another, which in effect is to call it *Subſtance*? We ſhould not know Bodies from Subſtances, were it not for their ſenſible *Qualities*; and the Principal of thoſe being now found due to ſomething elſe, we have as good Reaſon to believe that to be a Subſtance alſo.

Thus far went this wonderful Man, as long ſince as the Year 1675, as you may ſee more at large in the *Philoſoph. Tranſact. N.* And as himſelf acquaints us (with his uſual Modeſty) in his excellent Treatiſe of *Opticks* juſt now publiſhed, and come to my Hands while this Part is compoſing at the Preſs, where the Reader will meet with ample Satisfaction as to all Parts of the admirable Doctrine of *Light and Colours*. And that the World may ſee that the Account he ſo long ago Publiſhed of this Theory was both intelligible and certainly true, I have ſubjoined the ſubſequent *Experiments* which came to my Hands a Year ago, and are inſerted here alſo at the deſire of their Author, the ingenious Mr. *John Perks* of *Old Swinford* in *Worceſterſhire*.

An Abſtract *of Sir* Iſ. Newton's *Doctrine concerning* Light *and* Colours.

1. Light conſiſts of an infinite number of Rays Right-lined and Parallel, but of different Degrees of Refrangibility when meeting with a different *Medium*.

2. Eeach Ray according to its degree of Refrangibility, when ſo refracted, appears to the Eye of a different Colour.

3. The leaſt Refrangible Rays appear of a deep Scarlet, the moſt Refrangible appear of a Violent Blue, the intermediate proceeding from Scarlet to Yellowiſh, than to light Green, and ſo to Blue.

4. The Colours ariſing from the different Refrangibility of Light, are not only the more noted Colours of Red, Yellow, Green, Blue, but alſo all the intermediate Degrees of Red to Yellow, of Yellow to Green, *&c.* differing as the Degrees of ſound from Graye to Acute, in which there are not only the Notes of common Denomination, but alſo indefinite intermediate Degrees of Sounds, which are diſtinct different Sounds as the other.

5. Whiteneſs (ſuch as the Sun's Light appears) containing all theſe Degrees of Refrangibility, is conſequently made up of all the above-mentioned Colours.

6. Simple or Homogeneal Colours are ſuch as are produced by Homogeneal Lights or Rays, that have the ſame Degree of Refrangibility, and mix'd Colours are ſuch as are produced by Rays of different Refrangibility.

7. Rays of the ſame Refrangibility produce the ſame Colour, which Colour is not alterable by repeated Refractions, only made more ſtrong or faint as the Rays are united or ſcattered.

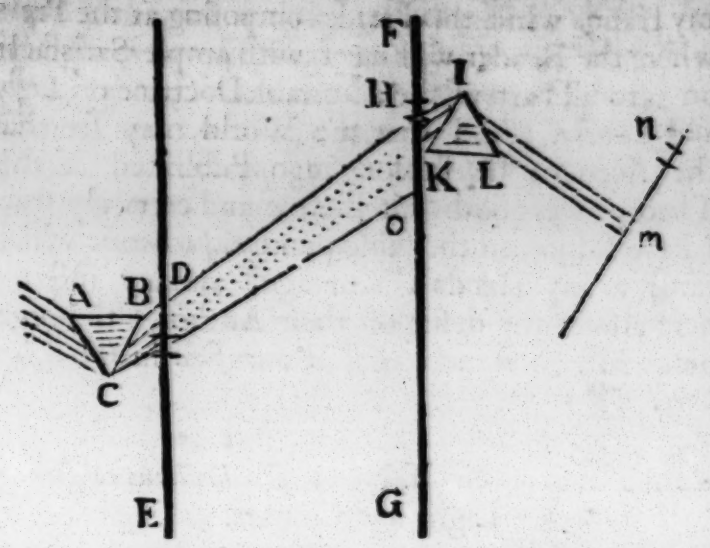
8. All Bodies appear of this or that Colour according as the Surfaces are adapted to reflect only the Rays of ſuch a Colour, or (at leaſt) in more plenty than the reſt.

Experiments for Confirmation of the foregoing Doctrine.

Experiment I.

The great Experiment on which Sir *Iſ. Newton* grounds his Doctrine (and which he calls *Experimentum Crucis*) is after this manner; *B E* and *F G* are two Boards about 4 or 5 Yards diſtance, having in each of them a little round Hole at *D* and *H*, about $\frac{1}{4}$ of an Inch Diameter; *A B C* is a Priſm expoſed to the Sun, *I K L* is another Priſm, whoſe Side *I K* is near parallel to the Side *B C* of the other, and receiving the Rays *D H*, refracts them to fall on a Paper *n m*.

The Colours will fall from *H* to *O* on the Board *FG*: Let one only Colour (ſuppoſe Blue) fall on the Hole *H*, and it will be refracted by the Priſm



I K L to fall (ſuppoſe) at *M*; then move the Glaſs *A B C* about its Ax, ſo as to bring another Colour (ſuppoſe the Red at *O*) to the Hole *H*, and it will by the Glaſs *I K L* be refracted not to *M*, but another Place (ſuppoſe *N*) ſome diſtance from the other, and in like manner will each Colour be refracted to fall on a different Place, tho' the Glaſs *I K L* be held unmoved. This Experiment proves the different Refrangibility of the Rays of Light, and that different Colours do thene ariſe.

For the Holes *D* and *H* being fix'd, and alſo the Glaſs *I K L*, 'tis plain, that the Rays have *a like Incidence* on the Glaſs *I K L*, but the different Places where they fall on the Paper, as *M*, *N*, &c. ſhew a different Refraction in the Glaſs *I K L*; and the Eye diſcovers a different Colour, according to the different Places on which the Rays fall, which demonſtrates the fundamental Doctrine of the Theory.

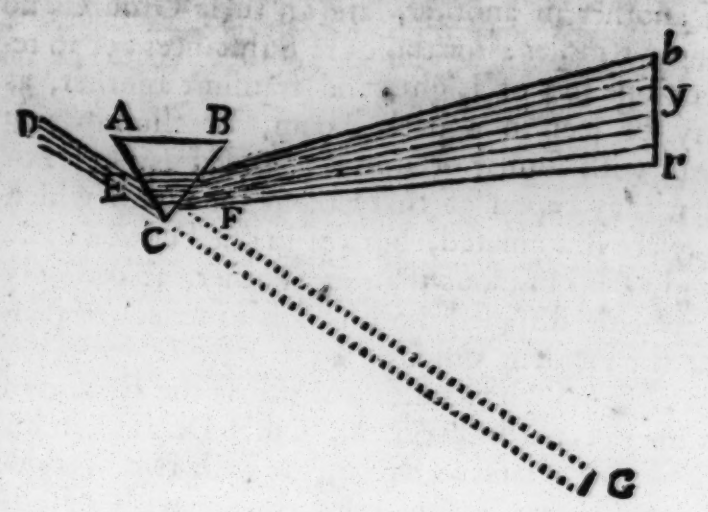
Sir *Iſ. Newton* directs this to be done in a dark Room, where (no doubt) all will appear more exact and lively. My Trial (for want of Conveniencies) was in an open Room, but it ſucceeded well enough to ſatisfy me of the Truth.

He obſerves, that the Oblong Image of Colours *H O* will be about 5 times its Breadth, which alſo ſhews the different Refrangibility of the Rays, which otherwiſe would be near round as the Hole *D* is.

Experiment II.

Being in a convenient Room, where the Sun ſhines thro' a Hole or open Caſement, turn your Back towards the Sun, and hold the one End of the Priſm ſo to your Eye, that the Sun may ſhine on the other End; then move it ſo about its Ax, that the Colours may appear ſomewhere on the Wall; find the Colours with your Eye looking thro' the other End of the Glaſs, and there will appear a Spot of perfect Light.

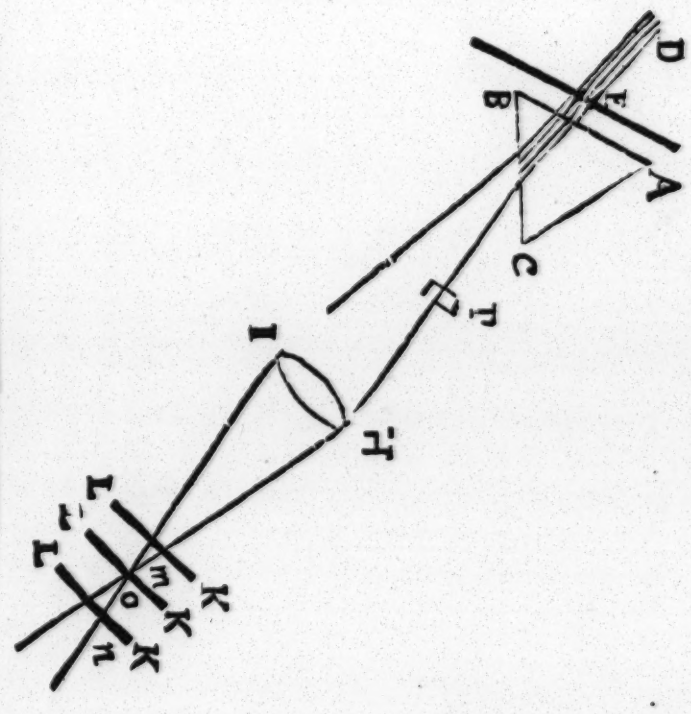
The Reaſon of this Appearance is this; The parallel Rays *D E* meeting with the Glaſs at *E*, and again with the Air at *F*, are ſeperated by theſe two Refractions, the leaſt Refrangible appear Red at *r*, and the moſt Refrangible appear Blue at *b*, with the intermediate Colours between. Theſe Colours being view'd by the Eye at *E*, the Rays come back (near) the ſame way they went, and are therefore in like manner *united* at the Eye, as they were in their Incidence from the Sun, and conſequently have the ſame Appearance (White) as the Light it ſelf. The Place where the Spot of Light appears to the Eye is at *G*, where the Rays would have



fallen had they not been intercepted, and of a Bigneſs according to what Light falls on the Glaſs, whereas the Coloured Image *b y r* will appear four or five times longer, by reaſon of the ſcattering of the differently refracted Ray.

Experiment III.

A B C is the Priſm, upon one of whoſe Sides is put a Paſt-board or thick Paper *A B*, or the like, with a little round Hole at *E*, which being expoſed to the Sun's Rays *D E*, they are refracted and carried (in Colours) towards *H I*.



H I is a Lens (or a common Magnifying Glaſs) broad enough to receive all the coloured Rays; where they being made to converge by the Glaſs, they will be united in *O*, the Focus of the Glaſs.

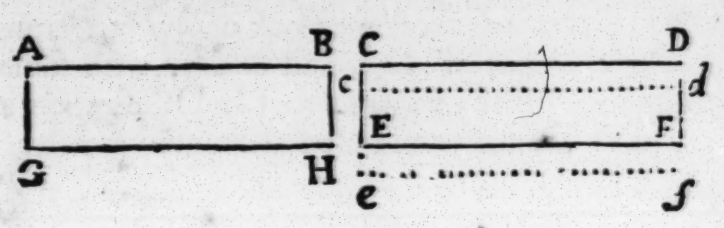
Hold a Piece of Paper *K L* in the Focus, where all the Colours are united, and the little Spot at *O* will be perfect Light or Whiteneſs: But if the Paper *K L* be held farther or nearer off (as at *M* or *N*) the Colours will appear. If any Colours be intercepted, as at *P*, the Light near *O* will not be clear White, but inclining to the remaining Colours. If the Blue be wanting, the White will be ſomewhat Reddiſh or Fleſh-colour, and if the Red be wanting, the White will encline to be ſomething Bluiſh: And if only one Colour be let come to the Lens, that Colour, without Alteration, will be transferr'd to the Paper *K L*.

This

This Experiment ſhews, (1.) That all the Colours being united make Light or Whiteneſs. (2.) That if any Original Colour be wanting, the White will not be pure. (3.) That a Simple Colour is not alterable by farther Refractions, which alſo will appear if another Priſm be put at *O*.

Experiment IV.

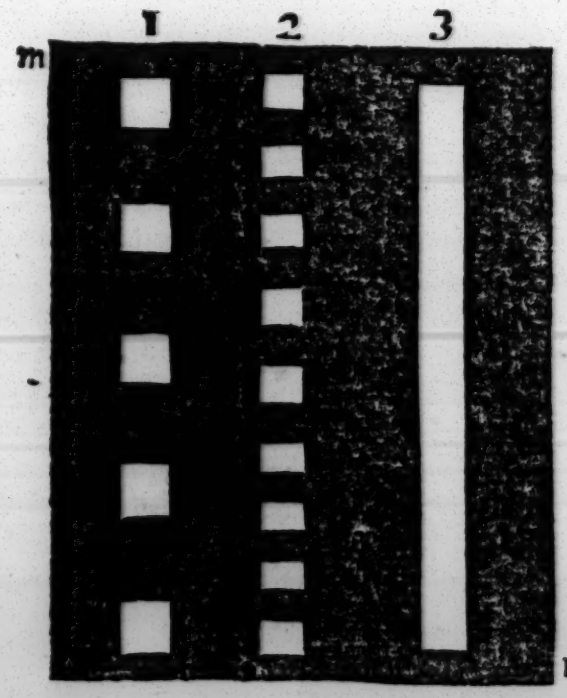
Let *ABGH* be a Piece of fine Silk of a lively Scarlet Colour, whoſe Edges *AB* and *GH* are ſtreight, parallel and ſmooth; let *CDEF* be a



nother Piece of Violet Blue Silk, like and equal to the other. Let them be placed, as in the Figure, on ſome black Cloath or Door, with their Edges in a ſtraight Line: View them through a Priſm at about two or three Yards diſtance: The Ax of the Priſm being Parallel to the Poſition of the Silks: So will the blue Piece *CF* appear lower than the other (*viz.*) as in *c d e f*. The Reaſon of which appearance is, that Blue is more Refrangible than Red.

This will more fully appear, if inſtead of the Blue Silk *CF*, there be let fall in the Place of *CF*, the Blue Rays from another Priſm (the other Colours being intercepted by a Paper with a Square Hole for the Blue to paſs through.) If the Silk *AH* and the blue Square *CF* be view'd thro' a Priſm (as before) the Blue will appear far below, as at *KL*, this being a more perfect Blue than any Silk can be of.

Experiment V.

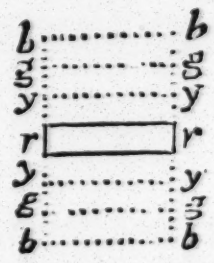


Let *MN* be the black Cover of a Book, Paper coloured Black, or the like; upon which lay in a ſtreight Line five or ſix little Squares of White Paper, about the Bigneſs and at the Diſtance as in the Figure, firſt Column: View theſe through a Priſm, ſo as that the Row of little Squares have its one End towards you, or be in a Plain perpendicular to the Ax of the Priſm, and about two Foot diſtance from the Glaſs; ſo will you ſee a Stream of Colours proceeding from every Square towards the next nearer you, the Colours ariſing out of each white Square. Move theſe Squares near to one another, or put others between them, as in the ſecond Column (ſtill keeping them in a ſtraight Line) and you will ſee as they come near, that the Colours mixing one with another will alter, approaching nearer to White till the Squares touch, and then all the Colours being perfectly mix'd they produce *Whiteneſs*, and appear as in the third Column, a white Line, only tagg'd with Red at the Top and Blue at the Bottom, there being no other Colours coming from above to mix with the uppermoſt Red, nor any Colours below the Blue at Bottom for it to mix with. If you turn the Paper *MN* aſide a little from its Perpendicularity to the Glaſs, the third Column, which before appeared White, will all appear in Colours ariſing out of the White, and Streaming towards you, being always in a Plain Perpendicular to the Axis of the Priſm.

From this Experiment and the foregoing Doctrine we have the Reaſon why a Sheet of white Paper, or the like, appears coloured only at the *Edges*, for *there* only the Colours want others to mix with them: In the Middle, taking any Point the ſeveral Colours from ſo many other Points meet there as make White. For Inſtance,

Let *r r* be any little Particle in the Middle of the white Surface, whoſe other Colours ſtreaming towards *B*, leave the Particle *r r* it ſelf Red, as the Squares will do in the laſt Experiment. The Yellow of the Particle *y y*, the Green of the Particle *g g*, the Blue of the Particle *b b* do all meet on the Particle *r r*, which is Red.

B

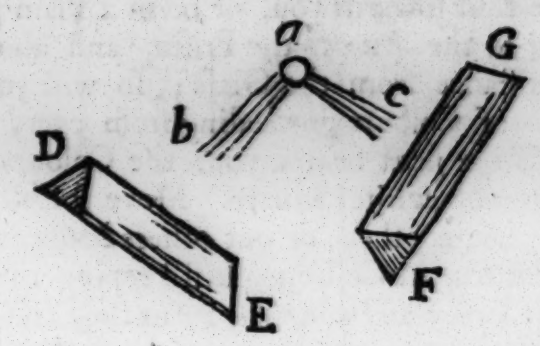


(For if *b b* were a white Particle, and all black about it, its blue Colour would be ſeen upon *r r*; and if *g g* were another, its Blue would be below *r r*, and its Green upon it, &c.) and ſo there being a Concurrence of all the Colours that make up White, it conſequently appears White. The ſame is to be ſaid of any other Particle lying ſo far from the Edges as to have other Particles between to tranſmit their Colours.

If a Square Paper be held ſo ſtraight before you that the two Side Edges be in a plain Perpendicular to the Axis of the Glaſs, they will be White, and no Colours appear but at the Top and Bottom, the Streaming of the Colours being in ſuch a perpendicular Plain, as may be obſerved by looking at any white Spot through the Glaſs, and then turning it a little obliquely to the Horizon, or one End higher than the other.

So in the Poſition of the Glaſs *DE* (*ſee the following Fig.*) the white ſpot aſcends its Colours towards *b*, and in the Poſition *FG* the Colours ſtream from *a* to *c*. If a black Spot, as *A*, upon a Paper be view'd through the Priſm, the Top will have Green and Blue upon it, and under the lower Part will appear Red and Yellow; the

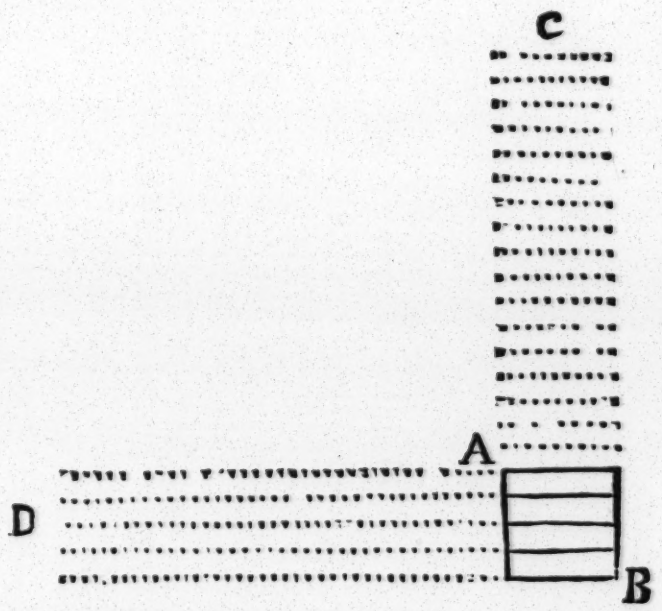
the Reaſom of which is, that the Blue comes from the White above it, and appears on the



Black, there being no other Colours to mix with it: The Red appears under the Spot, becauſe the black Spot tranſmits no other Colours to mix with the Red.

Experiment IV.

Hold the Priſm ſo to the Sum, as that thee Colours may appear upon a large plain Wall, as at *A B*; turn the Priſm ſwiftly about it Axis, ſo as that the Colours may move ſwiftly up and down, as from *B* to *C*.



So will there appear no Colour diſtinct, but a faint white Streak between *B* and *C*, which ſo appears, becauſe by the ſwiftneſs of the Motion the ſeveral Colours are confounded and mixed, and therefore appear White. Then move the Glaſs in ſuch manner, that the Colours may move ſideways and ſwiftly from *B* to *D*, in which Caſe the Colours will not diſappear, but make a ſort of Liſt of ſeveral Colours, becauſe they are not mix'd to make Whiteneſs, but each Colour keep in its own Line.

Experiment VII.

In a dark Room, having a little Hole for the Sun's Rays to come in, apply the Priſm to the Hole, ſo as that the Colours may appear on a Wall. Hold a Quantity of Smalt, or Powder-Blue, or blue Silk in the Colour ſeverally, and it will appear clear of the Colour of the Rays that fall on it, (*viz.*) Red while the Red Light falls upon it, and Yellow when the Yellow Light falls on it: but of all the Colours 'twill moſt ſtrongly reflect the Blue, the Surface being moſt diſpoſed to reflect thoſe Rays, *&c.*

Then view a Quantity of Vermilion, or a little Piece of Scarlet Silk in the Blue Light, and 'twill appear Blue, and Green in the Green Light; but of all the Colours, 'twill moſt ſtrongly reflect the Scarlet Rays, and appear deepeſt of that Colour. This Experiment confirms the 8th Propoſition, That Bodies appear of the Colour of thoſe Rays that are moſt plentifully reflected from the Body to the Eye. Thus far Mr. *Perks*.

I can now only give you ſome of the *Propoſitions* of Sir *Iſ. Newton*'s excellent Book of *Opticks*, relating to the Doctrine of *Light* and *Colours*, with ſomething from him by way of Proof and Illuſtration in the moſt Eminent and Material Points.

Prop. I.

Lights which differ in Colour, differ alſo in Degrees of Refrangibility.

Prop. II.

The Light of the *Sun* conſiſts of Rays differently Refrangible.

Prop. III.

The Sun's Light conſiſts of Rays differing in Reflexibility; and thoſe Rays are more *Reflexible* which are more *Refrangible* than others.

This, which ſeems to be a ſurpriſing Property of Light not before Diſcovered, he proves in his 9th and 10th *Experiments* of the First Book; where 'tis evident, that the Rays within a Priſm, and refracted by its Baſe at their going out into Air, being by the Revolution of the Priſm round its Axis made ſo oblique to the Baſe, as thereby to begin to be totally reflected by it: Then he ſhews that theſe Rays became firſt of all totally reflected, which before at equal Incidences with the reſt had ſuffered the greateſt Refraction; and the ſame thing he found to happen alſo when the Reflection was made by the common Baſe of two Priſms placed ſo together as to make a Parallelopiped, as in the 10th *Experiment*.

Prop. IV. *Probl.* I.

To ſeperate from one another the Homogeneal Rays of compound Light.

Prop. V.

Homogeneal Light is refracted regularly, without any Dilation, Splitting or Shattering of the Rays; and the confuſed Viſion of Objects ſeen through refracted Bodies by Herogeneal Light, ariſes from the different Refrangibility of ſeveral ſorts of Rays.

This he proves in his 5th, 12th, 13th and 14th *Experiments*; from whence it appears, that the croſs Poſition of a ſecond Priſm to refract the Light of the Sun which came to it from a former Priſm, placed at the ſmall Hole of a darkened Room, did not at all dilate the *Image* or *Coloured Spectrum* as to Breadth, nor increaſe it Dimenſions that way: As alſo, that Homogeneal Light, refracted by a Priſm, did not exhibit an oblong coloured Image, as Heterogeneal Light doth, but that a round

round Spot of it was by the Priſm refracted exactly in the ſame Figure, and of the ſame Colour it was before the new Refraction; and moreover, that Flies and ſuch like ſmall Objects placed in Homogeneal Light, and viewed through a Priſm, were not thereby at all rendred confuſed and indiſtinct as to appearance, whereas if placed in Heterogeneal Light, and viewed after the ſame manner, they ſeemed egregiouſly confuſed.

BOOK II. *Prop.* I.

The *Phænomena* of *Colours* in reflected or refracted Light are not cauſed by new Modifications of the Light variouſly impreſt, according to the various Terminations of the Light and Shadow.

For by this 10th *Experiment*, *Book* I. 'tis evident that the Sun's Light being tranſmitted into a dark Room through the parallel Surface of two Priſms faſtned together in the Form of a Parallelopiped, became totally of one Colour (either uniformly *Yellow* or *Red*) at its emerging out of the Priſm: In the Production of which Colour the Confine of Shadows (he ſhews) can have nothing to do, becauſe the Light changes from White to Yellow, Orange and Red ſucceſſively, without any alteration of the Confine of Shadow: At both Edges of the emerging Light where the contrary Confines of Shadow ought to produce different Effects, the Colour is one and the ſame, whether it be White, Yellow, Orange or Red; and in the *Middle* of the emerging Light where there is no Confine of Shadow at all, the Colour is the very ſame as at the Edges, the whole Light at its Entrance being of one uniform Colour, whether White, Yellow, Orange or Red, and going on thence perpetually without any change of Colour, ſuch as the Confine of Shadow is vulgarly ſuppoſed to work in its refracted Light at its Emergence.

Neither can theſe Colours ariſe from any new Modifications of the Light by Refractions, becauſe they change ſucceſſively from White to Yellow, Orange or Red, while the Refractions remain the ſame; and alſo becauſe the Refractions are made contrary ways by parallel Superficies, which deſtroy one another's Effects.

He ſhews alſo in *Experiment* the Firſt of this 2d Book, That by applying an Iron Wire, or ſuch like Body, to a proper Part of a very large Priſm, poſited about 20 Feet from the Hole of a darkned Room, you may ſo intercept the Rays at their Entrance, as to take away any one Colour (which you pleaſe) either wholly or in Part, out of the *Spectrum* or coloured Image, and leave the reſt remaining; which ſhews that all Colours have an Indifference to any Confines of Shadow, and therefore the Differences of theſe one from another don't ariſe from the different Confines of Shadow, whereby the Light is variouſly modell'd, as hath hitherto been the Opinion of Philoſophers. Again, a Lens being placed about 8 Feet from the Priſm at the Hole, had a Paper placed in its Focus, which, when it was ſituate perpendicular to the Light, appeared of its own colour White, but when very much oblique appear'd Yellow and Red when inclined one way, and Blue, when turned another, and yet here the Confines of Light and Shadow, and the Refractions of the Priſm remained in all Caſes the ſame. And the reaſon of the Phænomenon (he ſhews) is this, That the Paper in one Poſture being more oblique to the more refrangible Rays than to the leſs, is more ſtrongly illuminated by the latter than by the former; and therefore the leſs refrangible Rays are predominant in the reflected Light, and wherever they are ſo, they tinge the Light with Yellow or Red; as when the Paper being placed in the contrary way, and in an oblique Poſture, the more refrangible Rays become Predominant; and they always tinge the Light with Blues and Violet Colours.

Prop. II.

All Homogeneal Light hath its proper Colour anſwering to its degree of Refrangibility; and that Colour cannot be changed by Reflections and Refractions.

This is plain by Experiment, for after he had ſeparated the ſeveral ſorts of Rays one from another (as he ſhews how to do in the *Experiments* belonging to the 4th *Propoſ.* of his Firſt *Book*) and by that means got a quantity of Homogeneal Light; this Spot of Homogeneal Light was afterwards uncapable of being changed by either Refraction or Reflection, and all Bodies placed in that Homogeneal Light ſtill appear'd of its Colour, however different their own proper Colours were from that. From whence he concludes, That if the Sun's Light conſiſted but of one ſort of Rays, there would be but one Colour in the whole World; nor would it be poſſible to produce any new Colour by Reflections and Refractions; and conſequently all the variety of Colours depend upon the Compoſition of Light.

Prop. III. *Problem*

To define the Refrangibility of the ſeveral ſorts of Homogeneal Light anſwering to the ſeveral Colours.

In this the Author is very curious and Exact, ſhewing the Laws of the Refractions out of Glaſs into Air, whence by the 3 Axioms of his firſt Book, the Laws of Refractions out of Air into Glaſs are eaſily derived. And finding by Experiment, that when Light goes out of Air thro' ſeveral contiguous refracting *Mediums* (as thro' Water and Glaſs) and thence goes out again into Air, whether the refracting Surfaces be parallel or inclined to one another; that Light, as often as by contrary Refractions 'tis ſo corrected, as that it emergeth in Lines parallel to thoſe in which it was incident, continues ever after to be White: But if the emergent Rays be inclined to the Incident, the whiteneſs of the emerging Light, will by degrees, in paſſing on from the Place of Emergence, become tinged in its Edges with Colours. He thinks he can gather two Theorems (which he there gives) and by which the Refractions of the Rays of every ſort, made out of any *Medium* into Air, are known by having the Refraction of the Rays of one ſort; and alſo the Refraction out of one *Medium* into another, may be had as often as you have the Refractions out of them both into any third *Medium*. And theſe Theorems, if admitted into Opticks, would give a ſcope to treat that Subject voluminouſly after a new manner, not only by teaching thoſe things which tend to the Perfection of Viſion, but alſo by determining, Mathematically, all kinds of *Phænomena* of Colours which could be produced by Refraction.

Prop.

Prop. IV.

Colours may be produced by Compoſition, which ſhall be like the Colours of Homogeneal Light, as to the *Appearance* of Colour, but not as to the *Immutability* of it; and the Conſtitution of Light, and thoſe Colours, by how much more they are compounded, by ſo much are they leſs full and intenſe; and by too much Compoſition they may be diluted and weakened, till they ceaſe. There may alſo Colours be produced by Compoſition, which are not fully like any of the Colours of Homogeneal Light.

Prop. V.

Whiteneſs, and all Grey Colours between White and Black, may be compounded of other Colours; and the Whiteneſs of the Sun's Light is compounded of all the primary Colours, mixed in a due Proportion.

This he proves by many Experiments, and in particular by this: That a Lens being placed to receive the colour'd *Spectrum* caſt from a Priſm at the Hole of a darkened Room, the Light in the Focus of the Lens converged, and there made a bright Spot, which received on a white Paper there, and in a right or normal Poſition to the Rays, appeared White on the Paper; but if either the Paper be moved towards the Hole, or behind the *Focus* of the Lens, it will preſently begin to appear coloured with the uſual Colours of the Priſm. Now the Reaſon of its appearing White at the *Focus*, was, becauſe there all the Rays were exactly mingled; for if any Colour, ſuppoſe the *Red* or *Blue*, were by the Interpoſition of ſome Body intercepted at the Lens; the Image in the *Focus* would never appear White, but ſome how coloured; ſo that to make Whiteneſs the Blending or Mixture of the Rays is neceſſary. And then in

Prop. VI. he propoſes this *Problem.*

In a Mixture of Primary Colours, the Quantity and Quality of each being given, To know the Colour of the Compound.

Prop. VII.

All the Colours in the Univerſe which are made by Light, and depend not on the Power of Imagination, are either the Colours of Homogeneal Lights, or compounded of ſuch; and that either accurately or very nearly, according to the Rule of the preceding *Problem.*

For *Book* II. *Prop.* I. he ſhews, That the changes of Colours made by Refractions, do not ariſe from any new Modifications of the Rays impreſt by thoſe Refractions, and by the various Terminations of Light and Shadow, as has been the conſtant and general Opinion of Philoſophers. He has likewiſe proved, that the ſeveral Colours of the Homogeneal Rays do conſtantly anſwer to their degrees of Refrangibility (*Prop.* I. *Lib* I. and *Prop.* II. *Lib.* II.) and that their degrees of Refrangibility cannot be changed by Refractions and Reflections (*Prop.* II. *Lib.* I.) and by conſequence, that thoſe Colours are likewiſe immutable: He has alſo proved directly by refracting and reflecting Homogeneal Lights apart, that their Colours cannot be changed (*Pr.* II. *L.* II.) He has proved alſo, That when the ſeveral ſorts of Rays are mix'd, and in croſſing paſs through the ſame Space, they do not act ſo upon one another, ſo as to change each others colorifick Qualities (*Exp.* X. *L.* II.) but by mixing their Actions in the *Senſorium* beget a Senſation differing from what either would do apart; that is, a Senſation of a mean Colour between their proper Colours; and particularly, when by the Concourſe and Mixtures of all ſorts of Rays a white Colour is produced, the White is a Mixture of all the Colours which the Rays would have apart (*Prop.* V. *Lib.* II.) The Rays in that Mixture do not loſe or alter their ſeveral Colorifick Qualities, but by all their various kinds of Actions mix'd in the *Senſorium*, beget a Senſation of a middling Colour between all the Colours, which is Whiteneſs; for Whiteneſs is a Mean between all the Colours, having it ſelf indifferently to all, ſo as with equal Felicity to be tinged with any of them: A Red Powder mixed with a little Blue, or Blue with a little Red, doth not preſently loſe its Colour; but a White Powder mixed with any Colour, is preſently tinged with that Colour, and is equally capable of being tinged with any other Colour whatever: He has likewiſe ſhown, that as the Sun's Light is mixed of all ſorts of Rays, ſo its Whiteneſs is a Mixture of the Colours of all ſorts of Rays; thoſe Rays having from the beginning their ſeveral colorifick Qualities, as well as their ſeveral Refrangibilities, and retaining them perpetually unchanged, notwithſtanding any Refractions or Reflections they may at any time ſuffer, and that whenever any ſort of the Sun's Rays is by any Means (as by Reflection in *Exper* 9 and 10. *Lib.* I.) or by Refraction, as happens in all Refractions, ſeparated from the reſt, then they manifeſt their proper Colours.

Theſe things having been proved, ſays he, the Sum of all this amounts to the *Propoſition* here to to be proved; for if the Sun's Light is mixed of ſeveral ſorts of Rays, each of which have originally their ſeveral Refrangibilities and colorifick Qualities, and notwithſtanding their Refractions and Reflections, and their various Separations and Mixtures, keep thoſe their original Properties perpetually the ſame without alteration; then all the Colours in the World muſt be ſuch as conſtantly ought to ariſe from the original colorifick Qualities of the Rays, whereof the Lights conſiſt by which thoſe Colours are ſeen: And therefore, if the Reaſon of any Colour whatever be required, we have nothing elſe to do but to conſider how the Rays in the Sun's Light have by Reflections or Refractions, or other Cauſes been parted from one another, or mixed together; or otherwiſe, to find out what ſorts of Rays are in the Light by which that Colour is made, and in what Proportion; and then, by the laſt *Problem*, to learn the Colour which ought to ariſe by mixing thoſe Rays (or their Colours) in that Proportion. After this in

Prop. VIII. *and* IX.

He ſhews, how by theſe diſcovered Properties of Light, to explain the Colours made by Priſms, and alſo thoſe of the Rain-bow. And then in

Prop. X.

By the ſame diſcovered Properties of Light, he explains the Permanent Colours of Natural Bodies.

Shewing that their Colours ariſe from hence, that ſome Natural Bodies reflect ſome ſort of Rays, and others other ſorts, more copiouſly and ſtrongly than the reſt: As for Inſtance, *Minium*, or Red-lead, reflects the leaſt Refrangible, or Red making Rays, moſt copiouſly, and thence appears Red.

But

But *Violets* reflect the moſt Refrangible moſt copiouſly, and thence have their proper Colour; and ſo of other Bodies. Every Body reflects the Rays of its own Colour more copiouſly than the reſt, and from their Exceſs and Predominance in the reflected Light, hath its Colour.

Then in his Second *Book*, *Part* I. and II. he takes into Conſideration the *Phænomena* of thoſe Colours which are obſerved in thin tranſparent Bodies, making many excellent Obſervations about their Reflections and Refractions, and diſcovering many things as wonderful as they are certain. And here he finds new reaſon to conclude, that the colorifick Diſpoſitions of Rays are alſo connate with them and immutable; and conſequently, that all the Productions and Appearances of Colours in the World are derived not from any Phyſical Change cauſed in Light by Refraction or Reflection, but only from the various Mixtures or Separations of Rays, by vertue of their different Refrangibility or Reflexibility; and in this reſpect the Science of Colours becomes a Specolation as truely Mathematical as any other part of *Opticks*; that is, as far as they depend on the Nature of Light, and are not Creatures of the Imagination only. And in *Part* the Third, he diſcourſes again of the permanent Colours of Natural Bodies, and ſhews the Analogy between them and the Colours of thin tranſparent Plates; as alſo ſhewing their Conſtitutions, whereby they reflect ſome Rays more copiouſly than others: As alſo about the Colours which ariſe from the Inflection of the Rays of Light: In all which there is intermixed many excellent Obſervations and curious Experiments relating to this moſt copious Subject. See more under Light and Colour, in *Vol.* II.

Promiſcuous Obſervations and Experiments about Colours.

It's obſervable, that moſt tranſparent Bodies when they are either ſplit, divided, or extended ſo that they have no ſenſible thickneſs upon their Surfaces, exhibit various Colours like thoſe of the Rainbow. Thus is it with *Muſcovy* Glaſs when ſplit into exceeding thin Pieces, and fine Glaſs when blown at the Flame of a Lamp into Bubbles as thin or thinner than the fineſt Paper; and ſo we ſee it is in thoſe Bubbles which Children make out of a mixture of Soap and Water, and thoſe which ariſe from the ſhaking of almoſt any Chymical Oyle, or Spirit of Wine into very fine Froth.

Mr. *Boyle* found that one Grain of Cochineal diſſolved firſt into a pretty quantity of Spirit of Urine, and then that Diſſolution diluted with Water, would impair a ſenſible, though but a faint Colour, to fix Glaſſes of Water, each of which contained 43 Ounces and $\frac{1}{2}$, which amounts to above 125000 times its own Weight: And this ſhews the very great Diviſibility of the Parts of Matter, as well as the Inteſtine Motion of the Parts of Fluid Bodies.

Dr. *Hook* in his *Microgr.* ſeems to think there are but two Original Colours, *viz.* *Red* and *Blue*, which, *Page.* 64. he defines thus:

Red is an Impreſſion on the Retina, made by an Oblique and confuſed Pulſe of Light, whoſe ſtrongeſt Part preceeds, and its weakeſt follows. Blue, an Impreſſion made by an Oblique and confuſed Pulſe of Light, whoſe weakeſt part precedes, and its ſtrongeſt follows. Out of theſe two he ſuppoſes all other Colours may by mixture, *&c.* ariſe.

The Ways by which a Liquor may ſuddenly change the Colour of another Liquor, or of another Body, Mr. *Boyle* thinks reducible to ſuch as theſe.

1. By the Minute Particles of the Adventitious Liquors inſinuating themſelves into the Pores of the other, and filling them up either perfectly or in part; by which means the Light paſſing thro', the Liquor will be differently refracted from what it was before, when the Pores of it were only filled with Air, or perhaps ſome more ſubtle Fluid.

2. A Liquor may alter the Colour of a Body, by freeing it from thoſe things which hindred it before from appearing in its genuine and proper Colour; as when Water waſhes off the Filth of ordinary Bodies, and other Lixiviums or Menſtruums clear away, or four of the diſcoloured Ruſt of Metals, *&c.*

3. By making a Comminution of the Parts of any Body, and that either by really ſubdividing them and making them leſs, or elſe by disjoining and ſeparating ſuch Aggregates or Cluſters of Particles which clung together before.

4. Contrary to the laſt Way, the Colour of a Body may be changed by means of a Liquor's making Coalitions or Aggregates of ſeveral Particles, which before lay too ſcattered and diſperſed to exhibit any Colour; and this way the new Colours of Precipitates may be ſuppoſed in part to ariſe.

5. A Liquor may alſo change the Colour of a Body, by diſlocating and changing the Site and Poſition of the Parts of it: Thus bruiſed Fruits appear of a different Colour from their Ripe and Natural ones; and ſeveral Bodies are of a different Colour when diſſolved in a *Menſtruum* from what they had before.

6. The chiefeſt and moſt important way of all, as being that which doth contain many others within it, is by aſſociating the Saline Corpuſcles or any other ſort of the more rigid ones of the Liquor with the Particles of the Body that it is employed to work upon, and by that means muſt needs alter the Figure, Poſition, Bigneſs and Degree of Motion of the Component Particles of that Body.

The Learned Dr. *Grew* thus ſums up the Reſult of aboundance of curious Experiments about the Cauſes of *Vegetable Colours.*

1. While the Sulpher and Saline Principles of Plants do only ſwim together, and are not yet united into one Precipitate, no Colour reſults from them, but the Contents are rather Limpid; as uſually in the *Roots* and many other *Parenchymous Parts.*

2. But when they are united, and the Alkalines are predominent, they produce a *Green* Colour.

3. When the Sulphur and Alkaline are more equal, they make a *Tawny.*

4. When the Sulphur, Acid and Alkaline are nearly equal, they produce a *Yellow.*

5. When the Sulphur is predominent, and the Acid and Alkaline equal, it makes a Blue: But;

6. When the Sulpher and Acid are predominant to the Alkaline, it produces a *Purple*.

7. When the Sulpher is predominant to the Alkaline Principle, and the Acid to them both, it produces a *Scarlet*: But,

8. When the Acid is predominant to the Alkaline, and the Sulphur to them both, a *Blood-Red*; which is the higheſt and moſt Sulphurous Colour in Nature, *Anatom. of Plants*, P. 276, 277.

Experiments of the ſudden Change of Colours.

1. Into a ſtrong Solution of Sublimate in common Water (the Quantity a Spoonful or two) drop 5 or 6 Drops of good Spirit of Urine (or almoſt any Volatile Spirit) and the Mixture will preſently appear White; which Whiteneſs may immediately be deſtroyed by pouring in a little good *Aqua Fortis*. The Tribe of *Urinous Salts* are diſtinguiſhed by producing this white Colour.

2. Drop a large Drop of Syrup of Violets on White Paper, it will ſpread and exhibit a tolerable blue Colour; then if you drop upon it any Acid Spirit or Stygian Liquor, as ſuppoſe a Drop of Spirit of Vitriol, 'twill immediately turn into a fine Red; whereas a Drop of Spirit of Urine or any Volatile Spirit would have turned into a lovely Green; as alſo will a Drop of the Solution of Copper in Spirit of Urine, though it be of a deep Blue it ſelf. *Note*, To make the Experiment appear the better, 'tis beſt to ſtir about or mingle the Liquors with the Tip of your Finger.

3. The Eſſential Oil of Anniſeeds in cold Weather coagulates and turns Whitiſh; yet if on this Whitiſh Ointment, ſpread on White Paper, you let fall but a Drop or two of good Oil of Vitriol, a Heat and Smoak will ariſe, and a Blood-red Colour will be produced.

4. The *Adiaphorous* Spirit of Box mingled with a Solution of Mercury in *Aqua Fortis*, made firſt a deep Yellow, and then in a Minute or two turned a deeply *Red*; and being digeſted a Day or two, let fall a white *Precipitate*. Mr. *Boyle*.

5. An Infuſion of an Handful of ſliced *Lignum Nephriticum* in 4 Pound of Spring Water all Night, will give the Liquor that is poured off into a clear Glaſs Vial a Colour almoſt like that of Gold, provided you hold up the Vial between your Eye and the Light; but when you hold it from the Light, ſo that your Eye be between the Light and it, it will appear of a deep and lovely Blue Colour; which fine Blue Colour a few Drops of any Acid Liquor will immediately make diſappear, and about as many of Oil of *Tartar per Deliquium* or any ſuch fix'd Alkalizate Liquor will again reſtore.

6. Every one knows, that red Roſe Leaves held a while in the Smoak of Sulphur will turn pale; and yet if you infuſe old diſcoloured Roſe-Leaves that have been long dried in a Glaſs of Water, it will ſcarce impart any Colour to the Liquor; but on the dropping a due Quantity of the Spirit of Sulphur, the Liquor will turn into a lovely Red.

7. Tincture of Red Roſe-Leaves drawn with Water and a little Oil of Vitriol was put into a clear Vial about half full of fair Water, in ſuch a Proportion as that the Mixture was very red, but yet tranſparent; then into it was dropt leiſurely a little Spirit of Urine, and the Mixture being ſhaked, exhibited a fine Greeniſh Blue.

8. If into a Spoonful of the Infuſion of Powder of Logwood in Water, which will be Red, you drop two or three Drops of Spirit of Urine, it will produce a lovely Purple; but if the Water which drew the Tincture from the Logwood, had been impregnated with Spirit of Salt, the Drops of Spirit of Urine, inſtead of Purple, would have produced a Yellow Colour.

9. Three or four Drops of Oil of *Tartar per Deliquium* drop'd into a Spoonful or two of clear Solution of Sublimate in common Water, though the Liquors are both Colourleſs, will in a trice produce a deep Yellow Colour; which, by dropping in four or five Drops of Oil or ſtrong Spirit of Vitriol, may be as ſoon deſtroyed and made to vaniſh; and by putting in more of the Oil of Tartar, recovered again, *&c.* The Tribe of Lixiviate Salts are known and diſtinguiſhed by this Teſt, that they will all produce this Yellow Colour, when mix'd duly with a Solution of Sublimate.

10. Diſſolve Filings of Copper in good Spirit of Fermented Urine, the Solution will be deeply Blue; but if into a Spoonful of this you drop 2 or 3 Drops of Oil of Vitriol, the Ceruleous Colour will immediately vaniſh, and the Liquor become clear as Rock-Water.

11. If three times its Weight of Oil of Vitriol be in a Glaſs Retort placed in Sand, drawn off from a Quantity of good Quick-ſilver, it will leave a Calx as *white as Snow*; which yet as ſoon as ever common Water is poured on it, turns into one of the brighteſt and lovelieſt *Yellow Colours* in the World.

12. Diſſolve Camphire in Oil of Vitriol, and it will impart a deep and almoſt opake Red on the *Menſtruum*, though it ſelf be White, and the *Menſtruum*, if good, clear and tranſparent. And if into the Solution you pour a little Water, the Red Colour will vaniſh in a trice, the *Menſtruum* grow pale, and the Camphire be recovered again in its priſtine Form.

A CATALOGUE of the Simple Colours.

1. *Spaniſh White*, made of *Chalk* and *Alumn*, burnt together.
2. *Lapis Armenius*, ſuppoſed to be the ſame with the common *Blue Bice*.
3. *Ultramarina*, made of the blueſt *Lapis Lazuli*, which is freeſt from Gold Veins by Calcination.
4. *Smalt*, made of *Zaffer* and *Pot aſhes* calcin'd together in a Glaſs Furnace.
5. *Litmoſe*, ſuppoſed to be the Juice of a Plant.
6. *Indico*, by ſome ſaid to be a kind of Mud adhering to the Froth about Reeds in *India*. Others ſay it is a Plant like *Roſemary*, called *Intil*, growing in *Cambia*, which is gathered and dryed, then wetted with fair Water, and beaten to a Mud; this Operation being repeated, it is dryed and fitted for uſe.
7. *Indian Ink*, whoſe Compariſon is ſuppoſed to be burnt *Rice*.
8. *Cerus* or *Pſymithium*, is the Ruſt of Lead made by a Vaporous Calcination.
9. *Maſticot*, is a kind of improper *Calx* of *Tin*.
10. *Gambodia*, or *Gutta Gambæ*, is ſuppoſed to be the inſpiſſated Juice of a *Plant* that comes from the *Indies*.
11. *Oker*, a ſort of Natural Earth.
12. *Orpiment*, a fat inflammable Mineral, juſtly ranked

ranked amongſt *Poyſons* for its extream Corroſive Quality.

13. *Umber*, a native Earth.

14. *Red-Lead*, made of Litharge or burnt Lead, by a Reverberatory Calcination, or of *Ceruſs* put on a Platter over the Fire, which muſt be continually ſtirred till it has acquired a *Red-Lead* Colour.

15. *Burnt Oker*, is the common Yellow *Oker* burnt in open Fire.

16. *Cinnabar* or *Vermillion*, there are two ſorts, Native, or the *Minium* of the Ancients, which is a Mineral that yields *Quick-ſilver*, whereof, and of *Sulphur*, it chiefly conſiſts. It is found in the Mines of *Iſtria*.

The *Factitious Cinnabar* is that which we now uſe; and is made by a Sublimation of *Mercury* and *Sulphur*.

17 *Carmin*, made of *Cochineal*.

18. *Lake*, is made of *Flocks* dyed, or Shavings of *Scarlet-Cloth*, or of the *Cochineal Inſect*, or elſe of *Kermes-Berries*, their Tincture being extracted with a Lee of *Pot-aſhes*, and then precipitated with a Solution of *Roch-Allum*. After the ſame manner a *Lake* may be made of a Plant or Flower. There is alſo another ſort of *Lake* made of *Gum-Lac*, by extracting its Tincture with *Urine*.

19. *Sanguis Draconis*, is the Gum of a Tree which looks like dried Blood; 'tis brought out of ſeveral Places in the *Eaſt-Indies*.

20. *Earth Reddle*, or *Ruddle*, found in many Places of *England*.

21. *Lamb-black*, made of *Soot* of *Roſin* or *Pitch*, burnt in Places built on purpoſe for it, that keep in the Smoak.

COLUMN, in the Art Military, is the long File or Row of Troops, or of Baggage of an Army in its Match. To march in a *Column*, is to march a great Depth, or in a long File, inſtead of making a large Front. An Army marches in one two, three, or more *Columns*, according as the Ground will allow, and the General ſees expedient.

COLUMN, in Architecture, is properly that round long Cylinder or Part of a Pillar which is called the *Shaft*, *Trunk*, *Fuſt*, the *Scapus*, *Vivo*, *Tige*, *&c.* containing the Body of it from Spire to the Baſe, or from the Aſtragal of the Baſe to the Capital.

COLUMNÆ *Cordis*, are the Muſcles and Tendons by which the Heart is contracted and dilated.

COLURES, are two great Cirles imagined to paſs through the Poles of the World, one of them through the Equinoctial Points *Aries* and *Libra*, and the other through the Solſtitial Points *Cancer* and *Capricorn*, theſe are called the *Equinoctial* and *Solſtitial Colures*. And theſe divide the *Ecliptick* into four equal Parts or Quarters, which are denominated accordingly: And the Points where theſe paſs through are called the *four Cardinal Points*.

COLPUS, the ſame with *Sinus*.

COLUMELIA, the ſame with *Cion*.

COLUMMA *Naſi*, is the Fleſhy Part of the Noſe, prominent in the Middle near the upper Lip.

COLUMMA *Oris*, the ſame with *Coin*.

COLUMN, in Architecture, taken in the largeſt Senſe, is a ſort of Pillar of a round Form, which ſerves to ſupport or adorn a Building conſiſting of a Baſe, a Shaft or Shank (which is properly the *Column*) and a *Capital*. *Columns* are different according to the ſeveral Orders of Architecture.

The *Tuſcan* being the ſhorteſt and moſt ſimple, is ſeven Models long, comprehending its Baſe and Capital, and diminiſhed a fourth Part of its Diameter.

The *Dorick* ought to be Seven and a Half, or Eight Diameters long; and its Baſe and Capital are ſomewhat more beautify'd with Mouldings.

The *Ionick Column* is nine Diameters long, and hath its Capital ſet off with *Voluta*'s or curl'd Scrolls, differing in that reſpect from others as well as in its Baſe, which is peculiar thereto.

The *Corinthian* is the Richeſt of all, having two Rows of Leaves for the Ornament of its Capitals with Stalks or Stems, from whence ſhoot forth ſmall Voluta's. Its Length is Ten Diameters.

The *Compoſit Column* is likewiſe Ten Diameters long, and its Capital is made like that of the *Corinthian*, with the Angular *Voluta*'s or the *Ionick*.

COMA *Somnolentum*, is a deep Sleep, leſs than a Lethargy, without a Fever, wherein the Patient being awakened, anſwers to any Queſtion propounded to him, but falls into a profound Sleep again, with his Mouth open and his under Jaw fallen, more like to one dead than alive. *Blanchard*.

COMA *Vigil*, waking Drowſineſs, is a Diſeaſe wherein the Patients are continually inclined to Sleep but ſcarce can Sleep, being affected with a great Drowſineſs in the Head, a Stupidity in all the Senſes and Faculties, and many times with a *Delirium* too.

COMB, in a Ship, is a ſmall Piece of Timber ſet under the lower Part of the *Beak-head* near the Middle; it hath two Holes in it, and ſupplies to the *Fore-Tacks* what the Chiefs-Trees do to the Main ones, that is, to bring the Tacks aboard.

COMBATANT, the Herald's Word for two Lions born in a Coat of Arms in a Fighting Poſture, Rampant, and their Faces towards each other.

COMBINATION, is the Art of finding how many different Ways a certain given Number of things may be varied, or taken one and one, two and two, three and three, *&c.* *See* Vol. II.

COMBUST, a Term in Aſtronomy, when a Planet is not above 8 *Degrees* and 30 *Minutes* diſtant from the *Sun*, either before or after him; he is ſaid then to be *Combuſt*, or in *Combuſtion*.

COMETS, are what are commonly called *Blazing-Stars*. The Ancients, eſpecially *Ariſtotle* and his Followers, ſuppoſed them to be Meteors or Exhalations ſet on Fire in the higheſt Region of the Air: The Modern *Aſtronomers* have found them to be above the Orbit of the *Moon*, but yet to deſcend ſo low as to move in the Regions of the *Planets*: It is not improbable but that they may be a ſort of very *Eccentrical Planets*, and move Periodically about the *Sun*.

Mr. *Azout*, a *French* Gentleman, was the firſt as I can find, who pretended to perdict what would be the future Motion of a *Comet*; which he did for one that appeared *Jan.* 166$\frac{4}{5}$, and ſent Copies of them to the Secretary of the Royal Society, *Jan.* 2. 1664, *New Stile*. He alſo did the ſame for a ſecond Comet, which appeared the Year following.

Hevilius, in his *Prodromus Cometicus*, ſaith, he is almoſt poſitive no Account can be given of the *Phænomena* of *Comets*, without ſuppoſing the Annual Motion of the Earth.

Meaſuring the *Comet* in the Year 166$\frac{4}{5}$, he found it to be diſtant from the Earth above 5000 Semi-Diameters of the ſame; and that its true Diameter was then 25600 *German* Miles, which is 3 times as long as the Diameter of the Earth.

He ſuppoſes all of them to move round the *Sun* as their Center, and to be a kind of Spurious Planets.

Their Train or *Coma* he takes to be occaſioned by the Beams of the *Sun* falling on the Head of the *Comet*, and paſſing through the ſame Reflected and Refracted.

Afterwards, in 1668, he publiſhed his *Cometographia*, wherein he ſuppoſes, that the Trajectory of a *Comet* is nearly Rectilinear, or that they always move in a ſtraight Line.

Yet he ſuppoſes alſo a *Motion impreſſed*, and an Inclination of the *Comet*'s Disk to the Sun, as two Cauſes why *Comets* may ſometimes deviate from a ſtraight Courſe, eſpecially about the Beginning and End of their Appearance.

He obſerves, That this Line is ſomething near that of a *Parabola* ſometimes, but never is the Ark of any Circle: Alſo that there is in *Comets* a *Libratory* Motion, like that in the *Moon*.

The famous Sr. *Iſaac Newton*, in his excellent *Principia Philoſ. Mathem.* hath a large Diſcourſe of *Comets*, p. 473, *&c.* where he proves.

1. That they are above the Moon, and in the Region of the Planets, becauſe they have no Diurnal Parallax, but an Annual one: For thoſe *Comets* which move forward according to the Order of the Signs, are all at their Exit or Diſappearance, ſlower in their Motion than they were before, or (Retrograde) if the Earth be between them and the Sun; but they move ſwifter than ordinary when they begin to diſappear, if the Earth be in oppoſition to the Sun: And on the contrary, if they move contrary to the Succeſſion of the Signs, and have the Earth between them and the Sun, then they move more ſwifter than ordinarily at their Exit; but if the Earth be in oppoſition, they move ſlower, and retrograde towards their going off. This chiefly depends on the Motion of the Earth, as it is in the Planets, who, according as the Earth's Motion agrees with, or is contrary to theirs, appears ſometimes retrograde, ſometimes to move ſlower, and other times more ſwiftly.

If the Earth move the ſame way with the *Comet*, and ſwifter by its angular Motion round the *Sun* than the *Comet*, the *Comet*, when beheld from the Earth, will appear to be Retrograde.

And if the Earth move ſlower than it, the Motion of the *Comet* (ſubducting the Motion of the Earth) will be, to appearance, ſlower,

But if the Earth move a contrary way to the *Comet*, it will then appear to move ſwifter than the Earth: All which he illuſtrates and proves, and ſhews alſo a Way from the *Comet*'s Parallax to find its diſtance.

From the Conſideration alſo of the Curvity of the Way of a *Comet*, he concludes, That when they diſappear, they are much below the Orb of *Jupiter*; And that in their *Perigeums* and *Peribeliums*, they often deſcend below the Orbits of *Mars* and the inferior Planets.

From the Light alſo of the apparent Star that is in the Head of the *Comet*, he concludes their Vicinity to the Sun and Earth; and that they can by no Means be in the Region of the fixed Stars, as ſome have imagined, for then their Heads could no more be enlightned by the Sun, than the Planets are by the fixed Stars.

Conſidering alſo the Obſcuration of the *Comet* by that thick Fume or Vapour with which its Head is always encompaſſed, he concludes, That they muſt often deſcend down below the Sphere of *Saturn*, as he had before found by their Parallax. The ſame thing he concludes alſo by examining into the Cauſe of the *Coma* or Tail, and then draws theſe *Corollaries*.

1. That *Comets* ſhine by the Light of the Sun's Beams reflected from them.

2. That the Heavens are devoid of all Reſiſtance, ſuch as our Air and other *Mediums* have: For theſe *Comets* move every way with all the freedom that can be, obliquely, directly, and often againſt the Courſe of the Planets, and yet can continue their Motion for a very long while, even ſo. And therefore the Celeſtial Regions cannot be filled with Matter like the *Carteſian* Vortices, but muſt be almoſt void Spaces.

Next, in *Propoſ.* 40. *Book* 3. he proves, That *Comets* move round the *Sun* in Conick Sections, having their *Umbelici* in the Center of the *Sun*; and that by Lines drawn from themſelves to the *Sun*, they deſcribe *Area*'s proportional to their Times of Revolution, as the other Planets do: And he ſeems to think them a kind of Planets, and that they revolve in real Elliptical Orbits, though they nearly approach to *Parabola*'s. From which Propoſition he concludes,

1. That if *Comets* do ever come about again, their Orbits are very Eccentrical Ellipſes; and that their Periodical Times are to thoſe of the Planets in a Seſquialteral Ratio of the Tranverſe Axes; and therefore *Comets* being uſually above the Planets, and deſcribing Orbits of longer Axes than they, do really move ſlower than they; and particularly, that if the Ax of the Orb of a *Comet* were 4 times as long as the Ax of *Saturn*'s Orbit, the Time of the Revolution of the *Comet* to that of *Saturn*, would be $4 \times \sqrt{4}$, or 8 to 1; that is, 240 Years.

After this, in ſeveral *Lemma*'s, he prepares the Way to determine the Species of the Conick Section a *Comet* deſcribes; to find its Place at any intermediate given Time; and to determine the Trajectory from three Obſervations, which he illuſtrates by Examples.

Then he proceeds to conſider more particularly what the Bodies of *Comets* are, and concludes that they are ſolid, compact, fix'd and durable, like thoſe of the other Planets. Refuting the old Opinion of their being Meteors or Exhalations from this, That in their Tranſits, ſo near the *Sun* as we find they do go, they would be perfectly diſſipated, diſperſed and deſtroyed.

The Heat of the *Sun* he had before ſhewn to be as the Denſity of the Rays, or reciprocally as the Squares of the Diſtances of Places from the *Sun*: Wherefore ſince the Diſtance of the *Comet* which appeared in the Year 1680, being in its Periheli-on *December* the 8th, was then to the Diſtance of the Earth from the *Sun* as 6 to 1000 nearly. The *Sun*'s Heat in the *Comet* at that time was to his Heat with us at *Midſummer* as 1000000 to 36, or 28000

28000 to 1; whereas the Heat of boiling Water, as he tried, was but very little more than triple the Heat of our dry Earth exposed to the *Midsummer Sun*; and the Heat of red hot Iron he Conjectures to be about 3 or 4 times as great as that of boiling Water: Wherefore the Heat of the dried Earth or Body of the *Comet* in its *Peribelion*, was near 2000 times as great as that of red hot Iron; and consequently, if the *Comet* had been a Meteor, or an Aggregate of Vapours and Exhalations, the Sun would have rendred it invisible.

The *Comet* therefore acquired so great, so immense a degree of Heat in its *Peribelion*, that it must needs be a long time before it will be cold again; for he computes that a Globe of red hot Iron of the Dimensions of our Earth, would scarce be cool in 50000 Years. If therefore we suppose the *Comet* to cool 100 times as fast as red hot Iron, yet since his Heat was 2000 times greater than that of red hot Iron, if you suppose his Body to be of the same Bigness of our Earth, he will not be cool in a Million of Years.

He observes also, that the Tails of all *Comets* are longest and largest after their passing from the Sun, or just after their *Peribelions*; which shews that the Sun's Heat contributes to the encrease of the Tail: Whence 'tis more than probable, that the Tail of a *Comet* is only a long and very thin Smoak or train of Vapours which the ignited *Nucleus*, or the Head of the *Comet* emits from it. And this Notion he confirms after this, by refuting the two other Opinions about the Origin of the Tail of a *Comet*.

For some will have it to be only the Sun-Beams shining thro' the Head of the *Comet*, as they do, thro' a Crevise into a dark Place, and by that Means come to appear in that Form.

But this Notion he shews will not hold, because the Reason that the Sun-Beams appear thus lucid when his Rays shine thro' an Hole or Chink into a dark Place, is because the Light is reflected from the Particles of Smoak, small Dust, *&c.* which continually fly to and fro in the Air, and therefore is always more splendid where the Air abounds with the most gross and greatest number of Particles of this Nature. But in a thin and clearer Air, no such Appearance can well be seen; and consequently in the Celestial Regions, where probably there is little or no Matter to reflect, cannot be visible: For Light, as in the Sun-Beams only, is not discernable, but only so far as it is from thence reflected to our Eyes.

Others will have the Tails of *Comets* to be formed by the Refraction of Light as it passes thro' the Head of the *Comet* to the Earth: But this Opinion he thinks prest with many scarce answerable Difficulties; for first, the Tails of *Comets* never appear adorned with various Colours, which yet are usually the inseparable Concomitants of Refraction. Again, the Light of the fix'd Stars and Planets coming to us directly, and transmitted distinctly, plainly shews that the Celestial *Mediums* it passeth thro' have no refracting Power. And as to the Radiation and Twinkling of the fixed Stars, that ought to be attributed rather to a Refraction in our Eyes, or to be occasioned by the tremulous Motion of the Air, because when we look on them thro' a Telescope, there is no such thing. The Tremor of the Air, and of the ascending or descending Vapours, may easily occasion a little quick successive Distortion of the Rays from so small a Point as the Pupil of one's Eye; but they cannot do so from the much larger Aperture of a Telescope's Object Glass, which is the Reason why there is an apparent twinkling in the former, but not in the latter Case; and the Cessation of the Scintillation in the Latter, is a Demonstration that there is a regular Transmission of the Rays of Light without any sensible Refraction.

Lastly, If the Tails of *Comets* were produced by the Refraction of the Sun's Light shining thro' them towards us, and according to the Figure of the Heavens, were reflected to Parts opposite to the Sun, that Defluction in the same Regions of the Heavens must always be made towards the same Parts: But this, by plain and undoubted Observation, hath been found to be false in Fact, and therefore this account cannot be the true one.

That the Tails or Beards of *Comets* do arise from the *Nucleus* or Head, and ascend towards the Regions opposite to the Sun, is confirmed by the Laws which they observe; as, that lying in the Planes of the Orbits of *Comets* which pass thro' the Sun, they deviate from the Opposition of the Sun always towards those Parts, which their Heads, as they move forward, leave in those Orbits: That to a Spectator placed in these Planes, they appear in Parts directly opposite to the Sun; but that if the Spectator deviate a little from these Planes, their Deviation will become sensible, and every Day appear greater and greater: That, the Deviation, all things consider'd, is less where the Tail is oblique to the Orbit of the *Comet*; as also when the Head of the *Comet* approaches nearer to the Sun, especially if the Angle of the Deviation be observed near the Head of the *Comet*; besides that those Tails which do not deviate appear straight, but those that do, appear Curved: That the Curvature is greater where the Deviation is greater, and more sensible where the Tail is of the greater length; for in short ones it is hardly observable: That the Angle of Deviation is less near the Head of the *Comet*, and greater near the opposite Extreme, and therefore that the Tail turns its Convex Parts towards the Place from which the Deviation is made, and which are in a Right Line drawn from the Sun thro' the Head of the *Comet*, and produced infinitely: And that those Tails which are larger and longer, and which shine brightest, are more splendid towards their Convex Sides, and are better defined, or more distinctly terminated there, than on their Concave Sides.

Wherefore the *Phænomena* of the Tails of *Comets* depend upon the *Motion of their Heads*, and not upon *that Region of the Heavens* in which the Head is seen, and therefore do by no means arise from Refraction in the Heavens, but have their Matter supplied from the Head.

For, as in our Air, the Smoak of any kindled Body ascends upright if the Body be at rest, but obliquely if it have a Lateral Motion any way: So in the Heavens, where Bodies gravitate towards the Sun, Smoak and Vapours ought to ascend up from the Sun, and that in a Right Line, if the Smoaking Body be at rest, or obliquely, if it move any way laterally, and by its progressive Motion doth always desert those Spaces from whence the Superior Parts of the Vapours had ascended: And this Obliquity will be less where the Ascent of the Vapours is more swift, *viz.* near the Sun, and near the

the ſmoaking Body. From the Diverſity of this Obliquity the Column of the aſcending Vapour will be incurvated; and becauſe the Vapour in the Precedent Side of the Column, is ſomething newer or more recent than the other, it will therefore be a little more denſe, and conſequently more copiouſly reflect the Light, and be defined or terminated more diſtinctly than the other Side.

That there may ariſe from the Atmoſphere of *Comets*, Vapours enough to take up ſuch immenſe Spaces, may be underſtood from the Rarity of our Air: For Air, near the Surface of our Earth, takes up a Space 850 times as large as Water of the ſame weight with it; and therefore a Column of Air of 850 Foot high, weighs no more than one of Water of but one Foot high, if they have both the ſame Baſe. But a Column of Air of the height of the whole Atmoſphere, weighs no more than a Column of Water of about 33 Feet high, and of the ſame Baſe; and therefore if from this whole Column of Air you ſubtract the lower Part as far as the Height of 850 Foot, the remaining Column will weigh equal to a Column of Water of 32 Foot; from whence (by that Hypotheſis which is now confirm'd by many Experiments, it may be fairly concluded, that *the Compreſſion of the Air is as the Weight of the incumbent Atmoſphere; and that Gravity is reciprocally as the Square of the Diſtance of Places from the Center of the Earth.* I found by Circulation, ſaith he, (the Ground of which he gives in *Prop.* 22. *Lib.* 2.) that Air, at the Diſtance of our Earth's Surface, of only one Semi-diameter of the Earth, is more *rare* than it is with us in a Ratio much exceeding that which all the Space below the Orb of *Saturn* bears to the Diameter of a Globe of only one Inch in length. And therefore a Globe of our Air of only one Inch in Diameter, if it had but the ſame degree of Rarity which our Air hath at the Diſtance of 4000 Miles, or of the Earth's Semi-diameter from us, would more than fill all the Regions of the Planets, as far as the Sphere of *Saturn*, and much farther. Wherefore ſince Air, as you go higher, will ſtill grow immenſely *rare*, and that the *Coma* or *Atmoſphere* of a *Comet*, counted from its Center is about 10 times higher than the Superficies of the *Nucleus*, the Tail of it aſcending much higher, muſt needs be exceedingly rare.

And tho', becauſe of the great Craſſitude of the Atmoſphere of *Comets*, and the great Gravitation of Bodies towards the Sun, and the Gravitation of the Particles of Air and Vapour towards one another, it may be that the Air in theſe Celeſtial Spaces, and in the Tails of *Comets* may not be rarified quite ſo much, yet 'tis plain by this Computation, that a very little Quantity of Air and Vapours will ſuffice to ſolve all the *Phænomena* of the Tails of *Comets*.

For the very great Rarity of the Tails of *Comets* may be concluded by the fix'd Stars ſo plainly appearing thro' them, as we find they do. The Atmoſphere of our Earth ſhining with the Sun's Light, tho' perhaps its Thickneſs be but a few Miles, yet quite extinguiſhes all the Light of the fixed Stars, and obſcures the Moon it ſelf; whereas the immenſe Thickneſs of the Tail of a *Comet*, illuſtrated as our Atmoſphere is by the Rays of the Sun, will permit the ſmalleſt fix'd Stars to be ſeen thro' it without any Diminution of their Brightneſs.

And the Tails of moſt *Comets* have no greater Splendor than the Sun-beams exhibit when reflected from a Stream of Motes, Duſt, *&c.* in a darken'd Room, of but one or two Inches in Thickneſs.

At what time the Vapour aſcends from the Head to the Extremity of the Tail, may be almoſt diſcovered by drawing only a Right Line from the End of the Tail to the Sun, and then noting the Place where that Right Line cuts the Trajectory: For the Vapour in the Extremity of the Tail, if it aſcend in a Right Line from the Sun, will begin its aſcent at the time when the Head of the *Comet* is in the Place of Interſection.

But indeed the Vapour doth not aſcend in a Right Line from the Sun, but by retaining the Motion of the *Comet* which it had before its Aſcent, and compounding it with the Motion of its Aſcent, it aſcends obliquely; wherefore it will be a truer Solution of the *Problem*, to ſuppoſe the Right Line which interſects the Orbit to be parallel to the Length of the Tail, or rather (becauſe of the Curvilinear Motion of the *Comets*) that it diverge from the Line of the Tail. By this means I found that the Vapour which was in the Extremity of the Tail, *Jan.* 25. began to aſcend from the Head before *December* 11. and therefore had taken up more than 45 Days in its Aſcent: But all that long Tail which appeared *December* 10. aſcended in the ſpace of thoſe two Days, which were then juſt paſt ſince its *Perihelion*; wherefore the Vapour at the Beginning, when the *Comet* was near the Sun, aſcended prodigiouſly ſwift, and afterwards continued to aſcend with a Motion retarded by the Gravity of the Particles, and by that Aſcent encreaſeth the Length of the Tail: But the Tail, as long as it appeared, conſiſted almoſt all of that Vapour which aſcended from the Time of the *Perihelion*; and the Vapour which firſt aſcended and compoſed the Bounds of the Tail, did not vaniſh till it was both too far off the Sun to be illuminated by him, and off us to be viſible. Hence alſo the Tails of *Comets* which are ſhorter, do not aſcend with a quick and continual Motion from the Head, and then preſently vaniſh and diſappear; but are permanent Columns of Vapours and Exhalations, gathered from the Head by a very gentle Motion, and in a great ſpace of Time; which yet by participating of that Motion of their Heads which they had at the Beginning, they continue eaſily to move along with their Heads thro' the Celeſtial Regions. And from hence it may again be concluded, That the Heavens are filled with no Matter that hath any Power of Remittance or Reſiſtance in it; ſince only the Planets and Comets themſelves, but even ſuch very rare Bodies as the Tails of *Comets*, can both move there very freely and ſwiftly, and alſo continue that Motion for a vaſt while together.

This excellent Author ſuppoſes the Aſcent of Vapours into the Tails of *Comets*, to be cauſed by the Rarefaction of the Matter in the Atmoſphere at the Time of the *Perihelion*. Smoak, ſaith he, in a Chimney aſcends up by the Impulſe of the Air in which it ſwims or floats: And Air, rarify'd by Heat, aſcends by the Dimunition of its Specifick Gravity, taking the Smoak, and carrying it up along with it. Why ſhould not the Tail of a *Comet* be, after the ſame manner, ſuppoſed to be raiſed by the Sun? for the Sun-Beams do not agitate any *Mediums* which they paſs through, but only by Reflection

and

and Refraction. The reflecting Particles being made warm by this Action, do warm the Æther, with which they are compounded. This Æther (or whatever you will call it) being rarified by the Heat communicated to it, and having its Specifick Gravity by which it deſcendeth toward the Sun before, now diminiſhed by this Rarefaction, aſcends and carries along with it thoſe reflecting Particles of which the Tail of a *Comet* is compoſed.

To the Aſcent of theſe Vapours, it conduces that they are carried by a circular Motion round the Sun, and conſequently endeavonr to recede from the Sun, while the Atmoſphere of the Sun, and the Matters of the Heavens, doth either really reſt, or elſe being moved with no other Motion than what they have from the Sun's Circumrotation, are moved very ſlowly. Theſe are the Cauſes of the Aſcent of Vapours into the Tails of *Comets*, when they are within the Confines of the Sun, where their Oebits are more curved, and where *Comets* being within the *denſer*, and therefore *heavier* Atmoſphere of the Sun, have their Tails of the greateſt Length. For the Tails which are now produced by preſerving their own Motion, and at the ſame time gravitating towards the Sun, will move about him in Ellipſes like their Heads, and by that Motion will always accompany and freely adhere to their Head: For the Gravity of the Vapours towards the Sun, will no more cauſe the Tails of the *Comets* to forſake their Heads, and to fall down towards the Sun, than the Gravity of the Heads can make them fall off from their Tails. But their common Gravity they would either fall down to the Sun together, or be together retarded in their Aſcent: and therefore this Gravity doth by no means hinder, but that the *Heads* and *Tails* of *Comets* may receive and retain any Poſition to one another, which either the above-mentioned Cauſes, or any other may produce.

Theſe *Tails* therefore which are thus produced in the *Peribelions* of *Comets*, will go off along with their Heads into remotely diſtant Regions, and from thence, either with the *Comets* themſelves, return again to us after a long ſeries of Years; or rather being there rarified vaniſh quite away by little and little: For afterwards in the deſcent of their Heads towards the Sun, ſome little ſhort Tails ought gradually and ſlowly to be produced from the Heads, which afterwards in the *Peribelions* of ſuch *Comets* deſcend down into the Sun's Atmoſphere, muſt needs be immenſely encreaſed; for the Vapours in thoſe free Spaces will continually be rarified and dilated, whence it comes to paſs, that the Extremity of the Tail is always much broader than the End next to the Head of the *Comet*.

And it appears agreeable enough to reaſon, to ſuppoſe, that thoſe Vapours which are thus dilated, rarified and diffuſed throughout all the Celeſtial Regions, may by little and little by their own proper Gravity, be attracted down to the Planets, and become intermingled with their Atmoſpheres. For as to the Conſtitution of this Earth of ours, it is neceſſarily required that there ſhould be *Seas*, that from them vaſt quantities of Vapours being raiſed, by the Heat of the Sun, they may either gather into Clouds, and then fall down in Rain to moiſten and nouriſh the whole Earth, and to render it Fertile; or elſe (as ſome Philoſophers think with good Reaſon) being condenſed by the cold Tops of Mountains and Hills, run down from thence, and form Springs, Fountains and Riverrs; ſo for the Conſervation of the *Seas* and Moiſture of the *Planets*, *Comets* ſeem neceſſarily requiſite: from whoſe condenſed Exhalations and Vapours all that Moiſture which is conſumed in Vegetations and Putrefactions, and turned into dry Earth, may by degrees, be continually re-ſupplied and recruited: For all Vegetables do entirely grow and encreaſe from Liquors, and then, as to their greateſt Part, do turn by Putrefaction into dry Earth, and a Slime perpetually is precipitated to the Bottom of putrifying Liquors. From hence the Quantity or Bulk of dry Earth muſt continually increaſe, and the Liquors or Moiſture of our Globe continually decreaſe, and at laſt be quite evaporated and loſt, if they had not as continual a Supply from ſome Part or other of the Univerſe. And I do alſo ſuſpect (ſaith our Author) that that *Spirit* which is the fineſt, ſubtileſt, and beſt Part of our Air, and which is neceſſarily requiſite to the Life and Being of all things, comes chiefly from *Comets*.

The Atmoſphere of *Comets*, as they deſcend towards the Sun, are ſenſibly diminiſhed by their running out to afford Matter to produce the Tail, and (certainly in that Part which looks towards the Sun) do grow more narrow and contracted; but after this, as the *Comets* recede from the Sun, when they do not ſo much run out into the Tail, they are inlarged, if *Hevelius* hath rightly obſerved the *Phænomena*. But they appear leaſt of all when the Heads of the *Comets*, having been ſo exceedingly heated by the Sun (in the *Comet*'s *Peribelia*) blaze out into thoſe vaſtly great and bright ſhining Tails, and when the *Nuclei* being perhaps covered with a black thick Smoak, are covered by the lower Parts of the Atmoſphere: for all Smoak is greater and more black and thick when the Heat is very great.

Thus the Head of that *Comet* of which we have been ſpeaking, as equal Diſtances from the Sun and the Earth, appeared more obſcure after the *Peribelion* than before. For in *December* it appeared but like a Star of the 3d Magnitude, whereas in *November* it was like one of the Firſt or Second.

He concludes therefore, that *Comets* are a kind of *Planets* moving round the Sun in very excentrical Orbits; and as thoſe Planets which are neareſt the Sun, and revolve about him in leſſer Orbits, are leſſer than others, ſo he ſuppoſes thoſe *Comets*, which in their *Peribelion* come very near the Sun, are leſs than others, and revolve in leſſer Orbits.

If a *Comet* in its deſcent to, or aſcent from the *Sun*, approach near to a Planet as it paſſes by, and its Plain be different from that in which the Planets move: By its attractive Power it will, agreeably to the univerſal Law of Gravitation of Bodies, draw it from the Plain in which it before moved, and ſo cauſe it afterward to move to a new one, inclined to the former, but paſſing thro' the *Sun* as the former did.

Hence 'tis poſſible, That though the Planets originally revolved in the ſame common Plain, yet by the ſubſequent Attraction of *Comets*, their Plains may be inclined to one another and different, as 'tis certain, *de facto*, they now are.

Dr. *Gregory*, in his *Aſtronomical Phyſ. & Geometrica Lib.* 5. ſhews, That the ancient Aſtronomers and Philoſophers believed *Comets* to be very Eccencrical

centrical Planets revolving round the Sun; and that it was the Peripatetick School which brought up the Notion of their being nothing but Meteors and below the Moon.

Caſſini obſerved of the *Comet* which appeared in the Year 1680, that it was but 22 or 23 Degrees from the Sun, and yet to us appeared to have half its Globe illuminated, or not to be either *falcated* or *gibbous*; which alſo was obſerved of the *Comet* in the Month of *April*, 1665; and from thence he concludes juſtly, that thoſe *Comets* were at that time not only higher than the Moon, but alſo than the Sun himſelf; becauſe *Mercury* and *Venus* at that diſtance from the Sun do never appear full but when they are ſo.

The ſame Perſon thinks it is too raſh in the Modern Philoſophers to condemn as falſe and ridiculous, the Notion that hath been long received of the bad Preſages of *Comets*; for he ſaith, If the Tail of a *Comet* ſhould be intermingled with our Atmoſphere, or if the Matter of it ſhould, by its Gravity, fall down upon our Earth, it may induce changes in our Air, that may be very ſenſible among Animal and Vegitable Bodies. *Aſtron.* p. 408.

And p. 412. he ſhews the Way of determining the *Way* and apparent Place of a *Comet*. And p. 418. from four obſerved Places of a *Comet* to determine its Trajectory, if it were *Rectilineal*; and at p. 421. he gives the Method of determining the true Trajectory of a *Comet*. At p. 446. he ſhews how to find the Poſition of the Bodies of a *Comet*'s Orbit, and when the *Comet* will be in them; and p. 447. to find the Inclination of the Plane of ths *Comet*'s Orbit to that of the Ecliptick. And after this he ſhews how to correct the Trajectory, and to determine the Heliocentrick and Geocentrick Place of the *Comet* in the Trajectory, determined by the Method before given, for any given Time; as alſo to make neceſſary Tables for readily finding the Places of *Comets*. From p. 448. to 460.

The Famous *James Bernouli* in his *Syſtema Cometarum*, *An.* 1682, ſuppoſes, That there is ſome primary Planet revolving round the Sun in the Space of 4 Years and 157 Days, and at the Diſtance from him of 2583 Semi-diameters of the *Magnus Orbis*: The primary Planet he ſuppoſes either from his vaſt Diſtance or Smallneſs not to be viſible to us, but however, to have, at various diſtances from him, ſeveral Satellites moving round him (though none deſcending ſo low as the Orbit of *Saturn*;) and that theſe becoming viſible to us when they are in their *Perigæum*, are what we call *Comets*.

COMITATU *& Caſtro Commiſſo*, is a Writ whereby the Charge of a County, together with the keeping of a Caſtle, is committed to the Sheriff,

COMITATU *Commiſſo*, is a Writ or Commiſſion, whereby the Sheriff is authoris'd to take upon him the Command of the County.

COMITIALIS *Morbus*, the ſame with *Epilepſia*.

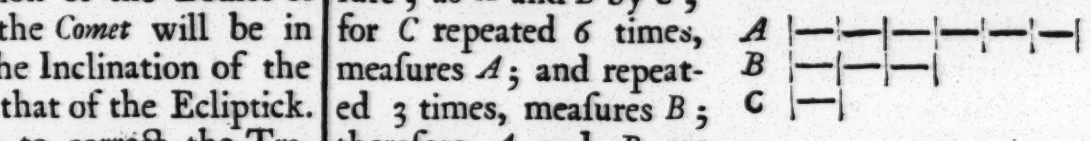
COMMA, is one of the Points or Stops uſed in Writing, and is thus mark'd (,) and is the leaſt in Power of them all, implying only a ſmall Reſt or little Pauſe, without breaking off the Sentence.

COMMA, in Muſick, is the Ninth Part of a Tone, or the Interval whereby a Semi-tone or a perfect Tone exceeds the Imperfect. This Term is uſed only in Theorical Muſick, to ſhew the exact Proportion between Concords.

COMMANDING *Ground*, in Fortification, is ſuch as overlooks any Poſt or ſtrong Place: Of this they reckon 3 ſorts; 1. *A Front Commanding Ground*, which is an Height oppoſit to the Face of the Poſt which plays upon its Front. 2. *A Reverſe Commanding Ground*, which is an Eminence that can play upon the Back of any Place or Poſt. 3. *An Enfilade Commanding Ground*, or *Curtin Commanding Ground*, which is an high Place that can with its Shot ſcour all the Length of a ſtrait Line.

COMMENDAM, is a Benefice that being void, is commended to the Care of ſome ſufficient Clerk, to be ſupplied till it may conveniently be provided of a Miniſter. He to whom the Church is commended hath the Fruits and Profits thereof only for a certain time, and the Nature of the Church is not changed thereby, but is as a thing depoſited in the Hands of him to whom it is commended who hath nothing but the Cuſtody thereof which may be revoked. When a Parſon is made a Biſhop, there is a *Ceſſion* of his Benefice by the Promotion; but the King may give him a Power to hold it in *Commendam*.

COMMENSURABLE *Magnitudes*, are ſuch as are meaſured by one and the ſame common Meaſure; as *A* and *B* by *C*; for *C* repeated 6 times, meaſures *A*; and repeated 3 times, meaſures *B*; therefore *A* and *B* are ſaid to be *Commenſurable*. *Def.* 1, 2, *&c.* 10. *c. e. Euclid.*



COMMENSURABLE *Numbers*, whether Integers or Fractions, are ſuch as have ſome other Number which will meaſure or divide them without any Remainder: Thus 6 and 8, $\frac{8}{12}$ and $\frac{3}{4}$ are reſpectively *Commenſurable Numbers*.

COMMENSURABLE *in Power*: Right Lines are ſaid to be *Commenſurable in Power*, when their Squares are meaſured by one and the ſame Space or Superficies. *Def.* 3. *e.* 10. *Eucl.*

COMMENSURABLE *Surds*, are ſuch *Surds* as being reduced to their leaſt Terms, become true Figurative Quantities of their kind; and are therefore as a Rational Quantity to a Rational.

COMMINUTION, is a dividing of a thing into very ſmall Parts or Particles.

COMMISSARY: In an Army there are two ſorts of Commiſſaries, 1. The *Commiſſary General of the Muſters*, or *Muſter-maſter General*, who takes an Account of the Strength of every Regiment, reviews them, ſees that the Horſe be well mounted, and all Men well armed and accoutred. 2. The *Commiſſary General of Proviſions*, who hath the Charge of furniſhing the Army with all things of that kind.

COMMISSURES, a Word uſed frequently by Mr. *Boyle* and others for the ſmall Pores of any Body, or the little Clefts, Cavities or Interſtices which are between the Particles of any Body; eſpecially when the Particles are broadiſh and flatiſh, and lie contiguous to one another, like very thin Plates.

COMMON *Axis*, in *Opticks*: See *Axis*.

COM-

COMMON *Diviſor*, is that Number which exactly divides any two other Numbers, without leaving any Remainder.

COMMON-PLEAS, is the King's Court now held in *Weſtminſter-Hall*: all Civil Cauſes, both Real and Perſonal are, or were, in former times, try'd in this Court according to the ſtrict Law of the Realm. The Chief Judge of that Court is called *The Lord Chief Juſtice of the Common-Pleas*, aſſiſted with three or four Aſſociates, which are created by Letters Patents from the King, and as it were inſtalled or placed upon the Bench by the *Lord Chancellor* and *Lord Chief Juſtice of the Court*. *Forteſcue*, cap. 51. The reſt of the Officers belonging to this Court are the *Cuſtos Brevium*, three Protonotaries, one Chirographer, fourteen Filacers, four Exigenters, Clerk of the Warrants, Clerk of the Juries, or *Jurata* Writs; Clerk of the King's Silver, Clerk of the Treaſury, Clerk of the Eſſoyns, Clerk of the Outlawries; whoſe diſtinct Functions ſee in their proper places.

COMMON *Ray*, in *Opticks*, is a Right Line drawn from the Point of Concourſe of the two *Optical Axes* through the Middle of the Right Line which paſſes by the Center of the Pupil of the Eye.

COMMON *Receptacle*, in Anatomy, is a certain Veſſel, ſo termed, becauſe it receives both the *Chyle* and *Lympha* promiſcuouſly, though ſome falſly call it the *Receptacle* of the *Chyle* in particular.

Common *Section* of two Planes: See *Section*.

COMMON *Senſory*, the *common* Perception of all Senſations, or that which receives the Images of ſenſible things, or the Impreſſion made by the Objects upon the Nerves, and according to theſe Impulſes determines the Appetite and exerts other Animal Actions.

COMMUNI *Cuſtodia*, was a Writ that lay for that Lord, whoſe Tenant, holding by Knight-ſervice, dies, and leaves his eldeſt Son under Age, againſt a Stranger that entreth the Land, and obtaineth the Ward of the Body: But now is become of no uſe.

COMMUNIA *Placita non tenenda in Scaccaria*, is a Writ directed to the *Treaſurer* and *Barons* of the *Exchequer*, forbidding them to hold Plea between two Common Perſons in that Court, where neither of them belong to it.

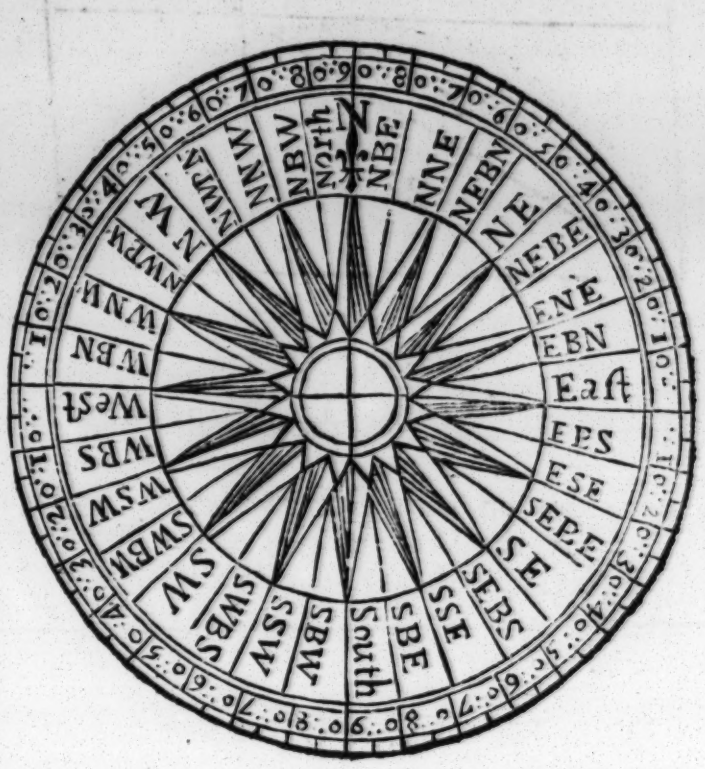
COMPARATIVE *Degree*, in Grammar, is when an Adjective hath joined to its natural and ordinary Signification the Word *more*, either actually or implied; as *more wiſe*, or *worſe*, that is, *more bad*.

COMPARISON, in Grammar, is the Variation of the Senſe of an Adjective, as to Degree; as *good*, *better*, *beſt*, are the three Degrees of Compariſon of that word.

COMPARTIMENT, is a regular orderly diſpoſition of agreeable Figures all round any Picture, Map, Draught, *&c.* for its better Ornament.

COMPASS, in Navigation, is a Circle divided into four Quadrants, repreſenting the four *Cardinal Winds*, or *Principal Points*, *Eaſt*, *Weſt*, *North*, and *South*; and each Quarter ſubdivided into eight other equal Parts, making in all 32 *Rhumbs* or *Points*.

This thus graduated Circle being drawn on a Chard, or Paſt-board, hath a toucht Needle or Wire placed under it, and in its Center a Braſs little Cell or a Conical Hollow, by which means it hangs horizontally on an erect Pin, and keeps its Lilly or North-Point always towards the *North*; by which means the Man at Helm, or Steerſman knows how to keep the Ship to her Courſe.



This Inſtrument, though it be ſubject to Accident, and always to Variation, is yet of vaſt uſe in *Navigation*; as alſo in *Surveying*, *Dialling*, and many other Parts of the *Mathematicks*.

The Learned Dr. *Wallis* conjectures, That the *Compaſs* was invented by an *Engliſhman*, becauſe the word *Compaſs* is uſed in many parts of *England* for a *Circle*.

COMPASS *Dials*, are ſmall ones fitted in Boxes for the Pocket, and ſhew the Hour of the Day by the Direction of the Needle; which ſhews how to place them right, by turning the Dial about till the Cock or Stile ſtand directly over the Needle, and point up to the Northward; but theſe can never be very exact, becauſe of the Variation of the Needle it ſelf.

COMPASS *of Proportion*, is an Inſtrument to divide Lines and Circles into proportional Parts at one opening of the Compaſſes, and is very much uſed in reducing or inlarging of Maps or Draughts. The *French* ſometimes call a *Sector* by this Name the *Compaſs of Proportion*.

COMPERTORIUM, a Judicial Inqueſt in the Civil-Law, made by Delegates or Commiſſioners to find out, or relate the Truth of a Cauſe.

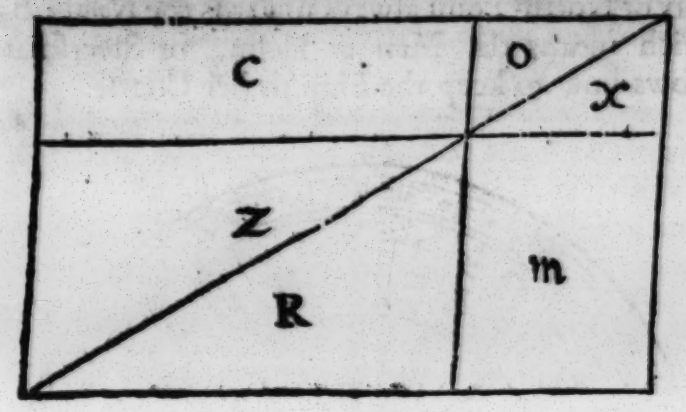
COMPLEMENT of any Ark of a Circle, or of any Angle, is what it wants of a Quadrant or 90 Degrees.

COMPLEMENT *of the Courſe*, in *Navigation*, is the Number of Points the *Courſe* wants of 90 *Degrees*, or eight *Points*, viz. of a *Quarter* of the *Compaſs*.

CONPLEMENT *of the Curtain*, in *Fortification*, is that part of the *Curtain* which (being wanting) is the *Demigorge*.

COMPLEMENT *of the Line of Defence*, is the Remainder of the *Line of Defence* after you have taken away the Angle of the Flank.

COMPLEMENTS *in a Parallelogram*, are the two leſſer Parallelograms *C* and *M*, which are made by drawing two Right Lines parallel to each ſide of the Figure, through a given Point in the Diagonal.



Propoſition.

In every Parallelogram the Complements *C* and *M* are equal: For $Z+C+O=R+M+X$, as making up on each ſide the great Triangle, made =by the Diagonal; of which $Z=R$ and $O=X$ (becauſe the Diagonal makes them ſo) wherefore the remaining Parallelogram $C=M$. *Q. E. D.*

COMPLEX *Terms*, in Logick, are ſuch as are compounded of ſimple or ſingle ones; which they call *Incomplex Terms*.

COMPLEX, or *Complicated Diſeaſes*: See *Complication*.

COMPLEXUS, a Muſcle of the Head, ſerving to move it backwards. It is alſo called *Trigeminum*, becauſe it hath plainly a three-fold Beginning, and ſeems to be compounded of 3 Muſcles; one Beginning is from the tranverſe Proceſſes of the fourth and fifth *Vertebræ* of the Thorax: The Second from the firſt and ſecond of thoſe *Vertebræ*; and the Third from the Spine of the 7th *Vertebra* of the Neck: After, in their Aſcent, they all unite together, and are inſerted into the *Occiput*, ſometimes by one, and ſometimes by a threefold Tendon.

COMPLICATION *of Diſeaſes*, is when divers Diſtempers ſeize on the Body at the ſame time, eſpecially if they depend one upon another.

COMPOSITA, or *Compouud Medicines*, are Medicines made up of any Simple Medicines; as certain Waters, Syrups, Electuaries, Opiates, Trochisks, Ointments, Plaſters, *&c.*

COMPOSITE *Order*, in Architecture, which is alſo called *Italick* and *Roman*, becauſe it was the Invention of the Ancient *Romans*, is ſo called, becauſe it is *compoſed* of the other four *Orders*, *viz. Tuſcan*, *Dorick*, *Ionick*, and *Corinthian*; the firſt is compoſed only of the *Ionick* and *Corinthian*.

COMPOSITON, in Painting, is uſed in the ſame Senſe with *Invention* or *Deſign*; See *Deſign*. There is alſo a certain Method of Demonſtration in Mathematicks call'd by this Name of,

COMPOSITION, which is the Reverſe of the Analytical Method, or of *Reſolution*: It proceeds upon Principles in themſelves ſelf-evident, on *Definitions*, *Poſtulates*, and *Axioms*, and a previouſly demonſtrated Series of Propoſitions, ſtep by ſtep, till it give you a clear knowledge of the thing to be demonſtrated. This is what they call the *Synthitical Method*, and is uſed by *Euclid* in his *Elements*.

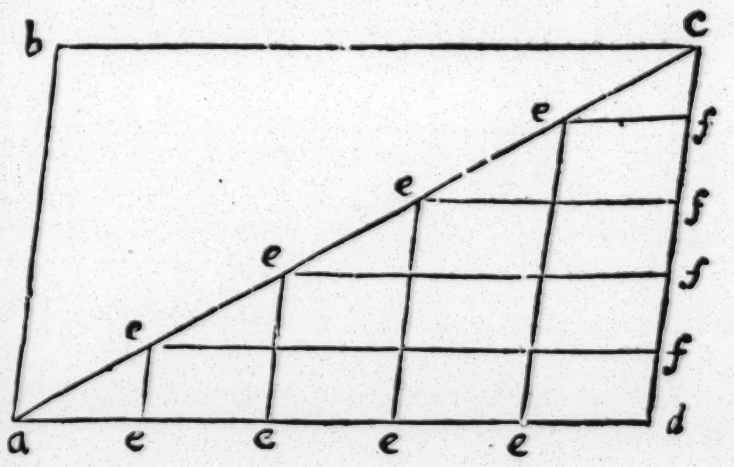
COMPOSITION *of Motion*, is the Compoſition of the ſeveral Directions or Declivities of Motion, whether equable or unequable.

If any Point be ſuppoſed to move or flow (for this Speculation gives an Illuſtration of the Doctrine of *Fluxions*) according to one and the ſame Direction; whether it move equably or not, whether it be *accelerated* or *retarded* in any Proportion whatſoever, it will ſtill keep the ſame Right Line, only the *Celerity will be changed*, and will be increaſed or diminiſh'd according to the Forces with which it is impelled.

Nay, if the Motion be ſo compounded as that the Directions be made one quite contrary to the other, as one ſuppoſe directly downward, the other upward, *&c.* yet ſtill the Line of Motion will be the ſame.

But if the Compounding Motions are not according to the ſame Line of Direction, but ſuch *as do interſect each other*, then the Compound Motion will not be according to the Line of Direction of either of the former, but in a different one from them both; and this either ſtraight or crooked, according as the Directions and Celerities ſhall require.

If two Compounding Motions be each of them *equable* (or every where equally ſwift) whether the Celerity of thoſe Compound Motions be each to other equal or unequal, yet the Line of the Compound Motion will ſtill be a ſtraight Line; and this, though the Motion be neither at Right Angles one to another, nor equally ſwift, nor (each to it ſelf) equable, if they be at leaſt but *Similar*, that is, if they be both accelerated and retarded alike.



Thus, for inſtance, if the Point *a* be impelled by a double impulſe of equal force, both upwards towards *b*, and alſo forwards towards *d*, 'tis plain, that when it is gone forwards as far as *e e*, it muſt of neceſſity be gone upwards as far *e f*; and if the Motions were both equable, it would always go on in the Diagonal *a c*.

Nay, if the Motions be unequal as to Celerity, ſo as, *v. gr.* it move twice as faſt upward as forward, *&c.* yet ſtill it muſt go on in the Diagonal *a c*, becauſe the Triangles *a e e*, *a e c*, *&c.* and *a c d* will ſtill be *Similar*, being as the Motions are: But if the Motions be *Diſſimilar*, then the Compound Motion muſt be a *Curve*.

And this Conſideration of the Compoſition of Motions is of great uſe in Mechanicks. See *Diton*'s Law of Motion.

COMPOSITION *of Proportion*, the comparing the Sum of the Antecedent and Conſequent with the Conſequent in two equal *Ratio*'s, as ſuppoſe 4. 8 :: 3. 6. they ſay by Compoſition of Proportion, 12. 8 : : as 9. to 6. But,

There is, as Dr. *Wallis* well diſtinguiſhes it in his *Algebra* (*Engl. Ed.* p. 85.) a great difference between Compoſition of Proportion by Addition, and by Multiplication; the Inſtance above is of Com-

Compoſition by addition; but if it had been 4 × 8 it would have been Compoſition by Multiplication. In one word, Compoſition of Proportion by Addition, is by Addition of the *Indices* of the *Ratio*'s, but by Multiplication, it is when the *Ratio*'s are multiplied into one another. See more of this Matter under the Word *Proportion*.

COMPOSSIBLE, is an old barbarous Word uſed to ſignify ſuch things as are capable of exiſting together, whereas ſuch as cannot exiſt together are called *impoſſible things*.

COMPOUND *Intereſt*, are thoſe which ſome Number may meaſure beſides Unity; as 15, which is meaſured by five and three.

COMPOUND *Quantities*, in *Algebra*, are ſuch as are connected together by the Signs + and —. and are expreſſed by the ſame Letters than one, or elſe by the ſame Letters unqually repeated; thus, $a + b - c$, and $bb - b$ are Compound Quantities.

CONPOUNDED, *Compoſite*, or *Aggregated Flower of a Plant*, is by the Botaniſts accounted ſuch an one as conſiſts of many little Flowers concurring together to make up one whole one, each of which hath its *Style* and *Stamina*, and adhering Seed, and are all contain'd within one and the ſame *Calyx* or *Perianthium*. This *Compoſite Flower* diſtinguiſhes a large *Genus* of Plants, which our Accurate Botaniſt, Mr. *Ray*, divides as follows:

Herbs of Compounded or Aggregated Flowers are,

1. Such as have a plain Leav'd Flower naturally, and for the moſt part full, and having their whole Body Milky (*i. e.* on cutting or cropping yielding a Milky Juice) and theſe have their Seeds.
   1. *Pappous* or *Winged*, *i. e.* having a little Lanugo adhering to each Seed, by which the Wind can carry it eaſily from place to place: Such as the *Lactuca*, *Tragopogon*, *Scorzonera*, *Dens Leonis*, *Hieracium*, and the *Piloſella*.
   2. Such as the ſolid Seed without any Pappus or Down upon them; as the *Eringium Luteum*, *Cichorium*, *Lampſana*.

2. Such as have a *Diſcous Flower*, that is, one compoſed of many ſhort, thick, compreſſed, ſmall *Floſculi* (which ſome by miſtake call *Stamina*) ſet together ſo as to make one flat or hollowiſh Superficies: And theſe alſo either are ſuch as have their Seeds,
   Pappous, as the *Tuſſilago*, *Petaſites*, *Carlina*, *Helenium*, *Doronicum*, *Conyza*, *Aſter*, *virga Aurea*, *Jacobœa*, *Stœchas Citrini*, *Jacea*, *Senecio*, *Euparorium Avicennæ*, *Cacalia Valgaris*, *Gnaphalium Maritimum*, and *Monſpelienſium*.
   Such whoſe Seeds are Solid and not Pappous, as the *Corymbiferous Herbs*; which ſee under that Word.

COMPULSION, is when in an Agent capable of Volition, the Beginning or Continuation of any Action is contrary to the Preference of his Mind.

COMPUTO, is a Writ ſo called of the Effect, becauſe it compelleth a Bailiff, Receiver, or Chamberlain to yield up his Accounts: It lieth alſo for Executors of Executors; and againſt tha Guardian in Soccage, for Waſte made in the Miniority of the Heir.

CONARIUM, or the *Glandula Pinealis*, is a part of the Brain hanging in a ſmall Cavity called the *Anus* in the hinder part of the third Ventricle of the Brain, and leading into the fourth; it is ſo called from being of the Shape of a Pine Cone. *Des Cartes* ſuppoſed this Glandule to be the Seat of the Rational Soul; but its Subſtance being the ſame with the reſt of the Brain, its probable it ſerves for the ſame Uſe.

CONATUS *Recedendi ab Axe motus*, is the Endeavour which any Body moved circularly hath to recede or fly off from the Center or Axis of its Motion.

CONCATENATION *of Cauſes*, is a Term ſometimes uſed to expreſs, that an Effect is the Reſult of a long Chain of Cauſes depending upon or linked one to another.

CONCAVE and *Concavity*, ſignifies the Hollowneſs of any thing: See *Convexity*.

CONCAVE *Glaſſes*, are ſuch as are ground hollow, and are uſually of a Spherical Figure, though they may be of any other; as *Parabolical*, &c.

All Objects ſeen through *Concave Glaſſes* appear erect and diminiſhed or leſſened.

What the *Virtual Focus* of a *Concave Glaſs* is, ſee under that Term.

The confuſed Appearance of a Point through any *Concave Glaſs* proceeds from the too great Divergence of thoſe Rays which fell on the Eye; wherefore, becauſe the more remote the Eye is from the Glaſs, the leſs will the Rays Diverge; therefore the farther the Eye is from a *Concave Glaſs*, the more *diſtinct* will be the Appearance of any Object thro' it, tho' the more *faint*.

The *Apparent Place* of Objects ſeen through Concaves, is always brought nearer to the Eye; which is the Reaſon why they help Short-ſighted Perſons, or ſuch as can ſee only nigh Objects Diſtinctly.

For a Rule to fit a *Concave Glaſs* to the Eye of ſuch a Perſon, let him obſerve nicely the Diſtance at which he can read Letters, or ſee Objects Diſtinctly; which ſuppoſe to be at 12 Foot, then will a *Concave Glaſs*, whoſe *Virtual Focus* is a Foot diſtant from it, make that Perſon ſee diſtant Objects diſtinctly.

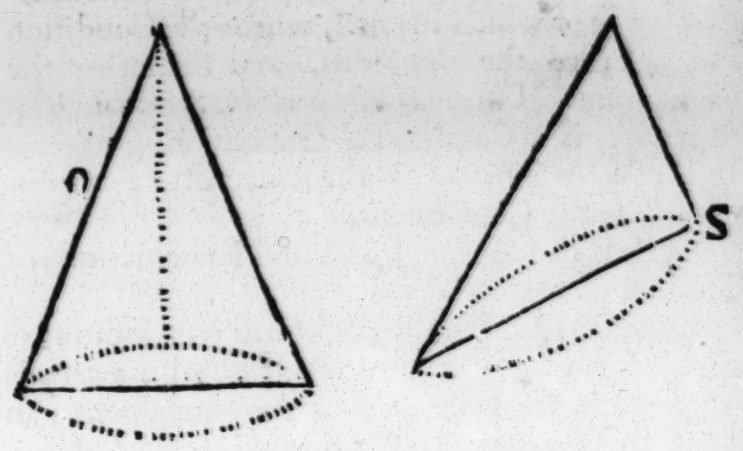
The farther the Eye is removed from any *Concave Glaſs* the leſs the Object appears, and a leſſer Area of it is ſeen; and when the Glaſs is exactly in the Middle between the Eye and the Object, the Object will appear the *moſt diminiſhed*, that that Diſtance between the Eye and Object will allow of.

CONCENTRATION, accoeding to Dr. *Grew*, is the higheſt Degree of Mixture, and is when two or more Atoms or Particles of the Mixture do touch by *Reception* and *Intruſion* of one into the other: And this he takes to be the Caſe of all fixed Bodies which are without Taſte or Smell, whoſe Conſtitution is ſo firm, that till the Particles are as it were *unprim'd* from each other, they cannot affect either of thoſe Senſes.

CONCENTRICK *Figures*, are ſuch as have the ſame common *Center*.

CONCEPTIO, a Grammatical Figure: See *Syllepſis*.

A *Cone* is ſaid alſo to be *Right* as to the Poſition of its Axis in reſpect to the Horizon; *i. e.* when its Axis be not ſo, 'tis called an *Oblique Cone*. A *Cone* is called *Scalenous*, when one Side of it is longer than the other, as *S*.



The ſolid Content of a *Cone* is found by multiplying the Area of its Baſe by $\frac{1}{3}$ of its perpendicular Height.

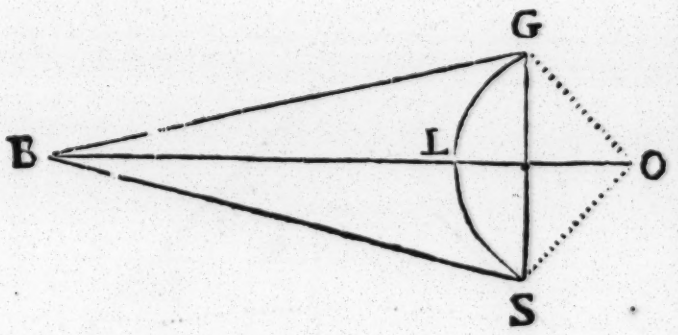
For a *Cone* is but a *Pyramid* of infinite Sides, and a *Pyramid* is equal to $\frac{1}{3}$ of its circumſcribing *Priſm*, and a *Priſm* is but a *Cylinder*, having an infinite Number of Sides; therefore a *Cone* is equal to $\frac{1}{3}$ of a Cylinder circumſcribing it. 7. *e.* 12. *Eucled.*

See alſo the Demonſtration under *Proportion of Solids.*

How to find the External Surface of a *Cone*, ſee under the Word *Pyramid.*

If a *Cylinder*, *Sphere* and *Cone* have the ſame Baſe and Altitude, the *Cone* is the Difference of the *Cylinder* above the *Sphere*; and *Cylinder*, *Sphere* and *Cone*, are as 3, 2 and 1. See *Cyliuder.*

CONE *of Rays*, in Opticks, are all thoſe Rays which fall from any Point, as ſuppoſe *B*, in any Ob-



ject, on whoſe Surface of any Glaſs, as *G L S*, having Vertex in *B*, and the Glaſs for its Baſe; ſuch is the *Cone G L S B.*

CONFECTIONS, a Compoſition of Powders, Gums, Sugar, Honey, Syrups, *&c.* made up into one Subſtance; and it is two-fold, either dry, as *Lozenges*, &c. or moiſt, as *Preſerves*, *Conſerves*, and all ſorts of *Antidotes. Blanchard.*

CONFISCATE, in Law, ſignifies to be forfeited to the Publick Fiſque or King's Treaſury: For among the *Romans* the Emperor's Treaſure was kept in Hampers or Baskets, which, in Latin, is *Fiſcus.* Now if a Man be Indicted for Felonioufly ſtealing the Goods of another, tho' in truth they are the proper Goods of the Perſon Indicted, yet if, when the Goods are brought in Court againſt him, as the Manner is, he ſhall then *Diſclaim* them, he doth by this *Diſclaimure* loſe the Goods, although he be afterwards acquitted of the Felony, and they ſhall be *Confiſcated* to the King; but it is otherwiſe if he does not Diſclaim them. The ſame Law is where Goods are found the in Felon's Poſſeſſion, which he diſavows, and afterwards is attainted of other Goods, and not of them, there the Goods which he diſavows are *Confiſcated* to the King; but had he been attainted of the ſame Goods, they ſhould have been ſaid to be *Forfeited*, and not *Confiſcated*, notwithſtanding the Diſavowment. So if an Appealof Robbery be brought, and the Plaintiff leaves out ſomeof his Goods, he ſhall not be received to enlarge his Appeal; and foraſmuch as there's none to have the Goods ſo left out; the King ſhall have then as *Confiſcate*, according to the old Rule, *Quod non capit Chriſtus, capit Fiſcus.*

CONFUSED *Viſion*: See *Viſion.*

CONGE, a Term in Architecture: See *Apophyge.*

CONGEALE, in Chymiſtry, is to let ſome Matter that is melted fix or grow into a Conſiſtency; as when a Metal is left to cool, which hath been melted in a Crucible; or when Wax, Fat, Butter, or the like, are taken from the Fire and ſet to cool, they ſay, 'tis let *Congeal.*

CONGLOBATE, a Word uſed for ſuch of the *Glands* in an Animal Body as are ſmooth in their Surface, and ſeem to be made up of one continued Subſtance: They ſerve to ſeparate the *Lympha* from the Arterious Blood, and to return it by the Lympheducts, either into the Chyliferous or Sanguiferous Veſſels, though ſome think the Glands of the Meſentary, and Breaſts of Lacteſcent Women ſerve to ſeparate true Chyle.

CONGLOMERATE *Glands*, are ſuch in an Animal Body as are uneven in the Surface, and are made up, as it were, of many leſſer Glands. Their Uſe in the Body is to ſeparate ſeveral ſorts of Juices from the Blood, and alſo to Elaborate and alter them, and by proper Ducts to convey them to their appropriate Receptacles and Cavities. Thus the *Parotides* and Maxillary Glands ſeparate and bring the *Saliva* into the Mouth by their proper *Ducts.*

CONGREGATION, according to Dr. *Grew*, is the leaſt Degree of Mixture; in which the Parts of the Mixt are *inconſiſtent*, and do touch each other but in a Point; and he ſaith, he hath many Arguments to induce him to believe, that the Atoms or Particles of all Fluids, as ſuch, do touch one another only after that Manner.

CONGRUITY, by the Naturaliſts is eſteemed a Relative Property to a Fluid Body, whereby any Part of it is readily united with any other Part, either of it ſelf, or of any other Similar Fluid or Solid Body. And *Incongruity* is a Property by which it is hindred from uniting with any Solid or Fluid Body diſſimilar to it.

CONGRUITY *of Geometrical Figures*: See *Concurring.*

CONICK *Sections*: See *Sections.*

CONJERIES, is the joining or collection together of many Bodies or Particles in Maſs or Lump.

CONIFEROUS *Plants*, whether Trees, Shrubs or Herbs, are ſuch as bear a Squammoſe Scaly Fruit, of a Woody Subſtance, and of a kind of Conical Figure, in which Cone are many Seeds, and when they are ripe, the ſeveral Cells or Partitions in the Cone gape or open, and the Seed drops out: Of this kind are the *Scorch* Firrs, Male and Female, and the Pine, which in our Gardens is called

called the *Scotch Firr*, the common Alder, and the Beech Tree.

CONJUNCTIVA *Tunica*, the ſame with *Adnata*.

CONJUGATE *Diameter*, is the ſhorteſt Axis or Diameter in an Ellipſis.

CONJUGATE *of the Hyperbola*, is a Line drawn parallel to the *Ordinates*, and thro' the Center or middle Point of the Tranſverſe Axis; and is always a middle Proportion between the *Parameter* (or *Latus Rectum*) and the *Latus Tranſverſum*. This Line alſo is ſometimes called the *Second Axis or Diameter*.

CONJUGATION of a Verb, in Grammar, is varying or forming it by Mood, Tenſe and Perſon.

CONJUNCTION, in Aſtronomy, is the meeting of the Stars or Planets in the ſame Degree of the Zodiack; and is either *Apparent* or *True*.

CONJUNCTION *Apparent*, is when the Right Line that is ſuppoſed to be drawn thro' the Centers of the two Planets, does not paſs thro' the Center of the Earth.

CONJUNCTION *True*, is when that Right Line being prolonged, paſſes alſo thro' the Center of the Earth.

CONJUNCTION, in Grammar, is an undeclinable Word, which is uſed to connect or join Words and Sentences together.

CONNIVENTES *Glandulæ*, are thoſe Wrinkles which are found in the Inſide of the *Inteſtinum Ileum* and *Jejunum*. For the inner Tunick of the Guts being longer than the Middle or the Outward, it doth frequently, and in many Places wrinkle or bag out, by which Means the Paſſages for the Contents become ſtrait'ned, and conſequently the Matter deſcends thro' the Guts more ſlowly, ſo that the Lacteals have the more time to imbibe Chyle.

CONOID, is a Solid produced by the Circumvolution of any Section of the *Cone* about its *Ax*, and may be either a

CONOID *Epileptical*, when made by an *Ellipſis*, and then is more commonly called a *Spheroid*; and if the Revolution be made round the *Latus Tranſverſum*, it forms an oblong *Spheroid*; but if round the Conjugate Axis, a *Prolate* or *Oblate one*: Such is the Figure of our Globe, and of the other Planets.

CONOID *Hyperbolical*, when made by an *Hyperbola*.

CONOID *Parabolical*, when it is produced by the Section called a *Parabola* turning about its *Ax*.

CONOIDES, the ſame *Conarium*.

CONSCRIBED, the ſame with *Circumſcribed*: Which ſee.

CONSECTARY, is a Deduction or a Conſequence drawn from a preceding Propoſition, and is the ſame with *Corollary*.

CONSENT (in Medicine) is the depending of one Diſtemper upon another: Thus a Difficulty of Breathing is ſaid to proceed by *Conſent* from a *Pleuriſy*, and in that Caſe does not require a particular Cure, becauſe it ceaſes as ſoon as the Diſeaſe on which it depends is removed; or the mutual Sympathy or Correſpondency betwixt the Parts of the Body, which is uſually ſaid to be occaſioned. 1. By the Likeneſs or Similitude of their Kind, as when one Nerve is affected with the Hurt of another. 2. By the Similitude of their Office or Function, as when the Intercoſtal Muſcles ſuffer by an Inflammation of the Diaphragm. 3. By a Communication of Veſſels, for which Reaſon a Fit of the Stone in the Kidneys is frequently attended with Vomiting. 4. By the Contiguity or Neighbourhood of the Parts, as when the Inflammation of the Pleura is communicated to the *Lungs*: But the two former may be reduced to the two latter, which are the only real Cauſes of a *Conſent* or Sympathy betwixt the Parts of the Body.

CONSEQUENCE or *Conſequentia*, a Term in Aſtronomy: See *Antecedence*.

CONSEQUENT, in Mathematicks, is the latter of two Terms of Proportion, as if the Proportion were of *A* to *B*, *B* is ſaid to be the *Conſequent*.

CONSERVA, a *Conſerve*, is a Compoſition of Flowers or Herbs beat together, to every Pound whereof, if they be dry, are added three Pounds of Sugar; if moiſter two Pounds, ſo that they may be kept ſeveral Years. *Blanchard*.

CONSISTENT *Bodies*, ſo Mr. *Boyle* calls ſuch as we uſually ſtile ſolid or firm ones, and he means ſuch whoſe Parts are firmly and conſiſtently united together, ſo that they do not ſlide over one another's Surfaces, as eaſily as the Parts of Fluid Bodies do.

CONSOLE, is a kind of Bracket or Shouldering-Piece in Building, which hath a Projecture, and ſerves to ſupport a Cornice, or to bear up Figures, Butts, Veſſels, and other Ornaments of the like Nature.

CONSOLIDATING *Remedies*, are thoſe things which cleanſing with a moderate Heat and Force, by taking Corruption out of Wounds, and preſerving the Temperature of the Parts, cauſe the Nouriſhment to be fitly apply'd to the Part afflicted. *Blanchard*.

CONSOLIDATION, is a Word uſed by Phyſicians and Surgeons for the uniting ſtrongly together the Fractures of broken Bones, or the Lips of a Wound; then they ſay the Parts begin to conſolidate or join together in one entire Piece, as they were before the *Fracture* or the *Solution of Continuity*.

CONSONANCE, in Muſick, is the Agreement of two Sounds, the one *Grave*, the other *Acute*, which are compounded together by ſuch a Proportion of each, as ſhall prove agreeable to the Ear. A *Uniſon* is the Firſt *Conſonance*, an *Eighth* is the Second, the *Fifth* is the Third, and then follows the *Fourth*, and the *Thirds* and *Sixths*, *major* and *minor*. There are other *Conſonances*, which are the Doubles or other Repetitions of the former. There can be but Seven or Eight *Simple Conſonances*; the *Perfect* ones are the *Uniſon*, the *Eighth* and the *Fifth*, with their Correſpondents.

CONSPIRATIONE, is a Writ that lies againſt Conſpirators.

CONSTABLE, is a Word variouſly uſed in our Common-Law: Firſt, for the *Conſtable of England*, who is alſo called *Marſhal*; his Office conſiſteth in the Care of the common Peace of the Land in Deeds of Arms and Matters of War. The Court of the *Conſtable* and *Marſhal* determineth Contracts touching Deeds of Arms out of the Realm, and handling things concerning War within the Realm, as Combats, Blazons of Armory, *&c.* But he may not deal with Battel in Appeals, nor, generally, with any other thing that may be tried by the Laws of the Land. Out of his Magiſtracy were drawn theſe lower *Conſtables* which

we

we call *Conſtables of Hundreds* and *Franchiſes*, and firſt ordained by the Statute of *Wincheſter*, which appointed for the Conſervation of Peace and View of Armour two *Conſtables* in every Hundred and Franchiſe: And theſe be now *High-Conſtables*, becauſe continuance of Time and increaſe of People and Offences, hath again, under theſe, made others in every Town called *Petit Conſtables*, which are in like Nature, but of inferior Authority to the other. Beſides theſe there be Officers of particular Places called by this Name, as *Conſtable of the* Tower, *Conſtable of the Exchequer*, *Conſtable of* Dover *Caſtle*, *&c.*

CONSTAT, is a ſort of Certificate made by the Clerk of the Pipe and Auditors of the *Exchequer*, at the Requeſt of any Perſon who intends to plead in that Court for the Diſcharge of any thing.

CONSTELLATION, or *Aſteriſm*, is a Company of fixed Stars, imagined to repreſent the Image of ſomething, and commonly called by the Name of that Thing: There are 21 *Northern* and 12 *Southern* ones.

CONSTIPATION, is when the Parts of any Body acquire a cloſer Texture than what they had before.

CONSTITUTIONIS *Baſilick*: See *Baſilick Conſtitutions*.

CONSTRICTION, is the crouding the Parts of any Body cloſe together in order to Condenſation.

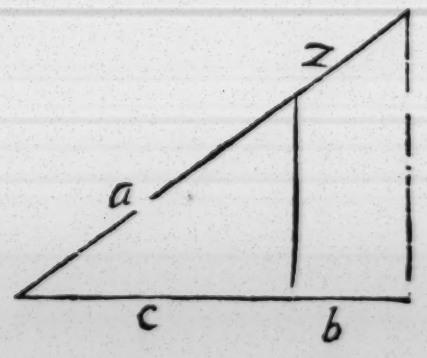
CONSTRICTOR *Labiorum*, *Sphincter & Orbicularis Labiorum*, a Muſcle which environs the Lips with Orbicular Fibres, and when it acts it purſes them up; wherefore ſome Name it *Oſculatorius*.

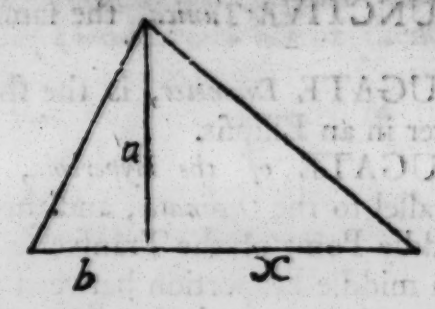
CONSTRICTORES *Alarum Naſi ac Depreſſores Labii Superioris*: Theſe Muſcles ariſe from the fourth Bone of the upper Jaw, immediately above the Gums of the *Dentes Inciſorii*, and aſcending, are ſoon inſerted to the Roots of the *Alæ Naſi* and ſuperior Parts of the upper Lip; they draw the upper Lip and *Alæ* downwards.

CONSTRUCTION *of Equations*, in Algebra, is the contriving ſuch Lines and Figures as ſhall demonſtrate the Equation, Canon or Theorem to be true Geometrically. And this is often of great Uſe to ſolve and illuſtrate Algebraical Equations: And the Manner of it you will ſee in the following Rules, which ſhew you how to reſolve Simple Equations into Proportionals, and to build a Geometrical Conſtruction thereupon.

1. Thus if $\frac{ab}{c} = z$, then $c : b :: a : z$; by 12. *e.* 6. *Euclid.*

Or if $\frac{aa}{b} = x$, then $b : a :: a : x$.





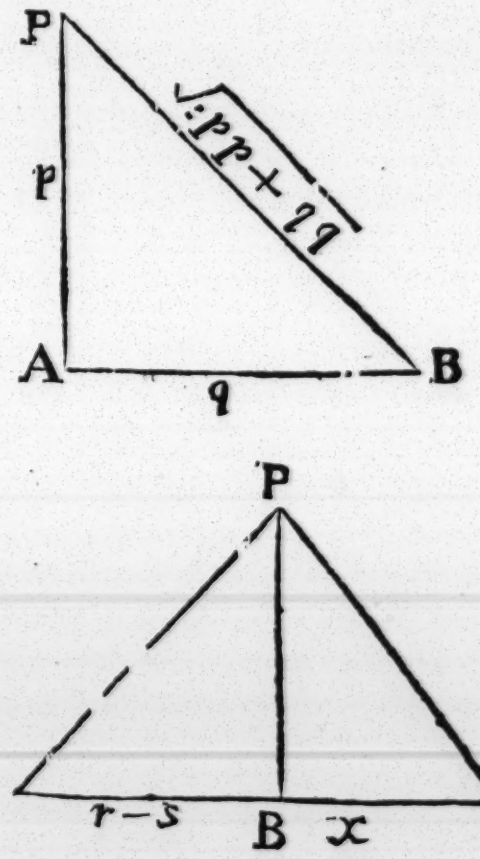
Or if $\frac{ab + ag}{b + i} = x$, then $b + i : b + g :: a : x$.

Or if $\frac{ab + ag}{b + i} = x$, then $b - i : b + g :: a : x$.

2. If $\frac{ab + mn}{r - s.} = x$, the Conſtruction and Solution will be more difficult, becauſe no Letter in the Numerator is taken twice; but that it may be ſo, and that *(a)* (for Inſtance) may be twice us'd, make, as $a : n :: m :$ to a Fourth Proportional, which call p; then $nm = ap$, and conſequently, $\frac{ab + ap}{r + s.} = x$; wherefore, by *Rule* 1, $r + s : b + p :: a : x$.

Or if this Equation were propoſed, $\frac{ab + m}{r - s} = x$, firſt find a mean Proportional between a and b, which ſuppoſe to be p; alſo another mean Proportional between m and n, which let be q; then the Equation will ſtand thus, $\frac{pp + qq}{r - s} = x$.

Let therefore a Right-angular Triangle be made, wherein the Perpendicular $AP = p$, and the Baſe $AB = q$; therefore ſhall $PBq = pp + qq$, which, ſince according to the Equation it is to be divided by $r - s$, make, as $r - s : PB (= \sqrt{pp + qq}) ::$

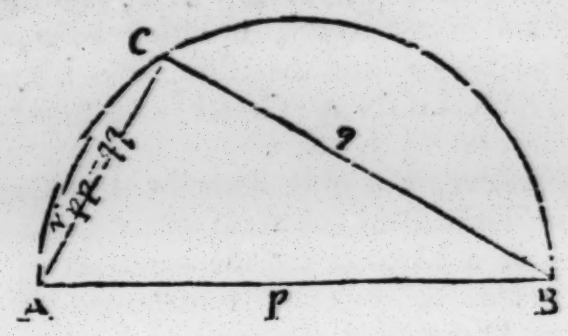


PB : to a Third Proportional, and that ſhall be x ſought.

3. In this Equation $\frac{ab - mn}{c + d} = y$.

Firſt, Make, as $a : m :: n : p$, a Fourth Proportional;

portional; then will $\frac{ab-ap}{c+d}=y$, and consequently (as in *Case* 3.) $c+d:b-p::a:y$.



Or you might (as in *Case* 2.) have found a mean Proportional between a and b, as alſo between m and n, which being called (as there) p and q, the Equation would have ſtood thus, $\frac{pp-qq}{c+d}=y$: Then having taken $AB=p$, and on it, as a Diameter, drawn a Semicircle, and applying in $BC=q$, the Square of AC will be $=pp-qq$; which, ſince it is to be divided by $c+d$, make, as $c+d:AC::AC:y$, the Quantity ſought.

4. Let this Equation $\frac{aabc}{ffg}=z$ be propoſed:

Firſt, Find out (p) a Third Proportional to f and a, then $fp=aa$; the Equation will ſtand thus, $\frac{fpbc}{ffg}=z$, that is, $\frac{pbc}{fg}=z$.

Secondly, Find a Fourth Proportional (q) to f, p and b, ſaying, as $f:p::b:q$; then will $fq=pb$, and conſequently the Equation will ſtand thus, $\frac{fqc}{fg}=z$, that is, $\frac{qc}{g}=z$; and therefore (as *Rule* 1.) $g:q::c:z$, ſought.

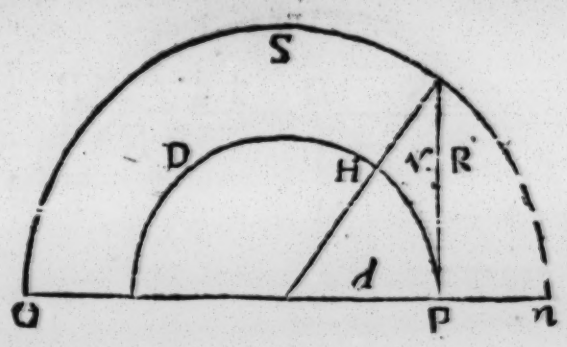
5. If this Equation $\frac{hkk}{mm}=z$ were propoſed,

Firſt, Find a Fourth Proportional to m, h and k, which let it be p; therefore $pm=hk$, and conſequently the Equation will ſtand thus, $\frac{pmk}{mm}=x=\frac{pk}{m}$; therefore $m:p::k:x$, ſought.

Conſtruction of all the Three Forms of *Quadratick Equations*, according to Mr. *Oughtred*'s Method of Solution.

Draw two Concentrick Circles, as in the Figure, and let the Diameter of the Greater be called S, and the Diameter of the Leſſer be D.

Which Letters S and D do repreſent the Sum and Difference of the Roots found, as H and d do the Half Sum and Half Difference.



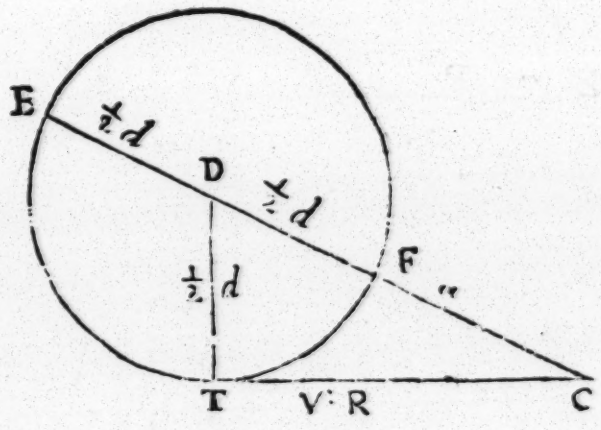
Since therefore his Theorem is, that $SS-DD=4R$, let $\sqrt{:R}$ be made a Tangent to the leſſer Circle, and a Right Sine in the Greater, and draw the Hypotenuſe H, and call the Baſe of the Triangle d.

Then will $HH-dd=R$, (*viz.* $\frac{1}{4}SS-\frac{1}{4}DD=R$;) wherefore $HH=R+dd$, and therefore $H=\sqrt{:R+dd}$: Thus H, if required, is found: Or if H had been given, and d required; now ſince $HH-R=dd$, therefore $\sqrt{:HH-R}=d$.

And having thus found H and D, then $H+d$ ($=Op$) = the greater Root a; and $H-D$ ($=pn$) = the leſſer Root e, which will be Affirmative or Negative according to the Form of the *Equation*.

CONSTRUCTION *of Quadraticks* after another Method, in Imitation of *Des Cartes*.

In the Firſt Form, which is $aa+da=R$, Let $FC=a$, the Leſſer of the Two Roots, and DF or $DT=\frac{1}{2}d$, *i. e.* Half the Co-efficient.

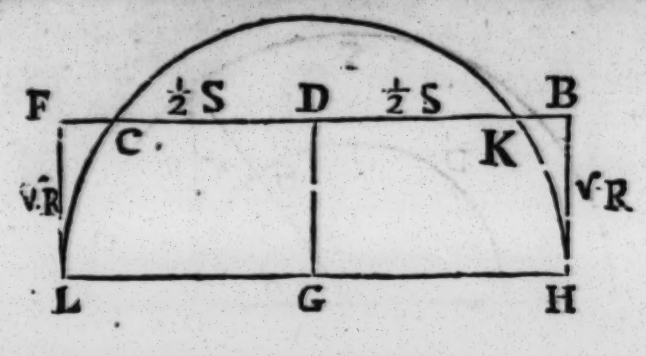


Then will $BC=d+a$, and conſequently $\square BCF=\square TC$, by 36 *e.* 3 *Euclid.* That is, $aa+da=R$.

In the Second Form, which is $aa-da=R$, Make $BC=a$, the Greater of the two Roots, and DF or $DT=\frac{1}{2}d$ (Half the Co-efficient;) Then will $\square BCF=\square TC$ (by 36 *e.* 3) or $aa-ad=R$.

In the Third Form, which is $Sa-aaR$, Let $FB=S$, and CB or $FK=a$ (the Greater Root;) Then will FC or $KB=S-a$.

But by 36. *e.* 3. *Eucl.*
$\square CBK$ or $KFC=\square BH$ or $\overline{FL}$;
That is, $Sa-aa=R$.



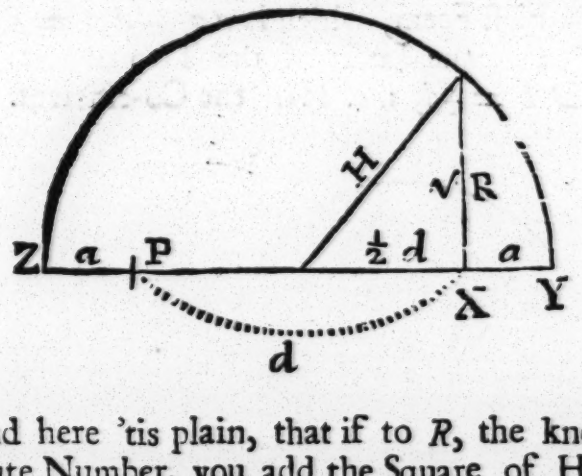
But if KB be ſuppoſed equal to a (the leſſer Root) Then will $KF = S - a$.

But $\square KFC = \square FL$, that is, $Sa - aa = R$, by 36. *e.* 3 *Eucl.*

The Three Forms of *Quadraticks* may alſo be conſtructed another Way after the following Manner, which agrees very well with *Harriot*'s Method of Solution by compleating the Square.

Thus; Suppoſe $aa + da = R$:

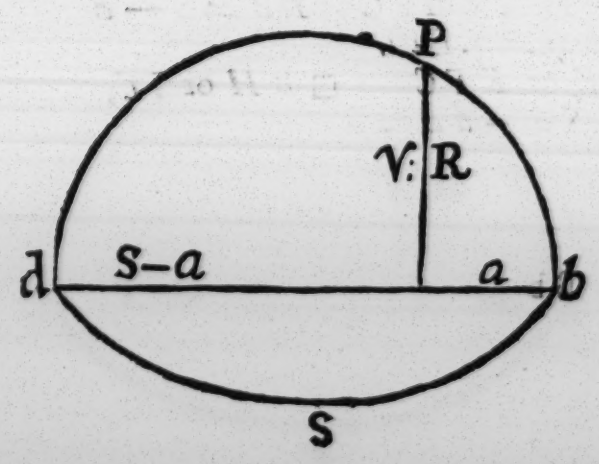
Draw a Line at pleaſure, and on it ſet the Co-efficient d, and biſect it: At any End of it erect perpendicularly a Right Line equal to the $\surd : R$. Then, with the Diſtance between the Top of the Line and the Middle of d, deſcribe a Circle, which will give you a, as you ſee; for then $\surd : R$ will be a mean Proportional, and $aa + ad = RR$, by 14 *e.* 6. *Euclid.*



And here 'tis plain, that if to R, the known or abſolute Number, you add the Square of Half the Co-efficient, or of $\frac{1}{2}d$, 'twill give you the Square of H, or of $\frac{1}{2}d + a$; from the Root of which, at laſt taking $\frac{1}{2}d$, there will remain a, the Leſſer of the two Roots ſought.

In the Second Form, where $aa - da = R$. Let zx be ſuppoſed $= a$; Then will $xy = a - d$; and conſequently (all things being conſtructed as before) $aa - ad = R$ (by 14. *e.* 6. *Eucl.*) And here, as before, $Q\frac{1}{2}d - R = HH$, which is equal to $Q\frac{1}{2}d + xr$; to the Square Root of which adding $\frac{1}{2}d$, you have zx or $py = a$.

As to the Third Form, *viz.* $Sa - aa = R$,



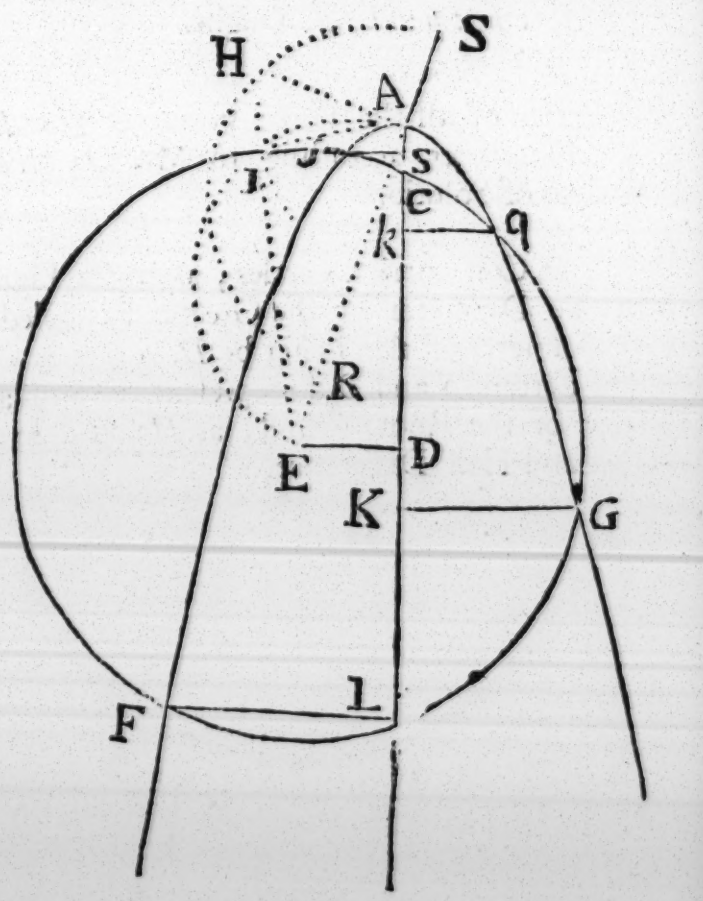
where the Co-efficient is the Sum of the Roots; on S, as a Diameter, draw the Circle dpb; then apply, in a Line equal to the Square Root of R, the abſolute Number perpendicularly as before; and then will $S - a. \surd : R :: \surd : R. a$; (for ſince S = to the Sum of the Roots, if either be a, the other muſt be $S - a$) and therefore $Sa - aa = R$.

CONSTRUCTION *of Cubick and Biquadratick Equations in Algebra.*

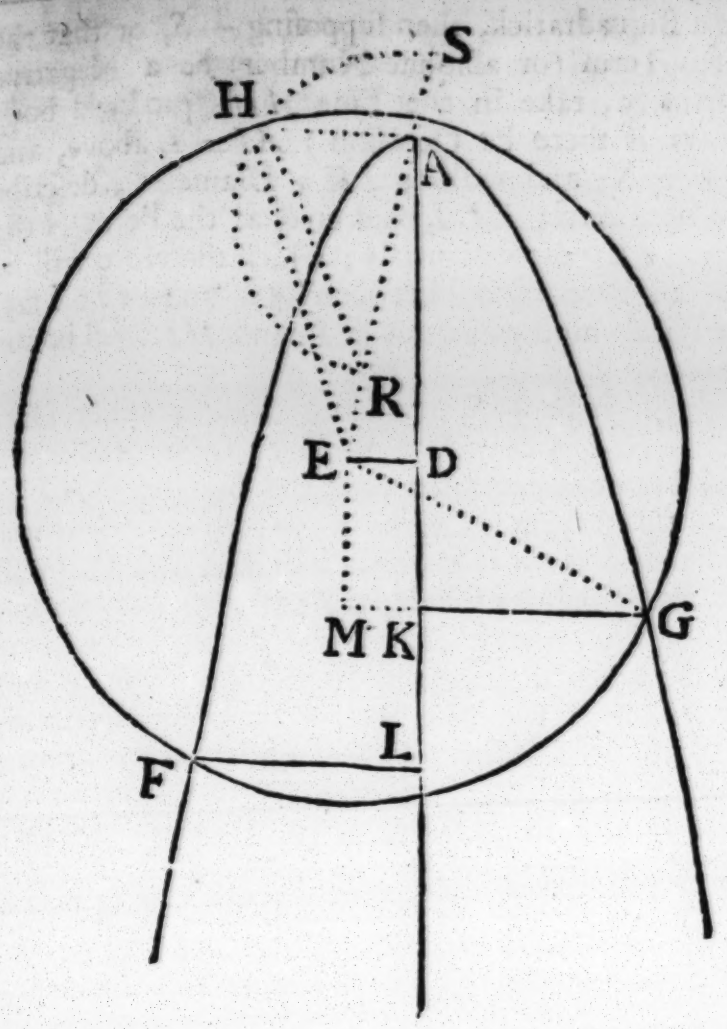
This, I believe, was firſt done by *Des Cartes*, who (in the Third Book of his excellent *Geometry*) hath given us a Method for the conſtructing and finding the true Roots of all Equations, not exceeding four Dimenſions, by means of a Parabola and a Circle; which Method was indeed not perfect, becauſe it would not conſtruct any Equations but ſuch as had their Second Term firſt taken away. However, becauſe it was that which gave the firſt Riſe to *Baker*'s excellent Rule, and to whatever Improvements have been ſince made in it, it's proper to give you an Account of it in the firſt Place.

When the Second Term is wanting, *Des Cartes* reduces all *Cubick Equations* to this Form, $Z^3.*.apz, aaq = o$; and *Biquadraticks* to this, $z^4.*.apzz, aaqz, aaar = o$; where a ſtands for the *Latus Rectum* or *Parameter* of any given *Parabola*, and is ſuppoſed equal to 1, that its Power may produce no Trouble in Operation: By which Means the former Equations will ſtand thus, $Z^3.*.pz, q = o$, and $Z^4.*.pzz, qz, r = o$.

Let then any *Parabola*, as FAG, be ſuppoſed to be deſcribed, whoſe Axis is $ACDKL$, and its *Parameter* $1 = a$, make AC equal to $\frac{1}{2}a$, ſo that the Point C will always be within the Parabola: Then take in the Axis (downwards from C, if P have a Negative Sign, but upwards in the Axis produced when it hath a Poſitive one) $CD =$ to $\frac{1}{2}p$. Then from the Point D (or C, if the Quantity p be wanting in the Equation) erect a Perpendicular to the Axis, as DE, and make it equal to $\frac{1}{2}q$; which DE muſt be on the Right-hand, if it have a Negative Sign, but on the Left if it be $+q$. After which, deſcribing a Circle on the Center E with the Radius EA, it will (if the Equation be

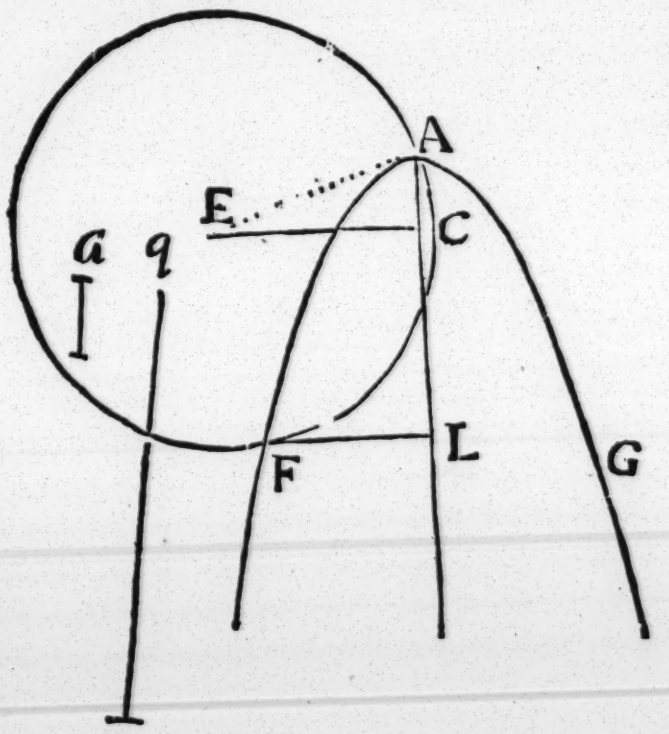


only



only a Cubick one) cut the Parabola in as many Points as the Equation hath true Roots; and the Affirmative ones will be Ordinates or Perpendiculars let fall from thence to the Axis on the Right-hand; and the Negative Roots Perpendiculars let fall on the Left-hand of the Axis.

But if the Equation be a Biquadratick one, the fourth Term r being there, and having a positive Sign, then from A take $AR = r$, and produce $AS = c$ or 1. Make RS the Diameter of a Circle, and at A erect HA perpendicularly; I say, the other Circle must pass through H, and its Radius



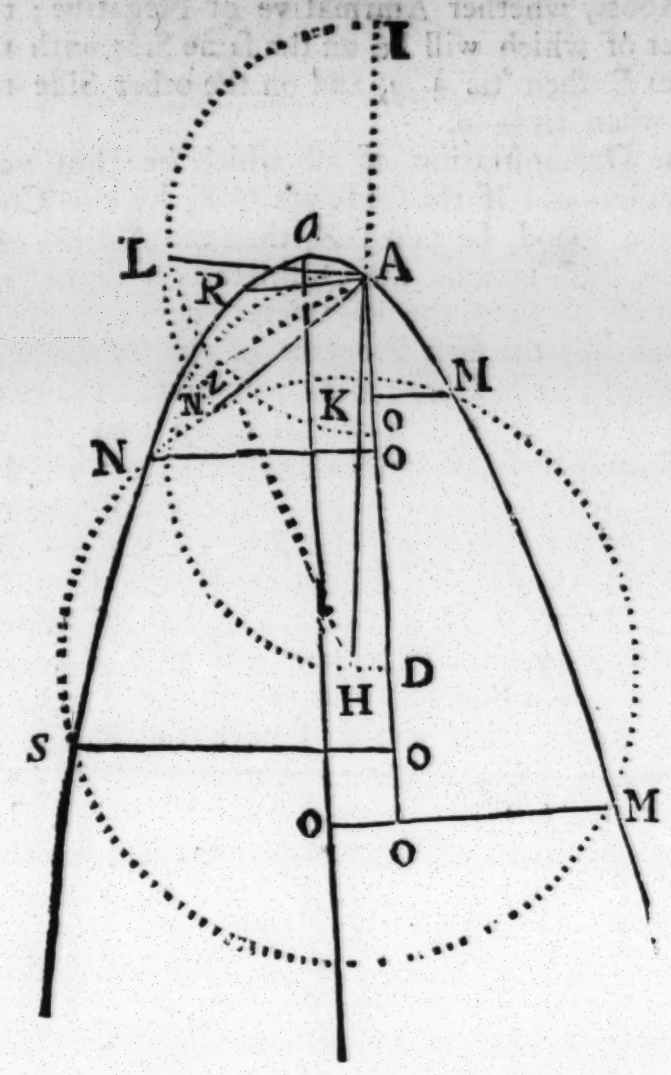
will be EH: But if r have a Negative Sign, there must yet another Circle be drawn on the Diameter AE, in which AI must be applied equal to AH, and that will find the Point I, through which the intersecting Circle must pass, and whose Radius will be IE, and Center E; which Circle may cut the Parabola in 1, 2, 3 or 4 Points, from whence perpendicularly let fall to the Axis, will be all the Roots, whether Affirmative or Negative; the former of which will be on the same Side with the Center E when 'tis $+ q$, and on the other Side the Axis when 'tis $- q$.

The Demonstration of all which he thus very easily gives us: If the Ordinate $G K$, by this Construction found, be called Z, then the Abscissa Ak will be ZZ, because the Ordinate is a mean Proportional between the Parameter (here 1) and the Abscissa (by the first Property of the Parabola;) wherefore, if from AK you take $AC = \frac{1}{2}$, and also $CD = \frac{1}{2}p$, you will find, by that Means, the Remainder DK or EM, which, in this Notation, will be $ZZ - \frac{1}{2}p - \frac{1}{2}$ (*See Figure the First*) whose Square will be $Z^4 - ZZp - ZZ + \frac{1}{4}pp + \frac{1}{2}p + \frac{1}{4}$. And because, by the Construction, DE or $KM = \frac{1}{2}q$, the Whole GM will be $= Z + \frac{1}{2}q$, and its Square will be $ZZ + qZ + \frac{1}{4}qq$. Add then this and the former Square of EM together, and you will have the Square of the Radius EG, $Z^4 - ZZp + qZ + \frac{1}{4}pp + \frac{1}{4}qq + \frac{1}{2}p + \frac{1}{4}$ (by 47 *e. Euclid.*) which Radius, or its equal EH, may be expressed another way, if we consider that $ED = \frac{1}{2}q$, and $AD = \frac{1}{2}p + \frac{1}{2}$, for then the Hypothenuse EA will be $\surd : \frac{1}{4}qq + \frac{1}{4}pp + \frac{1}{2}p + \frac{1}{4}$. Wherefore, since AH is a mean Proportional between $AS = 1$, and $AR = r$, it must it self be noted by $\surd : r$; Also since EAH is a Right Angle, the Square of EH = the Sum of the Squares of HA and EA, that is, $\square$ of HE or $EG = \frac{1}{4}qq + \frac{1}{4}pp + \frac{1}{2}p + \frac{1}{4} + r$; which last Quantity being equal to $Z^4 - ZZp + qZ + \frac{1}{4}pp + \frac{1}{4}qq + \frac{1}{2}p + \frac{1}{4} = \square EG$, as was proved before: If you compare them together, you will find this Equation to arise $Z^4 = .*. + pZZ - qZ + r$; whence 'tis plain IK is the true Root. *Q. E. D.*

Thus far went *Des Cartes* in this Matter; but he considering only the Axis of the Parabola, and not thinking of what might be done by the other Diameters, could not construct any Equations, but from which he had first ejected the Second Term. But our *Baker* took the Diameters or Parallels to the Ax also into Consideration, and by that Means did exceedingly perfect and improve this Construction of *Des Cartes*, and made it universal for all Equations not exceeding four Dimensions, without any previous Reduction of them, or taking any of the Terms.

And his Method is this, as you may find in his *Clavis Geometrica*.

Taking any Parabola, let the *Parameter* or *Latus Rectum* be called $1 = L$, (that so the Power of L may create no Trouble) and its Vertex a; then, at Right Angles to the Axis, inscribe $RA = \frac{1}{2}p$, (for half the second Term in the Equation) and then shall its Point A be the Vertex of the Diameter AD, to be drawn parallel to the Axis; so that the Distance of this Diameter from the Axis is always $\frac{1}{4}$ of p, or $\frac{1}{4}$ of pL (for L is = but to 1;) and consequently, when $p = o$, or when the second Term is wanting (as in *Des Cartes* his Construction) AD will be in the Axis, and the Points R, a and A all co-incident. Next in this Diameter AD, he determines the Point D by the Length of AD, and then erects in D a Perpendicular to DA, as DH, whose Length he determines also, and by that Means finds H the Center of the Circle, which is to intersect or touch the Parabola:



And this he performs by what he calls his *Central Rule*, viz.

1. $\frac{L}{2} + \frac{p}{8}\frac{p}{L} \pm \frac{q}{2L} = b = AD$; And,
2. $\frac{p}{4} \pm \frac{p\,p\,p}{6\,LL} \pm \frac{p\,q}{4\,LL} + \frac{r}{2\,LL} = d = DH.$

Which two Rules are demonstrated in his Book and *here*, under the Word *Central Rule*, which see; and because $L = 1$, they may be contracted thus,

1. $\frac{1}{2} + \frac{p\,p}{8} \pm \frac{q}{2} = B = AD.$
2. $\frac{p}{4} + \frac{p\,p\,p}{6} \pm \frac{q\,p}{4} \pm \frac{1}{2}r = d = DH.$

And you must observe, That in the Former of these Rules + signifies downwards from the Point *A*, and — upwards from it; and in the latter Rule + signifies towards the Left Hand, as — doth towards the Right; So according as the Affirmative or Negative Roots prevail, *H* will be on the Left or Right Hand of *D*.

And in both Parts if $p\,q$ or r be $= o$, the Member where it is found will vanish and become also $= o$.

As to the Signs of the Quantities in his Rule, he makes p always retain the Sign it hath in the Equation, but q always puts on a contrary one to what it had there: r is always with a positive Sign, except when $p\,r$ have contrary Signs in the Equation, and then r will always have a Negative Sign in the Rule.

Having thus, by his *Central Rule*, found *H* the Center of the Circle, the next Work is to determine the Radius; and if the Equation be no higher than a Cubick, *HA* is always the *Radius*; but if it be a Biquadratick, then supposing $-S$, or that the Fifth Term (or absolute Number) be a Negative Quantity, take in the Line *AH* (produc'd both Ways if there be Occasion) $AI = L$ above, and $AK = S$; and making *IK* a Diameter, describe the Semi-circle *KLI*, and erect at the Point *A* the Line *AL* perpendicularly; which therefore will be a mean Proportional between *AK* and *AI*: I say, the Circle must pass through *L*, and *HL* will be the Radius.

But if it be $+S$, you must draw another Diameter *HA*, and therein fit in or apply $AZ =$ to *LA* before found (for now the Square of *AL* is to be taken from *HA*, as in the former Case it was to be added to it) which will find the Point *Z* through which the Circle must pass, and the Radius will be *HZ*, which Circle being drawn, it will cut the Parabola in 4, 3, 2 or 1, or in no Point; and according to the Number of such Intersections, will the real Roots of the Equation be found, which will be always so many Perpendiculars from those Points to *AD*, as *e. gr. NO* on the Left Hand, *Mo* on the Right, &c. Of which, if there be no *p* or Second Term, and also it be $-r$, then on the Left Hand are the Positive Roots, and the Negative ones on the Right Hand: But if the Second Term be there, and with a Negative Sign, as $-p$, then *No* on the Left Hand are Affirmative, and the others *Mo* on the Right Negative; but if it be $+p$, 'tis on the contrary, *No* Negative, and *Mo* Positive.

The Demonstration of all which is very easy to one that hath considered the Demonstration above given from *Des Cartes*, on which this entirely depends; taking into Consideration also the Property of the Parabola, which *Baker* had from Mr. *Strode* of *Maperton*, that *The Latus Rectum: Is to the Sum of any two Ordinates :: As their Difference: Is to the Difference of the Abscissæ.*

CONSTRUCTION, in Geometry, is the drawing of such Lines as are previously necessary for the making any Demonstration appear the more plain and undeniable; and this Construction is always of such things as are well known and sought before.

CONSTRUCTION, in Grammar, is the natural, just and regular placing and disposing of Words in a Discourse, so as to make proper and intelligible Sense.

CONSULTATION, is a Writ whereby a Cause being formerly removed by Prohibition from the Ecclesiastical Court, or Court Christian, to the King's Court, is returned thither again; for the Judges of the King's Court, if, upon comparing the Libel with the Suggestion of the Party, they do find the Suggestion false, or not proved, and therefore the Cause to be wrongfully called from the Court Christian, then, upon this *Consultation* or Deliberation, they decree it to be returned again; whereupon the Writ in this Case obtained is called a *Consultation.*

CONSUMPTION, in general, signifies a Defect of Nourishment, or the consuming, wasting or decaying of the Body, and particularly of the Muscular Flesh: 'Tis frequently attended with a *Hectick* Fever, and is divided into several Kinds according to the Variety of its Cause, and the Parts it principally affects, as a *Scorbutick Consumption*, a *Consumption of the Lungs*, &c.

CON-

CONTACT, is when one Line, Plane or Body is made to touch another, and the Parts that do thus touch are called the Points or Places of *Contact*.

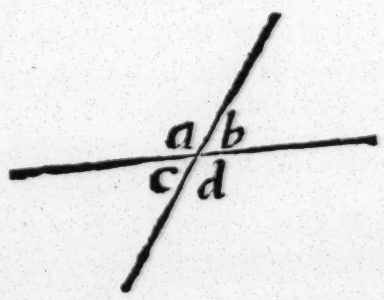
CONTAGION, the communicating or transferring of a Diſeaſe from one Body to another, by certain Steams or Effluvia tranſmitted from the Body of the Sick Perſon. Some Diſeaſes are *Contagious* by immediate contact or touch, as the Madneſs of a Dog, which is communicated by Biting; and the Venom of the *French-Pox*, which is tranſmitted from the infected Perſon in the Act of Copulation; ſometimes the *Contagion* is propagated by infected Cloaths, as in the Itch and Leproſy: And there are ſome *Contagions* that are tranſmitted through the Air to a conſiderable Diſtance, as the Plague and other Peſtilential Diſtempers; in which Caſe the Air is ſaid to be *Contagious*; that is, full of *Contagious* Particles or *Effluvia*.

CONTEMPLATION, is the preſerving of the *Idea* which is brought into the Mind for ſome time actually in view.

CONTENEMENT, ſeems to be Free-hold-Land which lies next a Man's Tenement or Dwelling-Houſe, that is, in his own Occupation.

CONTENT, in *Solid Geometry*, is the Meaſure of any Solid Figure, *viz.* in Cubick Inches or Feet, &c.

CONTIGUITY, is only the Surface of one Body's touching that of another. But *Continuity* is the immediate Union of the Parts which compoſe any Natural Body, ſo that one cannot tell where one begins, and another ends.



CONTIGUOUS *Angles*, in *Geometry*, are ſuch as have one Leg common to each Angle, and are otherwiſe called *Adjoining Angles*. Thus, the Angles *a* and *d* are called *Contiguous Angles*, but *b* and *c* *Oppoſite* or *Vertical*: See *Angle*.

CONTINENT, in *Geography*, is a great Extent of Land, which comprehends ſeveral Regions and Kingdoms, and which is not interrupted or ſeparated by Seas.

CONTINENT Cauſe of a Diſtemper, is that on which the Diſeaſe depends ſo immediately, that it continues ſo long as that remains, and no longer. Thus a Stone ſticking in the *Ureters*, is the Continent Cauſe of a Suppreſſion of Urine.

CONTINENT *Fever*, is that which performs its Courſe without either Intermiſſion or Remiſſion.

CONTINGENT, is a Caſual Event, which may or may not happen to come to paſs: 'Tis ſometimes alſo in *Mathematicks* uſed for the Word *Tangent*.

CONTINGENT *Line*, in Dialling, is ſuppoſed to ariſe from the Interſection of the Plane of the Dial with the Plane of the Equinoctial; and conſequently in this Line the Hour Lines of the Dial and the Hour Circles interſect each other. This Line is always at Right Angles with the Subſtilar Line.

CONTINGENT *Line*, the ſame with *Tangent Line*.

CONTINUAL *Claim*, is a *Claim* made from Time to Time within every Year and Day, to Land or other Thing, which, in ſome reſpect, we cannot attain without Danger.

CONTINUAL *Fever*, is that which ſometimes remits or abates, but never perfectly intermits; that is, the ſick Perſon is ſometimes better, but never perfectly free from the *Fever*.

CONTINUAL *Proportion*, *Arithmetical* and *Geometrical*: See *Progreſſion*.

CONTINUANDO, is a Word uſed in Law, when the Plaintiff would recover Damages for ſeveral Treſpaſſes in the ſame Action: For in one Action of Treſpaſs they may recover Damages for divers Treſpaſſes, laying the firſt with a *Continuando* to the whole Time, and in this Form;

CONTINUANDO *Tranſgreſſionem prædictam*, &c. *à prædicto die*, &c. *uſque talem diem*; ſo including the laſt Treſpaſs.

CONTINUED *Quantity* or a *Continuum*, is that whoſe Parts are inſeparably joined and united together, ſo that you cannot diſtinguiſh where one begins and another ends: See *Diſcrete Quantity*.

CONTINUED *Zocle*: See *Zocle*.

CONTRABANDED *Goods*, are ſuch as are prohibited by Act of Parliament or Proclamation to be imported into, or exported out of this into other Nations.

CONTRACT, is a Covenant or Agreement, with a valuable or lawful Cauſe or Conſideration; or elſe one thing muſt be given for another, which is called *Quid pro quo*; as if I ſell my Horſe for Money, or Covenant to make you a Leaſe of my Mannor in Conſideration of ſo much Money; theſe are *Good Contracts*, becauſe one thing is given for another: But if a Man make Promiſe to me that I ſhall have Twenty Shillings, and that he will be Debtor to me thereof; and after I aſk the Twenty Shillings, and he will not deliver it; yet I ſhall never have an Action to recover, becauſe the Promiſe was no *Contract*, but a bare Promiſe, and *ex nudo Pacto non oritur Actio*: But if any thing were given for the Twenty Shillings, though it be but the Value of a Penny, then had it been a *Good Contract*.

CONTRACTILE, is a Word uſed by ſome Phyſicians to expreſs ſuch Muſcles, and other Parts of the Body, as are uſually contracted.

CONTRADICTORY *Propoſitions*, in Logick, are either ſuch as conſiſt of an Univerſal and Particular, of which one Affirms, and the other Denies, as thus; *All Right lined Triangles have the Sum of their Angles equal to two Right ones*; *ſome Right lined Triangles have not the Sum of their Angles equal to two Right ones*; or elſe they are both Singular and Particular, one Affirming, the other Denying the ſame Thing, as the *Circle is Squarable*, *the Circle is not Squarable*.

CONTRA-*Fiſſura*, or *Counter-Fiſſure*, is a Fiſſure on one Side of the Head, occaſioned by a Blow or Fall upon the other.

CONTRA *Formam Collationis*, is a Writ that lies where a Man hath given Lands in perpetual Alms to any Religious Houſe, Hoſpital, &c. For if they Alien the Lands, then the Donor or his Heirs may recover them by this Writ, but not of the Alienee, although he be Tenant; tho' in all other Actions, where a Man demands Free-hold, the Writ ſhall be brought againſt the Tenant.

CONTRA *Formam Feoffamenti*, is a Writ that lies for the Heir of a Tenant infeoffed of certain Lands

Lands or Tenements by Charter of *Feoffment* of a Lord, to make certain Services and Suits to his Court, and is afterwards diſtrein'd for more than is contained in the ſaid Charter: This Writ lies not for the Plaintiff, who claims to purchaſe from the firſt *Feoffee*, but for the Heir to the firſt *Feoffee*.

CONTRA-*Indications*, are divers Conſiderations in a Diſeaſe that diſſwade a Phyſician from uſing ſuch a Remedy, when other Things induce him to it.

CONTRAMANDATIO *Placiti*, in Law, ſeems to ſignify a Reſpiting, or giving the Defendant further Time to anſwer; or an Imparlance, or Countermanding what was formerly ordered.

CONTRA *Mure*, in Fortification, is a little Wall built before another Partition Wall to ſtrengthen it, ſo that it may receive no Damage from the adjacent Buildings.

CONTRARY *Propoſitions*, in Logick, are two univerſal Enunciations, of which one Affirms, and the other Denies; as *all Squares are Parallelograms*; *no Squares are Parallelograms*.

CONTRATE *Wheel*, is that Wheel in Pocket-Watches and others which is next to the Crown-Wheel, whoſe Teeth and Hoop lie contrary to thoſe of other Wheels, whence it hath its Name.

CONTRAVALLATION, or *The Line of Contravallation*, in Fortification, is a Trench guarded with a Parapet, and uſually cut round about a Place by the Beſiegers, to ſecure themſelves on that Side, and to ſtop the Sallies of the Garriſon; 'tis without Muſket-Shot of the Town; ſo that the Army forming a Siege, lies between the Lines of *Circumvallation* and *Contravallaion*.

CONTRE-*Queve d'yronde*, a Term in Fortification, the ſame with the the *Counter-Swallow's Tail*, which ſee.

CONTRIBUTIONE *Facienda*, is a Writ that lieth where more are bound to one Thing, and but one is put to the Burden: As if Joint-Tenants, or Tenants in Common hold a Mill, *pro indiviſo*, and are equally to take the Profits thereof; the Mill falling to Decay, and one or more of them refuſing to contribute towards the Reparation, the reſt ſhall have this Writ to compel them.

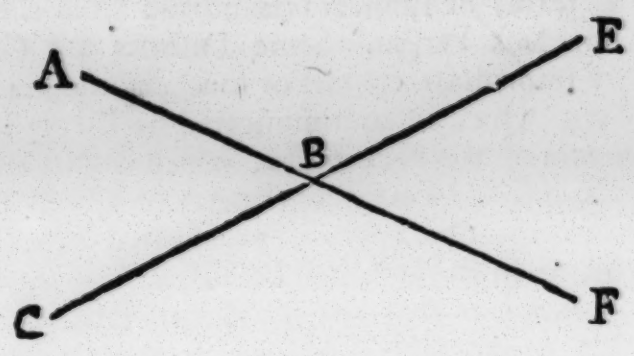
CONTROLLER, is an Officer who keeps a Roll of all other Officers Accounts; and in *England* we have divers Officers of this Name, as *Controller of the King's Houſe*, *Controller of the Navy*, *Controller of the Cuſtoms*, *Controller of Callis*, *Controller of the Mint*, *Controller of the Hamper*, who takes all Things ſealed in Leather Bags from the *Clerk of the Hamper*; and *Controller of the Pipe*, who writes Summons to the Sheriffs to levy the Debts of the Pipe.

CONTUSION of a Bone, is the bruiſing of a Bone by ſome hard and blunt Thing, that though it outwardly appear Whole, yet inwardly it is really Injured and out of Order.

CONVENTIO, is a Word uſed frequently both in Ancient and Modern Pleadings at Law.

CONVENTION, is a Writ that lieth for any Covenant in Writing not performed. *Fitz-Herbert* calls it a *Writ of Covenant*: *Nat. Brev. Fol.* 145.

CONVERGING, or *Convergent Rays*, in *Opticks*, are thoſe Rays which going from divers Points of the Object, incline towards one another, till at laſt they meet and croſs, and then become



Diverging Rays. Thus the Rays *AB* and *CB* do *Converge* till they come to the Point *B*, and then they *Diverge* and run off from each other in the Lines *B E*, *B F*.

CONVERSE: In Mathematicks one Propoſition is called the *Converſe* of another, when after a Concluſion is drawn from ſomething *ſuppoſed* in the *Converſe* Propoſition, that *Concluſion* is *ſuppoſed*; and then that which in the other was *ſuppoſed*, is now drawn as a *Concluſion* from it. Thus, as when two Right Lines are ſuppoſed to be parallel, and another croſſes them, 'tis demonſtrable that the Alternate Angles are equal; ſo 'tis equally true Converſly, that if the Alternate Angles are equal, the Lines which are croſſed muſt be parallel.

CONVERSION *of Equations*, in *Algebra*, is thus; if the Quantity ſought, or any Part or Degree of it be in Fractions, let all be reduced to one common Denomination (by Multiplication of the Whole, by the Denomination of the Fractional Part) and then omitting the Denominators, continue the Equation in the Numerators only. Thus, ſuppoſe $a - b = \frac{aa + cc}{d} + b + b$; multiply all by d, and it will ſtand thus, $da - db = aa + cc + db + db$. 'Tis called by *Vieta*, *Iſomeria*.

CONVERSION *of Propoſitions*, in *Logick*, is the changing of the Subject into the Place of the Prædicate, and the Prædicate into the Place of the Subject, and yet always retaining the ſame Quantity of both Propoſitions; as, Every Right-lined Triangle hath the Sum of its Angles equal to two Right ones; every Right-lined Figure that hath the Sum of its Angles equal to two Right ones, is a Triangle.

CONVEXITY, ſignifies any Protuberancy or ſwelling out of any thing; as Glaſſes are ſaid to be Convex, when they are thicker in the Middle than at the Edges; or rather, when their Surface riſes up regularly (ſo *Vitellio* defines it) above the Plane of the Baſe; as they are Concave, when the Surface ſinks down regularly, or with a regular Curvity below it; ſo that the ſame Thing may be, and often is, Concave within, and Convex without.

Here follow ſome Properties of *Convex Glaſſes*.

1. If an Object be in the Focus of a Convex Glaſs, and the Eye on the other Side the Glaſs, the Object will appear erect and diſtinct.

2. If any Object be in the Focus of a Convex Glaſs, and the Eye in the oppoſite Focus on the other Side, it will appear under the ſame Angle, as if

if the Eye were in the Place of the Glaſs; and conſequently the Diſtance being double in that Poſition of the Eye and Object, it will appear thro' the Glaſs magnified under an Angle almoſt double of what it would appear to the naked Eye; but the Eye can ſee no more of its Area than the Breadth of the Glaſs will permit.

Mr. *Molyneux*, in his *Dioptrica Nova*, ſhews how to determine the viſible Area of an Object in the Focus of a *Convex Glaſs* from the Diſtance of the Object, and of the Eye from the Glaſs, and the Glaſs's Breadth. *P.* 126. *Prop.* 34.

3. If an Object be farther from a *Convex Glaſs* than the Focus, and the Eye on the other Side be nearer than the diſtinct Baſe of the Glaſs, it will ſee the Object erect but confuſed; and it will be moſt confuſed when the Eye is placed in the diſtinct Baſe.

4. But if the Object being placed as before, the Eye be farther from the Glaſs than a diſtinct Baſe, it begins to ſee the Object *Inverted*, and at a due Diſtance diſtinct.

5. If the Object be nearer than the Focus, it will appear erect and diſtinct to an Eye placed on the other Side the Glaſs, at any Diſtance within the Eye's Power to diſcern it.

CONVICT, in the Common Law, is he that is found guilty of an Offence by the Verdict of a Jury: But *Crompton* ſays, that *Conviction* is either when a Man is Out-lawed, or appeareth and confeſſeth, or elſe is found Guilty by the Inqueſt.

CONVOCATION, is commonly taken for the General Aſſembly of the Clergy, to conſult of Eccleſiaſtical Matters in Parliament; and as there are two Houſes of Parliament, ſo there are two Places called *Convocation Houſes*, the one called *The Higher*, where the Archbiſhop and Biſhops ſit ſeverally by themſelves; the other, *The Lower Convocation Houſe*, where all the reſt of the Clergy ſit. An Engliſh *Convocation* or *Synod*, as it now ſtands for the Province of *Canterbury*, conſiſts of a *Preſident* (the Lord *Archbiſhop*) and 21 *Biſhops*, 22 *Deans*, 53 *Archdeacons*, 24 Proctors of *Chapters*, 44 Proctors for the *Dioceſan Clergy*, (2 for each Dioceſe) and one *Præcentor*. Cowell's *Interpreter*.

CONVOLUTION, is a winding or turning Motion which is proper to the *Trunks* of ſome Plants, as the *Convolvulæ* or *Bindweeds*, and to the Claſpers of Vines and of *Briony*; and Dr. *Grew* thinks that all thoſe Plants whoſe Roots are twiſted, have ſuch a *Convolution*; and he aſſigns two great Efficient Cauſes of this winding Motion, the *Sun* and the *Moon*: Methinks 'twere worth the while, as 'tis very eaſy, to try whether there be any ſuch *Convolution* or not in the Trunks of Plants, which may eaſily be done, as he hints, by tying a little Bit of Paper to any of the Branches which are exactly *South*, *North*, &c. and then ſeeing whether it will change its Poſition or not, in reſpect of the Point of the Compaſs.

CONVOLVULUS: See *Iliac Paſſion*.

CONUS *Fuſorius*, is a ſort of Crucible made to melt Iron or any other Metal. *Blanchard*.

CONUSANCE, the ſame with *Cogniſance*.

CONUSANT, in the Common Law, ſignifies Knowing or Underſtanding; as if the Son be *Conuſant*, and agrees to the Feoffment. *Cook* upon *Littleton*. Fol. 159. *b*.

CONVULSION, is a Motion whereby the Nerves, Muſcles and Members are contracted or remitted againſt the Will, or without it, as in the *Cramp*, *Epilepſy*, &c. *Blanchard*.

CONVULSIVE *Motions*, are ſudden and ſwift Concuſſions or Shakings that ceaſe and return alternately.

COOK-*Room*, in a Ship, is variouſly ſeated in ſome, and generally in great Ships it is in the Fore-Caſtle; in ſome other Ships it is ſeated in the *Hatch-way*, upon the firſt *Orlope*; and for Ships of War (which are termed Men of War) it might moſt properly be there, in regard of Danger by Fire, and the freer Uſe of the Guns that lie in the Fore-Caſtle, eſpecially if this *Cook-Room* (as ſome conceive) may be contrived to be moveable, and ſo in a Fight be ſtruck down into the Hold of the Ship. But after all, I cannot apprehend how it can be otherwiſe placed than in the Fore-Caſtle in great Ships, by reaſon of the Multitude of Men, which require, neceſſarily, the dreſſing of much Meat, and as neceſſarily a large and private Room to dreſs it in.

COPERCENERS, or *Parceners*, in Common Law, are ſuch as have equal Portions in the Inheritance of their Anceſtors; and as *Littleton* in the Beginning of his Third Book, ſaith, *Parceners* be either by *Law* or by *Cuſtom*; *Parceners by Law* are the Iſſue Female which (no Heir-Male being) come in Equality to the Lands of their Anceſtors. *Parceners by Cuſtom*, are thoſe that by Cuſtom of the Country challenge equal Part in ſuch Lands; as in *Kent*, by the Cuſtom called *Gavel kind*: This, amongſt the *Feudiſts*, is called *Adæquatio*.

COPERNICAN *Syſtem*, the ſame with the moſt Ancient or Pythagorean Syſtem of the World, which *Copernicus* revived; and it is ſince improved, and now generally adhered to by Aſtronomers, and is as follows.

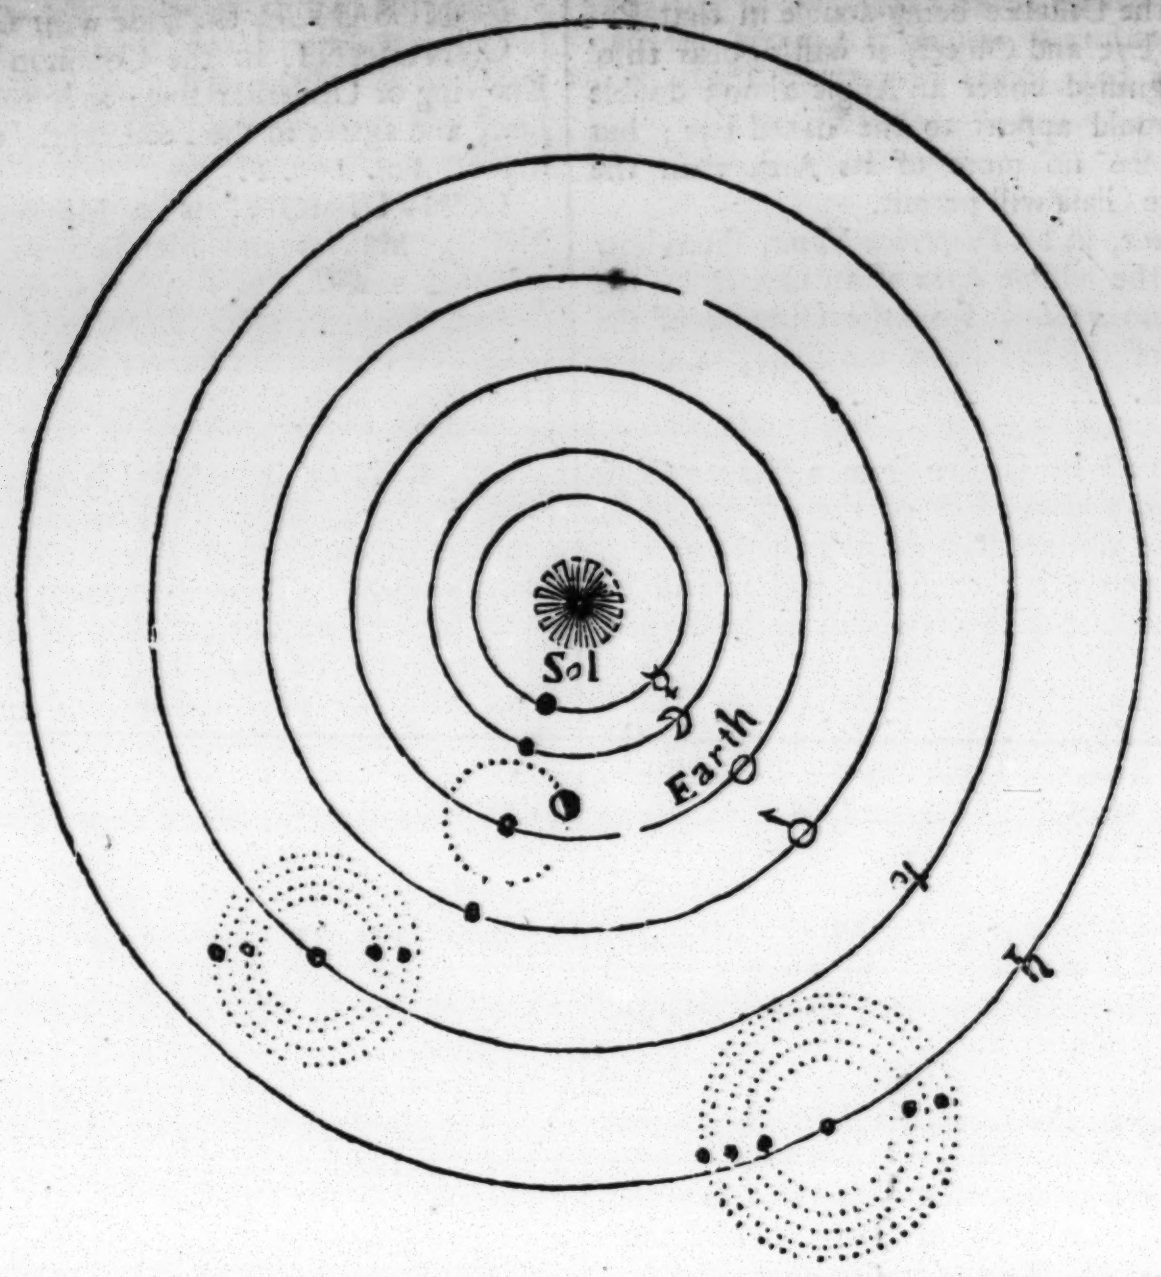
1. The Sun is ſuppoſed to be placed in the Middle, very near the Center of Gravity of the entire *Syſtem*, in the common *Focus* of every one of the Planetary Orbits.

Next to him *Mercury*, in about three Months Time, deſcribes his *Ellipſis*, and that ſo near, that we on the Earth rarely obtain a diſtinct View of him.

Next to *Mercury* is the *Elliptick* Orbit of *Venus*, whoſe Period is 7 Months $\frac{1}{2}$; and next to *Venus*, our Earth with its Attendant the *Moon* perform a joint Courſe, and meaſure out the Annual Period.

Next to the *Earth*, *Mars* alone, without any viſible Guard or Satellite accompanying him, revolves about the ſame Center in about two Years Time.

Next to *Mars*, tho' at a mighty Diſtance from him, the largeſt of the Planets *Jupiter*, with his four remarkable Satellites, takes his Round in 12 Years.



And Laſtly, *Saturn* with his five little *Moons* about him, according to *Caſſini*, deſcribes in 30 Years time, the fartheſt and moſt remote Orbit; and compleats the intire Planetary *Chorus*, as the Figure repreſents.

Beſides the Planets, whoſe Orbits are not very different from Circles, there are another *Species* of Bodies which are called *Comets*, revolving about the *Sun* in ſuch *Ellipſis*, as may paſs almoſt for *Parabola*'s, they are ſo exceeding Eccentrical; but as regularly retaining their ſeveral Periods and Orbits as the Planets themſelves, of which ſee *Comets*.

COPHOSIS, is a Deafneſs in the Ears. *Blanchard.*

COPIA *Libelli deliberando*, is a Writ that lieth, in Caſe when a Man cannot get the *Copy* of a Libel at the Hands of a Judge Eccleſiaſtical.

COPOS, is a Wearineſs of the Body, when the *Muſcles*, or their *Fibres* rather, are loaden and obſtructed with ſuch viſcous Humours, that they are rendred unfit for Motion. *Blanchard.*

COPPEL, or *Copple:* See *Cuppel.*

COPROCRITICA, are Medicines which purge away the Excrement in the Guts. *Blanchard.*

COPULA, in *Logick*, is the Verb that connects any two Terms in an Affirmative or Negative Propoſition; as God is Good, where (*is*) is the *Copula*. Riches alone *make* not a Man Happy, where (*make*) is the *Copula*.

COPULATIVE *Propoſitions*, are thoſe that include ſeveral Subjects or ſeveral Attributes joyn'd together by an Affirmative or Negative Conjunction; that is to ſay, *and* (*not*) or (*neither:*) For (*neither*) does the ſame thing as (*and*) in theſe ſorts of Propoſitions, for that (*neither*) ſignifies (*and*) with a Negative, which falls upon the Verb, and not upon the Union of the two Words which it joins; as if I ſhould ſay, *That Knowledge and Riches don't make a Man happy:* Here I unite Knowledge and Riches, affirming of both that they don't make a Man happy.

COPY-*hold*, is a Tenure for which the Tenant hath nothing to ſhew but the Copy of the Rolls made by the Steward of the Lord's Court; for the Steward as he doth inroll and make Remembrances of all other things done in the Lords Court; ſo he doth alſo of ſuch Tenants as he admitteth into the Court, to any parcel of Land or Tenement belonging to the Mannor; and the Tranſcript of this is called *The Copy of the Court Roll*, which is all the Tenant taketh from him, and keeps as his own Evidence: This Tenure is call'd *A Baſe Tenure*, becauſe it holdeth at the Will of the Lord: It is wont to be called *Tenure in Villanage* by ſome, who alſo ſay, that *Copy-hold* is but a new Name, yet it is not ſimply at the Will of the Lord, but according to the Cuſtom of the Mannor: So that if a *Copy-holder* break not the Cuſtom of the Mannor, and thereby forfeit his Tenure, he ſeemeth not ſo much to ſtand at the Lord's Curteſie for his Right, that he may be diſplaced hand over head at his pleaſure. Theſe Cuſtoms of Mannors be infinite, varying in one Point or other almoſt in every ſeveral Mannor.

Firſt, Some *Copy-holds* are *fineable* at Will, and ſome *certain:* That which is *fineable* at Will, the Lord

Lord taketh at his Pleaſure, but if it exceed two Years Revenue, the *Chancery*, *King's-Bench*, *Common-Pleas*, or *Exchequer*, may reduce them to Reaſon. That which is *certain*, is a kind of Inheritance, and called in many places *cuſtomary*, becauſe the Tenant dying, and the *Hold* being void, the next of Blood, paying the cuſtomary Fine (as 2*s.* for an Acre, or ſuch like) may not be denied his Admiſſion.

Secondly, Some *Copy-holders* have, by Cuſtom, the Wood growing upon their own Land, which by Law they could not have.

Thirdly, *Copy-holders*, ſome be ſuch as hold by the *Verge* in ancient *Demeſne*; and although they hold by *Copy*, yet are in Account a kind of *Free-holders*, For if ſuch a one commit Felony, the King hath *Annum*, *Diem* & *Vaſtum*, as in the Caſe of *Free-hold*. Some other hold by *Common Tenure*, called *Meer Copy-hold*, and they committing Felony, their Land eſcheateth to the Lord of the Mannor.

COR, the Heart, is a fleſhy *fibrous* Subſtance made up of ſeveral *Muſcles* and Tendons; it has two *Auricles* or *Ears*, and as many *Ventricles*: the *Vena Cava*, or great Vein, is faſten'd to the Right *Auricle*, and the *Pulmonary Vein* to the Left; the *Pulmonary Artery* is joyn'd to the Right *Ventricle*, and the great *Artery* to the Left. It is cloath-ed with a little *Membranous* Bag, called the *Pericardium*, wherewith it is joyned to the *Mediaſtinum*, and the *Diaphragm*; its Baſis is upwards, and Point downwards, and it is placed in the Middle of the Cheſt amongſt the Lobes of the Lungs. Its Uſe is to receive and diſperſe the Blood to all Parts in the Body. The Baſe of the Heart is environed round with a Plexus of Veins and Arteries.

Our Excellent Dr. *Lower* was the firſt that gave us the true Mechanical Structure of the Heart, and a very good rational Account of its Action: He explains the Syſtole of the Heart, by the natural Method of muſcular Contraction; but in order to account for its Diaſtole, he hath recourſe to a certain unaccountable Motion of *Reſtitution*, which ſeems not to be ſo well grounded.

The Heart being a ſingle Muſcle without an Antagoniſt, appears to be of the *Sphincter kind*; and *Borellus* in his *Oeconomia Animalis*, computes the Motive Power of a Man's Heart to be more than that of a Weight of 3000 lb. The Obſtacles to the Motion of the Blood through the Arteries, he judges equivalent to 18000 lb. *i. e.* 6 times as much as the Power of the Heart: He eſtimates the Power of the *Elaſtick Coat of the Arteries* at 45000 lb. whoſe Adventitious Help to move the Blood being deducted, he leaves the Heart with a force but of 3000 lb. to ſurmount a Reſiſtance of 135000 lb. that is, with one to move 45; and this mighty Power in the Heart he aſcribes to the Force of Percuſſion. Dr. *Drake*, in his Diſcourſe of the Motion of the Heart in *Phil. Tranſact.* N. 280. ſuppoſes that Reſpiration hath a great Influence to aſſiſt it; and that even the *Syſtole* or *Conſtriction* of the Heart is occaſioned in ſome meaſure by the help of the Diaphragm and Intercoſtal Muſcles, by whoſe Means the Blood hath a Paſſage opened for it into the Lungs, which denied, would be an Invincible Obſtacle: And he thinks alſo that the Syſtole is furthered by the Situation and Capacity of the Blood-Veſſels of the Lungs, in the ſeveral Times of the Elevation and Depreſſion of the Ribs; for by this Means a Paſſage is opened to the Blood to flow from the Right Ventricle of the Heart to the Left thro' the Lungs, to which it could not otherwiſe paſs; and the Oppoſition which the Blood contained in that Ventricle, muſt otherwiſe have made to its *Conſtriction*, is taken off. And thus the Dr. with great probability, ſuppoſes the Syſtole of the Heart to be much facilitated by the Action of the *Thorax*: But he ſaith, that neither the Diaphragm nor Intercoſtal Muſcles can contribute any thing towards the *Diaſtole*, the Cauſe of which, be it what it will, muſt be equal to that of the Heart, the Intercoſtal Muſcles, and the Diaphragm, to all which it acts as an *Antagoniſt*, dilating the Heart, as they conſtrict or cloſe it. The Dr. thinks ſuch a Power or Cauſe is not to be found any where in an Animal Body, and therefore it muſt be ſought without it; and he concludes that this Cauſe is the Weight of the incumbent Atmoſphere preſſing upon the *Thorax* and other parts of the Body, which he proves from Mr. *Boyle's* Experiments upon Animals in *Vacuo*, where, as ſoon as the Preſſure of the Incumbent Atmoſphere is removed, the Intercoſtal Muſcles and Diaphragm are contracted, and the Ribs elevated in an Inſtant, and can't by any Power of the Will be made to ſubſide, till the Air is let in again to bear them forcibly down: And, as in the *Elevation of the Coſtæ*, the Blood is in a manner ſolicited by the Paſſage now opened for it to flow into the Lungs; ſo in the *Depreſſion* of them by the Subſidence of the Lungs, and the Contraction of the Blood Veſſels (both which are conſequent thereupon) the Blood is forcibly driven, as it were by an Embolus, through the Pulmonary Vein into the Left Ventricle of the Heart; and that, together with the *general Compreſſion* of the whole Body, by the *Weight* of the *Atmoſphere*, which ſurrounds and gravitates upon the whole Surface of it, is *that Power* which cauſes the Blood to mount in the Veins, after the force impreſs'd upon it by the Heart is broken and ſpent, and which is ſufficient to force the Heart from its Natural State to Dilatation. And thus by the Contraction of the Heart (the proper Action of all Muſcles) and its Dilatation again this way, is the Circulation of the Blood ſet forward and kept going on.

COR, is by the *Botaniſts* uſed to ſignify the inward ſoft pithy and ſpongy part of any *Tree* or *Plant*, which they call alſo *Medulla* and *Matrix Arboris*.

COR *Caroli*, an extraconſtellated Star in the Northern Hemiſphere, ſituated between the *Coma Berenices*, and *Urſa major*, ſo called in Honour of King *Charles*.

COR *Hydræ*, a fix'd Star of the firſt Magnitude in the Conſtellation of *Hydra*; its *Longitude* is 142 *deg.* 49 *min.* *Latitude* 22 *deg.* 23 *min.*

COR *Leonis*: See *Regulus* or *Baſilicus*.

CORACOBRACHIALIS, or *Coracobrachieus*, is a Muſcle ſo called from its Origination and Inſertion: It ariſes partly fleſhy, and partly tendonous, from the Extremity of the *Proceſſus Coracoides Scapulæ*, and in its Deſcent it becomes larger, ſtrictly adhering to the Internal Tendon us beginning of the *Biceps*, and parts from it near its Tendonous Inſertion at the Middle of the Internal Part of the *Os Humeri*: Thro' this Muſcle paſſes a large Nerve, wherefore by ſome it is called *Perforatus*. When it acteth, the Arm is moved upwards, and turned ſomewhat obliquely outwards.

CORACOHYOIDES, are *Muſcles* which proceed from the Proceſs of the Shoulder-bone, call'd

Coracoides, and go on as far as the Bone *Hyoides*; their Uſe is to move obliquely downward.

CORACOIDES, is the Proceſs of the Shoulder-blade, in form of a Beak.

CORAM *non Judice*, is a Term in the Common Law, when a Cauſe is brought into a Court wherein the Judges have no Juriſdiction.

CORBEILS, in Fortification, are little Baskets about a Foot and a half high, eight Inches broad at the bottom, twelve at the Top; which being filled with Earth, are frequently ſet one againſt another upon the Parapet, or elſewhere, leaving certain Port-holes, from whence to fire upon the Enemy under Covert, without being ſeen by them.

CORD, in Geometry: See *Chord*.

CORDAGE at Sea, ſignifies in general all the Ropes belonging to the Rigging of a Ship.

CORDIALIA, are Medicines which are commonly thought to ſtrengthen the Heart; but they only put the Blood into a fine gentle Fermentation, which corroborates and facilitates the Motion of the Heart. *Blanchard*.

CORDON, in Fortification, is a Row of Stones made round on the outſide, and ſet between the Wall and the Fortreſs which lies in *Talu*, or a Slope, and the Parapet which ſtands perpendicular after ſuch a manner, that this Difference may not be offenſive to the Sight; ſo that thoſe *Cordons* ſerve only as Ornaments ranging round about the Place; neither are they uſed but in Fortifications made of Maſon's Work, the void Space being filled up with pointed Stakes in thoſe that are raiſed with Earth.

CORDS, in Muſick, properly ſignifies the Strings of a Harp, Violin, Lute, or any other Muſical Inſtrument: But the Term is alſo applied to denote the Sounds which proceed from ſuch Inſtruments, even from thoſe that have no Strings.

CORINTHIAN *Order of Architecture*, is ſo called from *Corinth*, the Place of its Invention. It obſerves the ſame Meaſure with the *Ionick*, and the Difference between them is chiefly in the *Capital*. See *Order* and *Column*.

Vitruvius makes the Height of the *Capital* to be two Modules, and this he divides into ſeven parts, of which the firſt is for the *Abacus*, and the other ſix downwards are for the Ornament.

CORNACHINE *Powder*, the ſame with what is ſometimes called the *Earl of* Warwick's *Powder*, and by Foreign Writers frequently *Pulvis de tribus*; it is a purging Powder made of equal parts of *Antimonium Diaphoreticum*, *Diagridium*, and *Cream of Tartar*.

CORNEA *Lunæ*: See *Lunæ Cornea*.

CORNEA *Oculi Tunica*, which is alſo called *Sclerotes*, and *Dura*, the *hard Tunick*, proceeds from a *Tunick* in the Brain called *Dura Meninx*; it is *pellucid* forwards, that it may tranſmit the viſible *Species*: Its Sides are covered with the *Albugineous Tunick*; inwardly it contains the *Aqueous Humour*.

CORNICHE, or as we pronounce it, *Corniſh*, in Architecture, is the third and higheſt part of the *Entablature*, and is commonly uſed to ſignifie the uppermoſt Ornament of any Wainſcot, &c. In reference to the *Pillar*, 'tis different according to the different Orders of Architecture. In the *Tuſcan* 'tis without Ornaments, and this Pillar of all others hath the leaſt Mouldings. The *Dorick* is adorn'd with *Dentils* like the *Ionick*, and which ſometimes hath its Mouldings cut into it. The *Corinthian* Pillar hath of all others the moſt Mouldings, and thoſe very often cut with *Modillons*, and ſometimes *Dentils*. The *Compoſite* hath its *Dentils* and its *Mouldings* cut, with its Channels or Chamferings under its *Platfond*.

CORNICULARIS *Proceſſus*: See *Ancyroides*.

CORNICULATE *Plants and Herbs*, are ſuch as after each Flower produce many diſtinct and horned Seed-pods; which Seed-veſſels are called *Siliquæ*: This kind is called alſo *Multiſiliquous*; ſuch as the *Sedum* or *Sempervivum*, *Telephium*, *Sedum Stellatum*, *Juncus Floridus*, *Helleborus Niger*, *Fraxinella*, *Aconitum* (or *Napellus*) *Aquilegia*, *Delphinum*, *Pæonia*, *Caltha Paluſtris*, *Althæa Lutea*, &c.

CORNISH *Ring of a Gun*, is the next from the Muzzle Ring backwards: See *Ordnance*.

CORNUA *Uteri*, are two lateral parts of the Womb in ſome Brutes, as Cows, Harts, Sheep, Goats, &c. yet ſome Authors have attributed the ſame parts to a Woman's Womb from ſomething which imitates them there; for at the Sides of the Bottom of the Womb, there is a ſort of *Protuberance* on both Sides, where the *Vaſa Deferentia* are inſerted; yet a Woman's Womb is rarely *Bipartite*, as it is in Brutes.

CORODIO *Habendo*, is a Writ whereby to exact a *Corody* of an Abby, or Religious Houſe.

CORODY *Habendo*, in Common-Law, ſignifies a Sum of Money, or Allowance of Meat, Drink, and Cloathing, due to the King from an Abby, or other Houſe of Religion, whereof he is Founder, towards the reaſonable Suſtenance of ſuch a one of his Servants, being put to his *Penſion*, as he thinketh good to beſtow it on. And the Difference between a *Corody* and a *Penſion* ſeems to be, That a *Corody* is allowed towards the Maintenance of any of the King's Servants that liveth in an Abby: a *Penſion* is given to one of the King's Chaplains, for his better Maintenance in the King's Service, until he may be better provided of a Benefice. It appears in *Weſt.* 2. *Cap.* 25. That an Aſſize ſhall lie for a *Corody*; and in others, That *Corodies* belonged ſometimes to Biſhops from Monaſteries; and alſo, That a *Corody* may be due to a common Perſon, by Grant from one to another; or of common Right, to him that is a Founder of a Religious Houſe, not holden in *Franc-Almoine*, for that Tenure was diſcharged of all *Corodies* in it ſelf. And a *Corody* is ſaid to be either certain or uncertain, and that it may be for Life, for Years in Tail, or in Fee.

COROLLARY or *Conſectary*, is an uſeful Conſequence drawn from ſomething which hath been already advanced or demonſtrated; as if from this, *viz. That a Triangle which has two equal ſides, has alſo two Angles equal*; you ſhould draw this Conſequence, *That a Triangle which has the three Sides equal, has alſo its three Angles equal.*

CORONA, in Architecture, is properly the flat and moſt advanced part of the Cornice, called by the *French Larmier*, and by us *the Drip*, becauſe it defends the reſt of the Work from Wind and Weather; but it is often taken by *Vitruvius* for the whole *Cornice*.

Corona, or the *Flat-Crown*, is alſo a particular Member in the *Dorick* Gate, made by ſo extraordinary an Enlargement of the *Larmier* or *Drip*, that it hath ſix times more breadth than Projecture. This ſort of *Corona* is no where found amongſt

mongſt the Ancients, except only in the Writings of *Vitruvius*.

CORONA *Borealis*, or the *Northern Garland*, a Conſtellation in the Northern Hemiſphere, conſiſting of about 20 Stars.

CORONA *Meridionalis*, a Southern Conſtellation conſiſting of 13 Stars.

CORONALE: See *Frontis*.

CORONALIS *Sutura*, is a Cleft in the Head made like a Comb, and joins as if the Teeth of two Saws were cloſely compacted into one another: It is placed in the upper Part of the Skull from one Temple to another, and is circumſcrib'd with the Bones of the Forchead, and that particularly called *Bregma*; in the Middle whereof the *Suture*, ſtiled *Sagittalis*, is terminated.

CORONARIA *Vaſa*, are the Veins and Arteries which ſurround the Heart to nouriſh it: They ariſe out of the *Aorta* before it comes out of the *Pericardium*; they encompaſs the *Baſis* of the Heart like a Garland; in their Circuit ſend down divers Twigs length-ways of the Heart, and when they have encompaſſed the *Baſis* and meet, they inoſculate with one another, but not with the *Veins*.

CORONATORE *Eligendo*, is a Writ which, after the Death or Diſcharge of any *Coroner*, is directed to the Sheriff out of the *Chancery*, to call together the Free-holders of the County for the Choice of another *Coroner*; and to certify into the *Chancery* both the Election and Name of the Party elected, and to give him his Oath.

CORONE, is an Acute Proceſs of the lower Jaw-bone, from its Likeneſs to the Beak of a *Raven* called *Roſtriformis*, in the Form of a Beak.

CORONER, is an ancient Officer of this Land, ſo called, becauſe he dealeth wholly for the King and Crown: There be four of them commonly in every County, and they are choſen by the Free-holders of the ſame upon Writ, and not by Patent. His Office eſpecially concerneth Pleas of the Crown. There be alſo certain ſpecial *Coroners* within divers Liberties, as well as thoſe ordinary Officers in every County; as the *Coroner of the Verge*, which is a certain Compaſs about the King's Court: And there are certain Charters belonging to Colleges and other Corporations, whereby they are licenced to appoint their *Coroner* within their own Precincts.

CORPORA *Cavernoſa Penis* (by *D'Graaf* called *Nervoſa*, and by others *Nervea Spongioſa*) are two *Capſulæ* or oblong *Folliculi*, fenced every where without with a thick Membrane. They ſpring with two diſtinct Originals from the lower Side of the *Oſſa Pubis*, whence ſtretching forwards, they meet one another, leaving an Interſtice before their Conjunction, in which the *Urethra* is conveyed: Where they leave the *Oſſa Pubis* they are each covered with a Membrane, and afterwards joined to each other by the Intervention of a *Septum Intermedium*, which, the nearer it comes to the Glans, is the more diminiſhed.

CORPORA *Olivaria*: See *Olivaria Corpora*.

CORPORA *Pyramidalia*, are Protuberances of the under Part of the Brain; they are in Length of about an Inch.

CORPORA *Striata*, are Protuberances upon the *Crura Medullæ Oblongatæ*.

CORPORAL, is an inferior Officer in a Foot Company, who hath charge over one of the Diviſions; places and relieves Centinels, and keeps good Order in the *Corps de Garde*: He receives the *Word* of the Inferior Rounds that paſs by his *Corps de Garde*.

CORPORATION, is a Body Politick authoriſed by the King's Charter, being of Capacity to take and grant, having a Common Seal, &c. Theſe are conſtituted either by Preſcription, by Letters Patent, or by Act of Parliament, and are either *Spiritual* or *Temporal*.

CORPOREITY, the School Term for the Nature of a Body.

CORPS *de Garde*, is a Poſt in an Army ſometimes under Covert, ſometimes in the open Air, to receive a Number of Men who are relieved from time to time to watch in their Turns for the Security of ſome more conſiderable Poſt; and it often alſo is taken for the Men thus watching, who are called the *Corps de Garde*.

CORPUS *cum Cauſa*, is a Writ iſſuing out of the *Chancery*, to remove both the Body and the Record touching the Cauſe of any Man lying in Execution upon a Judgment for Debt, into the *King's-Bench*, &c. there to lie till he have ſatisfied the Judgment.

CORPUS *Calloſum*, is the upper Part or Covering of a Space made by the joining together of the Right and Left Side of the internal Subſtance of the Brain. This Space forms the three Ventricles or *Foramen Ovale*, and its Bottom is the Internal Subſtance of the two Sides of the *Cerebrum* gather'd as it were into two Bundles, and are called the *Crura* of the *Medulla Oblongata*.

CORPUS *Glandulojum*, the ſame with the *Proſtata*.

CORPUSCLES, in Natural Philoſophy, ſignify the Minute Parts, or Particles, or Phyſical Atoms of a Body; and by this Word is not meant *Elementary Parts*, nor the *Hypoſtatical Principles* of the Chymiſts, but ſuch Particles, whether of a ſimple or compounded Nature, whoſe Parts will not be *diſſolved*, *disjoined*, or *diſſipated* by ordinary Degrees of Heat.

And that way of Philoſophizing which endeavours to explain things, and to give an Account of the *Phænomena* of Nature by the Motion, Figure, Reſt, Poſition, &c. of Corpuſcles or Minute Particles of Matter, is by the Honourable Mr. *Boyle* called very properly the

CORPUSCULAR *Philoſophy*; which was ſo very Ancient, that both before *Epicurus* and *Democritus*, and even before *Leucippus* taught in *Greece*, there was a *Phœnician* Philoſopher that explained Natural *Phænomena* by the Motions and Affections of the Minute *Corpuſcles* of Matter, as very old Writers inform us: and therefore this kind of Philoſophy ſhould rather be called *Phœnician* than *Epicurean*.

The chief Principles of the *Mechanical Hypotheſis* or *Corpuſcular Philoſophy*, Mr. *Boyle* ſums up in theſe Particulars:

1. They ſuppoſe that there is but one Catholick or Univerſal Matter, which is an extended, impenetrable and diviſible Subſtance common to all Bodies, and capable of all Forms.

2. That this Matter, in order to form the vaſt Variety of Natural Bodies, muſt have *Motion* in ſome or all its deſignable Parts: and that this Motion was given to Matter by God the Creator of all things, and has all manner of Directions and Tendencies.

3. Matter muſt alſo actually be divided into Parts, and each of theſe Primitive Particles, Frag-

ments or Atoms of Matter muſt have its proper Magnitude or Size, as alſo its peculiar Figure and Shape.

4. They ſuppoſe alſo, that theſe differently fiz'd and ſhap'd Particles may have as different *Orders* and *Poſitions*, *Situations* or *Poſtures*, from whence great Variety may ariſe in the Compoſition of Bodies.

CORRECTOR *of the Staple*, is a Clerk belonging to the *Staple* that Writeth and Recordeth the Bargains of Merchants made there.

CORRIDOR, in Fortification, is the *Covert-way* lying round about the whole Compaſs of the Fortifications of a Place, between the Outſide of the Moat and the Palliſado's.

CORROSIBILITY, is the Power of being corroded, eaten or diſſolved by any *Corroſive Menſtruum* or Liquor; and the Honourable Mr. *Boyle* reckons theſe Qualifications neceſſary to render any Body *Corroſible:*

1. That it be furniſhed with Pores of ſuch a Bigneſs and Figure, that the *Corpuſcles* of the *Menſtruum* or *Solvent* may enter them, and yet not be much agitated in them, without alſo giving briſk Knocks or Shakes to the ſolid Parts which conſtitute the Pores or Cavities: For ſometimes, though the Pores of a Body may be large enough to let in ſome groſs Corpuſcles, yet if theſe, for want of Solidity or Rigidity, are too flexible, or are of an Incongruous Figure to thoſe Pores, a Diſſolution may not enſue; as it happens when pure Spirit of Wine is in the cold put upon Salt of Tartar; or when *Aqua Fortis* is put upon powdered Sulphur.

2. That its conſiſtent Corpuſcles be of ſuch a Bulk and Solidity as doth not incapacitate them from being diſ-joined by the Action of the inſinuating Corpuſcles of the *Menſtruum*.

3. That the Coheſion of the Parts of the *Corrodible* Body be not ſo ſtrict, as that they are not ſeparable by the Action of the Diſſolvent.

CORROSIO *Chymica*, is a Diſſolution of mixed Bodies by *Corroſive Menſtruums*.

CORROSIVE *Medicine*, is one that has a Power of Corroding, as Lime, *Lapis Infernalis*, and other Cauteries.

CORROSIVENESS, is the Quality that ſome Liquors which are called *Menſtruums*, have of diſſolving or corroding Bodies.

And the Attributes or Qualifications which ſeem proper to render any Liquor *Corroſive*, Mr. *Boyle*, in his Mechanical Original of this Quality, reckons to be ſuch as theſe:

1. That the *Menſtruum* or diſſolving Liquour conſiſt of, or abound with ſuch Particles as are not too big to get in at the Pores or Commiſſures of the Body to be diſſolved; nor yet ſo ſmall, as readily to paſs through them, as the Rays of Light do through Glaſs; nor muſt they be unable, by reaſon of their great Slenderneſs and Flexibility, to disjoin the Parts they invade.

2. That theſe Corpuſcles be of a Shape fitting to inſinuate themſelves more or leſs into the Commiſſures or Pores of the Body, in order to diſſociate its ſolid Parts.

3. That theſe Particles have alſo a competent degree of *Solidity*, in order to disjoin the Particles of the Body to be diſſolved: And this Solidity differs much from the Bulk of the *Corpuſcles* mentioned in the firſt Requiſite; for one thing may be much more ſolid than another, tho' it have, as to Bulk, the ſame Dimenſions: Thus the Stalk of a Plant may be as big as a ſmall Iron or a Steel Rod, but the Latter is much ſolider than the Former.

4. That the Particles of the *Menſtruum* be Agile, and advantaged for Motion, in reſpect of their Shape, or their Smallneſs, or their Fitneſs, to have their Action befriended by the Preſſure of the Atmoſphere, which may help to drive them into the Pores of Bodies, or by the Agitation which theſe intruding Particles may be fitted to receive in thoſe Pores by the Tranſcurſion of ſome ſubtle Æthereal Matter.

CORRODENTIA: *Corroding* things, are things which eat up and conſume Excreſcent Fleſh with their ſharp *Particles*. Blanchard.

CORRUGANT *Muſcles*, according to ſome, are thoſe that help to knit the Brows when one frowns; but they ſeem to be only a Part of the *Frontal Muſcles* that have their Fibres running in this Place ſomewhat obliquely.

CORRUGATOR *Supercilii*, is by ſome Anatomiſts reckoned as a Muſcle of the Eye-brows, helping to knit them when we frown; but it ſeems to be only a Part of the Frontal Muſcles, having Fibres in this Place a little oblique.

CORRUPTION, is the Deſtruction, Extinction, or, at leaſt, the *Ceſſation*, for a Time, of the proper Mode of Exiſtence of any Natural Body: For whenever any Body loſes all, or any of thoſe Accidents which are eſſentially neceſſary to the conſtituting it of ſuch a kind, it is then ſaid to be corrupted or deſtroyed, and loſes its former Denomination, being not now a Body of the Kind it was before. But, as in *Generation*, nothing *Subſtantial* is produced, ſo here nothing *Subſtantial* is loſt or deſtroyed, but only that Modification of the Body which was its Form, and made it be of ſuch a *Species*.

CORTICAL *Part of the Brain*, is the outward Subſtance of the Brain, full of *Labyrinths* and *Meanders* in the Outſide; it is covered with a thin Skin, and is of an Aſh-griſly Colour, being, as *Malpighius* ſaith, only an Heap of little Oval Glands, and full of little Veſſels; inwardly the *Medullary Subſtance* is next to it. Its Uſe is thought by ſome to be for the generating Animal Spirits from the Blood, and hence they are conveyed by the *Medullary Subſtance* to the *Nerves*, and diſtributed through the whole Body: And the Seat of the Memory and Sleep is placed there by many Anatomiſts.

CORTIN, in *Fortification*, ſignifies the Wall or Diſtance between the Flanks of two Baſtions.

CORUSCATION or *Flaſhing*, is (by the *Carteſians*) an Exhalation ſpread under a Cloud, which ruſhing downwards is ſet on Fire and flaſheth.

CORVUS, a Southern Conſtellation in the Heavens, conſiſting of ſeven Stars.

CORYMBUS, in general, ſignifies the Top of any thing; but among the old Writers about Plants, *Corymbi* were the Bunches or Cluſters of Ivy Berries: Some alſo call the Top of the Stalk of a Plant, when 'tis ſo ſubdivided and adorned with Flowers or Fruits that it makes a round Spherical Figure, by this Name *Corymbus*, as the Tops of Leeks, Onions, and of the *Sambucus Aquatica*, *&c.* and others confound the Word with *Umbella*, which expreſſes the Flowry Top of ſuch Plants as have their Branches and Flowers ſpread round into the Form of what our Women now call an *Umbrella*.

But

But among our Modern Botaniſts it is uſed for a compounded diſcous Flower, whoſe Seeds are not *Pappous*, or do not fly away in Down; ſuch are the Flowers of *Daiſies*, *Corn-Marygold*, &c. and therefore the Accurate Botaniſt Mr. *Ray* makes one large Genus of Plants to be ſuch as have a compound diſcous Flower, but without any downy Wings to carry off their Seeds, and theſe he properly calls

Corymbiferous Plants; and theſe he diſtinguiſhes into,

1. Such as have a Radiate Flower, as the *Flos Solis*, *Calendula*, *Caltha*, *Flos Africanus*, *Chryſanthemum*, *Sagetum*, *Buthphalmum*, *Ptarmica*, *Abſinthium Umbelliferum*, *Millefolium*, *Bellis Major & Minor*, *Parthenium*, *Chamæmelum*, &c.

2. Such as have a Naked Flower, as the *Abrotanum Fœmina*, *Eupatorium Cannabinum fœmina*, *Coſtus Hortorum*, *Ageratum*, *Abſinthium*, *Artemiſia*, &c.

To which he adds ſuch as he calls

Corymbiferis Affines, *i. e.* ſuch Plants as ſeem akin to the *Corymbiferous* Kind, as *Scabioſa*, *Dipſacus*, *Carduus*, *Sphærocephalus*, *Eryngium*, &c.

CORYPHE, is the Crown of the Head; alſo the interior Extremity of the Fingers near the Nails. *Blanchard.*

CORYZA or *Gravedo*, is a Defluxion of a ſharp, ſalt, and thick Humour into the Mouth, Lungs, and Noſtrils, from the *Ventricles* of the Brain by the Olfactory *Nerves*; for when it grows thick, it can neither be *Percolated* by the Reins, nor paſs from the *Pituitary Glandule* through the *Infundibulum* into the *Veins*, and therefore it diſtils into the Noſtrils by the aforeſaid *Nerves*. *Blanchard.*

CO-SECANT, is the Secant of an Arch which is the Complement of another to 90°.

CO-SINE, is the Right Sine of an Arch, which is the Complement of another to 90 Degrees.

COSENAGE, or *Cognatione*, is a Writ that lies where the great Grandfather is ſeized in his Demeſne, as of Fee, at the Day of his Death, of certain Lands and Tenements, and dieth, and then a Stranger entreth and abateth; for then ſhall his Heir have this Writ of *Coſenage*.

COSHERING, in the Feudal Laws; as there were many Privileges inherent by Right and Cuſtom, ſo were there ſeveral then grievous Exactions impoſed by the Lords, by a ſort of Prerogative or Seignioral Authority, as to lie and feaſt themſelves and their Followers (called *Coſhering*) at their Tenant's Houſes.

COSMETICKS, are Medicines which whiten and ſoften the Skin, or, in general, any thing that helps to promote the External Beauty or good Appearance of the Perſon that uſeth it.

COSMICAL, a Term in Aſtronomy, expreſſing one of the Poetical Riſings of a Star; for a Star is ſaid to *riſe Coſmically*, when it riſes together with the Sun, or with that Degree of the *Ecliptick* wherein the Sun then abides; and the *Coſmical Setting*, is when a Star ſets and goes down in the *Weſt*, at the ſame time as the Sun riſes in the *Eaſt*.

COSMOGRAPHY, is a Deſcription of all the ſeveral Parts of the viſible World, delineating them according to their Number, Poſitions, Motions, Magnitudes, Figures, and their other Properties. The Two Parts of which are *Aſtronomy* and *Geography*.

COSSE and *Coſſick*, the old Word for *Algebra*.

COST, (in the Plural Number *Cotizes*) a Term in Heraldry, ſignifying a fourth Part of a *Bend*.

COSTÆ, the Ribs, are thoſe Bones which, with other Parts, makes the *Cheſt* or *Thorax*; Backward they are connected with the *Vertebræ* of the Back; Forward with the *Cartilages* of the Breaſt Bone: They are Twelve in number on each Side, the Seven upper are called *Coſtæ Veræ*, *True*, becauſe their Cartilaginous Ends are received into the *Sinus* of the *Sternum*; the Five lower *Spurious*, becauſe they are ſhorter and ſofter; the broader Part of the Rib is called *Palmula*, the ſtraighter towards the *Vertebræ*, *Remulus*. The Ribs are crooked like the Segments of Circles, and grow flat and broad as they approach the *Sternum*, but nearer the *Vertebræ* they are rounder and thicker, and at thoſe Ends have each a round Head, which being covered with a Cartilage, is received into the *Sinus* in the Body of each *Vertebra*; and at the Neck of each Head there is a ſmall Tubercle, which is alſo received into the *Sinus* of the Tranſverſe Proceſſes of the *Vertebræ*; and as they are thus articulated, the Ribs make an Acute Angle with the lower *Vertebra*. Each one hath a ſmall Canal or *Sinus* running along the under Side, in which lies a Nerve, Vein and Artery: Their Extremities, which are faſtened to the *Sternum*, are Cartilaginous, and the *Cartilages* make an Obtuſe Angle with the Bony Part of the Rib. Theſe *Cartilages* are harder in Women than Men, that they may the better ſuſtain the Weight of the Breaſts.

Dr. *Keil* obſerves very well in his *Anatomy*, P. 227. That if the Ribs had been articulated with the Bodies of the *Vertebræ* at Right Angles, the Cavities of the Thorax could never have been enlarged in breathing: If each Rib had been a rigid Bone articulated at both Ends to two fix'd Points, the whole Cheſt had been immoveable. If the Ribs had not been articulated to the Tranſverſe Proceſſes of the *Vertebræ*, the *Sternum* could not have been thruſt out to that Degree it is now, nor the Cavity of the Thorax increaſed ſo much as is requiſite in Inſpiration; for when the Ribs are pull'd up by the Intercoſtal Muſcles, the Angle which the Cartilages at the *Sternum* make with the Bony Part of the Rib, muſt be increaſed, and conſequently its Subtenſe, or the Diſtance between the *Sternum* and the Tranſverſe Proceſſes, lengthened. Now becauſe the Rib can't move beyond the Tranſverſe Proceſs, on the account of its being articulated with it, therefore the *Sternum* muſt either be thruſt to the other Side, or elſe outwards: It cannot move to the other Side, becauſe of an equal Preſſure upon the ſame Account there, and therefore 'tis thruſt outwards, or the Diſtance between the *Sternum* and the *Vertebræ* is increaſed: The laſt Ribs, which do not reach the *Sternum*, and conſequently conduce nothing to this Action, are not articulated with the Tranſverſe Proceſſes.

If we ſuppoſe the Cavity of the *Thorax* to be half a *Spheroid*, whoſe *Semi-Axis* is equal to the Height

Height of the *Thorax*, or about 15 Inches, and the Diameter of its greateſt Circle 12 Inches, then the Cavity of the *Thorax* will contain about 1130 Cubick Inches; but in an eaſy Inſpiration the *Sternum* is raiſed $\frac{1}{10}$ of an Inch (as I am aſſured by an exact Experiment) and therefore on that Account the *Thorax* is enlarged to the Capacity of 1150 Cubick Inches. To this, if we add the Space which the Diaphragm leaves, which is the Segment of a Sphere, whoſe Diameter is about 15 Inches, and the Solidity of that Segment 183 Inches, we ſhall have 22 Inches more, if the Diaphragm deſcends but one Inch; but if it deſcends an Inch and $\frac{1}{2}$, it then leaves room for 32 Inches of Air more to enter; and if it deſcends two Inches, the Cavity of the *Thorax* will be increaſed on the Account of the Motion of the Diaphragm alone to 86 Inches; ſo that in the leaſt Inſpiration which we can fairly ſuppoſe, the Lungs are diſtended with 42 Inches of Air, and ſometimes may receive above 70 or 100.

CO-TANGENT, is the *Tangent* of an Arch, which is the Complement of another to 90 *Degrees*.

COTYLE, the ſame with *Acetabulum*, is the Cavity of the Huckle Bone, which is appointed to receive the Head of the Thigh Bone.

COTYLEDON, the ſame with *Cotyle*.

COTYLEDONES, or *Acetabula Uterina*, are Glandules diſperſed up and down the uttermoſt Membrane inveſting the *Fœtus*, called *Chorion*, which ſeparate the *Nutritious Juice* from the Womb to nouriſh the *Fœtus*; but this is found only in ſome Animals; the *Placenta* in the Womb ſupplies their Place in Women: The gaping meeting of the Veins in the Womb alſo are called *Cotyledones* and *Acetabula*: Theſe Glandules are ſo called from the Reſemblance they bear to the Leaves of the Herb *Pennywort*, in Latin *Cotyledon*.

COUCHANT, the Term in Heraldry for a Lion born in any Coat of Arms, lying on his Belly, but with his Head erect.

COVENANT, is the Conſent of two or more to one thing, to do or give ſomewhat. *Covenant* is either in *Law* or in *Fact*; A *Covenant in Law*, is that which the Law intendeth to be made, though in Words not to be expreſſed; as if the Leſſee do demiſe or grant, &c. to the Leſſor for a certain Term, the Law intendeth a *Covenant* on the Leſſor's Part, that the Leſſee ſhall quietly enjoy his Leaſe for his Term againſt all Incumbrances.

Covenant in Fact, is that which is expreſly agreed between the Parties. There is alſo a *Covenant Real*, and a *Covenant meerly Perſonal*; A *Covenant Real* is that whereby a Man tieth himſelf to paſs a thing *Real*, as Lands or Tenements, as a *Covenant* to levy a Fine or Land, &c. A *Covenant meerly Perſonal*, on the other Side, is where a Man *covenanteth* with another by Deed to build him a Houſe, or any other thing, or to ſerve him, or to infeoff him, &c.

COVENANT is alſo the Name of a Writ: See *Convention*.

CO-VERSED *Sine*, is the remaining Part of the Diameter of a Circle, after the Verſed Sine is taken from it.

COVERTURE, in Law, is particularly applied to the Eſtate and Condition of a married Woman, who, by the Laws of our Realm, is *ſub poteſtate viri*, and therefore diſabled to make Bargains with any, to the Prejudice of her Self or her Husband, without his Aſſent and Privity, or at leaſt without his Allowance and Confirmation; and if the Husband alien the Wife's Lands during the Marriage, ſhe cannot gainſay it during his Life.

COVERT-WAY, in Fortification, is a Space of Ground level with the Field, on the Edge of the Ditch three or four Fathom broad, ranging quite round the Half-Moons and other Works toward the Country: It is otherwiſe called *Corridor*, and hath a Parapet raiſed on a Level, together with its *Banquets* and *Glacis*, which from the Height of the Parapet ought to follow the Parapet of the Place till it is inſenſibly loſt in the Field: It hath alſo a Foot Bank. One of the greateſt Difficulties in a Siege is to make a Lodgment on the Covert-way, becauſe uſually the Beſieged Palliſade it along the Middle, and undermine it on all Sides: This is ſometimes called, and that commonly, the *Counterſcarp*, becauſe 'tis on the Edge of it.

COVINE, (in Law) is a deceitful Aſſent or Agreement between two or more, to the Prejudice of one another.

COUNT, (in Law) ſignifies as much as the Original Declaration in a Proceſs, though more uſed in Real than in Perſonal Actions, as Declaration is more apply'd to Perſonal than Real.

COUNT-WHEEL, is a Wheel in the ſtriking Part of a Clock, moving round once in 12 or 24 Hours: It is by ſome called the *Locking Wheel*, becauſe it hath commonly 11 Notches in it at unequal Diſtances from one another, in order to make the Clock ſtrike 1, 2, 3, 4, &c. 'tis driven round by the *Pinion of Report*.

COUNTER-APPROACHES, in Fortification, are Works made by the Beſieged to hinder the Approach of the Enemy; and when they deſign to attack them in Form,

COUNTER-BATTERY is one raiſed to play againſt another.

COUNTER-BREAST-WORK, a Term in Fortification, the ſame with *Falſe Bray*.

COUNTER-CHANGED, is a Term in Heraldry, when there is a *mutual changing* of the Colours of the *Field* and *Charge* in an Eſcutcheon, by Reaſon of one or more Lines of Partition. Thus in the Coat of the Famous *Chaucer*, he beareth *Party per Pale, Argent and Gules, a Bend Counter-changed, i. e.* that Part of the Bend which is in that Side of the Eſcutcheon which is *Argent*, is *Gules*, and that Part of it which is in the other Side, is *Argent*.

COUNTER-COMPONED, the Herald's Term for a *Bordure*, or any Ordinary which hath two Rows only of *Checkers* of two different Colours; but when it hath three or more, they call it *Checky*.

COUNTER-FORTS, are certain Pillars and Parts of the Walls of a Place, diſtant from 15 to 20 Foot one from another, which are advanced as much as is poſſible in the Ground, and join'd to the Height of the *Cordon* by Vaults to ſupport the Way of the Rounds and Part of the Rampart; as alſo to fortify the Wall, and ſtrengthen the Ground; nevertheleſs they are not at preſent much uſed, except in large Fortifications.

COUNTER-FUGUE, in Muſick, is when the *Fugues* proceed contrary to one another.

COUNTER-GUARDS, or *Envelopes*, in Fortification, are large Heaps of Earth in Form of a Parapet, raiſed above the Moat before the Faces and the Point of the Baſtion to preſerve them; and then they conſiſt of two Faces, making an Angle Saliant, and parallel with the Faces of the Baſtion. If they are deſigned to cover one of the Faces of the Baſtion, they are ſhaped like a Demi-Baſtion, with a Parapet on the Face and Capital, but none on the Flank, which muſt lie open and be expoſed to the Fire of the Place; but there are few Places now fortified after this Manner by reaſon of the exceſſive Charge it requires.

COUNTERMAND, is where a thing formerly executed, is afterwards, by ſome Acts or Ceremony, made void by the Party that had firſt done it.

COUNTER-MARCH, in the Art of War, ſignifies changing the Face or the Wings of a *Battalion*, and this is done either by *Files* or by *Ranks*.

COUNTER-MARCH *by Files*, is when thoſe Men that are in the Front of the Battalion, go into the *Rear*.

COUNTER-MARCH *by Ranks*, is when the Wings or Flanks of the Battalion change Ground with one another.

COUNTER-MINE, in Fortification, is a Subterraneous Paſſage made by the Beſieged in ſearch of the Enemy's Mine, to give Air thereto, to take away the Powder, or by any other Means to fruſtrate the Effect of it, though it ſhould even happen to be fired by the Aſſailants.

COUNTER-PART, a Term in Muſick, only denoting one Part to be oppoſite to another; as the *Baſe* is ſaid to be the *Counter-part* of the *Treble*.

COUNTER-PASSANT; when two Lions are born in a Court of Arms, and one appears to be paſſing or walking quite the contrary way with the other, the Heralds call it by this Term *Counter-paſſant*.

COUNTER-PLEA, in Common Law, ſignifies that which the Demandant alledgeth againſt a Tenant in Courteſy or in Dower, who prayeth in Aid of the King; or him who hath the Reverſion for his better Defence.

COUNTER-POINT, in Muſick, is a Term whereby is underſtood the old Manner of compoſing Parts, before Notes of different Meaſure were invented; which was to ſet Pricks or Points one againſt another to denote the ſeveral Concords; the Length or Meaſure of which Points was ſung according to the Quantity of the Words or Syllables whereto they are apply'd; ſo that in regard that in compoſing our Deſcant we ſet Note againſt Note, as the Ancients did Point againſt Point; the Term *Counter-point* is ſtill retained in theſe Compoſitions.

COUNTER-SAILIENT, is when two Beaſts are born in a Coat of Arms in a Poſture of leaping from each other directly the contrary way.

COUNTERSCARP, in Fortification, is that Side of the Ditch which is next the Camp, or properly the *Talus* that ſupports the Earth of the *Covert-way*; although by this Term is often underſtood the *whole Covert-way*, with its *Parapet* and *Glacis*; and ſo it is to be underſtood when 'tis ſaid, *The Enemy lodged themſelves on the Counterſcarp*.

COUNTER *Swallow's Tail*, is an Out-work in Fortification, in the Form of a ſingle Tenaile, wider next the Place, *i. e.* at the Gorge, than at the Head, or next the Campaign: The Sides of this *Counter Swallow's Tail* are not ſo well flank'd from the Place as thoſe of the *true Swallow's Tail*, and therefore 'tis not ſo good.

COUNTER-TENOR, one of the mean or middle Parts of Muſick, ſo called as it were oppoſite to the *Tenor*.

COUNTER-TRIPPING; when two Staggs, or other Beaſts, are born in a Coat of Arms tripping, *i. e.* in a walking Poſture, and the Head of one is to the Tail of the other, the Heralds ſay they are *Counter-Tripping*.

COUNTERS, are Two Parts of a Ship; the *upper Counter* is reckoned from the Gallery to the lower Part of the ſtraight Piece of the *Stern*: The *lower Counter* is between the Tranſom and lower Part of the Gallery.

COUNTING-HOUSE, in the King's Houſhold: See *Green Cloth*.

COUNTY-COURT, is a *Court* held every Month by the *Sheriff*, or his Deputy the *Under Sheriff*.

COUPED, is the Herald's Word for any thing in an Eſcutcheon which is born, cut clear and evenly off, in oppoſition to its being torn off, which they call Eraſed: Thus the Arms of *Ulſter* which all Baronets carry, is a Dexter Hand *Couped* or cut off at the Wriſt.

COUPLE *Cloſe*, a Term in Heraldry, ſignifying the fourth Part of a *Chevron*: Theſe are never born but in Pairs, except a *Chevron* be between them, ſaith *Guillim*, but *Bloom* gives us an Inſtance to the contrary.

COURSE, in Navigation, is that Point of the Compaſs or Coaſt of the *Horizon* on which the Ship is to be ſteered from Place to Place; or rather the Angle between the *Rumb-Line* and the *Meridian*.

COURSES, in a Ship, are her *Main-ſail* and *Fore ſail*; when ſhe ſails under them only without lacing on any Bonnets, they ſay then ſhe goes under a *Pair of Courſes*.

COURT, is a Word that has divers Significations, but in Law 'tis the Place where Juſtice is judicially adminiſtred, of which you find Thirty Two ſeveral ſorts in *Crompton*'s Book of *Juriſdictions*, well deſcribed, and of them moſt are *Courts of Record*; ſome be not, and therefore are accounted *Baſe Courts*, in Compariſon of the reſt. Beſides theſe, there are alſo *Courts Chriſtian*, which are ſo called, becauſe they handle Matters eſpecially appertaining to Chriſtianity; and ſuch as, without good Knowledge in Divinity, cannot be well judged of; and therefore the Judges are Divines, as Archbiſhops, Biſhops, Archdeacons, and the like.

COURT-BARON, is a Court that every Lord of a Mannor hath within his own Precincts: And this Court is twofold; as if a Man having a Mannor in Town, to grant the Inheritance of the Copyholders thereunto belonging to another; this Grantee may keep a Court for the Cuſtomary Tenants, and accept Surrenders to the uſe of others, and make both Admittances and Grants. The other Court is of Free-holders, which is properly called *the Court Baron*, wherein the Suitors, that is, the Free-holders, be Judges, whereas of the other, the Lord or his Steward is Judge.

COURT *of Chivalry*, or the *Marſhal's Court*; the Judges are the *Lord High Conſtable* and the *Earl Marſhal of* England. This Court is the Fountain of Martial Law, and the *Earl Marſhal* is not only one

one of the Judges, but alſo to ſee Execution done.

COURT *of Delegates*: See *Delegates*.

COURT *of Peculiars*, is a Spiritual Court held in ſuch Pariſhes as are exempt from the Juriſdiction of the Biſhops, and are peculiarly belonging to the Archbiſhop of *Canterbury*.

COURT *of Requeſts*, is a Court of Equity of the ſame Nature with the *Chancery*, but inferior to it, being principally inſtituted for the Help of ſuch Petitioners as in Conſcionable Caſes deal by Supplication to His Majeſty. This *Court* had aſſumed ſo great Power to it ſelf, that it grew Burthenſome and Grievous, and therefore was taken away with ſome others by a Statute made 16 and 17 *Car.* I. *Cap.* 10.

COURTINE, or *Courtain*: See *Curtain*.

COURTESY, or *Curteſy of* England, ſignifies, with us, a certain Tenure, whereby a Man marrying an Inheritrix, that is, a Woman ſeized of Lands of Fee-ſimple or Fee-tail General; or ſeized as Heir of the Tail Special, and getteth a Child by her, that cometh alive into the World, though both it and his Wife die forthwith; yet if ſhe were in Poſſeſſion, he ſhall keep the Land during his Life; and is called *Tenant per legem* Angliæ, or *Tenant by the Curteſy of* England, becauſe this Privilege is not allowed in any other Countrey except *Scotland*, where 'tis called *Curialitas* Scotiæ.

COUTEUTLAUGH, he that willingly receiveth and cheriſheth, or hideth Out-Law.

COWARD; when a Lion is born in any Eſcutcheon with his Tail doubled or turned in between his Legs, they call it a *Lion Coward*.

COXÆ *Os*, the Hip Bone, called otherwiſe *Innominatum*, and *Ilium Coxendicis*, becauſe it contains the Gut called *Ilium*; it is annexed to the Sides of the *Os Sacrum*: In Infants it conſiſts of Three Bones, *Ilium*, *Iſchium*, and *Os Pubis*, which are joined together by *Cartilages* till ſeven Years of Age, then it is diſtinguiſh'd by a Triple Line: It grows into one continued Bone in Adult Perſons.

COXENDIX, the ſame with *Coxa*, and the *Os Iſchium*, is the Third and Inferior of the *Oſſa Innominata*, having a large Cavity called *Acetabulum Coxendicis*, which receives the Head of the Thigh-Bone; the Circumference of this Cavity is tipt with a Cartilage called its *Supercilium*: Where it joins the *Os Pubis*; it hath a large Hole called the *Foramen Iſchium* and *Pubis*, about whoſe Circumference the Muſcles called *Obturator Externus* and *Internus* do ariſe. At its lower End it hath a large Protuberance, on which we ſit, and from whence the Benders of the Legs ariſe; and a little above this, behind, it hath a ſmall acute Proceſs, between which and the former Protuberance lies the *Sinus* of the *Iſchium*, through which the Tendon of the *Obturator Internus* paſſes.

CRABB, an Engine of Wood with three Claws placed on the Ground like a Capſtern, which is uſed to launch Ships, or to heave them into the *Dock*.

CRADLE, ſo the Ship-wrights call a Frame of Timber raiſed along the Outſide of a Ship by the *Bildge*, ſerving the more ſecurely and commodiouſly to help to Launch a Ship: This is much uſed in *Italy*, *Spain*, and *Turkey*, where, for Safety's ſake, they alſo *trim* a great Ship in the *Cradle*.

CRAFT, is a Sea Word ſignifying all manner of Lines, Nets, Hooks, &c. which ſerve for Fiſhing; and becauſe thoſe that uſe the Fiſhing Trade uſe ſmall Veſſels, ſuch as Ketches, Hoys and Smacks, &c. they call all ſuch little Veſſels *Small Craft*.

CRAMA, *Croma*, *Chrama*, is a Mixture of any thing, whether Medicines or Elements. *Blanchard*.

CRANAGE, (in Law) is a Liberty to uſe a Crane for the drawing up of Wares from the Veſſels at any Creek of the Sea or Wharf unto the Land, and to make Profit of it: It ſignifies alſo the Money taken and paid for the ſame.

CRANE *Lines*, in a Ship, are Lines going from the upper End of the Sprit-Sail-Top-Maſt to the Middle of the Fore-ſtays; they ſerve to keep the Sprit-Sail-Top-Maſt upright and ſteady in its Place, and ſtrengthen it, in order that it may bear its Yard and Sail the better.

CRANE's *Bill*, a ſort of *Forceps* uſed by *Surgeons*, ſo Named from its Figure.

CRANIUM, is the *Compages* of the Bones of the Head, to which belongs the Bones of the Forehead, of the Sides of the Head, of the hinder Part of the Head, of the Temples, the Bone called *Sphenoides*, and another called the *Os Cribriforme*: It is like a Κράνος, or Helmet to the Head, which defends it from external Injuries; its upper Part is double: Some call it *Calva* and *Calvaria*: See *Calva*.

Each Bone in the *Cranium* is made up of two Tables or *Lamina*, between which there is a thin and ſpungy Subſtance made up of ſome Bony Fibres which come from each *Laminæ*, called in Greek *Diploe*, in Latin *Meditullium*. In it there are a great number of Veins and Arteries, which bring Blood for the Nouriſhment of the Bones. The Tables are hard and ſolid, becauſe in them the Fibres of the Bones are cloſe to one another. The *Diploe* is ſoft, becauſe the Bony Fibres are at a greater Diſtance one from another, by which Contrivance the *Cranium* is not only made lighter, but is alſo leſs ſubject to be broken. The External *Lamina* is ſmooth, and covered with the *Pericranium*; the Internal alſo is ſmooth, but on it there are ſeveral Furrows made by the Pulſe of the *Arteries* and the *Dura Mater*, whilſt the *Cranium* was ſoft and yielding.

The Bones of the *Cranium* are joined by four Sutures, the *Coronalis*, the *Lambdoidalis*, the *Sagittalis*, and the *Squamoſa*: The Three Firſt of which are called *Suturæ veræ*, the Laſt *Falſa*. The Bones of the *Cranium* are *Six proper*, as the *Os Frontis*, making the Front of the Skull; the *Os Occipitis*, which makes the hinder Part; the *Oſſa Parietalia* and *Temporum*, which conſtitute the Sides; and two *common Bones*, as the *Os Phenoides*, and the *Os Ethmoides*; all which ſee under thoſe Words.

CRANK, the Sea Term for a Ship that cannot bear her Sails, or can bear but a ſmall Sail for fear of overſetting; and they ſay ſhe is *Crank by the Ground*, when ſhe cannot be brought on Ground without Danger of overthrowing her.

CRAPULA, is an Head-ach proceeding from too much Wine. *Blanchard*.

CRASIS, in *Grammar*, is the ſame with *Synæreſis*, and draws two Letters belonging to different Syllables into one Syllable, as *Vement* for *Vehement*.

CRASIS, or *Temperamentum*, is a convenient Mixture of Qualities in an Animal Body. *Blanchard*.

CRATER, the Name of one of the Southern Conſtellations conſiſting of 11 Stars.

CRA-

CRATICULA, is a Chymical Inſtrument, made of ſquare Pieces of Iron as thick as one's Finger, placed ſo near one another in Acute Angles, that there's half a Finger's Space betwixt them: It is uſed in making of Fires to keep up the Coals. *Blanchard.*

CREAM *of Tartar*, is Tartar boiled in a great deal of Water, ſo that as much of it as can, may be there diſſolved; then the Diſſolution is paſſed hot through *Hippocrates* his Sleeve, and about half the Liquor being evaporated, the Remainder is ſet in a cool Place, and the Tartar will ſhoot into Cryſtals, and ſome of it be like a Cream on the Top of the Water: This Latter is properly the *Cream of Tartar*, and the Former are *Cryſtals of Tartar*, though both are of the ſame Nature and Uſe.

Sometimes the Ruſt of Iron powdered is boiled in the Water along with the Tartar, and then the *Cryſtals* are called the *Chalybeate Chryſtals of Tartar.*

CREEPING *Index*: See *Brachiolum.*

CREMASTER, the Name of a Muſcle, otherwiſe (from its uſe) called *ſuſpenſor Teſticuli:* 'Tis deſigned to keep the *Teſtes* from hanging down too much, and alſo to raiſe them up in *Coitu.*

CRENELLE, a Term in Heraldry, ſignifying the ſame as *Embatteled:* Which ſee.

CRENYLES, in a Ship, are ſmall Ropes ſpliced into the Bolt-ropes of the Sails of the Main-Maſt and Fore-Maſt; they are faſtened to the Bowling Bridles, and are alſo to hold by, when a Bonnet is ſhaken off.

CREPUSCULUM ſignifies Twilight, either Morning or Evening: See *Twilight.*

CRESCENT, the Herald's Term for an Half Moon, which they draw of this Figure; and though it be ſometimes born as Coat Armour, yet it is uſually the diſtinguiſhing Mark of the 2d Brother or Family from the Firſt.

CREST, in Heraldry, ſignifies that Repreſentation, whatever it be, whether of Animal, Vegetable, or other Artificial things, which is born on a *Wreath Chapeau*, &c. on the Top of the Helmet in any Atchievement: This they call alſo the *Cogniſance.*

CRIBRATION, the Chymiſt's Word for ſifting any Powder, or paſſing it through a fine Sieve.

CRIBROSUM *Os:* See *Ethmoides.*

CRIBRUM *benedictum antiquorum*, the Ancients fancied two Cavities placed long ways in the Reins; one uppermoſt, wherein the ſerous Blood was poured from the Emulgent Arteries; another lowermoſt, which they fancied was diſtinguiſhed with a certain Tranſverſe Membrane full of little Holes like a Sieve; whence they called it *Colatorium*, a Strainer; and *Benedictum Cribrum*, a bleſſed Sieve, through which they would have the *Serum* percolated into the *Ureters*, and the good Blood ſtay behind for the Nouriſhment of the Reins. *Blanchard.*

CRICOARYTÆNOIDES, are Muſcles which proceed from the Cartilage called *Cricoides*, laterally, and are inſerted into the *Arytænoides*, which, whilſt they draw the *Arytænois* ſideways and outwardly, the Opening or Rimula of the *Larynx* is dilated. *Blanchard.*

CRICOIDES, is the Cartilage of the *Larynx* or Wind-pipe in Faſhion of a Ring.

CRICOTHYROIDES, a Pair of Muſcles which proceed from the Cartilage of the *Larynx* like a Ring from the Fore-part of the *Cricoides*, and are terminated in that which is call'd the *Scutiformis*; they dilate the opening of the *Larynx* by moving a little obliquely: Its uſe is to pull up the *Annularis.*

CRIMNOIDES, or *Crimoides*, is Urine with thick Sediments at the Bottom like Bran. *Blanchard.*

CRISIS, is a ſudden change in a Diſeaſe, either towards a Recovery or Death: It ſometimes ſignifies a *Secretion* of Humours, but is more frequently taken for a Judgment paſſed upon a Diſeaſe; one *Criſis* is called *perfect*, another *imperfect*; the *Perfect* is that which frees the Patient perfectly from the Diſtemper, and it is either *Salutary* or Deadly, an *Imperfect Criſis* is that which does not clearly determine the Tendency of the Diſeaſe, but leaves Room for another *Criſis*; and this is two-fold, either *for the Better*, or *for the Worſe*; the Former is that which does not quite take away the Diſeaſe, but enables the Patient to bear it better; the latter is when the Diſeaſe becomes more violent and dangerous. *Blanchard.*

CRISTA *Galli*, is the Third Part of the Bone *Ethmoides*, or the inner Proceſs, not much unlike the Comb of a Cock; it ariſes betwixt the *Olfactory Nerves*, and has the Extremity of the third Cavity of the hard Skin of the Brain, called *Dura Mennix*, implanted in it.

CRISTÆ, are Excreſcencies of Fleſh growing about the Fundament, the Roots whereof are often chapt and cleft. *Blanchard.*

CRITERIUM, or *Criterion*, is a Judgment made of the Truth or Falſhood of a Propoſition, the Nature or Qualities of any Effect, &c.

CRITHE, or *Hordeolum*, is a little oblong Puſh or Swelling which grows to the Eye-brows where the Hairs are; ſo called from its Reſemblance to a Barly Corn. *Blanchard.*

CROCI, is a Word the *Botaniſts* uſe ſometimes for the *Apices* of Plants: Which ſee.

CROCUS *Martis*, or Saffron of Steel, ſo called from its reddiſh Colour: Of this there are ſeveral kinds, and diverſe ways prepared.

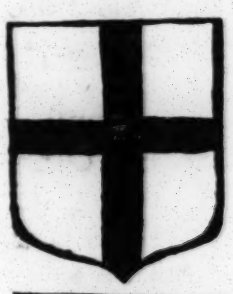
CROCUS *Martis Aperiens*, opening Saffron of *Mars:* Mr. *Lemery*, with great probability, aſſerts the beſt way of preparing this, is only to waſh Iron Plates, and then expoſe them to the Dew till they have contracted a Ruſt, which Ruſt is the *Crocus*, and may be ſcraped off, and the Plates waſhed and expoſed for more. He gives another good Way, which is, to expoſe Filings of Iron (for Steel is not ſo fit for Medicinal Uſes) in an Earthen Pan to the Rain, till they become a kind of Paſte, which is dried and powdered, and expoſed again to the Rain, and this for twelve times. Others calcine Filings of Iron or Steel with an equal Weight of common Sulphur; and ſome heat a Bar of Iron Red or rather White Hot, and then clap it between two Rolls of Brimſtone, and the Iron will melt and run down into a Veſſel of Water below: Steel ſo prepared, or by the former way, is called *Mars cum Sulphure præparatus.* Dr. *Willis*'s Way was to mix *Tartar* with Steel Filings, and no doubt many other Proceſſes of this kind there are,

all of which may be good Aperitives; tho' many aſſert the giving Filings in Subſtance, is as good a Way as any.

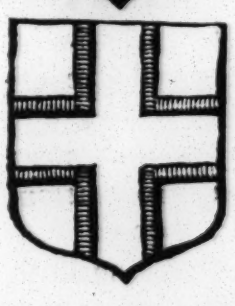
CROCUS *Martis Aſtringens, Binding Saffron of Steel*, is the Filings of Iron deprived of their more Saline Parts, which is done by waſhing them 5 or 6 times in ſtrong Vinegar, and then calcining them 5 or 6 Hours in a ſtrong Fire in a Pot, or upon a Tile. There are many other ways of preparing this *Aſtringent Crocus*, but this is a very good one.

CROCUS *Metallorum*, is a kind of Impure and *Opaque Glaſs* of Antimony, of a Liver Colour, whence often called *Hepar*, or Liver of Antimony, made by firing equal Parts of Powder of Antimony, and Salt Petre well mix'd, in an Iron Mortar covered with a Tile. 'Tis kindled by dropping in a Coal of Fire, a great Detonation enſues, which when over, ſtrike the Mortar to make the Matter fall to the Bottom: The ſhining Part is the *Crocus* or Liver, which muſt be ſeparated from the Droſs, waſhed and kept for uſe. Of this uſually is made the *Emetick Wine*, or *Vinum Benedictum*, by infuſing an Ounce of the *Crocus* powdered, in a Quart of Wine for 24 Hours.

CRONICAL: See *Acronical*.



CROSS, one of the Honourable Ordinaries in Heraldry, containing one fifth of the Field. There is great Variety in its Form, according to the Lines that compoſe it; but a plain *Croſs* is figured thus, by the Name of *Rainsford*. He beareth *Argent*, a *Croſs Sable*.



Sometimes there is a Line drawn parallel to the Out-line of the *Croſs*, and then the Field is ſuppoſed to appear through; this is called *a Croſs voided*, and born thus,

He beareth *Argent*, *a plain Croſs voided Azure*; and ſometimes the *Croſs* is *couped* as well as *voided*.

CROSS-*Bar-Shot*, is a round Shot or great Bullet, with a Bar of Iron put through it.

CROSS-LETTS, are little plain Croſſes, whoſe Ends alſo bear the Form of a plain Croſs. They are thus Figured, and are frequently born *Fitchee*, that is, pointed at Bottom: *Vid. Fitchee*.

CROSS-*Staff*, is an Inſtrument made of Box or Pear-Tree, commonly called the *Fore-ſtaff*, becauſe of taking forward Obſervations; and may be made alſo a *Back-ſtaff*, by adding a fourth Vane and Sight. 'Tis uſed by Seamen to take the Meridian Altitude of the Sun or Stars, in order to find the Latitude; 'Tis alſo by ſome uſed in Surveying, to take *Angles*.

CROSS *Jack*, in a Ship, is a ſmall Yard ſlung at the upper End of the Mizen-Maſt under the Top; it hath no *Halliards* nor *Tyes* belonging to it. Its Uſe is to ſpread and hale out the Mizen-Top-Sail Sheets. This is alſo called the *Croſs-Tree-Yard*.

CROSS *Piece*, is a great Piece of Timber going a-croſs the *Bitts* of a Ship, and unto it is the Cable *belayed* when ſhe rides at Anchor.

CROSS *Trees*, in a Ship, are 4 Pieces of Timber bolted and let into one another a-croſs at the Head of the Maſt: Their Uſe is to keep and bear the Top-maſts up, for the Foot of the Top-maſt is always faſtened into them. Thoſe who are more nice, call only thoſe two of theſe Timbers which go athwart Ships, the *Croſs Trees*; and then the others they call the *Treſſel Trees*.

CROSS *Tree Yard*, is a Yard ſtanding ſquare juſt under the Mizen Top, and to it the Mizen-Top-ſail is faſtened below.

CROSSIERS, are four Stars in form of a *Croſs*, which ſerve to ſhew thoſe that ſail in the *Southern* Hemiſphere, the *Antartick Pole*.

CROTAPHICK *Artery*, ſo ſome erroneouſly call the Tendon of the Muſcle called *Crotaphites* or *Temporalis*.

CROTAPHITES: See *Temporalis*.

CROTAPHIUM, a Pain in the Head.

CROTCHET, a Term in *Muſick*: See *Notes* and *Time*.

CROWN, in Geometry, ſignifies a plain Ring included between two concentrick Perimeters, and is generated by the Motion of ſome Part of a Right Line round a Center, the ſaid moving Part not being contiguous to the Center.

The *Area* of which will be had, if you multiply its Breadth by the middle Perimeter; for a Series of Terms in Arithmetick Progreſſion being $n \times \frac{a + \omega}{2}$, *i. e.* the Sum of the firſt and laſt multiplied by $\frac{1}{2}$ the Number of Terms, the middle Element muſt be $\frac{a + \omega}{2}$; wherefore that multiply'd by the Breadth or Sum of all the two Terms, will give the Crown.

CROWN-WHEEL, of a Watch, is the upper *Wheel* next the *Balance*, which, by its Motion, drives it; and this in *Royal Pendulums* is called the *Swing-Wheel*.

CROWN-WORKS, in Fortifications, are certain Bulwarks advanced towards the Field to gain ſome Hill or riſing Ground, being compoſed of a ſpacious *Gorge*, and two Wings that fall on the *Counterſcarp* near the Faces of the *Baſtion*, ſo that they are defended by them, and preſent on the Side of the Field an entire *Baſtion* between two *Demi-Baſtions*, whoſe Faces look towards one another. Thoſe Works have alſo their *Half-Moons*, and are raiſed only to take up and ſecure ſome large Space of Ground, or to defend the Head of a Camp when it is intrenched.

CROWNED *Horn-work*, is a *Horn-work* with a *Crown-work* before it.

CROW-FEET, in a Ship, are ſmall Lines or Ropes put through the Holes of the *Dead Men's Eyes*, and divided by that Means into 6 or 10, or ſometimes more Parts: They are of no uſe at all, but are there left hanging by the Boat-Swain to make a ſhew of ſmall Rigging. They are placed at the Bottom of the Back-Stays of the Fore-Top-Maſt, Mizen-Top-Maſt, and Gallant-Top-Maſt.

There goes alſo a Rope divided into 2 or 4 Portions from the upper End of the Sprit-Sail-Top-Maſt to the Fore-Top-Maſt Stay, which they call the *Sprit-Sail Top-Sail Crow-Foot*.

CROWS-FEET, (called alſo *Caltrops* and *Chauſſe Trapes*) are Irons ſo made with 4 Points of 2, 3 or 4 Inches long, that which way ſoever they fall, one Point may be uppermoſt; the ſhorter are to ſtrow on Bridges, the longer on the Ground, to gall the Feet of a Body of Horſe.

CRUCIBLE, is a Chymical Veſſel made of Earth,

Thus, ſuppoſe 28 were propoſed to be cubed, write it down ſo that there may be room to write 2 Figures between each Place; as,

```
2   8
```

I ſay, the *Cube* of 2 or 8, is 8 or 8cOO; then 3 times the Square of 2 (which is 12) multiply'd by 8, gives 99 = 3*aab*, which place orderly under the 8, as you ſee. Next, 3 times the Square of 8 is 192, and that multiply'd by 2 gives 384 = 3*abb*, which write alſo orderly, as you ſee: And laſtly, the *Cube* of 8 is 512, which muſt be written down ſo, that the firſt Figure of it to the Right Hand may ſtand under 8 in the Root; and then adding all together, you have 21952, the true *Cube* of 28.

```
8 . . . a a a
96 . . = 3 a a b
384 . 3 a b b
512 .   b b b
21952 = Cube of a + b
        or of 28.
```

If the Number to be *Cubed* had conſiſted of 3 or more Places, as ſuppoſe 285,

You muſt proceed as before to find the *Cube* of 28, the two firſt Figures toward the Left-hand, which is 21952; then after that you are to account that Number as the *Cube* of *a*, and go on to find the other Members as follows.

Imagine the next Figure 5 to ſtand 2 Places farther to the Right-hand, and let that be *b*; and 28 or 280, *a*; proceed therefore thus, 3 times the Square of 28 is 2352, which multiply'd by 5, makes 11760 = 3*aab*; write that down therefore as you ſee: Then ſay, 3 times the Square of 5 is 75, which multiply'd by 28, gives 2100 = 3*bba*; write that alſo down as you ſee: And laſtly, write the *Cube* of 5, which is 125 = *bbb*, in its proper order, as was ſhewed above, and then adding all together, the Sum will be 23149125, the *Cube* of 285.

```
2  8   5
:  :   :
21952 = a a a
 11760 = 3aab
  2100 = 3bba
   b25 = bbb
23149125
```

And after the ſame manner you muſt proceed on, let the Number to be *cubed* be never ſo large.

And this Method of the Compoſition of a *Cube Number*, being well underſtood, the Extraction of the *Cube Root* will be very eaſy and intelligible by the following Directions.

Suppoſe you were to extract the *Cube Root* out of this Number 23149125:

1. Beginning at the Right-hand, make a Prick or Point over the firſt Figure 5, and then over every third Figure afterwards; as many Points as there are, ſo many Figures will you have in your Root.

2. Find that *Cubick Number* which is next leſs than 23 (the firſt Part of the given *Cube*) which is 8, and place its *Cube Root* 2 in the Quotient; then write down 8 under, and ſubſtract it from 23, and to the Remainder bring down the next *Cube* 149; ſo will 15149 be the *Reſolvend*. And thus have you found *a* the firſt Member of the Root, which is 2 or 200; you muſt next try to find *b*, (that is) ſuch a Number, as that 3*aab*, 3*abb*, and *bbb* added all together, ſhall not be greater than 15149 the *Reſolvend*, for from that Number it muſt be ſubſtracted. Since therefore *a* = 2, 3 times *aa* will 12, which write down as you ſee; and multiplying *a* alſo by 3, it produces 6, which ſet down under the Former in the order as you ſee. Add the two laſt Numbers together, and they make 126, which is to be called a *Diviſor*, and is to divide all the *Reſolvend* except the laſt Figure on the Right-Hand: Enquire therefore how often you can have 126 in 1514, and though you can have it 9 times and more, yet 9 times will be too much, as you may ſoon find if you multiply 9, which is *b*, according to the Conditions above mentioned; let therefore the Figure to be placed in the Quotient be 8 = *b*, then, by 8 multiplying 3*aa*, I find the Product to be 96, which I write down under the *Reſolvend* as you ſee: Alſo ſquaring 8, I multiply it by 3*a* or 6, and the Product, which is 384, I write down alſo under 96; and then *cubing* 8, I write 512 under the former Numbers, only one Place more to the Right-hand; and adding all together they make 13952, which ſubſtracted from the *Reſolvend* 15149, leaves 1197; to which bringing down the laſt *Cube* 125, you have 1197125 for a new *Reſolvend*: Then for a new *Diviſor* tripple *a* or 28, and it makes 84 = 3*a*, which place under the *Reſolvend* one Place backward to the Left-hand: Tripple alſo the Square of *a* or 28, and the Product 2352 = 3*aa* write under the laſt Number 84, a Place yet more backward to the Left-hand, as you ſee. Add the two laſt Products together for a new *Diviſor*, and write it on the Left-hand of the laſt *Reſolvend*; and ſince on trial you will find it may be had 5 times in the *Reſolvend*, place 5 in the Quotient after 28, then *cube* 5 and write it under the *Reſolvend*: Alſo ſquare 5, and multiply that Square by 3 times 28, it makes 2100, which write down under 125, only a Place backward to the Left-hand, as you ſee; then multiply 3 times the Square of 28 by 5, and the Product (which is 11760) ſubſcribe (after the ſame manner) under 2100. Laſtly, add the 3 laſt found Numbers together, and you will find their Sum to be 1197125, which is exactly the *Reſolvend*; and ſo the Work is over, and 285 the true *Cube Root* of the given Number 23149125.

If the Number be not an exact *Cube*, you muſt add to the laſt Remainder as many times 3 Cyphers as you deſign Decimal Places in the Root, and ſo proceed as before.

CUBIFORME: See *Cuboides*.

CUBIT, or the *Ulna*, in Anatomy is a long hard Bone with a Cavity in its Middle, and lies on the Inſide of the Arm, reaching from the El-

bow to the Wriſt; but ſome make it to conſiſt of two Bones, the one called the *Ulna*, and the other *Radius*.

CUBITÆUS *Internus & externus*, are Muſcles of the Wriſt, the one ſerves to bend, the other to extend it.

CUBITÆUS *Externus*, is one of the Extenders of the Wriſt, ariſing from the External Knob of the *Os humeri*, and is inſerted in the upper and external Part of the *Os metacarpi* of the little Finger.

CUBITÆUS *Internus*, is one of the Benders of the Wriſt, ſprings from the inner Extuberance of the *Os humeri*, and paſſing along the *Ulna*, ends in the fourth Bone of the *Carpus*, and the *Os metacarpi* of the little Finger.

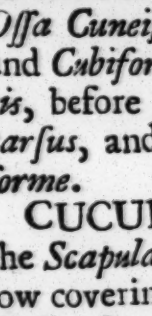
CUBITAL *Muſcle*: See *Anconæus*.

CUBO-*Cube*, the ſixth Power of any Number or Quantity.

CUBOIDES, is the ſeventh Bone of the *Tarſus* of the Foot; it lies in the ſame Rank with the *Oſſa Cuneiformia*: It is called alſo *Grandinoſum* and *Cubiforme*; behind 'tis joined to the *Os Calcis*, before to the two outer Bones of the *Metatarſus*, and on its inſide it is joined to the *Os Cuneiforme*.

CUCULLARIS, and *Trapezius*, is a Muſcle of the *Scapula*, ſo named, becauſe this with its Fellow covering the Back, repreſents a Cowl. It ariſes Fleſhy from the *Os Occipitis*, Tendinous from the *Ligamentum Colli*, and *Apex* of the Spine of the laſt *Vertebra* of the Neck, and eight ſuperior of the *Thorax*; from which broad Origination becoming Thick and Fleſhy, it's ſo inſerted to the *Clavicula*, and Tendinous to the *Spina Scapulæ*. Each Muſcle is Triangular, and both conjointly compoſe a Lozenge or *Trapezium*, whoſe large Diameter extends from the *Occiput* to the 15th *Vertebræ*; the ſhorter from near the Extremity of the *Spina Scapulæ* on one Side to that of the other. They contain a triple Series of Fibres, the Middle paſſing directly tranſverſe from the firſt *Vertebra* of the *Thorax*: Thoſe above deſcend, and thoſe beneath aſcend to their Inſertion, whereby the *Scapula* is variouſly moved according to their Directions, either obliquely upward, directly back, or obliquely down wards.

CUCUPHA, a Medicine for the Head, made of Odoriferous and Cephalick Spices beat to Powder, and ſtitched between two Pieces of Silk, or elſe ſewed within a Cap, and worn upon the Head againſt *Catarrhs* and other Diſeaſes of the Head. *Blanchard*.



CUCURBITE; ſo the Chymiſts call a Glaſs, Earthen or Copper Body of this Shape, becauſe it ſomething reſembles a Gourd. This Veſſel, with its *Head*, is moſt commonly uſed in Diſtillations or Rectifications. They call it uſually a *Body*.

CUCURBITINI *Lumbrici*, are broad Worms that breed in the Inteſtines, like the Seed of a Gourd.

CUCURBITULA, or *Cucurbita*, a *Cupping-Glaſs*, is a wide hollow Veſſel made of Glaſs or Tin, which is applied to the Body with Scarification or without it, to divert, to drive the Blood into the other Part, or to drive it out: If it be applied without Scarification, it is called *Cucurbita Cæca* and *Ventoſa*. *Cupping-Glaſſes* are applied to the more Fleſhy Parts, where the large Veſſels and Nerves cannot be hurt. The Drawing, which is performed by theſe Glaſſes, is done thus; After the Skin is ſcarify'd, the Air in the *Cupping-Glaſſes* is rarify'd and dilated by the Flame of the Tow that is fired within it, which, after it is cooled and condenſed, takes up leſs room than before; ſo that the External Air preſſing upon the Fleſh without, forces the Blood into the Glaſs. There are two ſorts of *Cupping-Glaſſes*, ſays *Celſus*, one of Braſs, and the other of Horn; the Former is open on one Part, and ſhut on the other; the Latter is equally open on one Part, on the other has a little Hole: Burning Tow is thrown into the Brazen one, and ſo its Mouth apply'd and forc'd upon the Body till it ſticks. That of Horn is apply'd ſingly by it ſelf, and by a violent ſucking at the little Hole, which muſt preſently be ſtopp'd up cloſe with Wax, it ſticks as faſt the other; but if other things fail, then a little Cup or Goblet with a ſtreight Mouth may be very fitly apply'd to the ſame Effect: After it has ſtuck, if the Skin be ſcarify'd before with a Pen-knife, it draws out the Blood; if it be whole and entire, it draws out the Flatulent Matter; therefore, where the Matter within is hurtful and offenſive, it muſt be apply'd the former Way; where there is an Inflammation, the Latter. The *Egyptians* at this Day uſe thoſe of Horn, as appears from *Proſper Alpinus*. *Blanchard*.

Now in *England* we commonly uſe *Cupping-Glaſſes* without Fire, which are evacuated by a ſmall Syringe which works like an Air-Pump; and for Scarification they have an Engine that doth it all at once with great Safety and very little Pain; and this was the Invention of the Ingenious Mr. *Hawksbee* in *Wine-Office Court* in *Fleetſtreet*, who makes the beſt Air-Pumps, and all Pneumatick Engines that ever I ſaw.

CUDDY, in a firſt Rate Man of War, is a Place lying between the Quarter-Deck and the Captain Lieutenant's Cabbin under the Poop, which is divided into Partitions for the Maſter and the Secretary's Officers.

CUI *ante Divortium*, is a Writ that a Woman divorced from her Husband, hath to recover Lands or Tenements from him, to whom her Husband did alienate them during the Marriage, becauſe ſhe could not gainſay it.

CUI *in Vita*, is a Writ of Entry that a Widow hath againſt him to whom her Husband aliened her Lands and Tenements in his Life-time; which muſt contain in it, That during his Life-time ſhe could not withſtand it.

CULMIFEROUS *Plants*, (ſee *Plants*, *N.* 23.) are by the *Botaniſts* accounted ſuch as have a ſmooth jointed Stalk, and uſually hollow; and at each Joint the Stalk is wrap'd about with ſingle, narrow, long, ſharp pointed Leaves, and their Seeds are contained in chaffy Husks.

CULMIFEROUS *Plants*, are of two kinds, either having, 1. a greater, or 2. a ſmaller Grain or Seed.

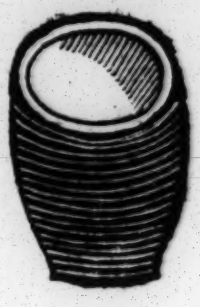
CULMIFEROUS *Plants*, with a greater or larger Seed or Grain, are ſuch as are called *Frumentaceous* and *Cereales*, becauſe their Seeds are uſed for Food; as for Bread, Beer, Broth, &c. Theſe they call the *Frumenta*, and are

Spicata,

Earth, and ſo tempered and baked as to endure the greateſt Fire. They are uſed to melt Metals, to flux Minerals, Oars, &c. and are of this Figure.

A *French Crucible.*

A *German Crucible.*



CRUDITY, in Diſeaſes, is when the Blood (as in continued *Fevers*) is not yet duly fermented and brought to a right Conſiſtence. *Crudity* of the Stomach, is when Meat, out of a Defect of Nouriſhment, or ſome other Cauſe, is not rightly fermented and turned into Chyle; and it is Threefold, *Apepſia*, *Bradypepſia*, and *Dyſpepſia*, of which in their proper Places. *Blanchard.*

CRUOR, Blood: See *Sanguis*. *Helmont* makes a Diſtinction betwixt *Sanguis* and *Cruor*; the Former whereof, he ſays, *is the Blood in the Arteries*, the Latter, *that in the Veins*.

CRURA, are the two Heads or Beginnings of the marrowy Subſtance of the Brain, called *Medulla Oblongata*.

CRURA *Medulla Oblongata*, the Internal Subſtance of the two Sides of the *Cerebrum*, gathered together as it were into two Bundles.

CRURAL *Artery*, by ſome ſaid to be the Artery of the Thigh, among whoſe Muſcles it divideth it ſelf: It is a Continuation of the *Iliack Artery*, which paſſing out of the Abdomen, and entring into the Thighs, it loſes its former Name, and is called *Cruralis*. Beſides ſome leſs remarkable Branches, before it come to the Ham, it ſends forth the External and Internal *Muſcle*; under the Ham it produces the Two *Poplitæa's*, and ſomewhat lower the *Surales*. Afterwards the Trunk it ſelf is divided into the Branches called *Anterior* and *Poſterior*; and the laſt of theſe is alſo ſubdivided into two ſmaller Branches which deſcend to the Foot.

CRURAL *Vein*; the Blood is conveyed from the lower Extremity of the Body by Six *Veins*, called, *The greater and ſmaller Iſchia*, *Muſcula*, *Poplitæa*, and *Saphœna*; which joined together, compoſe the Trunk of the *Crural Vein*, which aſcends to the Groin, and ends in the *Iliaca*.

CRUREUS, or *Femoreus*, is a Muſcle of the Leg, ſo called from its Situation on the Bone of the Thigh, like the *Muſculus Branchiæus*, on that of the Arm; its Origination is large and fleſhy, being continued from between the greater and leſs *Trochanter* of the Thigh Bone forwards to its lower Part; that is, immediately above its Inferior *Appendix*. Its Fleſhy Fibres deſcend directly, and become perfectly Tendinous a little below the upper Part of the Tendon of the *Rectus*, where it joins with it, and the Tendons of the *Vaſtus Externus* and *Internus*, which paſſes over the external Part of the *Patella*, (or on each Side of it) and is inſerted to a Prominence at the Superior and Fore-Part of the *Tibia*; it helps to extend the *Tibia*.

CRUS, or *Magnus Pes*, is all that Part of the Body which reaches from the Buttocks down to the End of the Toes; and it is divided into the Thigh, Leg and Foot. *Blanchard.*

CRUSTA *Lactea*, is a Species of *Achor*, Scurf, or cruſty Scab, only with this Difference, that an *Achor* infects only the Head, but this not only the Face, but almoſt the whole Body of an Infant at the time of its firſt Sucking. *Blanchard. Cruſta Lactea* turns white, but *Achors* have only one Colour.

CRUSTACEOUS Shell-Fiſhes, are ſuch as Lobſters, Crabs, Craw-Fiſhes, &c. which are covered with Shells conſiſting of ſeveral Pieces, and which uſually are ſofter too than thoſe of the *Teſtaceous Shell-Fiſhes*, which are all entirely of one Piece, and uſually much harder, thicker and ſtronger than the former, as the Oyſter, Scollop, Cockle, &c.

CRUSTULA, is the ſame as *Ecchymoma* in the Eye, being a Deſcent of Blood from the Arteries into the *Tunica Conjunctiva*, occaſioned by a Wound, Stroak, &c.

CRYMODES, is a cold ſhivering Fever, but many Times accompanied with an Inflammation of the inner Parts. *Blanchard.*

CRYSORCHIS, is an abſconding of the Teſticles in the Belly. *Blanchard.*

CRYSTALLINUS *Humor Oculi*, called alſo *Glacialis*, the Cryſtalline Humour of the Eye, lies immediately next to the Aqueous, within the opening of the *Tunica Uvea*; like a Glaſs put over a Hole, it collects and refracts the Rays which ſtrike upon it from all Parts: Its Subſtance is like Glue or the Gum of a Tree, very pellucid, and of a Conſiſtence like melting Wax, which, though it be preſs'd, does not eaſily yield and ſeparate. In Men it is ſhaped like a *Lens* or Convex Glaſs, which riſes thicker in the Middle than at the Edges: This Humour is the leaſt of all three, but is much more ſolid than any of them, and is cloathed with a ſmall Membrane of its own called *Aranea*, by reaſon of its Thinneſs, like to a Spider's Web.

CRYSTALLOIDES *Tunica*, the ſame with *Aranea Tunica*.

CUBATURE, in Geometry, is finding exactly the ſolid Content of any propoſed Body; as the *Quadrature* of a Surface is finding the Area of that Surface. There is a little Book lately written by one *Fantit* a *Frenchman*, entituled, *De la Cubature de la Sphere*, in which, with great Aſſurance, he pretends to find Geometrically the Solid Content of any Portion of a Sphere; but how little the Succeſs anſwers the Boldneſs of the Title, I leave the Reader to judge.

CUBBRIDGE-HEADS; ſo ſometimes are the *Bulk-Heads* of the *Fore-Caſtle* and the *Half Decks* called; the one the *Cubbridge-Head before*, the other the *Cubbridge-Head behind*.

CUBE, is a ſolid Body of ſix equal Sides, which are all Squares; 'tis one of the five regular Bodies, and its Content is found by multiplying any one Side or Face by the Height: See a Table of the different Weight of a Cubick Inch and Foot of ſeveral Bodies under the Word *Weight*.

CUBICAL *Artery*, by ſome is ſaid to be a Branch of the *Axillary*.

CUBICK *Equations*, in *Algebra*, are such whose highest Power consists of three Dimensions, or is a *Cubical Quantity*; as $aaa - 3bba = 2ccc$, where the highest Power of a the unknown Quantity, is a *Cube*.

Our excellent *Harriot* shews the Original of all such kind of Equations, to be either from the continual Multiplication of three Lateral or Simple Equations into one another, after they are first reduced to the Form of Binominals; or else by multiplying a Lateral Equation into a Quadratick; by both which Ways the same Quantity will be produced, as in this Example.

Let $a+b=o$, $a+b=o$, $a+b=o$ } by multiplying of which continually, you will produce the following Quantity, *viz.* $aaa + baa + bca + caa - bda - daa - cda - bcd = o$; which is an Original *Cubick Equation*, as he calls it. And by this Means he shews, That every *Cubick* hath, either Real or Imaginary, three Roots, sometimes all Affirmative, sometimes all Negative, or some Affirmative and some Negative: Of this see more in *Harriot* himself, or in Dr. *Wallis*'s *Algebra*, where he gives a large Account of this Method.

As to the Solution of *Cubick Equations*, though *Harriot*, *Des Cartes*, and others, have given very good Rules, yet no Body hath deduced so easy, natural and demonstrative a Method for it, as the profound Dr. *Wallis* in his *Algebra*, Chap. 46. which he tells us he did in the Year 1647, and is as followeth.

Since *Oughtred* proves, *Ch.* 18. *Art.* 15. of his *Clavis*: That $Zc = Z + 3ÆZ$, and $Xc = Z - 3ÆX$, they may be reduced thus, $Zc - 3ÆZ = Z$, and $Xc + 3ÆX = {}^cZ$: And then he found that $3AE$ was the triple Rectangle of the two Quantities A and E, whose Sum is Z, and ${}^cZ$ the Absolute Number was the Sum of their *Cubes* in the Former, but X the Difference of them, and ${}^cX$ the Difference of their *Cubes* in the Latter. And he found also, that all *Cubick Equations* might be reduced to one of these two Forms, for as for these two, $Zc - 3ÆZ = -Z$, and $Xc + 3ÆX = -Xc$, where ${}^cZ$ and ${}^cX$ are Negative Quantities, they only differ from the Former, in which they are Affirmative, in this, that here X and Z will be Negative Quantities, whereas there they will be Positive.

So that all *Cubick Equations* being reducible to these two Forms, the only Difficulty remaining is this, *Having the Rectangle of two Quantities, with the Sum or Difference of their Cubes, to find the Quantities themselves*, and consequently, *their Sum and Difference*.

Which is performed by resolving a Quadratick Equation of a solid Root (or one whose Root is a *Cube* or some higher Power.)

For $\frac{Æ}{A} = E$, $\frac{Æc}{Ac} = Ec$. $Ac + \frac{Æc}{Ac} = Ac + Ec = {}^cZ$, and so $\frac{Æ}{E} = A$ $\frac{Æc}{Ec} = Ac$, and $\frac{Æc}{Ec} + Ec = Ac + Ec = {}^cZ$, wherefore (multiplying by Ac or Ec, and then transposing the Terms) ${}^cAcc - {}^cZAc = -ÆcEcc - {}^cZEc$, whose Roots are $\frac{1}{2}{}^cZ \pm \sqrt{:\frac{1}{4}{}^cZq3 - Æc} = \frac{Ac}{Ec}$

And by the like Process it will be found, that $Ac - \frac{Æc}{Ac} = {}^cX = \frac{Æc}{Ec} - Ec$; and consequently, $Acc - {}^cXAc = Æc = Ecc + {}^cXEc$, whose Roots are $\sqrt{:\frac{1}{4}{}^cXq3 + Æc} \pm {}^cX = \frac{Ac}{Ec}$.

And then will the Sum or Difference of their *Cubick Roots* be $A + E = Z$, and $A - E = X$, the Roots sought in those *Cubick Equations*: That is, $\sqrt{c + \frac{1}{2}{}^cZ + \sqrt{:\frac{1}{4}{}^cZq3 - Æc}} + \sqrt{:C.} + \frac{1}{2}{}^cZ - \sqrt{:\frac{1}{4}{}^cZq - Æc} = A + E = Z$, $\sqrt{:C + \frac{1}{2}{}^cX + \sqrt{:\frac{1}{4}{}^cXq3 + Ec}} - \sqrt{C - \frac{1}{2}{}^cX + \sqrt{:\frac{1}{4}{}^cXq3 + Ec}} = A - E = X$.

N. B. If as we said above, the Absolute Quantity be Negative, as $-{}^cZ$, or $-{}^cX$, the Roots then will be $-A - E = -Z$, and $-A + E = -X$.

How to construct *Cubick Equations* after Mr. *Baker*'s Way by the *Parabola*, see *Construction of Equations*.

Mr. *Halley* (now our Learned Savilian Professer of *Geometry* at *Oxon*) in *Philos. Transact. N.* 190. gives a good Way to extract the Roots of all *Cubick Equations* by the Help of the Tables of Sines.

CUBICAL *Number*, is that which is produced by the Multiplication of a Square Number by its Root: Thus 64 is a *Cubick Number*, and is made by multiplying 16, the Square of 4, by the Root 4. In *Algebra* the third Power in a Series of Geometrical Proportionals continued, is called a *Cube*, as a is the Root, aa the Square, and aaa the Cube: And All *Cubick Numbers* may be ranged into the Form of *Cubes*, as 8 or 27, whose *Sides* are 2 and 3, and their *Bases* 4 and 9.

Theorem. Every true *Cubical Number* produced from a Binominal Root, consists of these Parts, *viz.* The *Cubes* of the greater and lesser Parts of the Root, and of 3 times the Square of the greater Part multiplied by the lesser, and of 3 times the Square of the lesser multiplied by the greater.

As is plain from bare Algebraical Multiplication in the following Example.

$$\begin{array}{r} aa + 2ab + bb \\ a + b \\ \hline aaa + 2aab + abb \\ \quad aab + abb + bbb \\ \hline aaa + 3aab + 3abb + bbb \end{array}$$

From whence 'tis very easy to understand both the Composition of any *Cubick Number*, and also the Reason of the Method for extracting the *Cube Root* out of any Number given.

Thus,

Spicatæ, whoſe Seed is either,

1. *Larger* and *more Oblong*, and that eaſily ſeparated from its Huſk by Pounding, or Beating, or Threſhing, as *Wheat (Triticum)* and *Rye (Secale;)* or not ſo eaſily parting with its Huſk, as *Spelt*, in Latin *Zea*, a ſort of Baſtard Wheat which grows plentifully in *Italy*, *Germany*, and *France*.

To which they add *Barley (Hordeum)* and *Rice (Oryza)* which are contained in a thicker Huſk than *Wheat* and *Rye*.

2. Whoſe Seed is cloſe and more round, as *Panick*, which is a Seed much ſown in *Germany*, and eaten by the Inhabitants.

Paniculatæ or *Jubatæ*, whoſe Seed is either
More Oblong, as *Avena Oats*; or
Roundiſh, as *Scordium* and *Milium*.
Paniculatæ and *Spicatæ ſimul*, as the *Indian Maeze*.

They reckon alſo ſome *Culmiferous Herbs* which are not *Eſculent*, or uſually eaten by Men; and theſe alſo are either
Spicatæ, as the *Phalaris (Canary Graſs)* and *Lolium*; or
Paniculatæ, as the *Lacryma Jobi*.

CULMINATE, is a Word uſed by Aſtronomical Writers, to expreſs a Star's or the Sun's being upon the Meridian, or having the greateſt Altitude that it can have that Day.

The *Culminating* of any Star, or being on the Meridian, may be found by the Globe thus;

Rectify your Globe and Hour Index, and bring the Star to the Brazen Meridian; then the Index will ſhew the Time of the Star's *Culminating*.

CULMUS, in Botanicks, is properly the Stalk of Corn or Graſs, but of no other Plant, for that is called *Caulis*.

CULVERING, a ſort of Ordnance, of which there are the *Extraordinary*, the *Ordinary*, and the *leaſt ſized Culvering*.

Culvering Extraordinary has $5\frac{1}{2}$ Inches Bore, 13 Foot long, weighing 4800 Pound Weight; its Load above 12 Pound, carries a Shot $5\frac{1}{4}$ Diameter, weighing 20 Pound Weight.

Culvering Ordinary, is a Size leſſer.

Culvering of the *leaſt Size*, is that whoſe Diameter is 5 Inches Bore, 12 Foot long, weighing about 4000 l. carries a Shot 3 Inches $\frac{3}{4}$ Diameter, weighing 14 l. 9 Ounces.

CULVERTAILE, the faſtening in of a Ship's *Carlings* into the Beam, is ſo called.

CUN, or *Cond*, a Sea Term, ſignifying to direct or guide: To *Cun* a Ship is to direct the Perſon at Helm how to ſteer her: See *Cond*.

CUNEIFORME *Os*, is a Bone ſo called from the Reſemblance which it hath to a Wedge; by the Ancients called *Multiforme*, by reaſon of the various *Proceſſes* on the Inſide and Outſide, which renders it rough and unequal: It is ſituate in the Midſt of the *Baſis* of the Brain, and is placed under it like a *Baſis*, ſo that it touches upon moſt of the Bones of the Head and the Upper Jaw. *Blanchard*.

CUNEIFORMIA *Oſſa*, are thoſe Bones of the *Tarſus* of the Foot which are accounted the Fourth, Fifth, and Sixth; and theſe are ſo called, becauſe they are large above, and narrow below, like Wedges: They link all three at the Side of one another, having their upper Part Convex, and their Lower Concave, by which means the Muſcles and Tendons in the Sole of the Foot are not hurt when we go. At one End, each hath a *Sinus* receiving *Os Naviculare*, and at the other End they are joined to the three inner Bones of the *Metatarſus*; the inmoſt of theſe Bones is the largeſt, and the middle one the leaſt.

CUNEUS, a Triangular Priſm, or a Wedge.

CUPPEL or *Coppel*, an Inſtrument in Chymiſtry in the Form of a Diſh, made of Aſhes well waſh'd (to cleanſe them from all their Salt) or of Bones throughly calcined: Its Uſe is to try and purify Gold and Silver; which is done by mingling Lead with the Metal, and ſo expoſing it in the *Coppel* to a violent Fire a great while; the Impurities of the Metal will then be carried off in Droſs, which Droſs is called *Litharge* of either Gold or Silver: 'Tis by the Refiners uſually called a *Teſt*.

CUPPING-GLASSES: See *Cucurbitula*.

CURATIO, is a right Way or Method of finding out by Symptoms and Indications proper Remedies for any Diſeaſe, in order to the Recovery of Health. *Blanchard*.

CURCULIO, the ſame with *Cion*.

CURIA *aviſare vult*, is a Deliberation that the Court intends to take upon any Point or Points of a Cauſe, before Judgment be reſolved on.

CURIA *Claudenda*, is a Writ that lieth againſt him that ſhould fence and cloſe up his Ground, if he refuſe or defer to do it.

CURIASSIERS, are Horſemen that wear Armour.

CURSITOR, is an Officer or Clerk belonging to the *Chancery*, that maketh out Original Writs: They are called alſo *Clerks of the Courſe*; and there be of theſe Twenty four in Number, which have allotted to each of them ſeveral Shires, in which they make out ſuch Original Writs, as are by the Subject required, and are a Corporation of themſelves.

CURTAIN, in Fortification, is the Front of the the Wall of a fortified Place between two *Baſtions*; or the longeſt ſtraight Line that runs about the Rampart, drawn from one Flank to the other, and bordered with a Parapat five Foot high, behind which the Souldiers ſtand to fire upon the Covert-way and into the Moat. Beſiegers ſeldom carry on their Attacks againſt the *Curtain*, becauſe 'tis the beſt flank'd of any Part.

CURTATION *of a Planet*, in Aſtronomy, according to ſome, is a little Part cut off from the Line of his Interval or Diſtance from the Sun.

CURTESY *of England*: See *Courteſy of England*.

CURVATURE, ſignifies Crookedneſs.

CURVE, the ſame with Crooked.

CURVES or *Curvilineal Figures*, are in Geometry, ſuch as are terminated or bounded by *Curved* or *Crooked Lines*: as *Circles* and *Ellipſes*; *and* all *Conick Sections*, *Spherical Triangles*, &c. are *Curves*.

CUSTODE *admittendo*, and *Cuſtode amovendo*, are Writs for the admitting or removing of Guardians.

CUSTODES *Libertatis Angliæ authoritate Parliamenti*, was the Stile wherein Writs and other Judicial Proceedings did run during the late Times of Trouble, *viz.* from the Murther of King *Charles* the Firſt, till the Uſurpation by *Cromwell*, mentioned

tioned and declared traiterous by the *Stat.* 12. *Car.* 2. *Cap.* 3.

CUSTOM, is (both by Common Lawyers and Civilians, taken to be) a Law or Right not committed to Writing, but eſtabliſhed by long uſe, and by the Conſent of our Anceſtors hath been, and is daily practiſed; and 'tis either *General* or *Particular*: A *General Cuſtom*, is that which is allowed through all *England*. *Particular Cuſtom* is that which belongeth to this or that County, or to this or that Lordſhip, Town, or City.

CUSTOMS *and Services*, or *Conſuetudinibus & Servitiis*, is a Writ of Right cloſe, which lieth againſt the Tenant that deforceth his Lord of the Rent or Service due to him: Of this ſee more at large in the *Old Nat. Brev.* Fol. 77.

CUSTOS *Brevium*, a Clerk belonging to the Court of *Common-Pleas*, whoſe Office is to receive and keep all the Writs, and put them upon Files, every Return by it ſelf; and at the End of every Term, to receive of the *Protonotaries* all the Records of the *Niſi prius*, called the *Poſtea*.

CUSTOS *Placitorum Coronæ*, ſeems to be the ſame with *Cuſtos Rotulorum*.

CUSTOS *Rotulorum*, is he that hath the Cuſtody of the Rolls, or Records of the Seſſions of Peace; and as ſome ſay, of the Commiſſions of Peace it ſelf: He is always a Juſtice of Peace and *Quorum* in the County where he hath his Office.

CUSTOS *Spiritualium*, or *Cuſtos of the Spiritualities*, is he that exerciſeth Spiritual or Eccleſiaſtical Juriſdiction in any Dioceſe during the Vacancy of the See, which, by the Canon-Law, belongs to the Dean and Chapter, but at preſent with us in *England*, to the Archbiſhop of the Province by Preſcription: Howbeit, divers Deans and Chapters do challenge this by ancient Charters from the Kings of this Land.

CUSTOS *Temporalium*, the Perſon to whoſe Cuſtody a vacant See was committed by the King as Supreme Lord, who as a Steward of the Goods and Profits, was to give account to the *Eſcheator*, and he into the *Exchequer*: His Truſt continued till the Vacancy was ſupplied by a Succeſſor, who obtained the King's Writ *De Reſtitutione Temporalium*, which was commonly after Conſecration, yet ſometimes before.

CUT *a Feather*; if a Ship hath too broad a Bow, they ſay ſhe will not *Cut a Feather*: that is, ſhe will not paſs through the Water ſo ſwiftly as to make it foam or froth.

CUTANEOUS *Diſtempers*, ſuch as affect the Skin, as the Itch, or Scab, *&c.*

CUTANEOUS *Glands* and *Veſſels*, are ſuch as are placed or terminated in the *Cutis* or Skin.

CUTICLE, *Scarff Skin*, is a Cover of the Skin without Senſe, extended outwardly over the whole Skin like a Membrane, full of innumerable ſmall Pores, accommodated to the avoiding of Injuries from Abroad, to the ſhutting up of the *Cutaneous Veſſels*, and to the more accurate perfecting of Tactile Qualities: It is nouriſhed by the Blood; for if it be loſt or periſhed, it comes again, though its Veſſels be but little conſpicuous. *Blanchard.*

Mr. *Luenhoeck* found by his Miſcroſcope, that the *Cuticula* conſiſted of an infinite Quantity of very ſmall Scales, ſo minute, that a ſmall Grain of Sand would cover near 200 of them; ſo that he thinks there are no proper Pores in the Skin, but that the Moiſture comes out under or from between the Scales.

CUTIS, is the Skin of a living Man, but *Pellis* is that which is flead off, and it is the outermoſt Cover of the whole Body, or a pretty thick Membrane wrought of ſeveral Filaments of the Veins and Arteries, Nerves and Nervous Fibres, complicated and interwoven with one another, full of Glandules and Lympheducts, or Veſſels that convey away the Vapours and Sweat, abounding with a great Number of Pores here and there, and ſenſibly perforated in many Places to let in and out, as occaſion requires; as at the Mouth, Noſtrils, Eyes, Ears, Privities, Fundament, *&c.* it is thickeſt of all upon the Head, moderately hard in the Neck and Back, finer in the Face, *Penis*, and outer Skin of the *Scrotum*; thin on the Sides, and thinneſt of all on the Lips; in ſome Places, as the Elbow, Forehead, Soles of the Feet, it ſticks very cloſe together. *Blanchard.*

CUTT-BASTION: See *Baſtion.*

CUTT-WATER, the Sharpneſs of the Head of a Ship below the Beak; 'tis ſo called becauſe it cuts or divides the Water before it comes to the Bow: This is called alſo the *Knee of the Head.*

CUVETTE, in Fortification, is a deeper Trench about four Fathom broad, which is uſually ſunk in the Middle of the great dry Ditch till you meet with Water, and ſerves both to prevent the Beſiegers Mining, and alſo the better to keep off the Enemy.

CYCLE, is a continual Revolution of certain Numbers, which ſucceſſively go on without any Interruption from the Firſt to the Laſt, and then return again to the Firſt, and ſo circulate perpetually. In the Calendar there are three principal *Cycles*, *viz.* the *Solar*, the *Lunar*, and the *Cycle of Indiction.*

CYCLE *of the Sun*, is a Revolution of 28 Years, in which time the ſame Dominical Letter comes about again in the ſame Order, and Leap-Years expire, and the 29th Year the *Cycle* begins again: This *Cycle* ſerves to find the Dominical Letter for any Year paſt, preſent, or to come.

To find the Cycle of the Sun.

Rule. To the Year add 9, and divide the Sum by 28, the Remainder is the *Cycle of the Sun.*

Example.

To 1701 add 9, the Sum 1710 divided by 28, the the Reſidue 2 is the *Cycle of the Sun.*

CYCLE *of the Moon*, is a Revolution of 19 Years, in which time the New Moons return to the ſame Days they were on before, and ſhe begins again her Courſe with the Sun. This was invented by *Meton* the *Athenian*, and is called the *Golden Number.* That which occaſioned probably the pitching upon this Number, was their Obſervations that the *Lunar* Eclipſes happen nearly again on the ſame Day of the Month 19 Years after the former; of which 'tis eaſy to give many modern Inſtances. *Enneadecaterides* is with ſome the Name of this *Lunar Cycle.*

CYCLE *of Indiction*, is a Revolution of three *Luſtrums* or fifteen Years, after which thoſe who uſed it began it again. This is more ancient than the precedent ones, and hath nothing to do with

with the Heavenly Motions, being eſtabliſhed by *Conſtantine*, *A. D.* 312. *Sept.* 24. who ſubſtituted them in the room of the *Olympiads*: They were ſo called, according to ſome Authors, becauſe they denoted the Year that Tribute was to be paid to the Republick. To find this *Indiction*, ſubſtract 312 from the Year given, and divide the Remainder by 15, and omitting the Quotient, what remains is the Year of the *Roman Indiction*.

Example, A.D. 1700
312

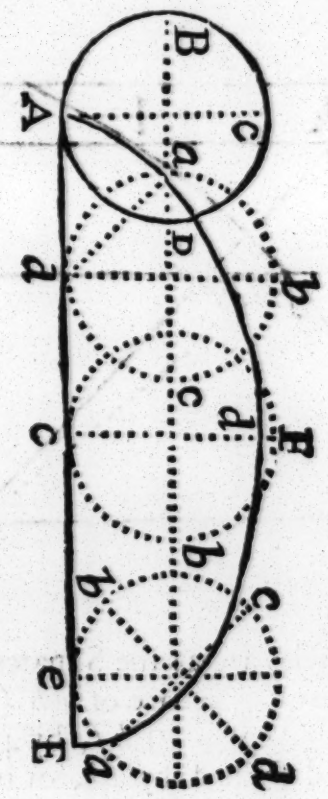
15) 1388 (92
135

38

8 = *Indiction.*

CYCLISCI, are Surgeons Inſtruments, wherewith they ſcrape away corrupt Fleſh, or the like: they are made in the Form of an Half-Moon.

CYCLOID: If on a Right Line, as *AE*, a Wheel or Circle be imagined to make one entire Revolution, or to move till the Point *A* come to touch the Line again at *E*: The Circle will deſcribe the Line *AE*, equal to its Periphery; and the Point

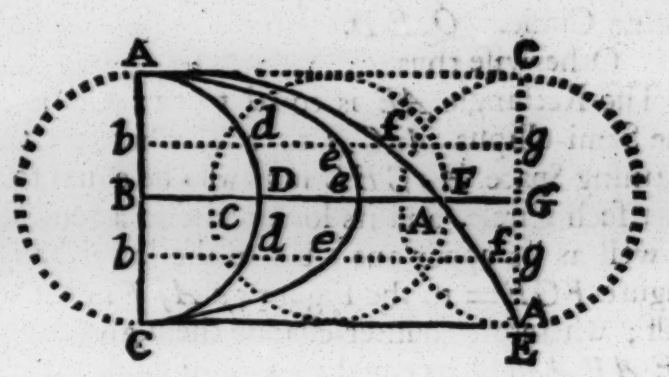


A will deſcribe a Curve Line *A a FE*, which is called a *Cycloid* or *Trochoid*, and the Space contained within this Curve and the Subtenſe *AE* is called the *Cycloidal Space*.

From the Conſideration of which Geneſis, 'tis very plain, that the Point *a* which deſcribes the Curve, will every where be diſtant from *d* the Point of Contact, by ſuch a Part of the Circle as is the Diſtance of that Point of Contact from *A*, the Beginning of the Line. Thus, when *Ad* is a Fourth Part of the whole Subtenſe, then will *da* be a Quadrant of the Generating Circle; when *Ac* is half that Line, then the Ark *a c* is a Semi-circle, &c. So likewiſe at the other End, when the Ark *a c* is an Octant, *eE* will be an Eighth Part of the Line *AE*.

Propoſition.

Any Semi-ordinate in the Cycloid *(or the Right Line* B F, *or* b f*) is equal to its correſponding Right Sine in the Generating Circle, (as* BD, b d*) together with the Arch of that Sine,* AD, *or* a d.



This is proved from the Conſideration of the Manner of the Generation of the *Cycloid* above delivered: For ſince the Right Line *CE* is equal to the Semi-circular Ark *ADC*, the Right Line *DF* muſt be equal to the Quadrantal Ark *AD*; for the ſeveral Arks of the moving Circle do every where generate Right Lines equal to themſelves; wherefore any Semi-ordinate drawn to the Curve of the *Cycloid* muſt be compounded of *df* or *DF*, *viz.* a Right Line equal to the Part of the Ark that hath revolved, and of *b d* and *BD* the Right Sine of that Ark in the Generating Circle. *Q. E. D.*

Corollaries.

1. Hence 'tis plain, that by means of the *Cycloid* a Right Line may moſt eaſily be found equal to any given Ark of a Circle, or to its whole Circumference; and conſequently the Quadrature of the Circle may Geometrically be had, if this *Cycloid* be a true Geometrical Curve, as indeed it is not.

2. If you ſuppoſe *de*, *De*, and *de* to be every where drawn equal to the Right Lines *bd*, *BD*, and *bd*; the Curve Line connecting their Extremities will be an Ellipſis (*by a* Propoſ. *which you will find under the Word* Elliptical Space) for the whole Aggregate of all theſe Right Lines, or the Elliptical Space will be double of the Semi-circular one; *i. e.* as *B e* is to *BB*; and conſequently the Curvilineal Space *Ae CDA* will be equal to the Semi-circular Space *ADCA*.

3. *DF* (*i. e. De* + *eF*) = Quadrant *DA*, wherefore ſince the Whole *BG* = to a Semi-circle, the Remainder *BD* + *FG* muſt alſo be equal to a Quadrant; but *BD* = *De* (by *Cor.* 2.) wherefore *eF* will be equal to *FG*; and the ſame Way of arguing will always prove *ef* above, equal to *fg* below, wherefore all the Indiviſibles in each being equal, the Space *ee Af F* will be equal to the Space *FGE*. Hence,

4. *'Tis plain, that the Cycloidal Space is always triple of the Generating Circle.*

For the Rectangle *BCEG* is equal to the whole Circle (becauſe on one Side is the Radius, and the other the Semi-circumference,) that is, is equal to the Semi-ellipſis *Ae CDA*; wherefore, if out of it you take the Quadrant of the Ellipſis *B e e CB*, what remains, which is the *Trapezium Ce GEC*, muſt be equal to the other Quadrant of the Ellipſis, or to the Semi-circle. But it was proved in *Cor.* 3. That the Trilinear Space *FGE* was equal

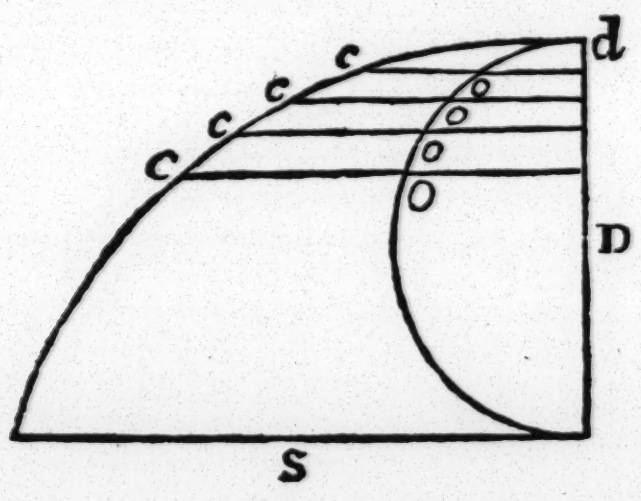
to *e e A f* F; wherefore the Trilinear Figure *A f F E C A* muſt alſo be equal to the Semi-circle; and conſequently the whole *Semi-cycloidal* Space *A F E C A* muſt be equal to three Semi-circles, and therefore the whole Cycloidal Space triple of the Generating Circle. *Q. E D.*

Otherwiſe thus;

The Rectangle *AE* is equal to two Circles, and the Semi-ellipſis *AeCA* to one, wherefore the remaining Space *AeCEC* muſt alſo be equal to another ſuch Circle, and its lower half to a Semi-circle, as well as its upper one; but in the lower half, the Figure *FGE* = to the Figure *e e A f F* in the upper half; wherefore counter-change them, and the Space *CE A F A* muſt be equal to a Semi-circle, and conſequently the Semi-cycloidal Space equal to three Semi-circles. *Q. E. D.*

The following *Demonſtration* of the ſame *Propoſition* I had from Mr. *Humphry Ditton*, who is very skilful in Things of this Nature: 'Tis very ſhort and plain, and depends on the Arithmetick of Infinites. Thus,

The Figure is a *Semi-cycloid*, where the Arks *d o*, *d o*, *d O*, &c. are ſuppoſed to be in Arithmetical Proportions, and conſequently ſo will the Lines *c o*, *c o*, *CO*, &c. which from the Nature of the *Cycloid* are all equal ſeverally to thoſe Arks: Now theſe being a Series of Arithmetical Proportions, will be to as many equal to the greateſt, as 1 to



2 (by *Prop.* 2. of Dr. *Wallis*'s *Arith. Infinit.*) wherefore the Space *C d O S* = $\frac{1}{2}$ *S D*, but $\frac{1}{2}$ *S D* = to the whole Circle; wherefore the whole Cycloidal Space *C D S* muſt be equal to three Semi-circles. *Q. E. D.*

The *Linea Celerrimi Deſcenſus*, as 'tis called, or the Curve which any heavy Body would deſcribe, ſuppoſing it to deſcend with the greateſt poſſible Swiftneſs, is *the Ark of a Cycloid.* This *John Bernoulli*, I think, firſt propoſed, as a *Problem* to be diſcovered, and it hath often been ſolved, but very briefly and eaſily by Mr. *John Craig*, in *Philoſ. Tranſact. N.* 268. In the *Acta Eruditorum Lipſ.* for *May* 1690, *p* 217. there is a Method of Inveſtigation for this Line by *James Bernoulli.*

CYEMA, the ſame with *Embryo.*

CYGNUS, the *Swan*, a Conſtellation in the Northern Hemiſphere, conſiſting of 35 Stars.

CYLINDER; the Hollow within every Piece of Ordnance, is called her *Concave Cylinder.*

CYLINDER, is a Solid Body, made by the Rotation of a Rectangled Parallelogram about one of its Sides.

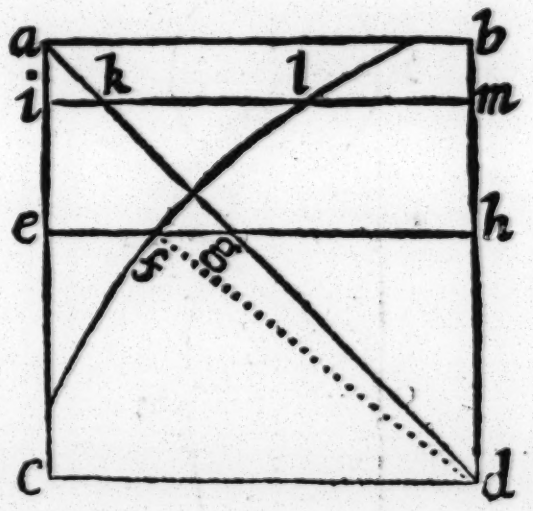
1. Since every *Cylinder* hath a Circle for its Baſe, it will be very proper to denote its Baſe thus, $\frac{1}{4}$ *r d d* (the Reaſon of which you have under *Circle:*) And then, if the Altitude of the *Cylinder* be called *h* (*i. e.* its height) the Solidity of the *Cylinder* will be expreſſed thus, $\frac{1}{4}$ *r d d h.*

2. If therefore the Altitudes of any two *Cylinders* be equal to the Diameters of their Baſes, *ſuch Cylinders muſt be to one another, as the Cubes of their Diameters or Altitudes*; for here, *h* the Height being the ſame with *d*, the Diameters of the Circle of the Baſe. If in one *Cylinder* it be called *d*, and in the other *D*, the Solidity of the former will be $\frac{1}{4}$ *r d d d*, and of the latter $\frac{1}{4}$ *r D D D*; but doubtleſs $\frac{1}{4}$ *r* being a common Efficient or Multiplier: $\frac{1}{4}$ *r d d d*: $\frac{1}{4}$ *r D D D* :: *d d d*: *D D D*; that is, the *Cylinders* are as the Cubes of their Diameters. *Q. E. D.*

3. Every *Cylinder* is triple of a Cone of the ſame Baſe and Height; which ſee proved in *Proportion of Solids.*

4. Every *Cylinder* is to a Sphere inſcribed, and of the ſame Baſe and Height as 3 to 2.

If the Square and Quadrant with the Diagonal *a d*, be ſuppoſed to revolve round the Axis *b d*, the Square will generate a *Cylinder*, the Quadrant an Hemiſphere, and the Triangle *a d b* a Cone all of the ſame Baſe and Height.



And ſince Circles are as the Squares of their Diameters, and that the Square of *e h* (= □ of *df*) = □ *g h* (= □ *h d*) + □ *hf*, by 47. *e.* 1; therefore the Circle deſcribed by *eh*, or its = *c d*, muſt be equal to two Circles deſcribed by *g h*, and by *hf*: Take away then the common Circle, deſcribed by *hf* from both, and there will remain the Circle deſcribed by *g h* = to the Ring deſcribed by *ef.* And thus it will always be, that (*v. gr.*) the Circle deſcribed by *k m*, will be equal to the Annulus or Ring made by the Motion of *i l*; wherefore all the Rings made by the Revolution of *e f*, *i l*, &c. muſt be equal to all the Circles deſcrib'd by the Motion of *g h*, *m k*, &c. that is, all the Solid, compoſed of the Rings made by the Motion of the Parts of the Trilinear Figure *c f l b a*, ſhall be equal to all the Circles generated by the Elements of the Triangle *a d b*: Wherefore ſince the Cone is $\frac{1}{3}$ of the *Cylinder* on the ſame Baſe and Height, and that the Solid made by the Trilinear *c f l b a*, is alſo another third Part, as being equal to the Cone; the Hemiſphere muſt be $\frac{2}{3}$ of the *Cylinder*, and conſequently, if the Baſe and Altitude of the *Cylinder* were equal to the Diameter of the Sphere, the whole Sphere would be $\frac{2}{3}$ of the *Cylinder.*

Cor.

Cor. 1. From hence we have the Dimenſions of the Sphere and Cylinder, both as to Solidity and Surface; for let *d* be the Diameter of the *Sphere* and *Cylinder*, and *r d* the Circumference of the Baſe of the *Cylinder*; then will the whole Baſe be $\frac{1}{4} r\,d\,d$, (which alſo is the Area of a great Circle of the Sphere;) and this Baſe multiply'd by *d* the Altitude, gives $\frac{1}{4} r\,d\,d\,d$ for the Solidity of the *Cylinder*; and therefore, by this *Prop.* $\frac{2}{3}$ of that gives the Sphere (*i. e.*) $\frac{1}{6} r\,d\,d\,d$ = Solidity of the Sphere; and that laſt Quantity divided by $\frac{1}{4} d$ (one Sixth of the Diameter) gives *r d d* the Surface of the Sphere.

2. Which Surface *r d d* is manifeſtly Quadruple of $\frac{1}{4} r\,d\,d$, the Area of a great Circle of the Sphere, or the Baſe of the *Cylinder*.

3. Wherefore, by multiplying *r d* (= to the Periphery of the Baſe of the *Cylinder* by *d* the Altitude) you have *r d d* for the Curve Surface of the *Cylinder*; which therefore is equal (taken without its proper Baſes) to the Surface of the Sphere; and conſequently, adding in the Baſes (each of which is $\frac{1}{4} r\,d\,d$) the whole Surface of the *Cylinder*, Baſes and all, will be $1\frac{1}{2} r\,d\,d$, that is, to the Surface of the Sphere as 3 to 2.

4. The Square of the Diameter (*d d*): To the Area of the Circle $\frac{1}{4} r\,d\,d$:: Is as $d : \frac{1}{4} r\,d$, (for $d\,d : \frac{1}{4} d\,d :: d : \frac{1}{4} r\,d$) that is, as the Diameter to $\frac{1}{4}$ of the Circumference.

5. Becauſe the Solidity of the *Cylinder* is $\frac{1}{4} r\,d\,d\,d$, therefore the Cone of the ſame Baſe and Height will be $\frac{1}{12} r\,d\,d\,d$, which is plainly the Difference between $\frac{1}{4} r\,d\,d\,d$ and $\frac{1}{6} r\,d\,d\,d$, the Solidity of the *Cylinder* and *Sphere*; ſo that *the Cone is equal to the Exceſs of the Cylinder above the Sphere*; and the *Cone*, *Sphere* and *Cylinder* are as 3, 2 and 1; ſo that the Sphere is two Thirds of the *Cylinder*. See this laſt proved much ſhorter under the Word *Indiviſibles*.

If you conſider a *Cylinder*, as compoſed of an infinite Number of *Cylindrical Surfaces* decreaſing (as the Circles of the Baſe on which they ſtand) in Arithmetical Progreſſion; if you call the outermoſt or greateſt Surface *S*, and the Radius of the Baſe *r*, the Solidity of the *Cylinder* will be expreſſed by $\frac{1}{2} r\,S$: And it will be diverting to meaſure a *Cylinder* by both of theſe different Ways, in order to ſee how nearly they will agree.

CYLINDROID, a ſolid Figure with Elliptical Baſes parallel and alike ſituated.

CYLINDRUS, is a Plaiſter made oblong, which ſome Phyſicians call *Magdaleo*. *Blanchard.*

CYLLOSIS: See *Cyllum.*

CYLLUM, ſignifies a Leg put out of Joint outwardly; alſo one Lame and Crooked.

CYMA, among the Botaniſts ſignifies the Top of any Plant or Herb.

CYMATIUM, a Member of Architecture, whereof one Half is Convex, and the other Concave: There are two Sorts of *Cymatiums*, *viz.* one called *Doucires* or *Right Gula*, the moſt advanced Part of which is Concave; and the other *Talon* or *Reverſed Gula*, which hath its moſt advanced Part Convex, but is hollow below, as the firſt is above.

CYMBIFORME *Os*: See *Os Naviculare.*

CYNANCHE and *Lycnanche*, ſo called becauſe it is frequently incident to Dogs and Wolves, is an Inflammation of the inner Muſcles of the *Larynx*, accompanied with a Difficulty of Breathing, and a continual Fever. *Blanchard.*

CYNANTHROPIA, is Madneſs given by a Dog, wherein the Patient flies Light, or any thing that is bright and ſplendid; fears Water, and trembles at the Sight and Remembrance of it: It proceeds uſually from a poiſonous Bite, or the like, of ſome mad Creature, as a Dog, a Wolf, *&c.* *Blanchard.*

CYNICUS *Spaſmus*, the Convulſion of the Muſcles of the Mouth, by which the Face is ſo diſtorted, that it reſembles the Countenance of a grinning Dog.

CYNODES *Orexis*, is a Canine Appetite, or an extreme Hunger join'd with Vomiting or a Looſeneſs: It ariſes from a too much or a too acid Ferment in the Stomach. *Blanchard.*

CYNODESMUS, is the Band which ties the little Skin of the Yard to the Glands.

CYNODENTES, are thoſe Teeth between the Axle-Teeth and the Grinders, called *Canini*, *Columellares*, and *Oculares*; Eye-Teeth, as we ſay. *Blanchard.*

CYNOREXIS: See *Cynodes Orexis.*

CYNOSURA, a Conſtellation conſiſting of ſeven Stars; otherwiſe called *Urſa Minor*, or the *Little Bear*, in the Tail of which is the *Polar Star.*

CYPHER, or *Nought*, thus noted (o), which put before a Figure, ſignifies nothing (except in Decimal Arithmetick, where it augments, being put before, in the ſame Proportion as when put after Integers) but after a Figure it increaſes it by Ten, and ſo onwards in Decuple Proportion, or by Tens, *ad Infinitum.*

CYPHOMA, or *Cyphoſis*, Crookedneſs of the Back.

CYPHOSIS, is the bending of the Vertebres of the Back toward the Back Parts.

CYRTOMA, is a Bunch on the Back, or a Tumor in any other Part.

CYRTOSIS, the ſame with *Cyrtoma.*

CYSTAROS, is the Gut call'd *Rectum*, the lowermoſt of all; alſo the Fundament.

CYSTICA, are Medicines uſed againſt Diſtempers in the Bladder.

CYSTICÆ *Gemelli*, a very ſmall Branch of the *Celiack* Artery diſperſed through the Gall-Bladder.

CYSTIS, is the Bladder that holds the Urine or the Gall.

CYSTIS *Choledochus*, the ſame with *Folliculus fellis.*

CYSTOTOMY, the cutting of a Bladder.

DACRYODES, are Ulcers which continually ſend forth Matter. *Blanchard.*

DACTYLE, is the Foot of a *Latin* Verſe conſiſting of three Syllables, whereof the firſt is long, and the other two ſhort; as *Carmina.*

DACTYLONOMY, is the Art of Numbring on the Fingers.

DADO, a Term in Architecture, by ſome Writers uſed for the *Dye*, which is the Part in the Middle of the Pedeſtal of a Column between its Baſe and Cornice: 'Tis of a Cubick Form, whence the Name of *Dye* is given to it.

DAILY MOTION of a Planet: See *Diurnal Motion.*

DAMAGE, is generally taken to ſignify any Hurt or Hindrance that a Man taketh in his Eſtate; but in Common Law it is Part of that the Jurors be to enquire of, paſſing for the Plaintiff or Defendant in a Civil Action, be it Perſonal or Real: For after Verdict given of the principal Cauſe, they are likewiſe asked their Conſciences (touching Coſts, which are the Charges of the Suit, called of the *Civilians*, *Expenſæ Litis*,) and Damages, which contain the Hindrances that the Plaintiff or Demandant hath ſuffered, by means of the Wrong done to him by the Defendant or Tenant.

This Word *Damage* (in Law) has two ſeveral Significations, the one *Properly* and *Generally*, the other *Strictly* and *Relatively*: *Properly*, as it is in Caſes where Damages are founded upon the Statute of 2 *H.* 4. *Cap.* 1. and 8 *H.* 6. *Cap.* 9. where Coſts are included within this Word *Damages*; for *Damage*, in its proper Signification, is ſaid *à Demendo*, when by Diminution a thing becomes worſe; and in this Senſe, Coſts of Suits are *Damages* to the Plaintiff, for by it his Subſtance is diminiſhed. But when the Plaintiff declares the Wrong done him to the *Damage* of ſuch a Sum, this is to be taken *Relatively*, for the Wrong which is paſſed before the Writ brought, and are aſſeſſed by Reaſon of the Treſpaſs aforeſaid, and cannot extend to the Coſts of Suit, which are future, and of another Nature.

DAMAGE CLEERE; *Damna Clericorum* is now aſſeſs'd by the Tenth Part in the *Common Pleas*, and the Twentieth Part in the *King's Bench* and *Exchequer*, of all *Damages* (exceeding five Marks) recovered either by Verdict, Confeſſion, or Judgment of the Court in all Actions upon the Caſe, Covenant, Treſpaſs, Battery, falſe Impriſonment, Dower, and all others wherein *Damages* are uncertain, which the Plaintiff was to pay to the *Prothonotary*, or chief Officer of that Court wherein they are recovered, before he ſhall have Execution for them. This was Originally only a Gratuity given to the *Prothonotaries*, and their Clerks, for drawing Special Writs and Pleadings, which afterwards grew to a Certainty; but now this is taken away by 17 *Car.* 2. *c.* 6. for that it was an unneceſſary Charge and Burden upon the King's Subjects.

DAMAGE *Feaſant*, in Common Law, is when Stranger's Beaſts are in another Man's Ground without Licence of the Tenant of the Ground, and there do feed, tread, and otherwiſe ſpoil the Corn, Graſs, Goods, and ſuch like; in which Caſe the Tenant, whom they *Damage*, may therefore take, diſtrain, and impound them, as well in the Night as in the Day: But in other Caſes, as for Rents and Services, and ſuch like, none may diſtrain in the Night.

DAMNATA *Terra*, is the ſame with the *Caput Mortuum* of the Chymiſts, being only the Earth or Maſs that remains in the *Retort*, &c. after all the other Principles are forced out by the Fire.

DANCETTE, a Term in Heraldry, when the Out-line of any Bordure or Ordinary is of this Shape, that is, indented in and out very largely, in which only it differs from *Indented.*

There is a bearing of a Bend called double *Dancette*; thus, he beareth *Azure*, a Bend double *Dancette Argent.*

DARKENED *Room*: See *Obſcura Camera.*

DARK *Tent*, is the Term which ſome Writers give to a Box made almoſt like a Desk with Optick Glaſſes, to take the Proſpect of any Building, Fortification, Landskip, &c. This is a Portable *Camera Obſcura*, or *Darkened Room*: See the Deſcription under *Obſcura Camera.*

DARSIS, is an Excoriation of the Skin. *Blanchard.*

DARTUS, is the ſecond or inner *Tunick* of the common Coats, which immediately cover the Teſticles; it ariſes from the *Membrana Carnoſa*, and ſeems to be Muſcular from its Power of conſtructing and wrinkling it ſelf up; it adheres to the *Tunica Vaginalis* that lies under it by many Membranous Fibres. *Ruyſch* ſaith, that it hath the *Membrana* alſo under the *Carnoſa Adipoſa.*

DASSYMA, is a ſuperficial Inequality of the inner Part of the Eye-lids, accompanied with a Redneſs. *Blanchard.*

DATA, is the Term in Mathematicks for ſuch Things or Quantities as are ſuppoſed to be given or known, in order to find out thereby other Things or Quantities which are unknown or ſought for; and *Euclid* uſes the Word *Data* (of which he hath a particular Tract) for ſuch Spaces, Lines, and Angles, as are given in Magnitude, or to which we can aſſign others equal: See *Given.*

DATIVE CASE, is the third Caſe in the Declenſion of Nouns, Pronouns, &c. and is ſo called, becauſe 'tis uſually governed by a Verb, which implies ſomething to be *given* to ſome Perſon, and the thing is put in the Accuſative Caſe, and the Perſon in the *Dative.*

DAVIS's *Quadrant*, is the common Back-Quadrant: See its Deſcription under the Word *Back-ſtaff.*

DAVIT, a Piece of Timber in a Ship, having a Notch at one End; in which, by a Strap, hangs a Block called the *Fiſh-Block*: And the Uſe of this Block is to hale up the Fluke of the Anchor, and to faſten it at the Ship's *Bow* or *Loof.* This *Davit* is ſhiftable from one Side of the Ship to the other, as Occaſion ſerves.

There is a ſmall *Davit* in the Ship's Boat, which is ſet over her Head with a Shiver, in which is brought the Buoy Rope wherewith to weigh the Anchor; and it is made faſt to the Carlings in the Boat's Row.

DAY, is either *Natural* or *Artificial*; the former is determined by the Motion of the Sun round the Earth in 24 Hours; the *Artificial* Day is the Time betwixt the Sun's Riſing and Setting; to which is oppoſed *Night*, which is the Time that the Sun is under the Horizon.

The *Natural Day* is alſo called *Civil*, becauſe it is by divers Nations reckoned divers Ways; the *Babylonians* began to account their *Day* from the Sun-riſing; the *Jews* and *Athenians* from the Sun-ſetting, whom the *Italians* follow to this Day, beginning their firſt Hour at Sun-ſet: The *Egyptians* began at Midnight, as we account our Aſtronomical Day, but the *Umbri* began at Noon.

The *Natural Day*, beginning at Noon or Midnight, is always equal; but that which is accounted from Sun-riſing or ſetting is unequal; and the *Artificial Day* is every where unequal, but juſt under the *Equinoctial Line*.

DEAD-MENS-EYES, in a Ship, are a Kind of *Blocks*, having many Holes in them, but no *Shivers*; and through them the *Lanniers* go, which make faſt the Shrowds below to the Chains. Sometimes, but rarely, the Main-Stays of a Ship are ſet taught by *Dead-Men's-Eyes* and *Lanniers*. The *Crowfeet* always do *reeve* through *Dead-Men's-Eyes*.

DEAD-RECKONING, at Sea, is that Eſtimation, Judgment, or Conjecture, which the Seamen make of the Place where a Ship is, by keeping an Account of her Way by the *Log*, by knowing the Courſe they have ſteered by the Compaſs, and by rectifying all with Allowance for *Drift*, *Lee*, *Way*, &c. according to the Ship's Trim; ſo that this Reckoning is without any Obſervation of the Sun, Moon, and Stars, and is to be rectify'd as often as any good Obſervation can be had.

DEAD-RISING, a Term in a Ship for that Part of her which lies aft between the Keel and her Floor Timbers, and next adjoining to the Stern-Poſt under the Bread-Room in a Man of War.

DEAD-WATER, is the Eddy Water juſt behind the Stern of a Ship; and if a Ship hath a great Eddy follows her Stern, they ſay *ſhe makes much Dead Water*: This is ſo called becauſe it doth not paſs away ſo ſwiftly as the Water running by her Sides doth.

DE BENE ESSE, a Term in Common Law, as when the Defendant's Depoſition or Bail is only allowed for the preſent, but after more full Examination is either to ſtand or fall.

DEBENTUR, was a Kind of Writing firſt given in the late Times of the Uſurpation to the Soldier, to ſecure the Payment of his Arrears; 'tis uſed alſo in the *Exchequer*; and in the King's Houſe *Debentures* are given uſually to the Servants, for the Payment of their Wages, Board-Wages, and the like. The Word is mentioned in the Act of Oblivion, 12 *Car.* 2. *c.* 2. and ſince the late Revolution hath been uſed in many Acts of Parliament, eſpecially in that which relates to the forfeited Eſtates in *Ireland*, out of which the Soldier's *Debentures* are appointed to be ſatisfied, 11 *W.* 3.

DEBET and *Solet*, is a Writ of Right which hath thoſe Words in it, as formal Words not to be omitted; as if a Man ſue for any thing that is now firſt of all denied, and which hath been enjoyed by himſelf and his Anceſtors before him; as for a Mill, common Paſture, &c. then both *Debet* and *Solet* muſt be uſed in the Writ of Right.

DEBILITY, is a Weakneſs of the Body proceeding from Swooning, Fainting, Hunger, Diſeaſe, or otherwiſe. *Blanchard.*

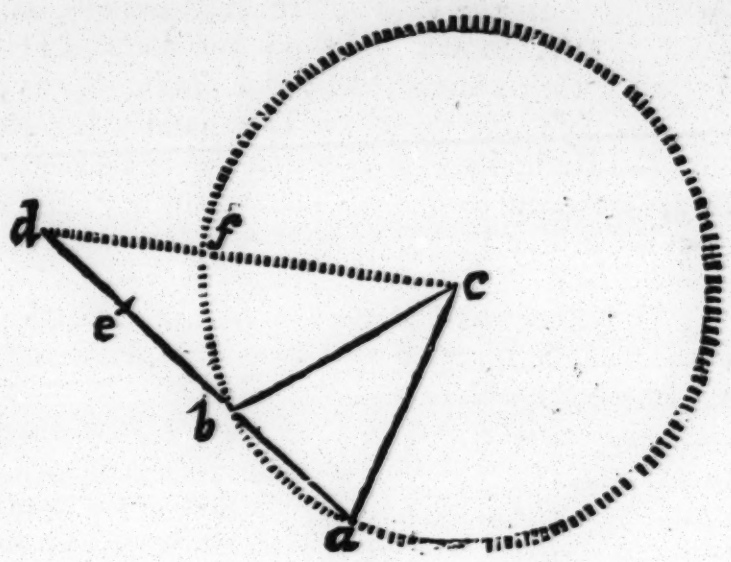
DEBITO, is a Writ that lieth where a Man oweth Money upon Obligation, or other Bargain for any thing ſold unto him.

DEBRUISED, a Term in Heraldry, when a *Pale*, &c. is born upon any Beaſt in an Eſcutcheon; for then they ſay, the *Beaſt is debruiſed of the Pale*.

DECAGON, is a plain Figure in Geometry, having 10 Sides and Angles; and if they are all equal to one another, 'tis then called a *Regular Decagon*, and it may be inſcribed in a Circle.

Propoſition.

The Side of a Regular Decagon is in Power and Length equal to the greateſt Segment of an Hexagon, cut according to Extreme and Mean Proportion. 9. *e.* 13. Euclid.



Let the Line *d b*, the Radius or Side of an *Hexagon*, cut into Extream and Mean Proportion in *e*, (*P.* 11. *e.* 2. *Euclid.*) be applied to the Circle in the Point *b*, and then produced till *b a* be the Side of a *Decagon*, or the Chord of 36°.

I ſay *b a* is equal to *b e*, and the □ *b a* = *b e*. Draw *b e*, *d c*, and *d c*.

Demonſtration.

The Angle *b c a* = 36°, and conſequently the equal ones *c b a* and *a*, each = 72°, wherefore *d b c* muſt be = 108°. Alſo ſince *d b* = *b c*, the = Angles *d* and *d c b* muſt be exact = 36°. and therefore the whole Angle *a c d* = 72°. or the Angle of a Pentagon; wherefore the △'s *a b c* and *a d c* are Similar, and conſequently *a d* : *a c* :: *a c* : *a b*, that is, *a d* : *d b* :: *d b* : *b a*; wherefore the whole Line *d a* is cut into Extream and Mean Proportion; and therefore, ſince *d b* is alſo ſo divided by the Suppoſition, the whole Line *d a* : *b d* :: as the whole Line *d b* : *b a*, but in the ſame Proportion is *b d* to *b e*; wherefore *b a* muſt be equal to *b e*, and the Power of one to the Power of the other.

A Fortification alſo conſiſting of 10 Baſtions, is ſometimes called a *Decagon*.

DECAMP, when an Army raiſes its Camp, and departs from the Place where it lay before, they ſay it is *Decamped*.

DECANT; to *Decant* a Liquor, is to pour off the clear Part of it by *Inclination*, as the Chymiſts ſpeak, that ſo it may be without any Matter or Sediment; and this Action the Chymiſts call a *Decantation*.

DECEMTALES: See *Tales*.

DECEPTIONE, is a Writ that lieth againſt him that deceitfully doth any thing in the Name of another, for one that receiveth Damage or Hurt thereby.

DECIDUOUS, is that which is apt or ready to fall, and is uſed in reference to the Flowers and Seeds of Plants: Thus the *Botaniſts* ſay, in ſome Plants the *Perianthium* or *Calyx* is *deciduous* with the Flow-

Flower, *i. e.* falls from off the Plant with it, but in others it is not.

DECIES TANTUM, is a Writ which lieth againſt a Juror which hath taken Money for the giving of his Verdict; called ſo of the Effect, becauſe it is to recover ten Times ſo much as he took.

DECIMAL *Fraction*, is that which hath for its Denominator 1. with a Cypher or Cyphers annexed; as $\frac{5}{10}$, $\frac{6}{100}$, $\frac{64}{1000}$, &c.

Which Denominator, for Brevity and Convenience ſake, is moſt commonly expreſſed by a Point or a Comma ſet on the Left-hand of the Numerator; thus, .5 is $\frac{5}{10}$. .46 is $\frac{46}{100}$. and .125 is a Hundred Twenty five Parts of any thing, ſuppoſed to be divided into 100 ſuch Parts.

N. B. As Cyphers ſet on the Right-hand of Integers do increaſe the Value of them *Decimally*, as 2, 20, 200, &c. ſo when ſet on the Left-hand of *Fractions*, they decreaſe the Value *Decimally*, as ,5. ,05. ,005. &c. but ſet on the Left-hand of Integers, or on the Right-hand of Fractions, they ſignify nothing, but only to fill up Places; thus, ,5000, or 0005. is but five Units.

1. To reduce any *Vulgar Fraction*, as ſuppoſe $\frac{5}{8}$ of a Pound, Shilling, Mile, Yard, Day, Hour, &c. to a *Decimal Fraction* of the ſame Value, whoſe Denominator ſhall be 1000; (I ſay 1000, for 10 or 100 are not large enough to do it without a Fraction.)

Say, by the *Rule of Three*, As 8 the Denominator of the *Vulgar Fraction*: Is to 5 its Numerator:: So will 1000 the Denominator aſſigned: Be to a 4th Term, which, by working, you'll find to be ,625. and therefore $\frac{625}{1000}$, or ,625. is a *Decimal* of the ſame Value with the former Fraction $\frac{5}{8}$.

2. *Addition* and *Subſtraction* of *Decimals* is performed juſt as Integers, only Care muſt be taken about duly placing each Part; as to which be ſure to place all the Points one under another, then add or ſubſtract as in common Arithmetick, diſtinguiſhing from the Sum or Remainder ſo many Figures for Decimals, as are the moſt Decimal Places in any of the given Numbers, as in the following Examples.

In *Addition*,

,73567	64,58
,705	9,7
,86	,005
,5	
2,80067	74,285

In *Subſtraction*,

From 35,5
Take 20,98679

Remains 14,51321

From 16,05
Take 10,9999

Remains 5,0501

Multiplication of Decimal Fractions.

General Rule.

'Tis no matter in what Order either Multiplicand or Multiplicator ſtand, only obſerve, *That there muſt be juſt as many Decimal Parts cut off by the ſeparating Point from the Product, as there are Decimals in both Factors:* The Work is juſt as in Integers.

Example 1. Where one *Decimal* multiplies another.

,365
,22
730
730
,08030

Here the Product is only 8030, but a Cypher is prefix'd to make up the five *Decimal* Places, there being ſo many in both Factors.

,0006	,464
,5	,9
,00030	,4176

Example 2. Where one Factor is an Integer, the other a *Decimal* Fraction.

4,64	3,65	46,4
9	22	9
41,76	730	417,6
	730	
	80,30	

Note, That when a *Decimal Fraction*, or mix'd Number, is to be multiplied by an Unit, with Cyphers annexed thereto, (as 10, 100, 1000, &c.) 'tis only removing the Separatrix ſo many Places towards the Right-hand in the Multiplicand, as there are Cyphers annexed to the Unit: Thus, if ,7652 were to be multiplied by

10	7 ,652
100	76 ,52
1000	765,2
10000	7652

The Product will be

The Reaſon of which is, becauſe there can be no more Decimals in the Product, than were in both the Factors; and the Cyphers any where on the Right-hand may be omitted, as being of no Value here.

By *Multiplication*, *Decimals* are reduced to the known Parts of ſuch Integers as they are *Decimals* of, *in this manner:* Multiply the given *Decimal* by the Number ſhewing how many known Parts of the next inferior Denomination are equal to that Integer, and purſue this as far as it will go, *v. gr.*

What is the Value of this *Decimal* ,8687; that is, ,8687 of a Day, or of a Pound Sterling, &c.

,8687 of a Day = 20 h.	,8687 of a Pound =
24 (50'. 55".	(20 17 s. 4 d. 1 q.
34748	17,3740
17374	12
20,8488	7480
60	3740
50,9280	4,4880
60	4
55,6800	1,9520

To find the Value of any Decimal of a Pound of *Engliſh* Money, there is this ready Rule in Practice: Suppoſe it were required to find the Value of ,8687 of a Pound; double the firſt Figure 8, and becauſe 6 (the next Figure) exceeds 5, add the Exceſs, which is 1, to the former Double, and 'twill make it

it 17; account thoſe for Shillings: Then imagining that 1, by which 6 exceeded 5, to be taken as 10, and to ſtand before the next Figure 8, it will make 18; from which abate 1, and the Remainder 17 is the Farthings, which make 4 *d.* 1 *q.* ſo that the Decimal was 17 *s.* 4 *d.* 1 *q.*

Alſo ,319 of a Pound = 6 *s.* 4 *d.* 3 *q.*

If the Second Figure be juſt 5, add one to the Shillings, and account the third Figure for the Farthings; if it be leſs than 5, add nothing to the Shillings, but account it as ſo many Tens, the third Figure for Farthings.

Diviſion of Decimal Fractions.

General Rule.

Work in all Caſes, as in Diviſion of Integers, but only obſerve, that there be juſt as many Decimal Places (and no more) in the Diviſor and Quotient together, as there were in the Dividend.

22)8,030(,3,65	22)8,030(3,65	22)80,30(3,65
66	66	66
143	143	143
132	132	132
110	110	110
110	110	110
0	0	0

In *Decimal Diviſion* there are Nine Caſes, all performed by the General Rule with a few Directions, as followeth.

1. To divide a whole Number by a greater whole Number;

To the Dividend add Cyphers at Pleaſure, and the Quotient will be all Decimal Parts, according to the Number of Cyphers added:

Thus, if 22 were to be divided by 365.

365) 22 ,0000 (,602, &c.
2190
1000
730
270

2. To divide a leſſer whole Number by a greater mix'd Number;

Add as many Cyphers to the Dividend, as (at leaſt) there are Places in the Diviſor:

Thus, 3,65) 22,0000 (6,02

Here, becauſe there are four Decimal Places in the Dividend (by the annexed Cyphers) and but two in the Diviſor, there muſt be two in the Quotient.

3. To divide a whole Number by a Decimal Fraction, annex (at leaſt) as many Cyphers to the Dividend, as there are Places in the Diviſor:

Thus, ,365) 22,0000(602

Here, there being three Places of Decimals in the Diviſor, and but three in the Dividend, there can be none in the Quotient.

4. To divide a mix'd by a whole Number:

22) 8,030 (,365

Here, there being no Decimals in the Diviſor, but three in the Dividend, there muſt be three in the Quotient.

5. To divide a mix'd Number by a mix'd Number:

2,2) 80,30 (36,5

Here, the Dividend having two Places of Decimals, and the Diviſor one, there muſt be one in the Quotient.

6. To divide a mix'd Number by a Decimal Fraction, as if 80,30 were to be divided by ,365, here add three Cyphers to 80,30 the Dividend, becauſe it may have as many or more Decimal Parts than are in the Diviſor, and it will ſtand

Thus, 365) 80,30000 (22,00
730
730, &c.

And becauſe the Dividend hath five Places of Decimals, and the Diviſor but three, there muſt be two in the Quotient.

7. To divide a Decimal by a whole Number:

22) ,8030 (,0365

Here needs no Cyphers be annexed, becauſe the Dividend is (apparently) bigger than the Diviſor; but becauſe the Dividend has four Places in it, and the Diviſor none, a Cypher muſt be prefixed in the Quotient to ſupply it, and ſo the true Quotient will be ,0365.

8. To divide a Decimal by a mix'd Number:

3,65) ,8030 (,22

Here, 'tis plain the Quotient muſt be ,22. becauſe there are four Decimals in the Dividend, and but two in the Diviſor.

9. To divide one Decimal by another:

,22) 8030 (3,65

Here 'tis plain by the General Rule.

But ſometimes Cyphers muſt be added to the Dividend, as when the Diviſor is bigger than the Dividend:

Thus ,365) ,22,0000 (,602

Where ſix Places of Decimals being in the Dividend, and three in the Diviſor, three muſt alſo be in the Quotient.

Note, That when any Number (either Decimal or Mix'd) is given to be divided by an Unit, with Cyphers annexed thereto (as 10, 100, 1000, &c.) it is only removing the Separatrix in the Dividend ſo many Places farther toward the Left-hand, as there are Cyphers annex'd to the Unit, prefixing Cyphers to the Dividend to ſupply the vacant Places (if need be:)

Thus, if 7562 were to be divided

By	The Quotient is
10	756,2
100	75,62
1000	7,562
10000	,7562
100000	,07562

DECIMIS *Solvendis pro Poſſeſſionibus alienigenarum*, is a Writ, or Letters-Patents, yet extant in the *Regiſter*, which lay againſt thoſe that had farm'd the *Priors Aliens* Lands of the Kings, for the Rector of the Pariſh to recover his Tythe of them.

DECK of a Ship, is a Planked Floor on which the Guns lie, and the Men walk to and fro. In great Ships there are three Decks, Firſt, Second, and Third, beginning to account from the loweſt; and ſome alſo have an *Half Deck*, which reaches from the *Main Maſt* to the *Stem* of the Ship. There is alſo a *Quarter-Deck*, which is from the *Steerage* aloft to the Maſter's Round-Houſe. There is alſo ſometimes a *Spare Deck*, which is the uppermoſt of all,

all, and is between the *Main Maſt* and the *Miſſen*: This *Deck* is called alſo the *Orlope*: Which ſee.

DECLARATION (in Common Law) is a ſhewing in Writing the Grief and Complaint of the Demandant or Plaintiff, againſt the Defendant or Tenant, wherein he is ſuppoſed to have received ſome Wrong: And this ought to be plain and certain, both becauſe it impeaches the Defendant, and alſo compels him to anſwer thereto.

DECLENSION, of a Diſeaſe, is when it recedes from its Height, and the Patient is beyond Danger: See *Acme*.

DECLINATION *Apparent*, is the Diſtance of the apparent Place of a Planet from the *Equator*.

DECLINATION *of the Sun*, is the Diſtance of the Parallel to the Equator which the Sun runs in any Day, from the Equator it ſelf: And this Diſtance (on the Globe) is reckon'd on the *Meridian*; and according as this Diſtance is towards either of the Poles of the World, 'tis called *North* or *South Declination*.

To find the Sun's greateſt *Declination*; you muſt, by ſome very large Quadrant, or ſuch like Inſtrument, take the Sun's greateſt Meridian Altitude, and his leaſt at the two Solſtices; the Difference between which is the Double of the Sun's greateſt Declination, or the Diſtance of the Tropicks; wherefore half of it is the thing ſought.

To find the Sun's or Star's *Declination* by the *Globe* or *Sphere*; bring the Sun's Place, or the Star to the Meridian, and the Degrees from the Equinoctial there reckoned either *North* or *South*, are the *Declination* at Noon.

To find the *Declination* of the Sun Trigonometrically, having given his greateſt *Declination* and Diſtance from the next *Equinoctial Point*:

Say, *As the Rad. is to the Sine of the Sun's Diſtance from the next Equinoctial Point, ſo is the Sine of the Sun's greateſt Declination to the Sine of the preſent Declination.*

Example: Suppoſe the Sun's Diſtance from the next Equinoctial Point to be 30°. 00. The greateſt Declination 23°. 30'.

Then to the Sine of 30°. 00'.	9,698970
add the Sine of 23°. 30'.	9,600700
And the Sum (leſs Rad.) = Sine of 11°. 30'.	19,299670

which is the Sun's preſent *Declination* required.

How to find the *Declination* of a Planet or Star that hath Latitude, ſee *Newton's Aſtron. Britan.* p. 10.

In the *Pythagorean* or *Copernican Syſtem*, the Sun's *Declination* is expreſs'd by the *Complement of his Diſtance from the Pole*, or by the *Diſtance of the Pole from the Horizon of the Diſk*, and is called *the Reflection*: And the Proportion to find it is this;

As the Rad. to the Sine of the Diſtance of the two Poles of the Ecliptick and the Equator:: So is the Sine of the Sun's Longitude to the Co-ſine of his Diſtance from the next Pole: The Complement of which laſt, is the *Reflection*, the Diſtance of the Sun from the Horizon of the Disk, or his *Declination*.

DECLINATION *of the Mariner's Compaſs*, is its *Variation* from the true Meridian of any Place. How to find this, ſee in *Variation*.

DECLINATION *True*, is the Diſtance of the *True* Place of a Planet from the *Equator*.

DECLINATION *of a Wall* or *Plane for Dials*, is an Arch of the Horizon, comprehended either between the Plane and the Prime Vertical Circle, if you account it from the *Eaſt* or *Weſt*, or elſe between the Meridian and the Plane, if you account it from the *North* or *South*.

There are many ways given by Authors, for finding the *Declination* of a Plane; of which, all thoſe that depend on the Magnetick Needle deſerve to be ſuſpected upon many Accounts. The common Method alſo, by finding the Sun's Horizontal Diſtance from the Pole of the Plane, is ſubject to many Errors and Difficulties. Mr. *Oughtred's* way, by a Semi-circle drawn on a Square Board, is the plaineſt and eaſieſt Method that can be well thought on of that Nature; but then there is Difficulty in ſetting the Pin truly perpendicular, as well as in placing the Board truly Horizontal; and at the ſame time is required the Sun's *Declination* and *Azimuth* to be had exactly. The very beſt way therefore that I ever met with for finding the *Declination* of a Plane, is to get, on a large ſquare Piece of Braſs or Wood, a Limb accurately divided into 360 Degrees, and (if it can be) every 5 Minutes; on the Center of which moves an Horizontal Dial, purpoſely made for the Latitude of the Place, and which hath a ſmall Bit of fine Braſs fixed on its Meridian Line, like a fiducial Edge, to cut the Degrees in the Limb. The Uſe of which is very eaſy; for at any time when the Sun ſhines, you need only apply that Side of the Square to the Plane where are 60 Degrees on the Limb; and then ſetting it as nearly as you can horizontally, turn the Dial about, till it ſhew exactly the true Hour of the Day (which before muſt be rightly found, and a Watch ſet to it) and then will the fiducial Edge cut the Degrees of the Plane's *Declination*; and which way to account it will be eaſily ſeen, becauſe the Dial pointing true *North* gives you an Idea of all the Points of the Compaſs.

And this Method will be of great Uſe to ſuch, whoſe Buſineſs is to make many Dials in or near the ſame Latitude.

DECLINATORIES, are Boxes fitted with a Compaſs and Needle, to take the Declination of Walls for Dialling, &c.

DECLINING *Erect Dials*, how to make; ſee *Dial* in *Erect declining Dials*.

DECLINING *Erect Planes*: See *Erect declining Planes*.

DECLINING { *Inclining* / *Reclining* } *Dials*, are thoſe whoſe Planes neither face directly any of the Four Cardinal Points; nor are they either perpendicular or parallel to the Horizon.

For the deſcribing of theſe Dials; firſt make an *Erect* one for the given *Declination*, according to the Direction in *Erect Declining Dials*; then let the *Height of the Stile* above the *Subſtile* be the { Difference between / Sum of } the Co-Latitude and *Inclination*, *Reclination*.

DECLINING { *Reclining* / *Inclining* } *Planes*: See *Dial Plan.*

DECLIVIS *Muſculus*: See *Obliquus deſcendens ſeu Declivis*.

DECOCTION, is a boiling of ſome Plants, Roots, Seeds, &c. for Medicinal Uſe, being the ſame as *Apozem*: Which ſee.

DECORTICATION, the peeling or unhusking of Roots, Seeds, Fruits, &c. or the freeing of them from their Barks, Rinds, Husks, or Shells.

DECORUM or *Decency*, in Architecture, is a ſuiting of all the Parts and Ornaments of a Building, ſo as they ſhall become the Station; as *Vitruvius* ſhews, when he ſpeaks of adjuſting the ſeveral Orders

ders to their Natural Affections; and he, as Mr. *Evelyn* obſerves, would never have placed a *Corinthian Column* at the Entrance into a Priſon, nor one of the *Tuſcan* Order before the *Portico* of a Church.

DECREPITATION *of Sea Salt*, or *of Sal Gemme*, is a Word uſed by the Chymiſts for a kind of Calcination of Salt thus; an earthen unglazed Pot is heated red hot over the Fire, and then an Ounce of Salt is thrown into it, and the Pot is preſently covered; a great cracking Noiſe ariſes, whence comes the word *Decrepitation*. If more Salt be to be decrepitated, the Pot muſt be kept ſtill red hot, and you muſt proceed as at firſt. The Deſign of it is to free the Salt from ſuperfluous Moiſture, but it renders the Salt ſo porous and apt to imbibe the Humidity of the Air, that it muſt always be kept in a Viol well ſtopp'd, or elſe the Air will ſoon moiſten it anew.

DECUPELATION, the ſame with *Decantation:* Which ſee.

DECUSSATION, a Term in Opticks, is the croſſing of any two Lines, Rays, &c. when they meet in a Point, and then go on apart from one another.

DECUSSORIUM, is a Surgeon's Inſtrument, wherewith the *Dura Mater* being highly preſſed, is accurately adjoined to the Skull, that the Purulent Matter gathered betwixt the Skull and the Skin, called *dura Meninx*, or *Mater*, may be evacuated by a Hole made with a Surgeon's Inſtrument, called *Trepanum. Blanchard.*

DE DEONERANDA *pro rata Portionis*, is a Writ that lies where a Man is diſtrained for Rent that ought to have been paid by others proportionably.

DEDIMUS *Poteſtatem*, is a Writ whereby a Commiſſion is given to a private Man, for the Speeding of ſome Act appertaining to a Judge; and by the *Civilians* is called *Delegation.*

DEEDS, in Common Law, ſignify Writings, that contain the Effect of a Contract made between Man and Man: See more in *Fait.*

DEEP *Sea-Line*, is a ſmall Line to Sound with, when a Ship is in very deep Water at Sea; at the End of it is a piece of Lead, called the *Deep-Sea-Lead*, at the Bottom of which is a *Coat of white Tallow*, to bring up Stones, Gravel, Sand, Shells, or the like from the Bottom, and to know the Differences of the Ground, which having been before diſcovered by other Obſervations, and entred in their Books, they gueſs by their Soundings what Coaſts they are upon, though they cannot ſee Land. If it happens that no Ground come up upon the Tallow, they gueſs they are upon *Ouzie Ground*, which they diſcover by ſounding again with a Woollen Cloth upon the Lead, whereby this Ground will be brought up.

DE *Eſſendo quietum de Tolonio*, is a Writ which lieth for them which are by Privilege freed from the Payment of Toll.

DE *Expenſis Militum*, is a Writ, commanding the Sheriff to levy ſo much a Day for the Expences of a Knight of the Shire; and a like Writ to levy Two Shillings a Day for every Citizen and Burgeſs, called *De expenſis Civium & Burgenſium.*

DEFAULT, in Law is a Non-appearance in Court, without ſufficient Cauſe made out.

DEFECTIVE or *Deficient Nouns*, in Grammar, are ſuch as want either a Number, a particular Caſe, or are *Indeclinable.*

DEFEIZANCE, ſignifies (in Law) a Condition relating to a Deed, as an Obligation, Recognizance, or Statute, which being performed by the Obligor or Recognizor, the Act is diſabled and annulled, as if it had never been done. The Difference between a *Proviſo* or a Condition in Deed, and a *Defeizance*, is this, That a *Proviſo* or Condition is annexed or inſerted in the Deed or Grant, whereas a *Defeizance* is uſually a Deed by it ſelf.

DEFENCES, in Fortification, are all ſorts of Works that cover and defend the oppoſite Poſts, as *Flanks*, *Parapets*, *Caſemates*, *Fauſſe-Brays:* 'Tis almoſt impoſſible to fix the Miner to the Face of a Baſtion till the Defences of the oppoſite one are ruin'd: *i. e.* till the Parapet of its Flank is beaten down, and the Cannon in all Parts that can fire upon that Face which is attacked, are diſmounted.

DEFENDANT, a Term in Law, is he that ſueth in an Action perſonal, as Tenant is he which is ſued in an Action real.

DEFENDEMUS, a word uſed in Feoffment or Donation, and bindeth the Donor and his Heir to defend the Donee.

DEFENSIVE, or *Defenſitive Medicines*, in Surgery, are Remedies applied outwardly to prevent an Inflammation, or any other Symptom that ſeems to threaten any Part, from arriving ſo far as to that Part.

DEFERENT, in Aſtronomy, an imaginary Circle or Orb (in the *Ptolemaick Syſtem*,) which is there ſuppoſed, as it were to carry about the Body of the Planet. 'Tis the ſame with the *Eccentrick.* The two Points where the Epicicle interſects the *Deferent*, are called the *Points of the greateſt Elongation.*

DEFICIENT *Nouns:* See *Defective.*

DEFICIENT *Numbers*, are ſuch, whoſe Parts added together make leſs than the Integer, whoſe Parts they be; as Eight, whoſe Parts being One, Two and Four, make but Seven; likewiſe the Parts of Sixteen make but Fifteen, and of Forty five make but Thirty three.

DEFILE, in Fortification, is a ſtraight narrow Lane or Paſſage, through which a Company of Horſe or Foot can paſs only in File, by making a ſmall Front, ſo that the Enemy may take an Opportunity to ſtop their March, and to Charge them with ſo much the more advantage, in regard that thoſe in the Front and Rear cannot reciprocally come to the Relief of one another. Hence to go off File by File is called *Defiling.*

DEFINITION, is an exact Deſcription, explaining the Nature of a thing by Eſſential Attributes. And there are three things neceſſary to make a *Definition* good.

1. It muſt be Univerſal; *i. e.* it muſt contain the whole Thing defined; therefore (as the Author of the *Art of Thinking* would have it) the common *Definition* of Time to be the Meaſure of Motion, is not good; for Time may be the Meaſure of Reſt as well as Motion.

2. It muſt be proper, that is, it muſt agree with the Thing defined.

3. It muſt be clearer than the Thing defined, that is, it ought to render the *Idea* of it more plain and diſtinct; and make us as much as may be to underſtand the Nature of it, and be ſerviceable to us to give a Reaſon of its principal Properties, which is that which we ought chiefly to conſider in *Definitions.*

DEFLAGRATION, in Chymiſtry, is the enkindling and burning of, in a Crucible, a Mixture of Salt or ſome Mineral Body, with a Sulphurous one, in order to make a Purification of the Salt, or a Regulus of the Mineral; of which ſee *Sal Prunella* and *Regulus of Antimony.*

DEFLECTION, is the Tendency of a Ship from her true Courſe by the Reaſon of Currents, &c. which divert her, and turn her out of her right way.

DEFLUVIUM, is a Diſtemper in Trees, whereby they loſe their Bark; 'tis cauſed by a ſharp Humour, that diſſolves the Glew whereby the Bark is faſtned to the Wood; and ſometimes by too much Drought.

DEFLUXION: See *Catarrh.*

DEGLUTITION, Swallowing, is an Animal Action, whereby Meat chaw'd in the Mouth, or any thing more liquid, deſcends into the Stomach by the Motion and Contraction of the Fibres of the Gullet. *Blanchard.*

DEGRADATION, is a Term in Painting, which expreſſes the leſſening and rendring confuſed the Appearance of diſtant Objects in a Landſkip, ſo as they ſhall appear there as they would to an Eye placed at that diſtance from them.

DEGREE, is the 360th Part of the Periphery of a Circle, it is ſub-divided into 60 Parts, called *Minutes*, and each of them again into 60 Parts more, called *Seconds*, and ſo into *Thirds*, &c.

DEGREE *Parodick:* See *Parodical.*

DEGREES *of Fire:* The Chymiſts reckon Four Degrees of Fire. The *firſt* is made by only 2 or 3 Coals, and is the moſt gentle Heat of all. The *2d*, is with 4 or 5 Coals, or only juſt to warm the Veſſel ſenſibly, but ſo that you may endure your Hand upon it for ſome Time. The *3d* Degree is when there is Heat enough to make a Pot boil that is full of 5 or 6 Quarts of Water. The *4th* Degree is as great a Heat as can be made in a Furnace; but all theſe muſt admit of ſome Variations, according to the Circumſtances of the Operations, Furnaces, Veſſels, Quantity of Matter, *&c.*

DEJECTION, the ſame with *Ejection*; is going to Stool, or an Evacuation of the Excrements by the Periſtaltick Motion of the Guts.

DELEGATES, in Law, are Commiſſioners delegated or appointed by the King's Commiſſion, to ſit upon an Appeal to him in the Court of *Chancery*, and is granted in Three Caſes; *Firſt*, When a Sentence is given in an Eccleſiaſtical Cauſe by the Archbiſhop, or his Official. *Secondly*, When a Sentence is given in any Eccleſiaſtical Cauſe in Places exempt. *Thirdly*, When Sentence is given in any Admiralty in Suits Civil or Marine, by order of the Civil Law.

DELETERIOUS, or *Deletery Medicines*, are ſuch Things or Particles as are of a poiſonous Nature.

DELF, one of the Abatements of Honour in Heraldry, being a Square in the Middle of the Eſcutcheon. See *Abatements of Honour.*

DELIGATIO, Swathing, is a part of Surgery that concerns the Binding up of Wounds, Ulcers, broken Bones, *&c.* and it is either Simple or Compound: The Simple is either equal or unequal; the equal is only round, which ſwathes the affected Member without any Declenſion to either Side; the unequal is divided into *Aſcia* and *Sima*, which at leaſt differ upon the Account of one being greater and the other leſs; *Aſcia* declines little from a Round, but *Sima* much. There are a great many more Diſtinctions of Swathing, taken from the Likeneſs of the Parts which are ſwathed, or from certain Animals and other Things. *Blanchard.*

DELIQUIUM *Animi*, Swooning, the ſame with *Eclipſis*, *Lipothymia*, *Syncope*, *Aſphyxea*, *Lipopſychia*, &c.

DELIQUIUM *Chymicum*, is either a Diſtillation by the Force of Fire; or a melting of the Calx, which is ſuſpended in moiſt Cellars, and a Reſolution of it into Lixivious Humour; thus when Salt of Tartar, or any ſuch fixed Alkali is ſet in a Cellar or ſome ſuch cool Place in an open Veſſel, it will run into a Kind of Water, which the Chymiſts call *Oil of Tartar per Deliquium.*

DELIRIUM, is a Depravation of the Imagination and Judgment, ariſing from a tumultuary and diſorderly Motion of the Animal Spirits, occaſioned by a Fever; whereupon the Perſons affected ſpeak ſeveral abſurd and incongruous things. *Blanchard.*

DELPHINUS, the *Dolphin*, a Conſtellation in the Northern Hemiſphere, containing 10 Stars.

DELTOIDES, is the Name of a triangular Muſcle, in Form like the *Greek* Letter Δ; it proceeds from the *Clavicula* or Channel-Bone, from the upper Proceſs of the Shoulder-Blade, and from the Proceſs of the ſame, which is called *Spiniforme*; and being faſtned to the Middle of the *Os humeri*, lifts it directly upwards, or ſomewhat forwards or backwards, according to the Direction of its differing Series or Fibres.

DELUGE, the ſame with an Inundation or overflowing of the Earth, either in part, or in the whole, by Water. There have been ſeveral very notorious Deluges or Floods, whoſe Memorials are recorded in Hiſtory; as that of *Ogyges* which overflow'd almoſt all *Attica*, and that of *Deucalion* which drowned all *Theſſaly* in *Greece*; but the moſt terrible one that ever was, was that which is uſually and very properly called the *Univerſal Deluge*, or *Noah's Flood*, which *overflow'd* and *deſtroyed* the whole Earth, and out of which only *Noah* and thoſe with him in the Ark eſcaped.

Men have been very ſollicitous to account for this diſmal Judgment Philoſophically, and to diſcover from whence ſuch an amazing Quantity of Water could come as was neceſſary to cover all our Globe to the Height of 15 Cubits above the higheſt Hills, for to that Height, *Moſes* ſaith expreſly, *Gen.* vii. 20. *the Waters prevailed*; and ſome have made ſo bold with him, as to deny there were any Mountains at all before the Flood, though he expreſly mentions them as a Standard for the Height of the Water; and others have denied the Univerſality of the Deluge, though the Text be as plain as Words can deliver, *That all the Hills over the whole Earth were covered.* Others have had recourſe to the ſhifting of the Earth's Center of Gravity, and ſo will have its Parts all drowned ſucceſſively: And our famous Theoriſt, Dr. *Burnet*, makes an Earth as it were on Purpoſe to be drowned at that time; which being in the Form of an orbicular Cruſt on the Face of the *Sea* (as we now call it, for he ſaith there was none before the Deluge) fell down into the Water, and ſo drowned its Inhabitants.

Now for my own part, I ſhould not at all be in care how to find Water for ſuch a Cataſtrophe, if that were all that appeared neceſſary to enquire after; for I could eaſily believe, that the Great Creator of the World could ſoon either educe *Subterraneam*, bring down *Superceleſtial*, or create Waters on purpoſe for ſuch an Occaſion; for nothing can be too hard for Omnipotence to effect; and I dare not make my Underſtanding a Judge how far it may be expedient for Him to make uſe of His Almighty Power without Secondary Cauſes.

But the Matter lies not here, the *S. S.* tells us, That the Waters of the Deluge came from two Funds, the *Great Deep below* and the *Rains above*; to theſe therefore we muſt ſtick, and look no further. Again, when we look into the Internal Parts of the Earth, even to the Greateſt Depth Men have ever digg'd or min'd, we find there that the Body of the Terreſtrial Globe is compoſed of *Strata*, Rows or Layers lying one over another, and which appear to every one that obſerves them to be Sediments of a Flood; beſides, in the Bodies of theſe *Strata*, though never ſo ſolid, nay even incloſed

ed within the Solidity of the firmeſt Flints, Marble, Stone, &c. we find a prodigious variety of the *Exuviæ* or Remains of Fiſhes, ſuch as their Shells, Teeth, &c. as well Marine ones, as thoſe which live in Lakes and Rivers: And from a due Obſervation of theſe, and repeated Conſiderations upon them, it was, that the Learned and Ingenious Dr. *Woodward*, Profeſſor of Phyſick in *Greſham College*, founded what he delivers upon this Subject; which therefore is not ſo much a *Theory*, as neceſſary Deductions, and unavoidable Conſequences drawn from Matter of Fact.

And from hence it is, and hence only, that he deduces the following *Inferences* relating to the *Univerſal Deluge*, in his *Natural Hiſtory of the Earth*; which appear to me very reaſonable, and are theſe.

1. That theſe Marine Bodies, and the other Spoils of Freſh-water Fiſhes, were born forth of the Sea by the Univerſal Deluge, and on return of the Water back again from off the Earth, they were left behind at Land.

2. That during the time of the Deluge, whilſt the Water was out upon, and covered the Terreſtrial Globe, all the *Stone* and *Marble* of the Antediluvian Earth; all the *Metals* in it; all the Mineral Concretions; and in a Word, all Foſſils whatever that had before attained any Solidity, were *totally diſſolved*; their Conſtituent Corpuſcles were disjoined, and their Coheſion perfectly ceaſed; and that the ſaid Corpuſcles of thoſe ſolid Foſſils, together with the Corpuſcles of theſe which were not before ſolid, ſuch as Sand, Earth, and the like; as alſo all Animal Bodies and Parts of Animals Bones, Teeth, Shells; Vegetables and Parts of Vegetables, Trees, Shrubs, Herbs; and, to be ſhort, all Bodies whatſoever that were either upon the Earth, or that conſtituted the Maſs, if not quite down to the Abyſs, yet quite down to the greateſt Depths we ever dig; all theſe, he ſays, were aſſumed up promiſcuouſly into the Water, and ſuſtained in it, in ſuch manner, that the Water, and Bodies in it, together made up one common Maſs.

3. That at length all the Maſs that was thus born up in the Water, was again precipitated and ſubſided toward the Bottom: And that this Subſidence happened generally according to the Laws of Gravity: That Matter, Body, or Bodies which had the greateſt Quantity or Degree of Gravity, ſubſiding firſt in order, and falling loweſt; *that* which had the next, or a ſtill leſſer Degree of Gravity ſubſiding next after; and ſo in their ſeveral Courſes: *That* which had the leaſt Gravity ſinking not down till laſt of all, but ſettling at the Surface of the Sediment, and covering all the reſt: That the Matter ſubſiding thus, form'd the *Strata* of Stone, Earth, Marble, Coal, &c. of which *Strata* lying one upon another, the Terreſtrial Globe, or at leaſt as much of it as hath ever been diſplayed to Human view, doth mainly conſiſt.

4. That the *Strata* of Marble, Stone, and of all other ſolid Matter attained their Solidity, as ſoon as the Sand or other Matter, whereof they conſiſt, was arrived at the Bottom, and well ſettled there; and that all thoſe *Stratæ* which are ſolid at this Day, have been ſo ever ſince that time.

5. That theſe *Strata* lying thus one on another, were all originally parallel; and they were plain, even and regular, rendring conſequently the Surface of the Earth even and ſpherical; that they were contiguous, and not interrupted or broken as we find them now; and that the whole Maſs of the Water lay then upon them, above them all, and conſtituted a Fluid Sphere environing round all the Globe.

6. That after ſome time, by the Force of an Agent ſeated within the Earth, theſe *Strata* were broken on all ſides the Globe; that they were *diſlocated*, and their Situation varied, being elevated in ſome Places, and depreſſed in others; and from hence aroſe all the Mountains, Valleys, and other Inequalities of our preſent Earth's Surface; all the Caverns and Grotto's, all the Perpendicular and Horizontal Fiſſures; the Channel of the Sea, all Iſlands, &c. In one word, the whole Terraqueous Globe was put, by this Diſruption and Diſlocation of the *Strata*, into the Condition which we now behold it. *Nat. Hiſt. of the Earth.* Part 2.

And afterward, in *Part* the 3d. conſidering farther this Matter of the Univerſal Deluge, he concludes from his *Obſervations*;

1. That the *Deluge* of *Noah* was truly *Univerſal*, and laid the whole Earth under Water, covering all, even the higheſt Mountains, quite round the Globe.

2. That at the time of the *Deluge*, the Water of the Ocean was firſt brought out on the Earth, and that *it* was immediately ſucceeded by *that* of the Abyſs, which was alſo brought out on the Surface of the Globe.

3. That upon the Diſruption of the *Strata*, and the Elevation of ſome, and the Depreſſion of others of them, which followed after that Diſruption towards the End of the Deluge, this *Maſs* of *Water* fell back again into the depreſs'd and loweſt Parts of the Earth, into Lakes and other Cavities into the *Alveus* or Channel of the Ocean; and through the Fiſſures whereby *this* communicates with the Ocean in the Abyſs, which it filled till it came to an *Æquilibrium* with the Ocean.

4. That the *Deluge* commenced in the *Spring Seaſon*, the Water coming forth upon the Earth in the Month which we call *May*.

5. That the *Deluge* did not happen from an accidental Concourſe of Natural Cauſes, but that many things were then done, which never could poſſibly have been done without the Aſſiſtance of a *Supernatural Power:* That the ſaid *Power* acted in this Matter with *Deſign*, and with the higheſt *Wiſdom:* And that as the Syſtem of Nature was then, and is ſtill ſupported and eſtabliſhed, a *Deluge* neither did nor could happen naturally.

The Learned and Ingenious Mr. *Whiſton*, now Mathematical Profeſſor of the Univerſity of *Cambridge*, in his *New Theory of the Earth*, ſuppoſes, and indeed makes it very probable from ſeveral ſurpriſing Co-incidences (as the exact Correſpondence between the *Solar* and *Lunar* Year, ſuppoſing, as he doth, that the Earth moved in a Circular Orbit before the *Deluge:* That the Earth at the Time of the *Deluge* ſhould be in its Perihelion, which is indeed the natural Effect of a Comet's paſſing by at that time, and drawing it from a Circular to an Elliptical Orbit: And alſo, That the Moon was then in ſuch a Place of its Orbit, as to be equally attracted by the Earth when the Comet paſſed by; I ſay, he renders it very probable) that a Comet deſcending in the Plane of the Ecliptick towards it Perihelion, paſſed juſt before the Earth on the firſt Day of the *Deluge:* The Conſequences of which he thinks would be, That this Comet, when it came below the Moon, would raiſe a prodigious, vaſt and ſtrong Tide, both in the ſmall Seas, which, according to his Hypotheſis, were in the Antediluvian Earth (for he allows no great Ocean there, (as in ours) and alſo in the Abyſs, which was under the upper Cruſt of the Earth. This Tide he ſuppoſes would riſe and increaſe all the time of the approach of the Comet towards the Earth, and would be at its greateſt Height when the Comet

was at its leaſt Diſtance from it. By the Force of which Tide, and alſo by the Attraction of the Comet, he judges, that the Abyſs muſt put on an Elliptick, or rather exactly Oval Figure, whoſe Surface being much larger than the former Spherical one, the outward Cruſt of the Earth incumbent on the Abyſs, muſt needs accommodate it ſelf to that Figure, which yet it could not poſſibly do while it held ſolid and conjoined together; and therefore he concludes, that it muſt of neceſſity be extended, and at laſt broken by the violent Force of the ſaid Tide and Attraction, and conſequently have innumerable Gaps and Clefts made quite through it, out of which the included Water of the Abyſs muſt iſſue, and ſo help to occaſion the *Deluge*.

He ſuppoſes further, That this Comet in its Deſcent towards the Sun, paſſed ſo cloſe by the Body of the Earth, as to involve it in its Atmoſphere and Tail for a good while, and conſequently left a vaſt Quantity of Vapours both expanded and condenſed on its Surface; a great Part of which being very much rarify'd after their firſt Fall, would be ſoon drawn up into the Air again, and afterwards fall down on the Earth in vaſt and prodigiouſly violent Rains; which was the Cauſe of the *Forty Days* Rain mentioned by *Moſes* in his Hiſtory of the *Deluge*. But the other great Rain, which with this laſted for 150 Days, was cauſed (he ſaith) by the Earth's coming a ſecond time into the Tail of the Comet: And from this double coming of the Earth into, firſt, the Atmoſphere, and then the Tail of the Comet, he ſuppoſes half the Water of the *Deluge* to be derived, as the other half came from the Abyſs; whoſe Waters he ſuppoſes were continued to be brought out from the Preſſure of that Water which came from the Comet, which he thinks would preſs downwards with a mighty Force, and endeavour to ſink the outward Cruſt of the Earth down into the Abyſs, and this would force the Subterranean Water up through the Clefts and Fiſſures before made in the Cruſt by the Violence of the Tide abovementioned. And at laſt, to remove this vaſt Orb of Waters again, he ſuppoſes a mighty Wind to have ariſen, which dried up ſome, and forced the reſt down into the Abyſs through the Clefts or Fiſſures by which it came up in a good meaſure before; only that a good Quantity indeed retired into the *Alveus* of the great Ocean (now firſt made) and into leſſer Seas and *Lakes*, &c. From the Calculation of this Comet he concludes, That the *Deluge* began on the 17th Day of the Second Month from the Autumnal Equinox (or on the 27th Day of *November*, in the *Julian* Stile extended backward) in the 2365th Year of the *Julian* Period, and in the 2349th Year before the Chriſtian *Æra*. He aſſerts alſo, That the Waters of the *Deluge* were ſtill, calm and free from Commotions, Storms, Winds and Tempeſts of all ſorts, during the whole time the Ark was afloat upon them: That at the *Deluge* the Earth was firſt divided into two vaſt Continents almoſt oppoſite to one another, and ſeparated by a vaſt Ocean, as it is now; and alſo, that ſince the *Deluge*, there neither hath nor will be any great or general Changes in the State of the World, till a Period be put to the preſent Courſe of Nature. How he makes out theſe things, the Reader will find in his *New Theory of the Earth*, which is very well worth the careful Peruſal of every Mathematical and Philoſophical Reader.

DEMAINE, or *Demeſn*, *Dominicum*, is a *French* Word, otherwiſe written *Domaine*, and ſignifieth, as *Hottoman* ſaith, *Patrimonium Domini, in verbis feudalibus, verbo Dominicum*, where, by divers Authorities, he proveth thoſe Lands to be *Dominicum*, which a Man holdeth originally of himſelf, and thoſe to be *feodum* which he holdeth of a Superior Lord.

In *England* no common Perſon hath any *Demaines* ſimply underſtood, for all dependeth either mediately or immediately on the Crown; for when a Man in pleading would ſignify his Land to be his own, he ſaith, That he is or was ſeiz'd thereof in his *Demaine*, as of Fee, *Lit. lib.* 1. *C.* 1. whereby he meaneth, That although his Land be to him and his Heirs for ever, yet it is no true *Demaine*, but dependeth upon a Superior Lord, and he holdeth by Service, or Rent in lieu of Service, and by both Service and Rent.

This Word *Demaine* is diverſly taken; ſometimes more largely, as of Lands and Tenements held for Life, &c. and ſometimes more ſtrictly, as for ſuch only as are generally held in Fee. This Word is ſometimes uſed for a Diſtinction between thoſe Lands that the Lord of the Mannor hath in his own Hands, or in the Hands of his Leſſee, demiſed upon a Rent for Term of Years or Life, and ſuch other Lands appertaining to the ſaid Mannor, which belongeth to the Free or Copy-holders. And the reaſon why Copy-hold is accounted *Demaines*, is, becauſe they that be Tenants to it, are judged in Law to have no other Right, but at the Will of the Lord; ſo that it is reputed ſtill, after a ſort, to be in the Lord's Hands: And yet in common Speech that is ordinarily called *Demeans*, that is, neither Fee nor Copy. Note alſo, That *Demaine* is ometimes uſed in a more ſpecial Signification, and is oppoſite to *Frank-Fee*: For Example, Thoſe Lands which were in the Poſſeſſion of *Edward the Confeſſor*, are called *Ancient Demaine*, and others be called *Frank-Fee*. *Kitchin*, Fol. 98. And the Tenants which hold any of thoſe Lands, be called *Tenants in Ancient Demaine*, the other *Tenants in Frank-Fee*, and alſo Tenants of the Common Law; the Reaſon is, becauſe *Tenants in Ancient Demaine* cannot be ſued out of the Lord's Court.

DEMI-BASTION, is a kind of Fortification that hath only one *Face* and one *Flank*.

DEMI-CANNON *loweſt*, the Name of a great Gun; (the ordinary ones are about 6 Inches bore, 5400 lb. Weight; ſome 10, ſome 11 Foot long, and carry a Shot of 30 Pound Weight;) it carries point blank 156 Paces; its Charge of Powder is 14 Pound Weight. There are alſo two Sizes of Demi-Cannon above this, which are ſomething larger, as the

Demi-Cannon Ordinary, which is $6\frac{1}{6}$ Inches Bore, 12 Foot long, weighs 5600 Pounds; its Charge of Powder is 17 Pounds 8 Ounces, carries a Shot $6\frac{1}{2}$ Inches in Diameter, and whoſe Weight is 32 Pounds, and the Piece ſhoots point blank 162 Paces.

Demi-Cannon of the largeſt ſize, is $6\frac{6}{8}$ Inches Bore, 12 Foot long, of 6000 Pounds Weight; its Charge is 18 lb. of Powder, and the Piece ſhoots point blank 180 Paces.

DEMI-CULVERING, a Piece of Ordnance; the common ſort of them are $4\frac{1}{2}$ Bore, 2700 lb. Weight, 10 Foot long, carries a Shot of 10 Pounds 11 Ounces, is charged with 7 Pounds 4 Ounces of Powder, and ſhoots Point blank 175 Paces.

Demi-Culvering of the loweſt Size, is $4\frac{1}{4}$ Inches Bore, 10 Foot long, of 2000 lb. Weight; its Charge is 6 Pound 4 Ounces of Powder; it carries a Ball of 4 Inches Diameter, and of 9 Pound Weight, and its level range is 174 Paces.

Demi-Culvering of the Elder ſort is $4\frac{6}{8}$ Inches Bore, 10 Foot long, and $\frac{1}{3}$ of 3000 lb. Weight; its Charge of Powder is 8 lb. and 8 Ounces, the Ball is 4 Inches $\frac{1}{2}$ Diameter, weighs 12 lb. 11 Ounces, and the point blank Shot 178 Paces.

DEMI-

DEMI-DISTANCE of *Polygons*: See *Polygons*.

DEMI-DITON, a Note in Muſick, being the ſame with *Tierce Minor*: See *Monochord*.

DEMI-GORGE, in Fortification, is half the Gorge or Entrance into the Baſtion, not taken directly from Angle to Angle where the Baſtion joins to the Cortine, but from the Angle of the Flank to the Center of the Baſtion, or Angle the two Cortines would make, were they thus protracted to meet in the Baſtion.

DEMI-QUAVER, a Note in Muſick: See *Notes* and *Time*.

DEMISE, (in Law) is applied to an Eſtate either in Fee-ſimple, Fee-Tail, or for Term of Life, and ſo it is commonly taken in many Writs: The King's Death is in Law termed *the Demiſe of the King*.

DEMOCRACY, is a Form of Covernment where the ſupreme Power and Authority is lodg'd in the People, and they chuſe all Adminiſtrators and Officers.

DEMONSTRATION, is a Chain of Arguments depending on one another, and founded primarily on firſt and ſelf-evident Principles, or plain Propoſitions eſtabliſhed and proved from them, and at laſt ending in the invincible Proof of the thing to be demonſtrated, as the Concluſion.

DEMURRER, (in Common Law) ſignifies a kind of Pauſe upon a Point of Difficulty in any Action. In *Chancery* the Defendant *demurrs* to the Plaintiff's Bill, averring it to be defective in ſuch and ſuch a Point; and demands the Judgment of the Court thereupon, whether he ſhall be compell'd to make any further or other Anſwer thereunto, *&c.*

DENEB, the ſame with *Cauda Lucida* or *Lion's Tail*, a Star ſo called: Which ſee.

DENIZEN, (in Law) ſignifies an Alien that is enfranchiſed by the King's Charter, and in all reſpects almoſt to do as the King's Native Subjects do, *viz.* to purchaſe and poſſeſs Lands, and to be capable of any Office or Dignity; yet it is ſhort of Naturalization, becauſe a Stranger Naturalized may inherit Lands by Deſcent, which a Man made only a *Denizen* cannot.

DENOMINATIVES, in Logick, are ſuch Terms as take their *Original* and *Name* from others.

DENOMINATOR *of a Fraction*, is the Number below the Line, ſhewing the Nature and Quality of the Parts which any Integer is ſuppoſed to be divided into: Thus in $\frac{6}{8}$, 8 the Denominator ſhews you, that the Integer is ſuppoſed to be divided into 8 Parts or half Quarters; and the Numerator 6 ſhews, that you take 6 of ſuch Parts, *i. e.* three Quarters of the Whole.

DENOMINATOR *of any Proportion*, is the Quotient ariſing from the Diviſion of the *Antecedent* by the *Conſequent*: Thus, 6 is the Denominator of the Proportion that 30 hath to 5, becauſe 5) 30 (6. This is alſo called the *Exponent* of the *Proportion* or *Ratio*.

DENSE: that Body is ſaid to be *Denſe* or Thick, when it hath more of Matter, in proportion to the Space or Room it takes up, than other Bodies have; and the being under theſe Circumſtances is called the

DENSITY *of Bodies*, as that which produces it, is called *Condenſation*.

The Denſity of Water to Air is, as Sr. *Iſ. Newton* ſtates it, as 800, or 850 to 1, allowing the Mercury in the Baraſcope 30 Inches; though Mr. *Boyle* and ſome others make it as 1090 to 1; but I judge the former Proportion comes neareſt the Truth.

The Denſity of Quick-ſilver to Water is as $13\frac{1}{2}$ to 1; and when the Quick-ſilver is extraordinary good, as 24 to 1 nearly; and conſequently the Denſity of Quick-ſilver to Air is as 11617 to 1.

Sir *Iſaac Newton* aſſerts the Denſity of the Planets *Sol*, *Saturn*, *Jupiter*, and of our Earth, and the *Moon*, to be as 100, 60, 76, 387, and 700, and concludes the Sun to be a little denſer than *Jupiter*, and our Earth 7 times more denſe than the *Sun*.

DENTARPAGA: See *Forfex*.

DENTIDUCUM: See *Forfex*.

DENTIFRICE, is a Medicine for the whitening, ſcouring, and faſtning the Teeth, and for ſtrengthning the Gums.

DENTILS, in Architecture, is a Member of the *Ionick Cornice*, ſquare and cut out at convenient Diſtances, which gives it the Form of a Sett of Teeth, and the Original of its Name.

DENTITION, is the Time that Children breed Teeth, which is about the ſeventh Month, or later; and uſually the upper Teeth come firſt, though in ſome the under; and amongſt theſe the Fore-Teeth firſt. *Blanchard*.

DEOBSTRUENT *Medicines*, Remedies that open Obſtructions.

DEODAND, a thing devoted or conſecrated to God for the Pacification of His Wrath, in caſe of Miſadventure, whereby any Chriſtian Man cometh to a violent End, without the Fault of any Reaſonable Creature; as if a Horſe ſhould ſtrike his Keeper, and ſo kill him; in this Caſe the Horſe is to be a *Deodand*, that is, given to God, that is, to be ſold, and diſtributed to the Poor, for an Expiation of that dreadful Event, though effected by an unreaſonable Creature.

DEOPPILATIVE, the ſame with *Deobſtruent Medicines*: Which ſee.

DEPART, a certain Operation in Chymiſtry is called *the Depart*, becauſe the Particles of Silver are made by it to *depart* from Gold, when they were before melted together in the ſame Maſs, and could not be ſeparated any other way.

'Tis done by melting the united Metals together in a Crucible with a ſtrong Fire, and while the Matter is in Fuſion, caſting it into a Veſſel of cold Water, the Mixture will be divided into very ſmall Grains, which being collected again, and having *Aqua fortis* poured on them, the *Menſtruum* will diſſolve the Silver, but leave the Gold at the Bottom in a Powder; which, after the Solution of the Silver is gently poured off, muſt be waſhed to ſweeten it. This is intended for a kind of Purification of Gold; but all the Particles of the Silver will ſcarce be ſeparated from it even this way. The only way to purify Gold exactly, is by Antimony: Which ſee under *Purification*; if you would purſue this

Depart farther, and get your *Silver* out of the *Aqua fortis*; put then into an Earthen Pan a Plate of Copper, and on it pour 10 or 12 times as much Water as the Quantity of your impregnated *Aqua fortis*; into which put in the *Menſtruum* of *Aqua fortis*, and let the Mixture lie ſtill for ſome Hours, or till you find the Copper-Plate to be covered all about with the Powder or Precipitate of Silver, and that the Water begins to turn Blue; then filtrate the bluiſh Water, and this is that which is called *Aqua Secunda*. Dry the Powder of Silver, and melt it into an Ingot in a Crucible, with a little Salt Petre. If you ſteep a Plate of Iron ſome Hours in this *Aqua Secunda*, you will have another

Depart; for the *Menſtruum* will let go the Copper which it had diſſolved, and which made it look Blue, to prey upon the Iron, and you will have your Copper in Powder on the Iron-Plate: And if you filtrate this Diſſolution, you may get the Iron out of it

it, by laying in it a Piece of *Lapis Calaminaris*, the Iron will depart out and fall to the Bottom in a Powder, and the Stone will be diſſolved, or at leaſt as much of it as the *Menſtruum* can contain. If you again filtrate this Water, and then pour upon it drop by drop the *Liquor of fix'd Nitre*, the *Lapis Calaminaris* will be precipitated to the Bottom: And laſtly, if you filtrate this Water as before, and after having evaporated a Part of it, ſet the reſt in a cool Place, you will have Chryſtals of Salt Petre which will burn like the ordinary ſort. *Note*, That though the Silver, the Copper, and the Iron could not be gotten perfectly out of the *Menſtruum*, yet the Liquor of fix'd Nitre will precipitate all the *Lapis Calaminaris*, and the remaining Particles of the Silver, Copper and Iron.

DEPARTER, or *Departure* from a Plea or Matter, is where a Man pleads a Plea in bar of an Action, and being replyed thereunto, doth in his Rejoinder ſhew another Matter contrary to his firſt Plea, that is called *a Departure from his Bar:* It is applied alſo to a Plaintiff, who in his Replication ſhews new Matter from his Declaration. So if a Man plead a general Agreement in Bar, and in his Rejoinder alledge a ſpecial one, this ſhall be adjudged a *Departure* in pleading: So in Treſpaſs, if the Defendant will plead a Diſcent, and the Plaintiff replies, that after this the Defendant infeoffed him; and the Defendant eſſoins that this Feoffment was upon Condition, for the Breach whereof he entred; this is a *Departure*, for it is new Matter.

DEPARTURE *in deſpight of the Court*, is when a Tenant or Defendant appears to an Action, and hath a Day over in the ſame Term, or is called after, though he had no Day given him, ſo that it be in the ſame Term: If he do not appear, but make default, it is a *Departure in deſpight of the Court*, and therefore he ſhall be condemned.

DEPHLEGMATED, *i. e.* cleared from its Phlegm or Water, is a Term uſed by the Chymiſts to expreſs that any Spirit is pure and unmix'd with Water or Plegm, which to effect, they *rectify* it, as they call it, that is, diſtil it over again; and when 'tis fully deprived of all Water and Phlegm, or at leaſt as much of it as it can well be, they ſay ſuch a Spirit is well *dephlegmated*.

DEPILATORY, an external Medicine that takes away the Hair from any Part of the Body.

DEPOSITION, is the Teſtimony of a Witneſs ſet down in Writing by way of Anſwer to the Interrogatories exhibited in *Chancery*, where ſuch Witneſs is called a *Deponent*.

DEPOSITION, in the Senſe of the Grammarians, is the Termination of the Dimenſions of a Latin or Greek Verſe, ſo as to diſcover whether it be perfect, redundant or deficient; wherefore in this reſpect they reckon four kinds of Verſes; *Acatalectick*, where no Syllable is wanting at the End; *Catalectick*, where a Syllable is wanting at the End; *Brachycatalectick*, where a Foot is wanting at the End; and *Hypercatalectick*, where a Syllable or two are redundant, and this kind is called alſo *Hypermetros*.

DEPRESSION *of Equation*: See *Equation*, N° 3.

DEPRESSION *of the Pole*; ſo many Degrees as you ſail or travel from the *Pole* towards the *Zenith*, you are ſaid to *depreſs the Pole*, becauſe it becomes (reſpectively) as much lower or nearer to the *Horizon*.

DEPRESSOR *vel Deprimens Auricularum*, a Muſcle of the Ear, in Beaſts ſerving to depreſs or let fall the Ear.

DEPRESSOR *Labii Inferioris*: It's difficult to determine whether this be one only, or two Muſcles, it lying between the *Depreſſores Labiorum Communes*, poſſeſſes that Part of the lower Jaw called the *Chin*, and aſcending with a direct and tranſverſe order of the Fibres, is inſerted into the nether Lip, in depreſſing of which it turns it outwards.

DEPRESSOR *Labiorum*, is a Muſcle that ariſes Fleſhy from the lower Edge of the inferior Jaw Bone laterally, and aſcends directly to its *Interior* at the Angle of the Lips: This, with its Partner and the *Quadrati* acting, expreſs a ſorrowful Countenance, in drawing down the Corners of the Mouth and Cheeks.

DEPRESSOR *Oculi*, is a Muſcle of the Eye which ariſes from the profoundeſt Part of the *Orbit*, and paſſes directly to its Inſertion to the oppoſite Part of the Globe of the Eye.

DEPRIMENS, or *Humilis*, one of the ſtraight Muſcles which move the Globe of the Eye; its Uſe is to pull it downwards.

DEPRIVATION, is a bereaving or taking away; as when a Biſhop, Parſon, Vicar or Prebend is *deprived* or depoſed from his Preferment for any Matter in Fact or in Law; as if a Schiſmatick or meer Lay-man be preſented, admitted, inſtituted and inducted, this is good Cauſe of *Deprivation*.

DEPTH *of a Squadron* or *Battalion*, is the Number of *Men* that are in a File; which of a Squadron is three, and of a Battalion generally ſix; whence it comes that we ſay a Battalion is drawn up 5 *deep*, or 6 *deep*.

DEPURATION, is the cleanſing of any Body from its excrementitious Dregs, or more groſs Parts.

DE *quibus ſur diſſei*, is a Writ of Entry: See *Fitzh. Nat. Brev.* Fol. 191.

DERAIGNE, or *Dereigne*, (in Law) ſignifies the Proof of a thing which one denies to be done by himſelf, and the Adverſary affirms it, defeating and confounding the Aſſertion of his Adverſary, and ſhewing it to be without and againſt Reaſon or Probability.

DESCANT, in Muſick, ſignifies the Art of compoſing in ſeveral Parts, and is threefold, *viz. Plain*, *Figurate* and *Double*.

Plain Deſcant, is the Ground-work or Foundation of Muſical Compoſition, and conſiſts altogether in the ordinary placing of many Concords.

Figurate or *Florid Deſcant*, is that wherein Diſcords are concern'd, as well (though not ſo much) as Concords; and may well be termed the Ornament or Rhetorical Part of Muſick, in regard that in this are introduced all the Varieties of Points, Figures, Syncopes, Diverſities of Meaſures, and whatſoever elſe is capable of adorning the Compoſition.

Double Deſcant, is when the Parts are ſo contrived, that the *Treble* may be made the *Baſs*, and on the contrary, the *Baſs* the *Treble*.

DESCENSION *Oblique*: See *Oblique Deſcenſion*.

DESCENSION *Right*: See *Right Deſcenſion*.

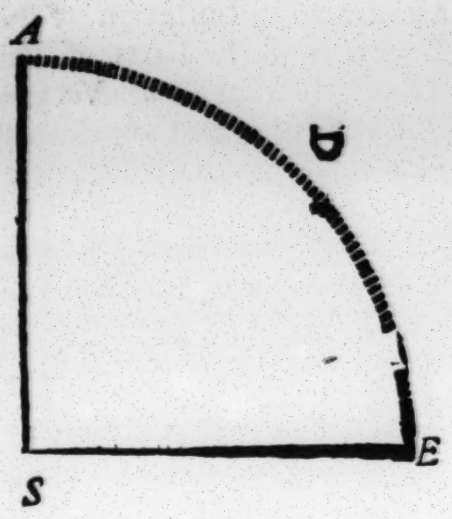
DESCENSORIUM, a Chymical Furnace, in which Subſtances are diſtill'd by Deſcent, or downwards.

DESCENT *in Law*: *Vid. Diſcent*.

DESCENTS, in Fortification, ſignify the Holes, Vaults, and hollow Places made by undermining the Ground, as the *Counterſcarp* or *Covert-way*; ſo that a DESCENT *into the Moat* or *Ditch*, is a deep digging into the Earth of the *Covert-way* in Form of a Trench, of which the upper Part is covered with *Madriers* or Clays againſt Fires, to ſecure the Paſſage into the *Moat*.

DE-

DESCENT *of heavy Bodies:* If a Body deſcend from *A* by its proper Gravity, it will come to the Center *S* in the ſame time as another ſuch like Body by its Revolution ſhall deſcribe the Quadrant *A D E. Princ. Phyſ. Math. Lib.* 1. *Prop.* 38. *Cor.* 1.



Wherefore abſtracting from the Reſiſtance of the *Medium*, all Bodies muſt needs deſcend equally ſwift, and come to the Center from the ſame Height at the ſame time, as in Fact is found by Experiment true.

An heavy Body let fall from any Height near the Surface of our Earth, deſcends in a Second of Time $16\frac{11}{24}$ Feet *Engliſh*, or 197 Inches and $\frac{1}{2}$.

Propoſition I.

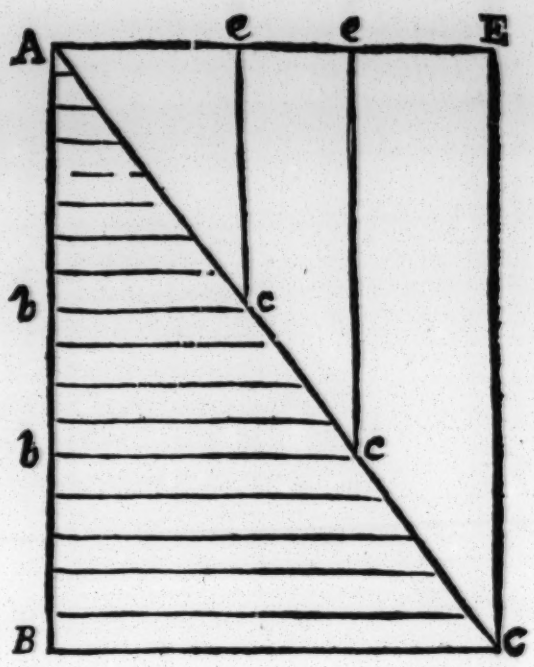
The Velocities of deſcending heavy Bodies are proportionate to the Times from the Beginning of their Falls. This follows (ſaith the Learned Capt. *Halley*, *Philoſ. Tranſ. N.* 179.) becauſe the Action of Gravity being continual, in every Space of Time the following Body receives a new Impulſe, equal to what it had before in the ſame Space of Time received from the firſt Power; *v. gr.* in the firſt Second of Time a Body hath acquired a Velocity, which in that Time would carry it a certain Diſtance; ſuppoſe 32 Foot, 2 Inches, and there were no new Force, it would continue to deſcend at that rate with *an equable Motion:* But in the next Second of Time, the ſame Power of *Gravity* continually acting thereon, ſuperadds a new *Velocity* equal to the Former, ſo that at the End of two Seconds, the *Velocity* is double to what it was at the End of the Firſt; and after the ſame manner may it be proved to be triple at the End of the third Second, and ſo on; wherefore the *Velocities of falling Bodies* are proportionate to the times of their *Falls*. *Q. E. D.*

Propoſition II.

The Spaces deſcribed by the Fall of a Body, are as the Squares of the Times from the Beginning of the Fall.

Demonſtration.

Let *A B* repreſent the *Time* of the *Fall* of a *Body*, *B C*, perpendicular to *A B* the *Velocity* acquired at the End of the *Fall*, and draw the Line *A C*; then divide the Line *A B* repreſenting the *Time*, into as many equal Parts as you pleaſe, as *b b b b*, &c. and from theſe Points draw the Lines *b c*, *b c*, &c. parallel to *B C*; 'tis manifeſt, that the ſeveral Lines *b c* repreſent the ſeveral *Velocities* of the falling Body, in ſuch Parts of the *Time* as *A b* is of *A B:* It is evident likewiſe, that the *Area A B C* is the Sum of all the Lines *b c* taken together, which according to the Method of *Indiviſibles*, are infinitely many; ſo that the *Area A B C* repreſents the Sum of all the *Velocities*, between none and *B C* ſuppoſed infinitely many; which Sum is the Space deſcended in the Time repreſented by *A B*. And by



the ſame Reaſon the *Area's A b c* will repreſent the Spaces deſcended in the Times *A b*; ſo that the Spaces deſcended in the Times *A B*, *A b*, are as the *Area*'s of the *Triangles A B C*, *A b c*; which, by the 20th of the 6th of *Euclid*, are as the Squares of their *Homologous Sides A B*, *A b*, that is to ſay, the *Times*; wherefore the Deſcents of falling Bodies are as the *Squares* of the Times of their *Fall*. *Q. E. D.*

Propoſition III.

The Velocity which a deſcending Body acquires in any Space of Time, is double to that wherewith it would have moved the Space deſcended by an equable Motion in the ſame time.

Demonſtration.

Draw *E C* parallel to *A B*, and *A B* parallel to *B C*, and compleat the *Parallelogram A B C E*; it is evident that the *Area* thereof may repreſent the Space, a *Body* moved equally with the *Velocity B C* would deſcribe in the Time *A B*; and the *Triangle A B C* repreſents the *Space* deſcribed by the Fall of a Body in the ſame time *A B* (by the foregoing *Propoſition.*) Now the *Triangle A B C* is half the *Parallelogram A B C E*, and conſequently the Space deſcribed by the *Fall*, is half what would have been deſcribed by an *equal Motion* with the *Velocity B C* in the ſame time; wherefore the *Velocity B C* at the End of the *Fall*, is double to that *Velocity* which, in the Time *A B*, would have deſcribed the *Space fallen*, repreſented by the *Triangle A B C* with an *equable Motion*. *Q. E. D.*

Propoſition IV.

All Bodies, on or near the Surface of the Earth, in their Fall deſcend ſo, as at the End of the firſt Second of Time they have deſcribed 16 *Feet, one Inch*, London *Meaſure, and acquired the Velocity of* 32 *Feet*, 2 *Inches in a Second.*

This is made out from the 25th *Prop.* of the 2d *Part* of Mr. *Hugenius de Horologio Oſcillatorio*; wherein he demonſtrates the time of the leaſt *Vibrations* of a *Pendulum*, to be to the Time of the *Fall* of a *Body* from the Height of half the length of the *Pendulum*,

dulum, as the *Circumference* of a *Circle* to its *Diameter*; whence, as a *Corollary*, it follows, That as the *Squares* of the *Diameter* to the *Square* of the *Circumference*, so half the Length of the *Pendulum* vibrating Seconds, to the *Space* described by the *Fall* of a *Body* in a Second of *Time*; and the Length of a *Pendulum* vibrating *Seconds* being found, 39, 125, or $\frac{1}{8}$ Inches, the *Descent* in a *Second* will be found by the aforesaid *Analogy* 16 Foot and one Inch; and by the last *Prop.* the *Velocity* will be double thereto; and near to this it hath been found by several *Experiments*, which, by reason of the *Swiftness* of the *Fall*, cannot so exactly determine its *Quantity*.

From these Four *Propositions* all *Questions* concerning the *Perpendicular Descent of Bodies* are easily solved; and either *Time*, *Height*, or *Velocity* being assigned, one may readily find the other two.

From them likewise is the Doctrine of *Projects* deducible, assuming the two following *Axioms*, *viz.*

1. That a *Body* set a moving, will move on continually in a *Right Line* with an *equable Motion*, unless some other Force or Impediment intervene, whereby it is accelerated, or retarded, or deflected.

2. That a *Body* being agitated by two *Motions* at a time, does by their *compounded Forces* pass through the same *Points* as it would do, were the two *Motions divided* and acted *successively*.

The Learned Mathematician Mr. *Keil*, in his Examination of Dr. *Thomas Burnet's Theory of the Earth*, P. 124. proves, That the Direction of heavy Bodies is not towards the Center of the Earth any where but at the Equator, or at the Poles: However they will be all perpendicular to their Horizons, and so there can be no Error in levelling of Lines, and in finding the Risings and Fallings of the Ground. And from hence (as he shews, P. 128.) 'tis plain, the Surface of the Earth cannot be exactly Spherical, but the Earth's Equatorial Diameter to its Polar is as 692 to 689.

DESCRIBENT, a Term in Geometry, expressing some Line or Surface which by its Motion produces a Plain Figure or a Solid: See *Dirigent*.

DESICCATION, is an Evaporation of superfluous Moisture by Heat.

DESICCATIVE *Medicines*, are the same with *Drying ones*.

DESIRE, is an Uneasiness in the Mind upon the absence of any Thing whose present Enjoyment carries the *Idea* of Delight with it; and is greater or less as that Uneasiness is more or less vehement.

DE SON *Tort Demesne*, are Words of Form in an Action of Trespass, used by way of reply to the Plea of the Defendant, when the Defendant says, He did what he did by the Command of his Master; the Plaintiff replies, That the Defendant did it *De Son Tort Demesne*, *viz.* of his own Wrong, &c.

DESPAIR, is the Thought of the Unattainableness of any Good, which works differently in Mens Minds, sometimes producing Uneasiness or Pain, sometimes Rest and Indolency.

DESPOTICK, is the same as absolutely Supreme, as when a Prince has gain'd such an Absolute and *Despotick* Power, that he will not be regulated by the Laws of his Country, but will govern only by his sole Will and Pleasure.

DESPUMATION, is a Term in Pharmacy, and signifies the clearing and cleansing of any Liquor, by letting it boil so as to take off the Scum.

DESSEIN, (in *French*) signifies two things in Painting, either in general, the *Design* or Thought that the Painter had about any great Piece, whether there be drawn only the *Out-lines* (or *Contours*; or whether he hath proceeded farther to put in the Shadows or the Colours; and if there appear much Masterly Skill or Judgment in the Thought or Design, we say the Design was Great and Noble, &c.

It also signifies the just Measures, the Proportions and external Forms which those Objects ought to have that are drawn in Imitation of Nature; and in this Sense 'tis one of the Parts of Painting, and may be called a *just Imitation of Nature*.

DESTILLATION, is an Extraction of the moist or unctuous Parts which are rarified into Vapour or Smoke, as it were, by the Force of Fire.

Destillation is performed *per Vesicam*, *i.e.* in a *Cucurbite* (before describ'd) by a *Retort*, by *Deliquium*, by *Filtre*, by *Descent*, &c. and that either in *Balneo Mariæ*, *Sand*, *Vapours*, *Dung*, the *Sun*, a *Reverberatory*, &c.

DET, or *Debt*, is a Writ that lies where any Sum of Money is due to a Man by reason of Account, Bargain, Contract, or Obligation, or other Specialty to be paid at a certain Day, which is not paid, then he shall have this Writ; but Action of *Debt* will not lie for Money due to a Lord by his Tenant for any Rent-Service, but he must distrain for it: So for Rent-charge or Rent-seck, which any Man hath for Life in Tail or in Fee, he shall not have any Action of *Debt* as long as the Rent continues, but his Executors may have an Action of *Debt* for the Arrearages due in the Lives of their Testator.

DETACHMENT, a Military Term, signifying a certain Number of Soldiers taken out of a greater Body, on purpose to be employed in the Undertaking of some particular Enterprise; it is to form a kind of flying Camp, to relieve a Party already engaged in Battel, to join a separate Army, to assist at the Siege of a Place, to enter into some Garrison, &c.

DETENTS, in a Clock, are those Stops which, by being lifted up or let fall down, do lock and unlock the Clock in striking.

DETENT-*Wheel*, or *Hoop-Wheel*, in a Clock, is that which has a *Hoop* almost round it, wherein there is a Vacancy, at which the Clock locks.

DETERGENT: See *Abstergent*.

DETERMINED *Problem*, in Geometry, is that which hath but one, or but one certain Number of Solutions. This Problem hath but one only Solution, *viz. To describe an Isosceles Triangle on a given Line, whose Angles at the Base shall be double to that at the Vertex:* But this following hath two Solutions; *To find an Isosceles Triangle, whose Area and Perimeter are given.*

A determined Problem may be either Simple or Linear, Plane, Solid or Surfolid: Which see.

DETERRATION, is a Removal of the Earth, Sand, &c. from the Mountains and higher Grounds, down into the Valleys and lower Parts: This is occasioned by Rain, which wash the Earthy Matter down by degrees; but this cannot be very considerable, or much raise the Surface of the Earth, as some have imagined, because a good Part of it is sunk into the Clefts and Caverns of the Rocks and Mountains, a great Quantity is born down into Rivers, and thence into the Sea, and the richer and finer Part helps to compose the Bodies of Plants and Vegetables.

DETERSIVE *Medicines*, are such as are used to cleanse the Body from sluggish, viscous and glutinous Humours.

DETINUE, is a Writ that lieth against him, who having Goods or Chattels delivered him to keep, refuseth to deliver them again; and he taketh his Action of *Detinue* that intendeth to recover the thing delivered

delivered, and not the Damages ſuſtained by the *Detinue*.

DETONATION, is a Chymical Word, expreſſing the thundring Noiſe that is often made by a Mixture being enkindled in the containing Veſſel; for the volatile Parts do fly out with great Velocity and Impetuoſity: 'Tis the ſame with *Fulmination*.

DETRUSOR-URINÆ, is a Muſcle which is by ſome reckoned the firſt proper Membrane of the Bladder, lying under that which is derived from the *Peritoneum*; its Carnous Fibres embracing the whole Bladder like a Hand (as *Spigelius* repreſents it) compreſſes it in the Evacuation of the Urine.

DEVASTAVERUNT *bona teſtatoris*, is a Writ lying againſt Executors for paying Legacies and Debts without Speciality, before the Debts upon the ſaid Specialities be due, to the Prejudice of Creditors.

DEVENERUNT, is a Writ directed to the Eſcheator, when any of the King's Tenants holding *in Capite* dies, and when his Son and Heir within Age, and in the King's Cuſtody dies, then ſhall this Writ go forth, commanding the Eſcheator, that by the Oaths of Twelve good and lawful Men, he enquire what Lands or Tenements, by the Death of the Tenant, come to the King.

DEVISE, or *Diviſe*, (in Common Law) is when a Man in his Will bequeaths his Lands or Goods to another after his Deceaſe; and he to whom the Lands or Goods are bequeath'd, is called the *Deviſe*.

DEVOURING, if any Fiſhes are born in an Eſcutcheon in a feeding Poſture, the Herald's Term for it is Devouring, becauſe Fiſh ſwallow all their Meat whole.

DEUTEROPATHIA, is a Diſeaſe that proceeds from another Diſeaſe; for Example, as the Head-Ach from the Diſtemper of another Part, the Morbifick Matter being tranſlated thither from its former Repoſitories. *Blanchard.*

DEW, is compoſed of Steams of the Terreſtrial Globe, which, for a while, ſwim to and fro in the Air, but at laſt convene into Drops, and then fall down again to the Earth.

DEW *of Vitriol*, ſo ſome Chymiſts will call a kind of *Phlegm* which is drawn from Vitriol in *Balneo Mariæ*, or with a gentle Heat.

DEXTER *Side* or *Point*, is the *Right* Side or Point in an Eſcutcheon. *Vid. Eſcutcheon.*

DIABETES, ſo *Galen* calls it, and *Agineta Dipſacus*, from the great Thirſt that attends it: and as others will have it, from a certain ſort of Serpent called *Dipſacus*, found eſpecially in *Libya*, which poyſons with its Bite, and brings an unquenchable Thirſt upon the Perſon affected. The Diſeaſe is too great a Fuſion of the Blood, whereupon the *Serum* paſſes the Reins, and is voided in great Quantities by the Paſſages of the Urine. *Blanchard.*

DIABROSIS, is a Solution of the *Continuum* by Corroſion of the Parts. *Blanchard.*

DIACLYSMA, is a waſhing of the Mouth to cleanſe it, or to ſtrengthen the Teeth or Gums. *Blanchard.*

DIACOPRÆGIA, a Medicine of Goat's Dung, and uſed againſt Tumours in the Spleen and Glandules behind the Ears, called *Parotides*. *Blanchard.*

DIACOUSTICKS, or *Diaphonicks*, is the Conſideration of the Properties of refracted Sound, as it paſſes through different Mediums.

DIACRISIS, is a Diſtinction and Dijudication of Diſeaſes and Symptoms. *Blanchard.*

DIADOCHE, is a ſucceeding by a *Criſis*. *Blanchard.*

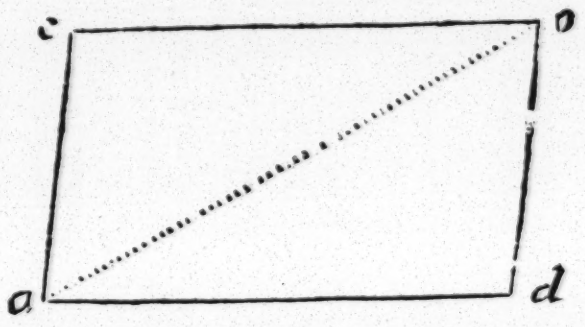
DIADROME, the ſame with the *Vibration*, or Motion, or Swing of a Pendulum.

DIÆRESIS, in Anatomy, is the eating out, or conſuming of the Veſſels of an Animal Body, when, from ſome cutting corroding Cauſe, ſome Ways and Paſſages are made which naturally ought not to have been; or when ſome which really are, yet are dilated more than ordinary, ſo that the Humours which ought to have been contained in the Veſſels, run out. *Blanchard.*

DIÆRESIS in *Grammar*, is the Diviſion of one Syllable into two, as in this Verſe of *Tibullus*, *Stamina non ulli diſſolüenda Deo*, for *Diſſolvenda*. This DIÆRESIS is uſually noted by two Points placed over a Letter, to ſhew that it is founded by it ſelf, and not joined with any other, ſo as to make a Diphthong; as *Æra* by the Points over the *e*, is diſtinguiſhed from *Æra*. 'Tis alſo a kind of *Metaplaſm* or Addition to a Word, by dividing one Syllable into two, as *Aulaï*, by a *Diæreſis*, is of three Syllables, inſtead of *Aulæ*.

DIÆTETICA, is a Part of Phyſick that preſcribes the Uſe and Knowledge of the *ſix non-natural Things*, as the Phyſicians ſpeak.

DIAGONAL, in Geometry, is a Line drawn acroſs from Angle to Angle in any Figure, and is by

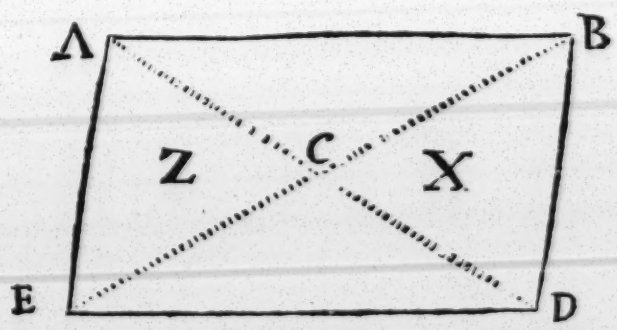


ſome called the *Diameter*; as in this Figure, *a b* is called a *Diagonal*

Propoſitions.

1. Every *Diagonal* divides a Parallelogram into 2 equal Parts; for the 2 △'s, *a c b* and *a b d* have the Sides *c b* = *a d*, *a c* = *d b* (becauſe oppoſite ones of the Figure;) and the Angle *c a b* = to the alternate one *a d b*, wherefore they are equal to each other. *Q. E. D.*

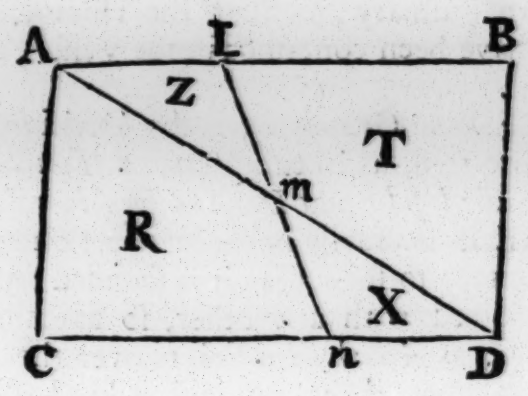
2. Two *Diagonals* *A D* and *B E* being drawn in any Parallelogram, do biſſect each other: I ſay *A C* = *C D*, and *B C* = *C E*; for in the Triangles *Z* and *X*, the Vertical Angles at *C* are equal, and



the alternate ones *E AD* and *ADB* are alſo equal, and the Side *AE* = *BD*; therefore all the Sides of *Z* are equal to thoſe of *X*, and conſequently *AC* = *CD*, and *EC* = *CB*. Q. E. D.

3. A Line (as *L N*) paſſing thro' the middle Point (*m*) of the *Diagonal* of a Parallelogram (*AD*) divides the Figure into two equal Parts: I ſay *Z* + *R* = *T* + *X*; for *Z* + *T* = *R* + *X* (becauſe of the

Diagonal) and the Triangle Z = Triangle X, as having the vertical Angles at M, and the alternate ones DAB and ADC, and alſo the Side AM and MD, all reſpectively equal to each other; therefore the remaining Trapezium R, when the



Triangle Z is taken away, muſt be equal to T when X is taken away; but if R be equal to T, and $Z = X$, then $Z + R$ muſt be equal to $X + T$, and each will be equal to half the Parallelogram. *Q. E. D.*

DIAGONAL *Scale*: See *Scale*.

DIAGNOSTICKS, a Term in Medicine, are the preſent Signs whereby to judge of a Diſeaſe, or a Knowledge whereby Men underſtand the preſent Condition of a Diſtemper; and they make it threefold, either a right Judgment of the *Part affected*, of the Diſeaſe it ſelf, or of its *Cauſe*.

DIAGRAM, is a Scheme for the Deſignation or Demonſtration of any Figure.

DIAGRYDIUM, or *Diacrydium*, Scamony prepared by boiling it in a hollowed Quince; ſome prepare it with Juice of Quince, and others with Juice of Lemons, or of pale Roſes.

DIAL, the firſt *Sun-Dial* that was ſet up in *Rome*, was by *Papyrius Curſor*, about the Year of the City 447, (and before that there is no mention, ſaith *Pliny*, of any Account of Time but of the Sun ſetting and riſing:) This Dial was ſet up in the Temple of *Quirinus*, but it went not right. About 30 Years after this, *M. Valerius Meſſala* (ſays *Varro*) being Conſul, brought out of *Sicily*, from the taking of *Catana*, another *Dial*, which he ſet up on a Pillar near the *Roſtrum*; but for want of its being made for that particular Latitude, it could not go true. Nevertheleſs they made uſe of it 11 Years, and then *Martius Philippus*, who was Cenſor with *L. Paulus*, ſet up another that was more exact. The *Greeks* alſo were a long Time without *Clocks* and *Sun-Dials*. Some attribute the Invention of *Sun-Dials* to *Anaximenes Mileſius*, and ſome to *Thales*. There are many Kinds of *Dials* mentioned by *Vitruvius*, as, one invented by *Beroſus* the *Chaldean*, which was on a reclining Plane, parallel almoſt to the Equinoctial; on this was an half Circle, and thence 'twas called *Hemicyclus*.

Ariſtarchus Samius found out the *Hemiſphere Dial*, and there were ſome *Spherical* ones, with a Needle for a *Gnomon*. The *Diſcus* of *Ariſtarchus* was an *Horizontal Dial*, with its Limb raiſed up all round to prevent the Shadow from extending it ſelf too far off.

DIAL-PLAINS, are plain Superficies upon which the Hour-Lines are drawn in any Latitude, and may be diſtinguiſhed into *Parallel*, *Perpendicular* and *Oblique*, according to their Poſition with reſpect to the *Horizon* of the Place where they are made.

Parallel Plains or *Dials* are ſuch as lie level with the *Horizon*, and on that account termed *Horizontal Dials*.

Perpendicular Plains are ſuch as ſtand erect to the *Horizon*, and ſuch are all thoſe that are ſet againſt an upright Wall or Building; which are of two Sorts, *viz.* either *Direct* or *Declining*; and theſe are often called *Mural Dials*.

Erect, *Direct South*, *Weſt*, *North*, *Eaſt Plains*, are thoſe Walls or Plains which face any one of the four *Cardinal Points of the Horizon*, and the *Dials* made upon ſuch a *Plain* are called *Erect*, *Direct South*, *Weſt*, *North*, *Eaſt Dials*.

Erect { *South*, *North*, } *Plains declining Eaſt* or *Weſt*, are thoſe *Plains* which lie open to any Two of the *Cardinal Points*, as to the { *South*, *North*, } and *Eaſt*, or to the { *South*, *North*, } and *Weſt*.

Oblique Plains, *reclining* from the *Zenith*, or *inclining* to the *Horizon*, are alſo of two ſorts, *viz.* either *direct Reclining*, or *Declining* and *Reclining*.

Direct South, *Weſt*, *North* or *Eaſt Recliners*, are thoſe *reclining Plains* which lie open to any one of the *Cardinal Points* of the *Horizon*.

Reclining { *South*, *North*, } *Plains declining Eaſt* or *Weſt*, are thoſe *Plains* which face any Two of the *Cardinal Points* { *South*, *North* } and *Eaſt*, or to the { *South*, *North*, } and *Weſt*.

DIALECT, is the peculiar Manner of *Idiom*, Spelling and Pronunciation of any Language in particular Places of the Nation: Thus among the *Greeks*, the *Ionick* and *Dorick* Way of Speaking and Writing was different from the *Athenian*, which therefore are called the Dialects of the *Greek* Language; and ſo it is in all Countries.

DIALECTICAL *Arguments*, in Logick, are ſuch as are barely probable, but do not convince or determine the Mind to either Side of the Queſtion; tho' ſome will have *Dialecticks* to be the ſame as the Art of true Reaſoning in general, and to be as comprehenſive as univerſal Logick.

DIALEIMMA, the ſame with *Apyrexia*.

DIALLING-GLOBE, is an Inſtrument made of *Braſs* or *Wood*, with a Plane fitted to the *Horizon*; and an Index particularly contrived to draw all Sorts of *Dials*, and to give a clear Demonſtration of that *Art*.

DIALLING-SPHERE, is an Inſtrument made of *Braſs*, with ſeveral Semi-circles ſliding over one another on a moving *Horizon*, to demonſtrate the Nature of the Doctrine of Spherical Triangles, and to give the true *Idea* of drawing Dials on all Manner of Planes: See more in *Dial*.

DIAMETER, is a Line that paſſes through the Middle of any Figure from one Corner to another; and this ſhould rather be called the *Diagonal*.

DIAMETER of a Circle, is a Right Line which paſſes through the Center of a Circle, and is terminated at each End by the Circumference dividing the Circle into two equal Parts.

DIAMETER of a *Conick Section*, is a Right Line drawn through the Middle of the Figure, and biſſecting all the *Ordinates*; and if it biſſect them at Right Angles, 'tis called the *Axis of the Section*, and often the *Ax*.

DIAMETER *Conjugate*, in the *Ellipſis*, is the ſhorteſt *Axis* or *Diameter*.

DIAME-

DIAMETER *Conjugate*, in the *Hyperbola*, is a Line drawn parallel to the *Ordinates*, and through the Center or middle Point of the Tranſverſe Axis, and is always a middle Proportional between the *Latus Rectum*, and the *Latus Tranſverſum*.

DIAMETRICALLY *Oppoſite*, is when two things are oppoſed to one another right acroſs, or directly contrary, as one End of a *Diameter* is to another.

DIANA'S *Tree*; diſſolve an Ounce of *Silver* in 3 Ounces of Spirit of Nitre, then pour the Diſſolution into a Matraſs, in which before you had put 18 or 20 Ounces of Water, and two Ounces of *Quick-ſilver*: The Glaſs muſt be filled up to the Neck; and all muſt lie ſtill on a round of Straw in ſome cool Place for 40 Days together, during which time the Tree will begin to ſpread forth its Branches, and will have little Balls at the End which will repreſent Fruit.

Another like a Firr Tree may be thus made; diſſolve an Ounce of Coppel *Silver* in 3 Ounces of *Aqua fortis*; ſet the Glaſs in Sand, and evaporate about half the Moiſture, after which add to the Remainder 3 Ounces of good diſtilled Vinegar; let it be a little hot, and keep it ſtirring; then put the Matraſs into a little cool Place for about a Month, and then the Tree will riſe up to the very Top of the Liquor.

To recover the *Silver* again in both theſe Experiments: In the *Former* take the whole Matter and ſhake it together, and then boil it for about ½ an Hour in an Earthen Veſſel; then let it cool till it's juſt no more than luke-warm, and pour upon it gently a Quart of Water, in which you had before diſſolved 2 Ounces of Salt; a white Precipitate will fall down, which gather and dry. Put it into a Retort in a Sand Furnace, fitting to it a Receiver filled with Water, and beginning with a ſmall Fire at firſt, increaſe it till the Retort is red hot. The Quick-ſilver will diſtil drop by drop into the Receiver; continue the Fire till no more will come; you will find the Mercury in the Bottom of the Receiver, which waſh and dry with a Linnen Cloth and Crumbs of Bread. The *Silver* will remain in the Retort, which may be recovered into pure *Silver*, by melting the Matter in a Crucible with a little *Salt Petre*.

In the latter Experiment, to get the *Silver* again, you need only pour ſalt Water upon the whole ſhaked together, which will precipitate a white Powder, and that Powder melted in a Crucible with a little *Borax* or *Salt-Petre*, will run into fine *Silver*. Becauſe this way of making *Diana's Tree* is very tedious, Mr. *Homberg* hath given us, in the *Memoirs Mathem. & de Phyſique*, *A. D.* 1692. *P.* 146. the following Method of making this curious Experiment in leſs than a Quarter of an Hour's Time.

Take four Drams of Filings of fine *Silver*, with which make an Amalgam, without heat, with two Drams of *Quick-ſilver*; then diſſolve this *Amalgam* in 4 Ounces of *Aqua Fortis*: Pour this Solution into 12 *Paris* Points of common Water (which is about 3 Gallons *Engliſh*;) ſtir it about a while to mingle it well together, and then keep it in a Glaſs Veſſel well ſtopp'd.

When you would make the Experiment, take about an Ounce of it and put it in a ſmall Viol, wherein put alſo about the Quantity of a ſmall Peaſe of the ordinary *Amalgama* of Gold or Silver, which ſhould be as ſoft as Butter, and ſet the Viol at reſt for about two or three Minutes; preſently after which you will ſee ſeveral ſmall Threads or Filaments ariſing perpendicularly from the little Bulb of the newly put in *Amalgama*, and which will ſenſibly grow, and thruſt out on the Sides ſmall Branches in the Form of a Tree. The Bulb or Ball of the *Amalgama* will grow hard, and be like a Pellet of white Earth, but the little Tree will be of the Colour of bright *Silver*.

Only obſerve, That the Water which ſerves once for this Experiment, will not ſerve a ſecond time.

Mr. *Homberg* ſaith, you may vary the Form of this Metalline Tree almoſt as you pleaſe: The ſtronger you make the firſt deſcribed Water, the thicker will the little Tree be in Branches, and the ſooner formed; but if that be weak, the Branches will be ſparing, ſlender, and ſlow in growing: And afterwards he ſhews how ſeveral other kinds of Trees may be formed alſo by Chryſtallization and by Digeſtion.

DIAPASMA, according to *Pliny*, is a dry Medicine made up of dry Powders, to be ſprinkled upon ſomething, as either upon Cloaths to perfume them, or upon Ulcers or Wounds ſeveral ways, or upon Drink to make it more delicious. *Blanchard.*

DIAPASON, a Greek Word, ſignifying a Chord including all Tones: 'tis the ſame with what we call an *Eighth* or an *Octave*, becauſe there are but ſeven Tones or Notes, and then the *Eighth* is the ſame again with the firſt. *Ariſtot.* ſays, it was not called *Dioctо*, as it ſhould have been, becauſe the ancient Harp, which had all the Tones then known, had but 7 Strings, the Terms whereof are as 2 to 1.

DIAPEDESIS, is an Eruption of the Blood by reaſon of the Thinneſs of the Veſſels. *Blanchard.*

DIAPENTE, an Interval of *Muſick*, whoſe Terms are as 3 to 2, it being the ſecond of the Concords, and makes an *Octave* with the *Diateſſaron*; it is otherwiſe called a *perfect Fifth*.

DIAPER, in Heraldry, ſignifies a Bordure fretted all over with ſome ſuch things as Bordures uſed to be charged with, all appearing between the Frets; a bearing which hath been uſed in ſome *French* and *Belgick* Coats of Arms.

DIAPHANEITY, is the Property of ſuch a Body as is *Diaphanous*, which is one that is tranſparent like Glaſs, the Humours of the *Eyes*, the *Tunica Cornea*, &c. And ſuch a Body hath its Pores ſo ranged and diſpoſed, that the Beams of Light can paſs freely through them every way.

DIAPHORESIS, Sweating, is a Perſpiration of all manner of *Effluvia* through the inviſible Pores of the Body.

DIAPHORETICKS: See *Sudorificks*.

DIAPHRAGMATICK-ARTERY, is by ſome ſaid to iſſue from the Trunk of the *Aorta*, and thence to go to the *Diaphragma*.

DIAPHRAGM, by ſome called *Septum Tranſverſum* and *Diſeptum*: The *Midriff*, is a Muſcle compoſed of two others, which divide the Middle from the Lower Cavity; the Firſt and Superior Muſcle ariſes from the *Sternum*, and the Ends of the laſt Ribs on each ſide. Its Fibres from this Semicircular Origination, tend towards their Center, and terminate in a *Tendon* or *Aponeuroſis*, which hath always been taken for the Nervous Part of the *Diaphragm*. The Second and Inferior Muſcle comes from the *Vertebræ* of the Loins by two Productions, of which that on the Right Hand comes from the Firſt, Second and Third *Vertebræ*. That on the Left Side is ſomething ſhorter, and both theſe Productions,

ctions join and make the Lower Part of the *Midriff*, which joins its Tendon with the Tendon of the Other, ſo as that they make but one Membrane, or rather Partition.

The *Diaphragm* is covered with a Membrane from the *Pleura* on its Upper ſide, and by the *Peritoneum* on its Lower; it is pierced in the Middle to make a Paſſage for the *Vena Cava*, and in its Lower part, for the *Oeſophagus*, and for the Nerves which go to the Upper Orifice of the Stomach. And again, between the Production of the Inferior Muſcle, paſſes the *Aorta*, the *Ductus Thoracicus*, and the *Vena Azygos*.

The *Diaphragm* receives Veins and Arteries called *Phrenicæ* from the *Cava* and *Aorta*, and ſometimes on its Lower Part two Branches from the *Vena Adipoſa*, and two Arteries from the *Lumbares*. It hath two Nerves which come from the third *Vertebræ* of the Neck, which paſs through the Cavity of the *Thorax*, and are diſperſed in the Muſcles of the *Diaphragm*.

In its Natural Situation the *Diaphragm* is Convex on the Upper ſide towards the Breaſt, and Concave on its Lower one towards the Belly: Therefore when its Fibres Swell and Contract, it muſt become plain on each ſide, and conſequently the Cavity of the Breaſt is enlarged to give Liberty to the Lungs to receive the Air in Inſpiration; and at the ſame time the Stomach and Guts are preſt for the Diſtribution of the Chyle. But it diminiſhes the Cavity of the Breaſt when it reſumes its Natural Situation, and preſſes the Lungs for the Expulſion of the Air in Expiration.

DIAPHRATONTES, are the Membranes called the *Pleura*, which cover the Inſide of the *Thorax*, and leave a kind of Partition in the Middle, called *Mediaſtinum*. *Blanchard*.

DIAPHTHORA, is a Corruption of any Part of the Body.

DIAPLASIS, is the Setting of a Limb which was out of Joint.

DIAPLASMA, is an Ointment, or Fomentation.

DIAPNOE, the ſame with *Diaphoreſis*.

DIAPYEMA, the ſame with *Empyema*.

DIAPYETICA, are Medicines which ripen and concoct Purulent Matter.

DIARIA *Febris*, the ſame with *Ephemera*.

DIARRHOEA, is a Looſeneſs in the Belly which ejects ſeveral Bilious, Pituitous, and other Feculent Excrements.

DIARTHROSIS, is a good Conſtitution of the Bones, whereby they are apt to move eaſily and ſtrongly; ſuch as is in the Arm, Hand, Thigh, Foot, &c.

DIASTOLE, is the Dilatation or Expanſion of the Heart, when the Blood flows into it, from the place where it is as it were accended, the Lungs.

DIASTOLE is alſo an *Accent* in Grammar, which ſhews that thoſe Words or Sentences to which it is adjoined, are to be ſeparated, and is marked thus (,) 'Tis alſo the making long a Syllable which is naturally ſhort.

DIASTYLE, is a ſort of Edifice, where the Pillars ſtand at ſuch a diſtance one from another, that three Diameters of their Thickneſs are allow'd for *Intercolumniation*.

DIATESSARON, a Word uſed in Muſick, ſignifying an Interval compoſed of one greater *Tone*, one leſſer, and one greater *Semi-Tone*; its Proportion being as 4 to 3. In Muſical Compoſition 'tis called a *Perfect Fourth*.

DIATHESIS, is the Natural or Præternatural Diſpoſition of the Body, whereby we are inclined to perform all Natural Actions ill or well. *Blanchard*.

DIATONICK, a Term which ſignifies the Ordinary ſort of Muſick which proceeds by different Tones, either in aſcending or deſcending; it contains only the two greater and leſſer Tones, and the greater Semi-Tone.

DICHOPHYIA, is a Fault in the Hair, when it parts and disjoins too much. *Blanchard*.

DICHORÆUS, is the Foot of a Latin Verſe conſiſting of four Syllables, of which the firſt is long, the next ſhort, the Third long, and the Laſt ſhort. 'Tis compounded of two *Choræus*, as *Comprobare*.

DICROTUS, is a Pulſe that beats twice.

DIDYMI, are Twins.

DIEM *clauſit extremum*, is a Writ that lieth for the Heir of him that holdeth Land of the King, either by Knight-Service or Soccage, and dieth, be he under or at full Age, directed to the Eſcheator of the County, to enquire of what Eſtate the Party died ſeized, and who is next Heir to him, and of what Value the Land is.

DIES CRITICI: See *Critici Dies*.

DIES-DATUS, a Term in Law, ſignifying a *Reſpite* given to the Tenant or Defendant by the Court.

DIESIS, in Muſick, is the Diviſion of a Tone below a Semi-tone, or an Interval compoſed of a leſſer or imperfect Semi-tone; ſo that when Semi-tones are placed where there ought to be Tones, or when a Tone is ſet where there ſhould be only a Semi-tone, this is called *Dieſis*.

Enharmonical Dieſis, is the Difference between the Greater and the Leſſer Semi-Tone.

Theſe *Dieſes* are the leaſt ſenſible Diviſions of a Tone, and are mark'd on the Score in Form of St. *Andrew*'s Croſs.

DIEU SON ACT, are Words uſed in our Law, and it is a Maxim, That the *Act* of God ſhall prejudice no Man: and therefore if a Houſe be beaten down by Tempeſt, or other *Act* of God, the Leſſee for Life or Years ſhall not only be quit in an Action of Waſte brought againſt him, but hath by the Law a ſpecial Intereſt to take Timber to build the Houſe again, if he will, for his Habitation. So when the Condition of an Obligation conſiſts in two Parts, in the Disjunctive, and both are poſſible at the Time of the Obligation made, and afterwards one of them becomes impoſſible by the *Act* of God, the Obligor is not bound to perform the other part, for the Condition ſhall be taken beneficially for him.

DIFFERENCE, in Logick, ſignifies an Eſſential Attribute belonging to any *Species* that is not found in the *Genus*, and is the *Univerſal Idea* of that *Species*; thus Body and Spirit are two *Species* of Subſtance, which do contain in their *Ideas* ſomething more than is in that of Subſtance; in Body we firſt find Impenetrability and Extenſion; in a Spirit a Power of Thinking and Reaſoning; ſo that the *Difference* of Body is impenetrable Extenſion, and the *Difference* of a Spirit is Cogitation.

DIFFERENCE, in Mathematicks, is the Remainder when one Number or Quantity is ſubſtracted from another.

DIFFERENCE *of Aſcenſion*: See *Aſcenſional Difference*.

DIFFERENCE *of Longitudes*, of two places on the Earth, is an Arch of the Equator, comprehended between the *Meridians* of thoſe two places.

DIFFERENCES in a Coat of Arms; So the Heralds call ſuch things as diſtinguiſh one Family from another, or Perſons of the ſame Family from each other. They are by *Guillim* accounted either *Ancient*

cient or *Modern*: The *Ancient* ones are the *Bordures* of all Kinds; the *Modern* are the *File* or *Labe*, *Creſcent*, *Mullet*, *Martlet*, &c.

DIFFORM, is a Word uſed in Oppoſition to *Uniform*, and ſignifies that there is no manner of Regularity in the Form or Appearance of a thing. The *Botaniſts* uſe it as a Diſtinction of the Flowers of Plants. See *Flower*.

DIFFUSION, is uſually taken to ſignify the diſperſing of the ſubtile *Effluvia* of Bodies into a kind of Atmoſphere all around them; thus the Light diffuſed by the Rays of the Sun, iſſuing all round from that amazing Body of Fire, and thus are the Magnetical Particles diffuſed every where round about our Earth in Parts adjacent to it.

DIGASTRICUS or *Biventer*, is a double Bellied Muſcle (whence its Name) which ariſes from the Proceſs called *Mammiformis* or *Maſtoides*, whence deſcending it becomes Tendinous, paſſing through the *Stylohyoideus*, and an Annular Ligament faſtned to the *Os Hyoides*; from which Bone ſome Tendinous Fibres do ariſe, and join with its ſecond fleſhy Belly, aſcending from thence to its Inſertion at the Middle of the Inferior Part of the Lower Jaw. The Middle Tendon of this Muſcle, and its Partner, paſſing through Two Annular Ligaments, fix'd to the *Os Hyoides*, as Ropes through a double Pulley, is a wonderful Contrivance of the Author of Nature to render them capable of pulling the Lower Jaw down, which had their Progreſs been direct from their Originations, that could not have been performed. Nor are there any Proceſſes, whether of the *Vertebræ* of the Neck, or the neighbouring Parts, that could give an Origination to thoſe Muſcles below their Inſertion, as in ſome *Quadrupeds*; wherefore the Divine Architect of Human Bodies has placed this double Pulley below their Terminations, whereby they perform their deſigned Office. Hence *Deglutition* is hindred when theſe Muſcles are in Action, they then preventing the Aſcent of the Tongue and *Larynx*: neither can we at that Time draw the lower Jaw down, becauſe the *Center of Direction* is pulled upwards; wherefore we are obliged on that Occaſion to keep the Jaws cloſe together. But in Dogs and other Voracious Animals, who have theſe Muſcles ariſing from the Tranſverſe Proceſſes of the firſt *Vertebræ* of the Neck, theſe Actions are not dependant; whence it is they devour their Aliment ſo quick.

DIGEST or *Pandects*; the 1ſt Volume or Tome of the Civil Law is called *Digeſts*, or *Pandects*: *Digeſts*, becauſe the Author hath put, or digeſted all things, every Book and Title in its proper and natural Place and Order; and *Pandects* from πᾶν and δέχομαι, as containing and comprehending in it ſelf all that ever *Juſtinian* drew or collected out of 150000 Verſes of the old Books of the Law.

This *Digeſt* was collected from the Works of 27 Venerable and Eminent Old Lawyers, whereof ſeveral were before Chriſt, and the Others flouriſh'd in the Time of the Emperors, even unto the Time of *Maximinus*, as we find from *Spartianus* and *Lampridius* in that Emperor's Life. The *Tome* of the *Digeſts* is divided into 7 Parts, and they again into 50 Books. To this *Tome* Sir *Thomas Ridley* adds the *Inſtitutions* or *Inſtitutes*; which ſee under that Word.

DIGESTER, a Veſſel ſo called by its Inventor Mr. *Papin*, and is a kind of *Balneum Mariæ Clauſum*.

DIGESTIO *Chymica*, a *Chymical Digeſtion*, is when things are digeſted by an Artificial Heat, juſt as they are naturally in the Stomach, which is when ſome Matter is put over a gentle Heat, to infuſe it in ſome proper *Menſtruum* or Liquor fit to diſſolve it, that ſo it may, as near as can be, be like the Effect of a Natural Heat.

DIGESTION, the Concoction of the Aliments, or the Diſſolution of them, by which they are turned into Chyle.

Mr. *Charles Leigh*, then of *Brazen-Noſe College* in *Oxon*, has a Diſcourſe concerning *Digeſtion*, publiſhed in *Phil. Tranſ. N.* 162. wherein he ſuppoſes that there is neceſſary to Digeſtion in the Stomachs of Animals, 1. *A Liquid Menſtruum*, which by its peculiar Faculty operates upon their Meat, and helps to diſſolve it. 2. A gentle Heat in the Stomach, which he thinks it receives from the Liver, and therein falls in with the Opinion of Dr. *Gliſſon*. 3. 'Tis neceſſary that the Stomach have a *Natural Situation*. 4. That the *Omentum* be aſſiſting; for it hath been found by Anatomy, that where the *Omentum* hath been purified in an Human Body, it was always accompanied with a bad Digeſtion and loſs of Appetite; and 'tis alſo obſervable, that thoſe Creatures which have no *Omentum*, as Hares and Conies, &c. do help their Concoction by doubling their hinder Legs, and reſting their Bellies upon them. 4. 'Tis neceſſary that the Stomach ſhould have a *Tunica Villoſa*, which both helps to divide the Meat into ſmall Parcels, and alſo keeps the *Tunica Carnoſa* from being too much diſtended, which would by degrees weaken and injure its Tone. 5. 'Tis neceſſary that the Guts ſhould lie in a winding Poſition, and be of a good length; for otherwiſe the Meat digeſted in the Stomach would paſs away too faſt.

The firſt of theſe, the *Liquid Menſtruum* or *Natural Ferment* of the Stomach, he thinks conſiſts of theſe Ingredients; 1. The *Saliva* or Spittle. 2. The Juice contained in the Stomachical Glands. And 3. The Nitro-aerial Spirit of the Nerves.

DIGESTIVE *Medicines*, are either *Internal* or *External*.

The *Internal* are uſually preſcribed to prepare the Body by Purgation, which they do by making the Humours fluid, attenuating and drawing viſcous or tough Subſtances, tempering ſuch as are ſharp, diluting Salts, blunting, concentrating, and imbibing Acids, &c.

External Digeſtives, are ſuch as ripen a Tumor, or generate good and laudable Matter in a Wound.

DIGIT, in Aſtronomy, is the Twelfth Part of the Diameter of the Sun or Moon; 'tis uſed to expreſs the Quantity of an Eclipſe.

DIGITATUM *Folium*, among the Botaniſts is the Term for the Leaf of the Plant, which either is compoſed of many ſimple Leaves ſet together upon one Foot-ſtalk, as in Cinque-foil, Vetches, &c. or elſe when there are many deep Gaſhes or Cuts in the Leaf, as in thoſe of Straw-Berries, Hops, &c.

DIGITORUM *Tenſor*: See *Extenſor Digitorum Communis*.

DIGITS, or *Monades*, a Term in Arithmetick, ſignifying any *Integer* under Ten, as, 1, 2, 3, 4, 5, 6, 7, 8, 9.

DIJAMBUS, is the Foot of a *Latin* Verſe of four Syllables, and compounded of two *Iambicks*, ſo that the firſt and laſt are ſhort, and the two middle long, as *Severitas*.

DILATATION, among the Anatomiſts, is when any Paſſages or Receptacles in the Body are too much ſtretched or diſtended; and in general, it ſignifies a thing's taking up more Space than it did before.

DILATORIUM, is a Chirurgeon's Inſtrument wherewith the Mouth is dilated or opened: It is called

called likewiſe *Speculum Oris*, becauſe by it one may ſee into the Mouth.

DILATORES *Alarum Naſi*, are ſmall thin Muſcles, having a double Order of Fibres decuſſating each other, not unlike the *Muſculi Intercoſtales*; they pull up the *Alæ*, and dilate the Noſtrils.

DILEMMA, is an Argument compounded uſually of four or more Propoſitions, and ſo diſpoſed, that own or grant which you will of them, yet ſtill the Argument ſhall preſs you, and hem you in with Difficulties not readily to be ſolved or ſurmounted, eſpecially if the *Dilemma* be juſt; in order to which, *the Diviſion and Enumeration of the Parts muſt be adequate and entire*; *your Antagoniſt muſt be truly preſſed and affected with one or more of the Propoſitions*; and the *Arguer* himſelf free from a Poſſibility of having the *Dilemma* returned upon him.

DILUTE, is a Word frequently uſed by the Writers of Chymiſtry and Pharmacy, and ſignifies the Diſſolution of the Parts of a dry Body in a moiſt or liquid one; for when the Body is ſo diſſolved, they ſay 'tis *diluted*.

DIMENSION, in Geometry, is either Length, Breadth or Thickneſs: Thus, a Line has, they ſay, one *Dimenſion*, *viz.* Length; a Surface two, *viz.* Length and Breadth; and a Body or Solid hath all three *Dimenſions*. 'Tis uſed alſo with Regard to the Powers of any Root in an Equation, which are called the *Dimenſions of that Root*; as in a Biquadratick Equation, the higheſt Power hath 4 *Dimenſions*, or its Index is 4.

DIMETIENT, the ſame with *Diameter*.

DIMINISHED *Angle*, a Term in Fortification. See *Angle*.

DIMINUTIO: See *Litotes*.

DIMINUTION, in Muſick, is nothing elſe but the diminiſhing or abating ſomewhat of the full Value or Quantity of any *Note*.

DINUS, according to ſome, is the Name of a Diſeaſe called uſually the *Vertigo*.

DIOPTER, is the ſame with the *Index* or *Alhidada* of an *Aſtrolabe*, or the like *Inſtrument*.

DIOPTRA, is an Inſtrument uſed by Chirurgeons, whereby one may ſee into the *Matrix*; otherwiſe called *Dilatatorium*, wherewith the Womb is dilated and enlarged in the Extraction of a dead *Fœtus* out of it, or in the inſpecting any Ulcers that are in it: 'Tis alſo called the *Speculum Matricis*.

DIOPTRICKS, is a Part of *Opticks* treating of the different Refractions of the Light paſſing through different *Mediums*, as the Air, Water, Glaſſes, &c.

DIORTHOSIS, a Chirurgical Operation, by which crooked or diſtorted Members are made even, and reſtored to their Primitive and regular Shape.

DIOTA, the Chymiſt's Term for a circulating or double Veſſel.

DIPLASIASMUS, is a Reduplication of Diſeaſes; alſo two Muſcles of the Arm, which ſerve to turn it about. *Blanchard.*

DIPLOE, is the lower thin Plate or Shell of the Skull; alſo a double Veſſel uſually with Chymiſts.

DIPLOMA, the ſame with *Diploe*; ſometimes it is taken for a complicated or folded Cloth.

DIPPING *Needle*, is an *Engliſh* Diſcovery (Dr. *Wallis* thinks by Mr. *Blagrave*, or ſome other Greſhamite, *Phil. Tranſ.* 276.) of a Property in the *Magnetick Needle*; that beſides its Polarity or Verticity, which is its Direction towards the *North* in a Horizontal Poſition, it hath alſo a Direction of Altitude above the Horizon; and that it will (if duly poized about an Horizontal Axis) always point to a determinate Degree of Altitude or Elevation above the Horizon in this or that Place reſpectively.

DIPSACUS, according to ſome, is the ſame with *Diabetes*.

DIPTERON, in Architecture, is a Name which the Ancients attributed to thoſe Temples which were encompaſſed with a double Row of Pillars, making two Portico's, which they called *Wings*; but we commonly call them *Iſles*, from the *French* Word *Ailes* of the ſame Signification.

DIPTOTES, are ſuch Nouns in Grammar as have but two Caſes, as *Suppetiæ*, *Suppetias*, &c.

DIRECT; in Aſtronomy, a *Planet* is ſaid to be *direct*, when by its proper Motion it goes forward in the *Zodiack* according to the Succeſſion of the Signs, or rather when it appears ſo to do, the Obſerver's Eye being placed on our Earth.

DIRECT, *Erect*, *Eaſt* or *Weſt Dials*, are thoſe whoſe Planes lie directly open to the *Eaſt* or *Weſt* Points of the Heavens, or parallel to the Meridian of the Place.

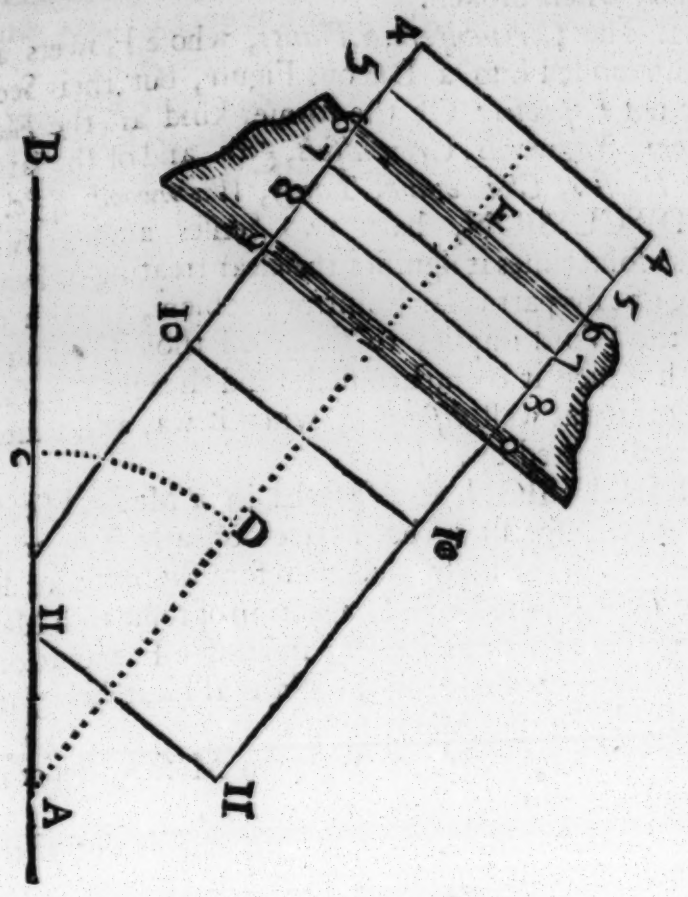
To draw this Dial, the Style's Height may be found according to the Bigneſs of the Plane, and the Diſtance of the Hour Lines from each other, by the Direction given under *Polar Dials*, making of them a Table, as in the following one, for the *Lat.* 51. *Deg.* 32. *Min.*

Hours.	*Angles at Pole.*		*Tangent.*		*Hours.*
Eaſt.	*D.*	*M.*	*Inch*	*P.*	*Weſt.*
4	30	00	5	77	8
5	15	00	2	68	7
6	*Subſtyle.*		00	00	6
7	15	00	2	68	5
8	30	00	5	77	4
9	45	00	10	00	3
10	60	00	17	32	2
11	75	00	37	32	1
12	*Infinite.*		*Infinite.*		

Then to deſcribe the Dial, draw the *Horizontal Line* A B; and with 60 *Deg.* from your Chords deſcribe the prick'd Arch *C D*, whereon ſet the Co-Latitude of the Place from *C* to *D*. From *A*, through *D*, draw *A D E*, repreſenting the Equator of the Dial; then chuſe a Point in this Line to be the Hour of 6, as at *E*. Draw 6 *e* 6 at Right Angles with the Equator; and from *E* ſet off the ſeveral Tangents as you find them in the Table, and thoſe ſhall be the ſeveral Points for the Hours, and through each Point draw the Hour Lines parallel to the Equator 6 *e* 6.

The *Style* may be a ſtraight Pin equal in Height to the Right Line 6, 9. in either Dial, or which is better and more uſual, a Rod or Ledge of Iron ſupported by two Legs, and ſet upon the Line 6, 6, and of the ſame Height 6, 9 as the Pin.

A Direct, Erect, East Dial, Lat. 51 *Deg.* 32 *Min.*



The *West Dial* is made after the same manner, only set and numbred a contrary way.

DIRECT, *Erect, South or North Dials:* See *Prime Verticals.*

DIRECT, *Erect Planes:* See *Dial Planes.*

DIRECT { *Inclining* / *Reclining* } *Plains:* See *Dial Planes.*

DIRECT *South* or *North* { *Inclining* / *Reclining* } *Dials*, are those whose *Planes* { *Incline* to the / *Recline* from the } { *Horizon* / *Zenith* } and lie directly open to the *South* or *North.*

These *Dials* are described after the same manner with *Direct South Dials*, only observing this Rule in placing the *Style.*

In *South Incliners*, the Difference of the *Angle of Inclination*, and the *Height of the Pole*, is the *Height of the Style* above the *Plane.*

If the *Pole's Height* be { greater / lesser } than the *Angle of Inclination*, then the { *North* / *South* } *Pole* is elevated, and the Center is { below. / above.

In *Direct North Incliners*, the Sum of the *Angles of Inclination* and *Elevation of the Pole*, is the *Height of the Style* above the *Plane.*

Note, That *Reclining Dials* are to be made after the same Manner; for *South Incliners* are *North Recliners*, and *North Recliners* the same with *South Incliners*, the one being the Back-side of the other.

DIRECT *Ray*, in *Opticks*, is the Ray which is carried from a Point of the visible Object directly to the Eye through one and the same *Medium.*

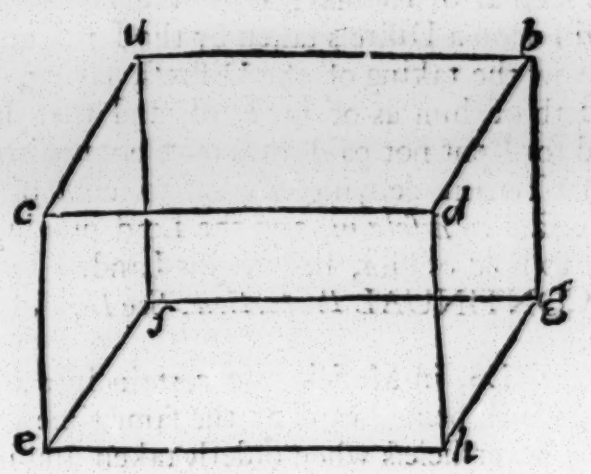
DIRECT *Sphere:* See *Right Sphere.*

DIRECTION, a Term in Mechanicks, wherein, by the *Line of Direction*, they always mean the Line of Motion that any Body observes, according to the Force impressed upon it, and which is determined or *directed* to move such a way.

DIRECTRIX of the *Conchoid:* See *Conchoid.*

DIRIGENT, a Term in Geometry, expressing the Line of Motion, along which the *Describent Line* or Surface is carried in the *Genesis* of any Plane or Solid Figure.

Thus, If the Line *a b* move along the Line *a c*, so that the Point *a* do always keep in the Line *a c*, a Parallelogram, as *a b c d*, will be form'd, of which the Side *a b* is the *Describent*, and the Line *a c* the *Dirigent:* So also if the Surface *a b c d* be suppo-



sed to be carried along the Line *c e*, in a Position always parallel to it self in its first Situation, the Solid *a d f h* will be formed where the Surface *a d* is the *Describent*, and the Line *c e* is the *Dirigent.*

DISABILITY, in Law, is taken notice of four several ways; *viz*, by the Act of the Ancestor; by the Act of the Party; by the Act of Law; and by the Act of God.

1. *Disability* by the Act of the Ancestor, is if a Man be attainted of Treason or Felony; by this Attainder his Blood is corrupted, and thereby himself and his Children are *disabled* to inherit.

2. *Disability* by the Act of the Party himself, as if one Man make a Feoffment to another that then is Sole, upon Condition that he shall enfeof a Third before *M.* and when such Feoffment is made, the Feoffee takes a Wife; he hath by that *disabled* himself to perform the Condition according to the Trust in him reposed, and therefore the Feoffer may enter and out him. Also if a Man be excommunicated, he cannot, during that Time, sue any Action, but shall be thereby *disabled*; and so in other Cases.

3. *Disability*, in Act of Law, is properly when a Man, by the sole Act of Law, is *disabled*, and so is an Alien born; and therefore if a Man born out of the King's Ligeance will sue an Action, the Tenant or Defendant may say that he was born in such a Country out of the King's Ligeance, and demand Judgment if he shall be answered; for the Law is our Birthright, to which an Alien is a Stranger, and therefore *disabled* to take any Benefit thereby.

4. *Disability* by the Act of God, as to be *Non compos mentis*, or *Non sanæ memoriæ*, which so *disables* him, that in all Cases where he gives or passes any thing, or Estate out of him, after his Death it may be disannulled and avoided.

DISCENT, in commom Law, signifies an Order or Means whereby Lands or Tenements are derived unto any Man from his Ancestors, as to make his *Discent* from his Ancestors, and is to shew how and by what Degrees the Lands in Question came to him from his Ancestors. And this *Discent* is either *Lineal* or *Collateral*; *Lineal Discent* is convey'd downwards in a right Line from the Grandfather to the Father, and from the Father to the Son, and from the Son to the Nephew, &c. *Collateral Discent* is springing out of the Sid of the whole Blood, as Grandfather, Father's Brother, &c.

DISCENS *sive Disciformis Cometa*, (according to some) is a *Comet* resembling the Shape of a round Dish or Platter; and the Chief of this kind is called a *Solar Comet*, from the likeness of its Rays to those of

of the *Sun*; and otherwiſe *Roſa* and *Chryſeus*, from its bright Silver Colour mix'd with a Golden or Amber Colour: Thoſe of this ſort, which are not abſolutely circular, but reſemble the Figure of a Shield, are thence termed *Clypeiformes*.

DISCLAIMER, in Law, is a Plea containing an expreſs Denial or Refuſal; as if the Tenant ſue a Replevin upon a Diſtreſs taken by the Lord, and the Lord avow the taking of the Diſtreſs, ſaying, That he holdeth of him as of his Lord, and that he diſtrained for Rent not paid, or Service not performed; then the Tenant denying himſelf to hold of ſuch Lord, is ſaid to *diſclaim*, and the Lord proving the Tenant to hold of him, he loſes his Land.

DISCONTINUAL *Proportion*: See *Diſcrete Proportion*.

DISCORDS, in Muſick, are certain Intervals of Sounds, which being heard at the ſame time offend the Ear; nevertheleſs when orderly taken and intermix'd with Concords, they make the beſt Muſick. Theſe *Diſcords* are the Second, Fourth and Seventh, with their Octaves; that is to ſay, all Intervals, except thoſe few which preciſely terminate the *Concords*, are *Diſcords*.

DISCOURSE, in a Logical Senſe, is that rational Action of our Mind by which we form or infer any new Judgment from others before made; or whereby we can infer or conclude one thing from another.

DISCRETE or *Disjunct Proportion*, is when the *Ratio* between 2 Pairs of Numbers or Quantity is the ſame, but there is not the ſame Proportion between all the four Numbers: Thus, if theſe Numbers 6 : 8 :: 3 : 4, are conſidered, the *Ratio* between the firſt Pair 6 and 8 is the ſame as that between 3 and 4, and therefore theſe Numbers are proportional; but 'tis only diſcreetly or disjunctly, for 6 is not to 8, as 8 to 3; that is, the Proportion is broken off between 8 and 3, and is not continued all along, as it is in theſe following, which are called *Continual Proportionals*, *viz.* 3 : 6 :: 12 : 24.

DISCRETE *Quantity*, is ſuch as is not continued and joined together, as *Number*, whoſe Parts being diſtinct Units, cannot be united into one *Continuum*; for in a *Continuum* there are no actual determinate Parts before Diviſion, but they are potentially Infinite; wherefore it is uſually and truly ſaid, *That continued Quantity is diviſible in Infinitum*.

DISCRETIVE *Propoſitions*, are thoſe where various Judgments are made and denoted by the Particles (*but*, *notwithſtanding*) or Words of the like Nature either expreſs'd or underſtood: Thus, *Fortune may deprive me of my Wealth, but not of my Virtue: They who croſs the Sea, change only their Country, but not their Diſpoſition*, are called *Diſcrete Propoſitions*.

DISCUS, among the *Romans*, was a round Quoit of Metal or Stone about a Foot in Diameter, which, in ancient Exerciſes, they threw in the Air to ſhew their Strength: Alſo they gave the ſame Name to a round Shield conſecrated to the Memory of ſome famous Hero, and hung up in the Temples of their Gods as a Trophy for ſome great Action. From the Figure of either of which, but rather from the former, comes the Word ſo much in uſe among Aſtronomers, *viz.* the *Disk* of the Sun or Moon; by which they mean the Round of the Planet's Body as it appears to us.

DISCUS, is uſed by the Botaniſts to denote the middle, plain and flat Part of ſome Flowers, ſuch as *Caltha*, *Flos Solis*, &c. becauſe 'tis in Figure like the ancient *Diſcus*: And they reckon two kinds of Plants with a *Diſcous Flower*;

1. Such as have the Flower compounded, and the Seed pappous, but the Leaves and Stalks are not Milky when broken.

2. The *Corymbiferous Plants*, whoſe Flowers are compounded into a Diſcous Figure, but their Seeds are not *Pappous*: Of the former kind are the *Fleabanes*, *Ragweeds*, *Groundſels*, &c. and of the latter are *Daiſies*, *Chamemile*, *Tanſy*, *Wormwood*, &c.

DISCUSSION, hath two Senſes among Writers; ſometimes it ſignifies the clear treating or handling of any particular Point or Problem, ſo as thereby the Word implies to *ſhake* off thoſe Difficulties with which it is embarraſſed; and thus we ſay, ſuch a Point was well *diſcuſſed*, when it was well treated of and cleared up. But

DISCUSSION is alſo uſed in a Medical Senſe, for the diſperſing the Matter of any Tumor or Swelling in the Body, and therefore the Surgeons define *Diſcuſſion* to be an Evacuation of ſome thin Matter gathered in any Part by inſenſible Evaporation; and this is procured by the Natural Heat being increaſed by proper Medicines.

DISDIAPASON, a Term in Muſick, denoting a double Eighth or Fifteenth.

DISEMBOGUE, when a Ship paſſeth out of the Mouth of ſome Gulph, they call it *Diſemboguing*: They ſay alſo of a *River*, that at ſuch a Place, or after it hath run ſo many Leagues, it *diſembogues* it ſelf into the Sea.

DISJUNCT *Proportion*, the ſame with *Diſcrete*: Which ſee.

DISJUNCTIVE *Propoſitions*, are thoſe wherein the Disjunctive, Conjunctive (*or*) is found; as, *either the Sun moves about the Earth, or the Earth about the Sun*; *Men are guided either by Intereſt or Fear*.

DISLOCATION, the ſame with *Luxation* or putting a Limb or any Bone of the Body out of Joint.

DISMES *Decimæ* are Tythes, and ſignify the Tenth Part of all the Fruits of the Earth, or tame and profitable Beaſts of it, or of Mens Labour.

DISMOUNT, in the common Military Uſe, is to unhorſe, as to diſmount the Cavalry; but they call it alſo *diſmounting of Cannon*, when they are thrown off the Carriages, and are broken, or any Horſe rendred unfit for Service.

DISPART, a Term in Gunnery, ſignifying the ſetting a Mark on the Muzzle-Ring of a Piece of Ordnance, or thereabouts, ſo that a Sight-Line taken upon the Top of the Baſe Ring againſt the Touch-hole, by the Mark ſet on or near the Muzzle, may be parallel to the Axis of the Concave Cylinder. The common Way of doing which, is, to take the two Diameters of the Baſe Ring, and of the Place where the *Diſpart* is to ſtand, and divide the difference between them into two equal Parts, one of which will be the Length of the *Diſpart*, which is ſet on the Gun with Wax or Pitch, or faſtened there with a Piece of *Twine* or *Marlin*: But an Inſtrument may be made to do it to all poſſible Nicety.

DISPENSATORY, is a Book uſed by *Apothecaries*, wherein all Medicines, at leaſt the moſt uſual, are contained and preſcribed, that they may be prepared in the Shops all the Year round.

DISPLAYED, the Term in Heraldry for an Fagle in an erect Poſture, and her Wings ſpread abroad.

DISPONDÆUS, is the Foot of a Latin Verſe conſiſting of four Syllables, and thoſe all long, as *Concludentes*, ſo that this is a Compoſition of two *Sponde's*.

DISPOSITION: See *Method.* In Architecture they call the juſt placing of all the ſeveral Parts of an Edifice, according to their proper Order, *Diſpoſition.*

DISQUISITION, an Enquiry into the Nature, Kinds and Circumſtances of any Problem, Queſtion or Topick, in order to gain a right Notion, and to diſcourſe clearly of it.

DISSEISIN, in Law, ſignifies an unlawful diſpoſſeſſing a Man of his Land, Tenement, or other immovable or incorporeal Right.

DISSEISIN *upon Diſſeiſin,* is where the *Diſſeiſor* is *diſſeiſſed* by another.

DISSEMINATE *Vacuum:* See *Vacuum.*

DISSIMILAR *Leaves,* are the two firſt Leaves of any Plant at its firſt ſhooting out of the Ground; and are ſo called becauſe they uſually are of different Form from the common Leaves of the grown Plant. Theſe Dr. *Grew* obſerves to be nothing but the very Lobes of the Seed expanded and thus advanced. Their Uſe is for the Protection of the *Plume,* which being young and tender, is thus guarded on each Side, and alſo hath ſome Rain or Dew gradually conveyed down to it by this Means.

DISSIMILAR *Parts,* in Anatomy, (by ſome called *Compound* and *Organical*) are ſuch as can be divided into various Parts different from one another; as the Hand is into Veins, Muſcles, Bones, &c. whoſe Portions are neither of the ſame Nature nor Denomination.

DISSOLVING *Medicines:* See *Diſcuſſion.*

DISSOLUTION, is when Electuaries and Powders are mingled and diſſolved in Water or a Decoction. *Blanchard.*

DISSONANCE, in Muſick, is a diſagreeable Interval between two Sounds, which, being continued together, offend the Ear.

DISTANCE, in Navigation, is the Number of Degrees, or Leagues, &c. that a Ship has ſailed from any given Point.

DISTANCE *of the Baſtions,* in Fortification, is the Side of the *Exterior Polygon.*

DISTEMPER, a Term in Painting for the working up of Colours with ſomething elſe beſides bare Water or Oil; for if the Colours are prepared with the former of theſe, that kind of Painting is called *Limning*; and if with Oil, 'tis called *Painting in Oil,* and ſimply *Painting*; but if the Colours are mix'd with Siſe, Whites of Eggs, or any ſuch proper glutinous or unctuous Subſtance, and not with Oil, they then ſay 'tis done in *Diſtemper,* as the admirable *Cartons* are at *Hampton Court.*

DISTENTION, is when Parts are puffed up, dilated or relaxed by any thing; as the Guts by Wind raiſed from Effervescencies within them, whence Oppreſſions and Pains frequently proceed. *Blanchard.*

DISTILLATION, is drawing off ſome of the Principles of a Mixture, as the Oil, Spirit, Water, &c. in proper Veſſels, by the help of a Fire; and is twofold.

1. *Per Aſcenſum,* when the Matter to be diſtilled above the Fire.

2. *Per Deſcenſum,* when the Matter to be diſtilled is below the Fire, and ſo the Vapour not being able (by the Contrivance of the Veſſel) to riſe upward, is forced to precipitate and to diſtil down to the Bottom of the Veſſel.

Oil of Cloves, if you would have it White, is beſt made this Way.

Diſtillation of Vegetables or Minerals is very different, according to the Nature of the Body to be diſtilled. Acid Spirits are drawn in a ſtrong Re-

tort, and with very great Fires, and uſually in a Reverberatory Furnace. Ponderous Woods are diſtilled in a Retort after the ſame manner, and with near the ſame Degree of Heat, ſuch as *Guajacum, Box,* &c. and in theſe firſt comes a little Phlegm, and then the Fire increaſing, the Spirits fly out in white Clouds; when they ceaſe to come, the Matter in the Receiver is filtrated through a Tunnel lined with Cap-Paper; the Spirit will paſs, but leave the Black Fetid Oil in the Tunnel, which afterwards may be rectify'd (if it be worth while) by making it up into Pellets with Sand, and then diſtilling it over again in a naked Fire, there will come over a clear Oil. The Spirit alſo may be rectify'd by diſtilling it over again in a Glaſs Alembick: Put Fire to the black Coals remaining in the Retort, and they will ſoon kindle and turn to Aſhes; which Aſhes may be calcined a while in a Potter's Furnace, and then a *Lixivium* being made of them with Water, and the Water filtrated and evaporated, the fix'd Salt of the Wood will remain at the Bottom; and thus all the five Principles may be drawn from *Amber, Ponderous Woods,* &c.

Plants that are Odoriferous are to be diſtilled *per Veſicam,* but firſt let a ſtrong Decoction of the ſame Plant be poured hot upon the Plant it ſelf bruiſed and put into the Body, and there let the Matter digeſt two Days, the Veſſel being cloſe ſtop'd: Then fit all things for Diſtillation, and with a Fire of the ſecond Degree draw off about half the Water you poured on the Plant; this will be a very good Water, and taſte and ſmell ſtrongly of the Plant.

Preſs through a Cloth ſtrongly what remains in the Body, filtrate and evaporate in a gentle Heat till the Matter be of the Conſiſtence of thick Honey. This is the *Extract* of the Plant; but the Extracts of Odoriferous Plants are not ſo good as thoſe of Vegetables which are not ſo, becauſe abundance of the finer Volatile Parts evaporate with the Moiſture.

Dry what remained in the Cloth after Expreſſion, and then burn it (with more of the Plant dried, if you will:) Make a *Lixivium* of the Aſhes, and then filtrate and evaporate to drineſs, and the fix'd Salt of the Plant will remain at the Bottom. And thus may Balm, Wormwood, Sage, Hyſſop, &c. be diſtill'd, and their Waters, Oils and Extracts made, and their fix'd Salts gain'd.

To diſtil Plants that are not Odoriferous, 'tis beſt to proceed thus; pound the Plant, and then fill two Thirds of the *Veſica* or *Alembick* with it, and after that pour on a good quantity of the expreſſed Juice of the ſame Plant, ſo that the bruiſed Matter may float in the Juice, and not ſtick to the Bottom or Sides of the Veſſel: Then fit on the Head, and draw off about half as much Water as you uſed Juice; this will be a very good diſtill'd Water of that Plant. Preſs through a Cloth what remains in the Still, and let the Juice ſettle; then filtrate it, and after that, in a ſmall Heat, evaporate about two Thirds of the Liquor in a Glaſs or Earthen Veſſel; then remove the Veſſel into a Cellar, or ſome ſuch cool place, and the *Eſſential Salt* will ſhoot out into Chryſtals; which gather, and keep in a Viol well ſtop'd; or you may make the *Extract fixed Salt* of it as above directed, as of an Odoriferous Plant.

To diſtill a Spirit from any Plant like that of Scurvy-Graſs, they proceed thus: The Plant is pounded to a Pulp in a Marble Mortar, and then put into an Earthen Veſſel ſo as to fill it but half full; after which the expreſſed Juice of the ſame Plant is pour-

ed upon it till it be about 6 Inches above the Matter: After this they mix with it all about a Pint of *Yeſt* or *Barm*, and then ſtopping the Veſſel, they ſet it to ferment, either in the warm Sun, or in Horſe Dung, for three or four Days, or more if it be cold Weather: As ſoon as you perceive that it hath done fermenting, and that its Surface begins to ſink or ſubſide, put the Matter ſpeedily into a Cucurbite or *Veſica*, and luting on the Head, ſet the Veſſel in a *Balneum Vaporis*, and diſtil, with a gentle Fire, about two Pints of the Liquor, which will be very Spirituous; and if you rectify again, and draw off half of it, it will be a very fine Spirit. What remains in the Body may be diſtill'd farther, and a Water will run off, that is as good or better than any diſtill'd Water of that Plant drawn the common way.

After this Manner alſo the *Ardent* or *Inflammable* Spirit of Roſes, &c. may be drawn.

DISTINCT *Baſe*, in Opticks, is that preciſe Diſtance from the Pole of a Convex Glaſs, in which Objects, beheld through it, appear *diſtinct* and well defined; ſo that 'tis the ſame with what is otherwiſe called the *Focus*. The *Diſtinct Baſe* is cauſed by the Collection of the Rays proceeding from a ſingle Point in the Object, into a ſingle Point in the Repreſentation; and therefore Concave Glaſſes, which do not unite, but ſcatter, and diſſipate the Rays, can have no real *Diſtinct Baſe*.

DISTINCT *Viſion*: See *Viſion*.

DISTORTION, is when the Parts of an Animal Body are ill placed or ill figured.

DISTRESS, in Law, ſignifies a Compulſion in certain real Actions, whereby to bring a Man to appear in Court, or to pay a Debt of Duty denied; the Effect thereof, moſt commonly, is to drive the Party diſtrained to replevy the *Diſtreſs*, and ſo to take his Action of Treſpaſs againſt the Diſtrainer, or elſe to compound with him for the Debt or Duty for which the *Diſtreſs* was made. There are ſeveral things not *diſtrainable*; for a *Diſtreſs* muſt be of a thing whereof a valuable Property is in ſome Body, and therefore Dogs, Bucks, Coneys, and the like, that be *feræ naturæ*, cannot be diſtrained. 2. Although it be of a valuable Property, as a Horſe, (yet when a Man or Woman is riding on him) or an Ax (in a Man's Hand cutting of Wood) and the like, are for that time privileged, and cannot be diſtrained. 3. Valuable things ſhall not be diſtrained for Rent, for Benefit and Maintenance on Trades, which, by conſequence, are for the Commonwealth, and are by Authority of the Law there; as a Horſe in the Smith's Shop; Materials in the Weaver's Shop for making Cloth; Cloth or Garments in the Taylor's Shop, Sacks of Corn or Meal in a Mill, nor in a Market, nor any thing diſtrained for *Damage-feaſant*, for it is in *Cuſtodia Legis*. 4. Nothing ſhall be diſtrained for Rent, that cannot be rendred again in as good a Plight as it was at the time of the *Diſtreſs* taken; as Sheaves or Shocks of Corn cannot be diſtrain'd for Rent, but for *Damage-feaſant* they may. 5. Beaſts belonging to the Plough ſhall not be diſtrain'd, but Goods may. 6. Furnaces, Cauldrons, or the like, fix'd to the Freehold, or the Doors or Windows of a Houſe, or the like, cannot be diſtrained. When a *Diſtreſs* that hath Life in it, is taken, it muſt be brought into the common Pound, or kept in an open Place, where the Owner may give it Food.

Diſtreſs is taken to be either *Real* or *Perſonal*: *Diſtreſs Real* is made upon immoveable Goods, as the *Grand-Cape* and *Petit-Cape*, by which the Land it ſelf is ſeized. *Diſtreſs Perſonal*, is made by taking a Man's moveable Goods, and detaining them for Security of his Appearance to the Suit. *Diſtreſs* is alſo either *Finite* or *Infinite*; *Finite* is that which is limited by Law, how often it ſhall be made to bring the Party to Trial of the Action: *Diſtreſs Infinite*, is with Limitation until the Party come, as againſt a Jury that refuſeth to appear *Super certificatione Aſſiſæ*, where the Proceſs is a *Venire facias*, *habeas corpora*, and *Diſtreſs Infinite*, &c.

DISTRIBUTIO *Chyli*, the Chyle is diſtributed when, after a due Fermentation in the Ventricle and the Guts, it ſoaks into and through the Glandulous Tunick of the Inteſtines; and paſſing through the Lacteal Veins, and its proper Channel along the Side of the Thorax, at laſt falls into the Subclavian Vein, that it may circulate with the Blood, and receive its Colour. *Blanchard*.

DISTRICHIASIS, is a double Row of Hair on the Eye-lids.

DISTRINGAS, is a Writ directed to the Sheriff or any other Officer, commanding him to diſtrain one for Debt to the King, &c. or for his Appearance at a Day.

DISSYLLABLE, is a Word conſiſting only of two Syllables, as *Vertue*.

DITONE, a double Tone, or the greater Third, is an Interval in Muſick which comprehends two Tones; the Proportion of the Tones that make the *Ditones*, is as 4 to 5, and that of the *Semi-ditones* as 5 to 6.

DIVERGENCE *Point*: See *Vertical Focus*.

DIVERGENT, or *Diverging Rays*, in *Opticks*, are thoſe *Rays* which going from a Point of the viſible Object, are diſperſed, and continually depart one from another, according as they are removed from the Object.

DIVIDEND, in Arithmetick, is the Number propoſed to be divided into certain equal Parts.

DIVIDUAL, is that part of the *Dividend* diſtinguiſhed by a Point, in working by the Rule of *Diviſion* in Arithmetick.

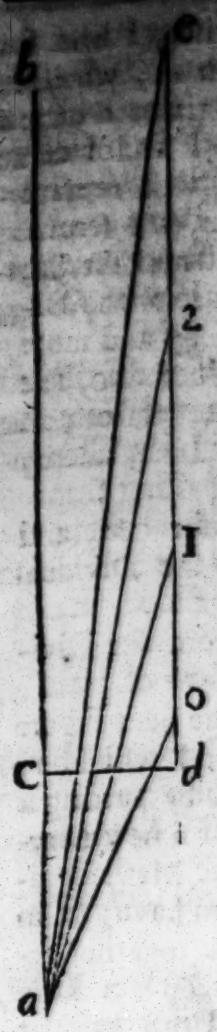
DIVINATORIA *Virgula*: See *Virgula Divinatoria*.

DIVISIBILITY, is that Diſpoſition of a Body, whereby it is conceived to have Parts, into which it may actually or mentally be divided.

All Quantity is infinitely, or rather indefinitely diviſible: for ſhould it be otherwiſe, it would be diviſible into Parts that are not *Quantæ*, which cannot be, for no accidental Change can deſtroy the eſſential Properties of a Being: Yet this infinite *Diviſibility* can never actually be effected, becauſe when you have divided a Line, or any other Quantity, into any number of Parts, every one of theſe Parts is further diviſible into as many Parts as the whole was, and ſo on, as is many ways demonſtrable in Geometry; wherefore there can be no ſuch thing as a determinate Number of actual Parts in any continued Quantity; which is farther alſo demonſtrable from the Conſideration of incommenſurable Quantities; as *that the Diagonal of a Square is incommenſurable with its Side*, as *Euclid* proves, *Lib.* 10. *Prop.* 117. And that the Parts in any Line are Infinite or Indefinite, will plainly appear by the following *Diagram*.

Let the Line *a b* be conceived to be drawn parallel to *d e* at the perpendicular Diſtance *c d*, which ſuppoſe to be half an Inch: 'Tis plain, the Line *d e* being capable of being infinitely produc'd, there may be taken in it as many Points, *o*, 1, 2, *e*, as you pleaſe; and from *a* to each of them can a Right Line be drawn, as in the Figure, which will divide the Line *c d*, though but of $\frac{1}{2}$ an Inch in Length, into as many Parts as you take in the low-

er



er Parallel *d e*. And though the Diviſions in the Line *c d* do ſtill leſſen upwards, yet they can never become nothing, becauſe no Line drawn from *a* to any Part of *d e*, though never ſo remote, can poſſibly ever coincide with the upper Parallel *a b*.

See alſo the Learned Mr. *Keil*'s 4th *Philoſophical Lecture*, read in the Univerſity of *Oxon*, and lately publiſh'd.

And that the Parts of Solid Bodies are almoſt infinitely ſmall, and that they are capable of being divided wonderful minutely, the Honourable Mr. *Boyle* ſhews by theſe Inſtances.

1. A Piece of Silver Wire was drawn ſo ſmall, that the Weight of but a Grain would reach to 27 Foot or 324 Inches in Length; and ſince an *Engliſh* Inch can eaſily be divided into 200 equal Parts, one Grain of this Wire may be divided into 64800 Parts; and ſince this Diviſion relates only to the Surface of the Wire, its Solidity may eaſily be conceived to conſiſt of many Millions of ſuch Parts.

2. One of the Oval Caſes of Silk-Worms was drawn out into a Length that much exceeded 300 Yards, and yet weighed but two Grains and a half; ſo that each Cylindrical Grain of that Silk, was at leaſt 120 Yards in Length.

3. A Grain of Leaf Gold was extended into an Area of above 50 Inches; and then ſuppoſing the Area reduced to a Square, and its Sides divided after the Manner above-mention'd, *i. e.* ſo that there be 200 Diviſions in an Inch: If parallel Lines be ſuppoſed to be drawn through thoſe ſubtile Diviſions, the Area will be divided into no leſs than two Millions of little Squares.

4. If you ſuppoſe the Silver Wire mentioned above, to be gilt with Gold (and allow for the Gilding 8 Grains of Gold to an Ounce of Silver, which yet is more than is commonly uſed) you will find an Ounce of Gold may cover as much Wire as will reach to 155½ Miles in Length.

5. By diſſolving one Grain of Crude Copper in a good Proportion of Spirit of *Sal Armoniack*, a deep Blue Colour was produced, and after this a good Quantity of diſtill'd Water was put to it to dilute it, yet ſo as that the Blue Colour did ſtill remain viſible; and on the comparing the Weight of the Liquor with the Grain of Copper firſt diſſolved, it was found, that one Grain was capable of imparting a ſenſible Colour to above 513620 times its Bulk of Liquor.

DIVISION, in general, ſignifies the diſtributing or parting of any Whole into its proper Parts, and is only a Compendium of *Subſtraction*; for the *Diviſor* is ſo many Times contain'd in the *Dividend*, as there are *Units* in the *Quotient*; ſo that ſubſtracting continually the *Diviſor* from the *Dividend*, and accounting an Unit for each Time, the Sum of thoſe Units is the *Quotient*.

In *Diviſion* the Number or Quantity to be divided, is called the *Dividend*; that by which you divide, the *Diviſor*; and the number of Times that the *Dividend* contains the *Diviſor*, is called the *Quotient* or *Quota*, and ſometimes the *Parabola*; the Reaſon of which ſee under that Word.

In all Diviſion, as one is to the Diviſor; ſo is the Quotient to the Dividend; wherefore though in whole Numbers the Quotient muſt always be *leſs* than the Dividend, yet in Fractions it muſt always be *greater*.

Thus, let 36 be divided by 4, the Quotient is 9, leſs than 36, becauſe, ſince 1 : 4 :: 9 : 36; 1 being leſs than 4, 9 muſt be alſo leſs than 36: But if $\frac{4}{5}$ were to be divided by $\frac{3}{4}$ the Quotient $\frac{16}{10}$ will be much bigger than the Dividend $\frac{4}{5}$, becauſe as 1 :: $\frac{3}{4}$ :: $\frac{16}{10}$: $\frac{4}{5}$, (*i. e.*) as one is to the Diviſor :: ſo is the Quotient to the Dividend; but 1 is greater than $\frac{3}{4}$ or $\frac{1}{2}$, wherefore $\frac{16}{10}$ muſt alſo be greater than $\frac{2}{5}$.

DIVISION in *Species* or *Algebra*, is, in general, the reducing the Dividend and Diviſor to the Form of a Fraction, which Fraction is the Quotient: Thus, if *a b* were to be divided by *c d*, it muſt be placed thus, $\frac{a\,b}{c\,d}$, and that Fraction is the Quotient; though ſome chuſe to write it thus, $c\,d)\,a\,b$, or $ab \div cd$, which laſt Mark $\div$ is the common Character for *Diviſion*.

For the performing the Work of Diviſion *Algebraically, obſerve theſe* Rules.

1*ſt Rule*, When the Dividend is equal to the Diviſor, the Quotient is Unity, and muſt be placed in the Quotient, becauſe every Thing contains it ſelf once.

2*d Rule*, When the Quotient is expreſs'd Fraction ways (as in *Simple Diviſion*) if the ſame Letters are found equally repeated in every Member of the Numerator and Denominator, caſt away thoſe Letters, and the Remainder is the Quotient: Thus, $\frac{a\,b}{b}$ (a, and $\frac{a\,b\,c}{a\,b}$ (c, &c.

3*d Rule*, When there are any Co-efficients, divide them as in common Arithmetick, and to the Quotients annex the Quantities expreſs'd by Letters: Thus, $\frac{360\ a\,b}{24\ b}$ ($= 15\,a$.

4*th Rule*, The general Way of *Diviſion* of Compound Quantities, is like the ordinary Way in common Arithmetick, reſpect being had to the Rules of Algebraick *Addition*, *Subduction*, and *Multiplication*; as alſo, that like Signs give +, and unlike — in the Quotient, taking care to divide every Part of the Dividend by its correſponding Diviſor (*i. e.* that whoſe Letters ſhew it of the ſame Kind with the other) to prevent a Fraction which would otherwiſe ariſe:

Thus $a + b)\ a\,a + a\,b - c\,a - c\,b\ (a - c.$

$a\,a + a\,b$

$0 \qquad 0 - c\,a - c\,b$

$- c\,a - c\,b$

0

That the ſame Reaſon for like Signs giving a poſitive, and unlike a negative Quotient, muſt hold in *Diviſion* as well as in *Multiplication*, is clear from conſidering the Nature of *Diviſion* (which is only reſolving the thing into its Parts) therefore, ſince every Dividend is nothing elſe but the Product of the Diviſor and Quotient multiplied by each other,

the Quotient muſt conſiſt of ſuch Signs which could produce the Dividend; therefore if the Dividend be divided by a Quantity that hath a ſimilar Sign with it, the Quotient muſt be poſitive; if by a Quantity having a diſſimilar Sign, it muſt be Negative.

It may be a General Rule in Compound Diviſion in Algebra, always to place ſuch a Letter in the Quotient, as will, when multiplied into the Diviſor, produce the Dividend, for that is always a Rectangle under the Diviſor and the Quotient.

An Example of Compound Diviſion in Algebra.

$zz-16)\ z^5-8z^3-124\,zz-64\,(z^3+8z+4$

z^5-16z^3

$8z^3-124\,zz$

DIVISION *in whole Numbers* is thus perform'd.

1. To divide by one Figure is very eaſy, as ſuppoſe 6759 were to be divided amongſt 3 Men, how much is each Man's Share? Set the Numbers down as you ſee here; 3) 6759 (2253.

And then ſay, 3 is contained in 6 (the firſt Figure towards the Left-hand of the Dividend) twice; wherefore I place 2 in the Quotient; then I go on to the next Figure, and ſay, 3 is found in 7 twice, and there is one over: I place 2 in the Quotient again; and I imagine the one that was over to ſtand before the next Figure 5, which will make it 15: Then I enquire how oft I can have the Diviſor 3 in 15, and finding it juſt 5 times, I place 5 in the Quotient. Then I go to the laſt Figure, and aſk how often I can have 3 in 9, which I find to be 3 times I write 3 in the Quotient; and ſo the Operation is over, 2253 being the true Quotient, or the number of Pounds that each Man muſt have.

2. When you are to divide a Number by a Diviſor that conſiſts of 2, 3, or more Places, the Operation is more tedious and difficult (it being indeed the hardeſt Leſſon in Arithmetick) but yet it may, with a little Practice, be readily perform'd thus; ſuppoſe 940488 Crowns were to be divided among a Ship's Company conſiſting of 263 Men, what is each Man's Share.

1. Set down the Numbers as you ſee; then firſt diſtinguiſh by a Point a Part of the Dividend, which ſhall be greater than, or at leaſt equal to the Diviſor, which is called the *Dividual*, and is firſt to be divided: Then ſeek how often you can have 263 in 940, which, becauſe it is uſually the hardeſt Taſk to find exactly, obſerve carefully this Rule: Firſt ſay, I can have 2, the firſt Figure of the Diviſor, 4 times in 9, the firſt of the Dividual, and there will remain 1, which 1 I imagine to ſtand before 4, the ſecond Figure of the Dividual, which will therefore be 14; but then conſidering 6, the Figure of the Diviſor, I find I cannot have as I ought, 6 four times in 14; wherefore I conclude I cannot have 263 four times in 940: I try next then what will 3 do; and I find I can have 2 three times, and that there will remain 3, which 3 I imagine to ſtand before 4, the ſecond Figure of the Dividual, and then it will make it 34; trying therefore with 6, the ſecond Figure of the Diviſor, I find I can have that 3 times in 34, and more than enough will remain to be placed before 0, the laſt Figure of the Dividual; I therefore place 3 in the Quotient juſt after the crooked Line, and by that Figure which is the

263) 940488 (3576
789
1514
1315
1998
1841
1578

0

2*d* Operation, I multiply the Diviſor 263, and write the Product 789 *orderly* under the Dividual 940. Then,

3*dly*, I ſubſtract the Product 789 from the Dividual, and there remains 151.

4*thly*, To which I bring down 4, the next Figure to the Right Hand of the *Dividual*, and which, to ſhew that I have done with, I mark, by putting a Point under it; ſo I have now 1514 for a new *Dividual*. Then do I enquire again, by the Method given in the firſt Article, how often I can have 263 in 1514, and comparing thoſe Numbers together according to that General Rule, and which a little Practice will make very eaſy, I find I can have it but 5 times; wherefore I put 5 in the Quotient, and by that multiply my Diviſor, and ſubſcribe the Product 1315 *orderly* under the laſt *Dividual*. Then I ſubſtract it alſo from thence, and find a Remainder of 199; to which Remainder I bring down the next Figure 8 from the Dividend (having alſo pointed it there) and then I have 1998 for a new Dividual; with which, as before, comparing my Diviſor 263, I find that I can have it but 7 times; wherefore placing 7 in the Quotient, by that I multiply the Diviſor 263, and ſubſcribing the Product orderly under the Dividual 1998, ſubſtracting it alſo from thence; and to the Remainder, which is 157, bringing down 8, the laſt Figure of the Dividend, I have 1578 for a new Dividual; with which, comparing as before, the Diviſor 263, I find, on trial, that I can have it juſt 6 times in it; ſo I write 6 in the Quotient; by that Figure 6 multiply the Diviſor, ſubſcribe the Product 1578 under the Dividual, and making Subſtraction, find no Remainder; wherefore I conclude the *Diviſion* is ended, and that 3576 is the true Quotient, or Number of Crowns each Man is to have for his Share.

And this Example, if carefully heeded, will be ſufficient to teach any one the Way of dividing by more Figures than one; the ſeveral Operations of which Method are briefly ſumm'd up in this *Latin* Verſe,

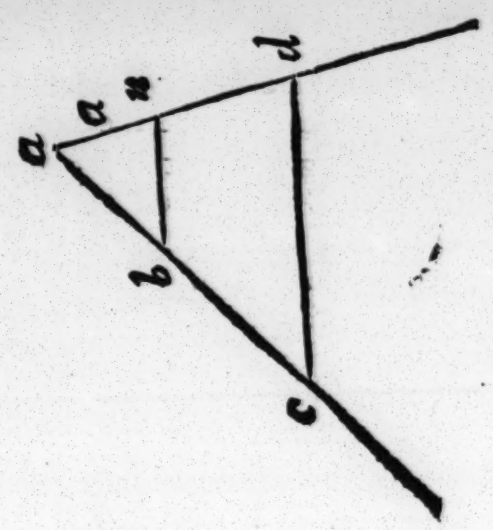
Dic quot, multiplica, ſubduc, transferq; ſecundum.

The only true Proof of *Diviſion* is by *Multiplication*, for the Product of the Quotient and Diviſor muſt always be equal to the Dividend: Thus, 3576 multiplied by 263, produces 940488, becauſe what is deſtroyed by *Diviſion*, is reſtored by *Multiplication*.

DIVISION *Geometrical*, or *Diviſion in Lines*, is called *Application*; the Deſign of which, when it is exerciſed about the Conſtruction of plain Problems, is only this, *viz.* a Rectangle being given, as alſo a Right Line, to find another Right Line, ſo that the Rectangle contained under it, and the Right Line given, ſhall be equal to the Rectangle firſt given; which *Effection* or *Conſtruction* is called the *Application* of a given Rectangle to a Right Line given; and

and the Right Line arising by such *Application* is called the *Parabola*, or *Geometrical Quotient*, and may be found out by the *Rule of Three*, by making, As the Line given: Is to one Side of the Rectangle :: So is the other Side: To the Line sought.

Not unlike to which is *D. Cartes*'s Way of working *Division* in Lines by Scale and Compass: Thus, suppose $a\,c$ (=6) were to be divided by $a\,d = 3$, make any Angle at pleasure, and therein set off first $a\,d$ (= 3) the Divisor, and then on the same Leg $a\,u$ = to Unity: Then on the other Leg of the Angle set $a\,c$ (= 6) the Dividend, and join $d\,c$, and to it, through u, draw $u\,b \parallel$ to $d\,c$, which shall cut off $a\,b$ the Quotient sought; for, as $a\,d : a\,u :: a\,c : a\,b$; that is, As the Divisor: Is to Unity: So is the Dividend: To the Quotient; on which depends the Reason of all *Division*.



DIVISION *in Decimal Fractions*: See *Decimal Fractions*.

DIVISION *in Vulgar Fractions*: See *Fractions*.

DIVISION *of Logarithms*: See *Logarithms*, N°. 7.

DIVISION *by Logarithms*: See *Logarithms*, N°. 9.

DIVISION *of Proportion*: See *Proportion*, N°. 9.

DIVISOR, in Arithmetick, is the dividing Number, shewing how many Parts the *Dividend* is to be divided into.

DIVORCE, or *Devorce*, is, in the Common Law, a Separation of two Persons actually married together, and therefore is the Solution of the *Vinculum Matrimonii*, and is not only *à Mensa, sed etiam à Thoro*; and therefore a Woman thus divorced, received all again that she brought with her. This is only upon a Nullity of the Marriage, upon some Essential Impediment, as Consanguinity or Affinity within the prohibited Degrees, Pre-contract, Impotency, or such like; of which there are 14 usually summ'd up in these Verses by the Divines and Civilians;

Error, Conditio, Votum, Cognatio, Crimen,
Cultus, Disparitas, Vis, Ordo, Ligamen, Honestas,
Si sis Affinis; si forte coire nequibis;
Si Parochi & duplicis desit præsentia Testis,
Raptûrâ si sit mulier, &c.

DIURESIS, is a Secretion of the Urine by the Reins, which is done after this Manner; There are little Glandules placed near the Emulgent Arteries, wherewith the *Serum* is separated from the Blood, and is conveyed by little Channels (of which the Substance of the Reins does principally consist) to the *Caruncula Papillares*, thence to the *Pelvis*, thence to the *Ureters*, thence to the Bladders, and so out of Doors. *Blanchard.*

DIURETICKS, are those Medicines which by parting, dissolving, and fusing the Blood, do precipitate the *Serum* by the Reins into the Bladder. *Blan.*

DIURNAL *Motion of a Planet*, is so many Degrees and Minutes, *&c.* as any Planet moves in 24 Hours; also the Motion of the *Earth* about its Axis (in the *Copernican System*) is called its *Diurnal Motion*, which causes the Vicissitudes of Days and Nights.

DIURNAL *Arch*, is the *Arch* or number of Degrees that the Sun, Moon or Stars describe between their Rising and Setting.

DIUTURNITY, is the long Continuance or Duration of any Being.

DIZZYNESS: See *Vertigo*.

DOCK, is a Pit, great Pond or Creek by the Side of an Harbour, made convenient to work in, in order to build or repair Ships, and is of two sorts.

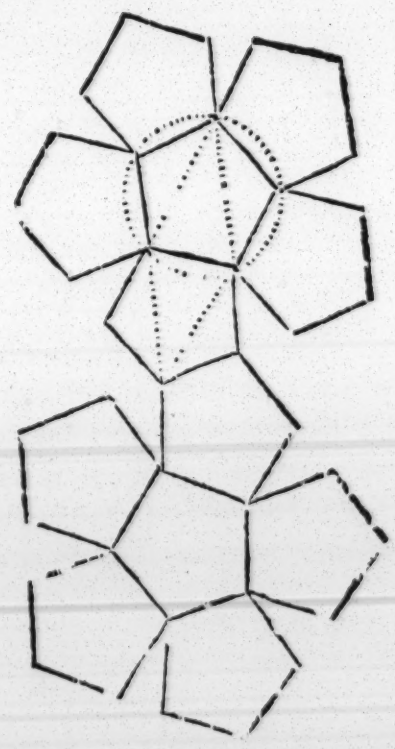
1. A *Dry Dock*, where the Water is kept out of the *Dock* by great Flood-Gates, till the Ship is built or repaired; but after that, can easily be let in to Float and Launch her.

2. A *Wet Dock*, is any Place in the Ouze out of the Tide's way, where a Ship may be haled in, and so *dock her self*, or sink her self a Place to lie in.

DODECADACTYLUM, is the first of the small Guts, beginning from the *Pylorous* of the Stomach, and ending where the Gut *Jejunum* begins: It is so called as if it were the Length of the twelve Fingers, which yet is never observed in any Men amongst us; perhaps the Ancients mistook, from inspecting the Guts of some Brutes: 'Tis most usually called *Duodenum*. *Blanchard.*

DODECAEDRON: See *Regular Bodies*. This Solid consists of twelve Quinquangular *Pyramids*, whose Vertexes or Tops meet in the Center of a Sphere that is conceived to circumscribe this Solid, and consequently have their Bases and Altitudes equal; wherefore, having found the Solidity of one of those Pyramids, and multiplied it by the number of Bases, (*viz.* 12.) you have the Solidity of this *Dodecaedron*.

The following Figure being drawn on Pastboard, cut half through, and then folded up, will represent a *Dodecaedron*.



Its Solidity is found by multiplying the Base into $\frac{1}{3}$ of its Distance from the Center 12 times: And to find this Distance, take the Distance of two parallel Faces, the Half is the Height.

DODECAGON, a regular Polygon consisting of twelve equal Sides and Angles: In Fortification 'tis a Place with twelve Bastions. DODE-

DODECATEMORY: The twelve Signs of the *Zodiack*, *Aries*, *Taurus*, &c. are ſo called, becauſe each of them is the twelfth Part of the *Zodiack*.

DOGMATICK MEDICINE, is a Rational Practice of Phyſick; *Hippocrates* was its firſt Author, and after him *Galen*; therefore thoſe Phyſicians are called *Dogmatical*, who, upon the Principles, as they pretend, of the School Philoſophy, reject all Medicinal Vertues that they think not reducible to manifeſt Qualities; but *Galen* hath long ago obſerved very well of ſuch Men, that they muſt either deny plain Matter of Fact, or aſſign but very poor Reaſons and Cauſes of many Effects they pretend to explain.

DOME, ſo the CHYMISTS call the arched Cover to their Reverberatory Furnace: See the Figure of it under that Word, or in *Furnace*.

DOME, in Architecture, is a round, vaulted or arched Roof of a Church, or any ſuch great Building.

DOMINICAL LETTER, one of the firſt ſeven Letters of the Alphabet, wherewith the Sundays are mark'd throughout the Year in the *Almanack*.

To find the Dominical Letter.

Divide the Year, its 4th, and 4 by 7. what's left ſubſtract from 7, the Letters given. *A* 1, *B* 2, *C* 3, *D* 4, *E* 5, *F* 6, *G* 7.

Example.

In the Year	1701
The 4th Part, omitting Fractions, is	425
To both which add the number	4
The Sum is	2130

Which Sum divided by 7, leaves 2 remaining, and 2 from 7 leaves 5, which ſhews the Dominical Letter for the Year 1701, is the Fifth in the Order of the Alphabet, that is, *E*.

DOMINICUM, *Demain*, or *Demeſne*, are Lands not rented to Tenants, but held in *Demeſne*, or in the Lord's own Uſe and Occupation.

DOMO REPARANDA, is a Writ for one againſt his Neighbour, by the Fall of whoſe Houſe he feareth Hurt to his own.

DONJON, in Fortification, is generally taken for a large Tower or Redoubt of a Fortreſs, where the Garriſon may Retreat in caſe of Neceſſity, and Capitulate with greater Advantage.

DORICK *Order of Architecture*, was invented by the *Dorians* a People of *Greece*, whence the Name. If its Columns are Simple and Plain without *Pilaſters*, *Palladio* ſaith they ought to be 7 Modules and one Half, or 8 Modules high. The Intercolumniations are to be little leſs than 3 Diameters of the Column: And this Manner of Building is by *Vitruvius* called *Diaſtyle*.

But if the Columns have *Pilaſters*, their Height, reckoning Baſe and Chapiter, muſt be 17 Modules and $\frac{1}{3}$; and by the by, though the Module in all the other Pillars be a Diameter divided into 60 equal Parts, yet in this Order the *Module* is to be accounted but as the Semi-diameter, and is therefore of 30 ſuch Parts, according to *Palladio*.

This Pillar hath no proper Baſe, which is the Reaſon that moſtly in the Ancient Buildings you ſee them without any Baſe at all, as in *Marcellus* his Temple at *Rome*, &c.

But when the Attick Baſe is given it, it much augments its Beauty, and then the Height of the Baſe is to be $\frac{1}{2}$ the Diameter of the Column.

The Capital's Height alſo ought to be half the Diameter of the Pillar at the Baſe, and the Architecture the ſame Height. The *Freeſe* is a *Module* and $\frac{1}{2}$ Height, and the *Cornice* is a *Module* and $\frac{1}{3}$. The *Triglyph* is one *Module*, and its *Capital* the 6th Part of one; the *Metops* or Space between *Triglyph* and *Triglyph*, is in Length the ſame with the Height of the *Triglyph*.

This Order being deſigned to repreſent Solidity to us, ought not to be uſed but in great and maſſy Buildings, as the Outſide of Churches and publick Places.

The Entablature here is more Maſſy and Tall than in the other Order, becauſe the Strength of the Column is ſo much greater, it being uſually $\frac{1}{4}$ of the Column. The *Cornice* muſt be without any Foilage or Trimming, and if you allow *Modillions*, they muſt be Square and Plain.

The Freeſe here hath a regular Ornament, which are the *Triglyphs*; the *Metops* or Space between which ſhould be exactly Square.

The Architrave of this Pillar hath alſo a peculiar Ornament, which are certain Pendulous Drops under the *Triglyphs*, which yet ſeem as it were to be faſtened to it.

DORMANT, is the Herald's Term for the Poſture of a Lion born *ſleeping*, in any Coat of Arms.

DORSI LONGISSIMUS, is a Muſcle which ariſes in Common with the *Sacrolumbalis* from the Spine of the *Os Ilium*, and the ſuperior Part of the *Sacrum*, and all the Spines of the *Vertebræ* of the Loins, Externally Tendinous, Internally Fleſhy: In its Aſcent it is inſerted to the Tranſverſe Proceſſes of the *Vertebræ* of the Loins, and as it marches over the laſt Rib this great Muſcle divides it ſelf into Two, the Outermoſt of which is the *Sacrolumbalis*, but the Innermoſt next to the Spine is the *Longiſſimus Dorſi*, which aſcends with a partly Fleſhy and partly Tendinous Outſide, and Fibres paſſing ſomewhat obliquely outward; part of which Tendinous Fibres ariſe diſtinct from the inferior Spines of the *Vertebræ* of the *Thorax* and Superior of the Loins, from which ariſe ſome Fleſhy Fibres aſcending obliquely inwards, and are inſerted to the fifth, ſixth, and ſeventh Spine of the *Thorax*, as expreſt by *Bidloo*, and called *Semi-Spinalis*. The other larger Part of this Muſcle aſcending on the *Thorax*, divides its ſelf into many diſtinct Fleſhy Portions, not much unlike a Palm Branch, which are inſerted in a twofold Manner to the Tranſverſe Proceſs of each *Vertebra* of the *Thorax* and Tubercle of each Rib, as alſo to the tranſverſe Proceſſes of the *Vertebræ* of the Neck.

When this and its Partner acts, they are not only ſerviceable in keeping the Trunk of the Body erect, and bending it backwards, but they are alſo uſeful in Progreſſion, as it may be obſerved when either Leg is moved forwards, this Muſcle on the ſame Side is in Action, which ſeemeth to be advantageous in rendring the *Os Ilium* at that time ſtable, ſo that the Thigh may be the more commodiouſly elevated, in regard it is ſo moved by a Muſcle ariſing from the *Vertebra* above the *Os Ilium*, namely the *Pſoas*.

DORSIPAROUS and *Dorſiferous Plants*, are ſuch as are of the *Capillary* kinds without Stalks, and bearing their Seeds on the Backſides of their Leaves: Theſe are called by ſome Botaniſts *Epiphylloſperma*, and by others *Hypophylloſperma*: See *Capillary Plants*.

DORSUM, or *Tergum*, the Back, is the hinder Part of the *Thorax*; but the *Dorſum* of the Hand or Foot is their Outſide. *Blanchard.*

DOSE, is a ſet Quantity of Phyſick, being uſually as much as is given at once.

DOTE ASSIGNANDA, is a Writ that lies for a Widow, where it is found by Office that the King's Tenant was ſeized of Tenements in *Fee* or *Fee-Tail* at the Day of his Death, *&c.* and that he holdeth of the King in chief, *&c.* for in this Caſe the Widow cometh into the *Chancery*, and there maketh Oath that ſhe will not marry without the King's Leave, and hereupon ſhe ſhall have this Writ to the Eſcheator.

And this ſort of Widow is called the *King's Widow.*

DOTE *unde nihil habet*, is a Writ of Dower that lieth for the Widow againſt the Tenant which bought Land of her Huſband in his Life-time, whereof he was ſeized ſolely in Fee-Simple or Fee-Tail, in ſuch ſort as the Iſſue of them both might have inherited it.

DOUBLE-DESCANT: See *Deſcant.*

DOUBLE *Horizontal Dial*, invented by Mr. *Oughtred*, and made of *Braſs* with a double *Gnomon*, one to ſhew the Hour on the Outward Circle, the other to ſhew the ſame Hour in the *Stereographick* Projection (drawn on the Plate.) This not only finds the *Meridian*, Hour, *&c.* but ſhews the Sun's Place, Riſing and Setting, Declination, Amplitude, Altitude, and Azimuth, Diurnal Arch, and many uſeful Propoſitions; and may be very well applied to the making of *Dials.*

DOUBLE or *Flank'd Tenaille*: See *Tenaille.*

DOUBLE-PLEA, in Law, is that wherein the Defendant alledgeth for himſelf two ſeveral *Matters* in Bar of the Action, whereof either is ſufficient to effect his Deſire in debarring the Plaintiff. And this is not to be admitted in the common Law, wherefore it is well to be obſerved when a *Plea* is *double*, and when not, for if a Man alledge ſeveral Matters, the one nothing depending on the other, the *Plea* is accounted *Double*; if they be mutually depending one on another, then it is accounted but ſingle.

DOUBLE-VESSEL, in Chymiſtry, is when the Neck of one *Bolt-head* or *Matraſs* is put and well luted into the Neck of another; and this is uſed for the *Circulation* of Spirits, in order to their being exalted and refined as high as can be: See *Matraſs.* Of this there are ſeveral Figures; 'tis ſometimes called a *Pellican*, and alſo *Diota.*

DOUBLING, in a Military Senſe, is to put two Ranks or Files of Soldiers into one, ſo that when the Word of Command is *Double your Ranks*, then the 2d, 4th and 6th Ranks are to march up into the firſt third and fifth, ſo that of 6 Ranks they make but 3, leaving double the Interval there was between them before, which is not ſo when they double the half Files, becauſe then 3 Ranks ſtand together, and the 3 others come up to double them; that is, the 1, 2 and 3 are doubled by the 4, 5 and 6th, or on the contrary. *Double your Files* is for each other to march to that next to it on the Right or Left, according to the Word of Command, and then the 6 Ranks are turned into 12, the Men ſtanding 12 deep, the Diſtance between the Files being now double of what it was before.

DOUCINE, in Architecture, is an Ornament of the higheſt Part of the *Cornice*, or a Moulding cut in Form of a Wave, half Convex and half Concave.

DOWER, in Common Law, ſignifies that which the Wife bringeth to her Huſband in Marriage, called by ſome *Maritagium*; but it is taken moſt commonly for that which ſhe hath of her Huſband after the Marriage is determined, if ſhe out-live him, and this is the third Part of all the Lands of which the Huſband was in his Life-time actually ſeized, in an Eſtate of Fee-Simple or Fee-Tail.

DRABLER, a ſmall Sail in a Ship, the ſame to a Bonnet (which ſee) that a Bonnet is to a Courſe, and is only uſed when the Courſe and Bonnet are too ſhoal to Cloath the Maſt.

DRACO, a Conſtellation in the Northern Hemiſphere conſiſting of 33 Stars.

DRACO VOLANS, with the Meteorologiſts, is a Fat, Heterogeneous, Earthy Meteor, appearing long and ſinous, ſomething in the Shape of a flying Dragon; and this Shape they will have to ariſe from the latter Part of the Matter of this Meteor, being fired with greater Impetuoſity than what comes firſt out of the Cloud; and they ſuppoſe the broken Parts of the Cloud, and the Sulphureous Matter which adheres to them, forms the apparent Wings of this imaginary Dragon.

DRACUNCULUS, is an Ulcer which eats thro' even a Nerve it ſelf. *Blanchard.*

DRAGON'S *Head* and *Tail*, or the Nodes of the Moon, in Aſtronomy, are two Points where the Orbit of the Moon, which makes with it Angles of 5 degr. cuts the Orbit of the Sun at the *Ecliptick*, the one of them tends Northwards, the Moon being there to have *North* Latitude, and the other Southwards, where ſhe commences *South.* This her Deviation from the *Ecliptick* ſeems, according to ſome Men's Fancy, to make a Figure like to that of a *Dragon*, whoſe Belly is where he has the greateſt Latitude, and the Interſections repreſent the *Head* and *Tail*; from which Reſemblance 'tis ſo called.

But *Note*, Theſe Points abide not always in one Place, but have a Motion of their own in the *Zodiack*, and *Retrograde* almoſt 3 Minutes a Day, and compleat their Circle in about 19 Years; ſo that the Moon can be but twice in the *Ecliptick* during her Menſtrual Period, but at all other times will have *Latitude* as they call it.

DRAPERY, ſignifies, in Painting or Sculpture, the Cloathing of any Human Figures, and when the Folds of Garments hang eaſy and natural, and yet appear ſtrong, we ſay the Drapery is very good.

DRASTICK *Remedies*, are thoſe that operate quickly and effectually.

DRAUGHT *Compaſſes*, are *Compaſſes* with ſeveral moveable Points to draw fine *Draughts* of *Charts*, *Maps*, *Architecture*, *Fortification*, *Dialling*, &c.

DRAW, a Ship is ſaid to draw ſo much Water, according to the Number of Feet ſhe ſinks into it: Thus, if fifteen Foot from the Bottom of her be under Water, or if ſhe ſink into the Water fifteen Foot perpendicular, ſhe is ſaid to draw Fifteen Foot Water: According as ſhe draws more or leſs Water, ſhe is ſaid to be of more or leſs *Draught.*

DRAW-BRIDGE, is a *Bridge* made after the Manner of a Floor, to be drawn up or let down (as Occaſion ſerves) before the Gate of a Town or Caſtle.

DRAWING *Medicines*: See *Epiſpatick.*

DRIFT-SAIL, in a Ship, is a Sail uſed under Water; it's veered out right a-head upon the Sea in a Storm, having Sheets faſtned to it as other Sails have, its Uſe being to keep the Ship's Head right upon the Sea: It's alſo uſeful to hinder a Ship's driving with a Cur-

a Current, and ſo generally uſed by Fiſhermen, eſpecially in the North Seas.

DRIP, in Architecture: See *Larmier*.

DRIVE, a Ship is ſaid to *Drive*, when an Anchor being let fall, it will not hold her faſt, but that ſhe ſails away with the Tide or Wind; the beſt way to help which is to veer out more Cable (for the more Cable ſhe has out, the ſurer and ſafer ſhe rides) or elſe to let fall more Anchors.

Alſo when a Ship is *a Hull* or *a Trye*, we ſay ſhe *Drives to Leeward*, or in with the Shoar, according to the Way ſhe makes.

DROPS, in Architecture, the ſame with *Guttæ*, which ſee.

DROPSY: See *Hydrops*.

DRY; Bodies are called *Dry*, when the Pores intercepted between their more ſtable Parts, are not filled with any viſible Liquor.

DRY *Moat*: See *Moat*.

DUCES TECUM, is a Writ commanding one to appear at a Day in the *Chancery*, and to bring with him ſome Evidence, or other thing, that the Court would view. There is another kind of *Duces tecum* directed to the Sheriff, upon return that he cannot bring his Priſoner without danger of Death, he being *adeo Languidus*; then the Court grants a *Habeas Corpus* in the Nature of a *Duces tecum licet Languidus*.

DUCKUP, a Word uſed at Sea by the Steerſman, or he that is at Helm, when either Main-ſail, Fore-ſail, or Sprit-ſail hinder his Sight ſo, that he cannot ſee to ſteer by a Land Mark or the like, for then his Word is *Duckup* the Clew Lines of thoſe Sails: And as to the Sprit-Sail, when a Shot is to be made by a Chaſe Piece, and the Clew of that Sail hinders the Sight, they ſay, *Duckup* the Clew Lines of the Sprit-Sail; that is, hale the Sail out of the Way.

DUCTILITY, is an eaſy yielding Extenſion and Spreading of the Parts of any Metal under the Hammer, *&c.* and this is moſt remarkably the Property of Gold, whoſe *Ductility* is ſo great, as to be really wonderful; for Mr. *Rohault* tells us, That *Gold Beaters* of one Ounce of Gold, make 2790 ſquare *Leaves* of *Gold*, each containing two Inches and ten *Lines*; and by deducting the Waſtes that are cut off (which amounts to near one half of it) the Surface of every *Leaf* of *Gold* will be found to contain 1156 ſquare *Lines*; ſo that all of them joined together Side by Side, will make a *Surface* of 3155880 ſquare *Lines*. And if the third Part be added to this, as a Conſideration for the Loſs in the making, 'twill follow, that *Gold-Beaters*, out of one Ounce of *Gold*, beat 4270840 ſquare *Lines*.

DUCTUS ADIPOSI: See *Sacculi Adipoſi*.

DUCTUS ALIMENTALIS, ſo our moſt accurate Anatomiſt Dr. *Tyſon* calls the *Gula*, Stomach and Inteſtines, all which make but one continued Canal or Duct: And this *Ductus* he very truly makes the proper Characteriſtick of an *Animal*, or, as the Schools would expreſs it, the *Proprium Quarto Modo*, for all *Animals* have this Duct, and none but *Animals*.

DUCTUS BILARIUS. } See *Porus Bilari-*
DUCTUS HEPATICUS, } *us*; this and the *Ductus Syſticus* together make the *Ductus Communis Choledocus*, which goes obliquely to the lower End of the *Duodenum*, or Beginning of the *Jejunum*, and after it hath pierced the firſt Coat, it runs near two Fingers Breadth between the Coat before it opens into the Cavity of the Inteſtine, which oblike Inſertion ſerves inſtead of a Valve to hinder the return of the *Bile* into it again.

DUCTUS CHYLIFERUS, is a Veſſel, in the lower Part whereof, called the *Receptaculum Chyli*, all the *Lacteal* Veins, and many Lymphæducts, are terminated. It ariſes about the Kidney on the Left Side, and aſcending along the *Thorax* near the great *Artery*, ends at the *Subclavian* Vein on the Left Side. It is furniſhed with ſeveral Valves, that the Matter which aſcends by it may not fall down again betwixt the fourth and ſixth *Vertebræ*: It is variouſly forked or divided. It's Uſe is to convey the Chyle and *Lympha* from the lower Parts to the Heart. This Duct is alſo ſometimes called the *Ductus Communis Lympharum*, becauſe the Lymphatick Veſſels diſcharge themſelves into it, and very uſually *Ductus Thoracius*.

DUCTUS CYSTICUS, is a Pipe going from the Neck of the Gall Bladder to that Part where the *Porus Bilarius* joins it; 'Tis of the Bigneſs of a Gooſe Quill; it goes not in a ſtraight Line, but as it were depreſt by the Liver; ſeveral ſmall Bilary Ducts open into it, and its inner Membrane hath many Wrinkles, which retard the Motion of the Bile.

DUCTUS PANCREATICUS, is a little Channel which ariſes from the *Pancreas* or Sweet-bread, running all along the Middle of it, and is inſerted into the *Duodenum*, near, or not far off, the Paſſage which conveys the *Bile*: It carries a Juice, which it diſcharges into the *Duodenum*, to ferment and volatilize the Meat from the Acid Ferment of the Stomach and the Mixture of the Gall. The Learned Dr. *Graaf* got a Juice out of it that was ſomething acid; though others doubt of it, and of many Diſeaſes which *Silvius* attributes to the Effervеſcency of this acid pancreatick Juice with the Gall in the *Duodenum*. However there is ſometimes an acid Juice found in it, and often a ſalt and auſtere, but frequently an inſipid Liquor. This Canal was firſt found by *Virtſungus*, and is frequently from him called the *Ductus Virtſungianus*.

DUCTUS RORIFERUS, (ſo the Noble *Bilſius* calls it) the ſame with *Ductus Chyliferus*.

DUCTUS SALIVARES, or *Salivarij*, are Paſſages which proceeding from the *Maxillary Glandules* or *Parotides*, go as far as the Jaws and Sides of the Tongue, where they emit the Juice we call Spittle, which conduces to the better chewing and ſwallowing of ſolid Meat, and much to its Fermentation too. *Steno* was the firſt who diſcovered the *Ductus Salivaris exterior*, as he tells us in his Book *De Muſculis*.

DUCTUS THORACIUS: See *Ductus Chyliferus*.

DUCTUS UMBILICALIS: See *Funiculus*.

DUCTUS URINARIUS: See *Ureters*.

DUELLISTS, ſo Mr. *Boyle* calls the two Principles of thoſe Chymical Philoſophers, who will needs explicate all the *Phænomena* of Nature from the Doctrine of *Alkali* and *Acid*, and the ſuppoſed *Hoſtility* that there is between them, ſo that whenever they meet, they do as it were engage and fight a *Phyſical Duel*.

DULCIFIED *Spirit of Sal Armoniack*: See in *Volatile Spirit of Sal Armoniack*.

DULCIFY, when equal Parts of Spirit of Wine, and any acid Menſtruum, ſuch as Spirit of Salt, *Nitre*, *Vitriol*, *&c.* are digeſted together for 3 or 4 Day's Time, the Chymiſts call it *Dulcifying* the Acid Spirit; and after that 'tis called *Spiritus Salis*, *Nitri*, *Vitrioli Dulcis*, *&c.*

DUM *fuit infra ætatem*, is a Writ which lies for him that before he came to his full Age, made a Feoffment of his Land in Fee, or for Term of Life, or

in Tail, to recover them again from him to whom he conveyed them.

DUM *non fuit compos mentis*, is a Writ that lieth againſt the Alience or Leſſee, for him that not being of ſound Memory, did alien any Land or Tenements in Fee-Simple, or for Term of Life, Fee-Tail, or for Years.

DUODENUM, is the firſt of the Inteſtines or Guts, and is about 12 Finger's Breadth long; 'tis continued to the *Pylorus*, from which turning downwards, it runs under the Stomach immediately above the *Vertebræ* towards the Left Side, and ends at the Firſt of the Windings under the *Colon:* At its lower End there are two Pipes or Canals which open into its Cavity, one from the Liver and Gall Bladder, called the *Ductus choledochus communis*, the other from the *Pancreas*, called the *Ductus Pancreaticus*. This Inteſtine differs from the *Jejunum* and *Ileum*, in that its Paſſage is ſtraighter, and its Coats are thicker.

DUPLICATE PROPORTION, or *Ratio*, muſt be well diſtinguiſhed from *Double:* In a Series of *Geometrical Proportionals*, the Firſt Term to the Third is ſaid to be in a *Duplicate Ratio* of the Firſt to the Second, or as its *Square* is to the Square of the Second: Thus in 2, 4, 8, 16, the *Ratio* of 2 to 8 is *Duplicate* of that of 2 to 4, or as the Square of 2 to the Square of 4; wherefore *Duplicate Ratio* is the Proportion of *Squares*, as *Triplicate* is of *Cubes*, &c. and the *Ratio* of 2 to 8 is ſaid to be compounded of that of 2 to 4, and of 4 to 8.

DUPLICATION, is the doubling of any thing, or multiplying of it by 2; alſo the folding of any thing back again on its ſelf.

DURABLE FORTIFICATION: See *Fortification.*

DURA MATER: See *Mater Dura.*

DURATION, is the *Idea* which we have of the Continuation of the Exiſtence of any thing, and is the ſame thing with Time, when this is mathematically and abſolutely conſidered; but the vulgar Time is the Meaſure of this *Duration* taken from the Motion of the Heavenly Bodies, &c.

Mr. *Lock* defines *Duration* to be the *Idea* which we have of periſhing Diſtance, of which no two Parts exiſt together.

DURESSE, a Term in Law, ſignifying a Plea uſed by way of Exception by him, that being caſt into Priſon at a Man's Suit, or otherwiſe by Beating or Threats hardly uſed, doth unwillingly ſeal unto him a Bond during his Reſtraint; for the Law holdeth ſuch Specialty void, but rather ſuppoſeth it to be by Conſtraint, and *Dureſſe* pleaded ſhall avoid the Action.

DYALLING, is the Art of deſcribing Hour-lines truly on any given Plane, ſo as thereby to ſhew the Hour of the Day when the Sun ſhines.

It is founded on this Suppoſition, That the whole Earth is but a Point in compariſon of the *Magnus Orbis*, or the Sphere of the Sun's Motion round it (or of it round the Sun;) and therefore the Hour Lines drawn on any Plane, are in Effect the ſame with thoſe right Lines produced by the mutual Interſection of a great Circle of the Sphere, parallel to the Plane of the *Dyal*, and to the Planes of the ſeveral Hour Circles.

For the *Plane* of every *Dyal* is parallel to ſome greater Circle of the Sphere, which is as far from the Plane of the *Dyal*, as is the Point aſſigned for the Apex or Point of the Style.

The Situation therefore of the Plane is the firſt thing to be conſidered, and this, properly ſpeaking, is only in reſpect of the *Horizon* or the *Meridian.*

In Reference to the *Horizon*, if a Plane lie exactly *parallel* to it, it is called properly an *Horizontal Plane*, and the *Dyal* drawn on it an *Horizontal Dyal.*

If the Plane be *perpendicular* to the *Horizon*, as all thoſe of Walls are ſuppoſed to be, the *Dyal* deſcribed on it is called an *Erect mural Dyal:* If the Plane be *oblique* to the *Horizon*, it either hangs over towards you, making an acute Angle with it, and then 'tis called an *inclining Plane*, or elſe it falls off backward from it, making an obtuſe Angle with it, and then 'tis called a *Reclining Plane*; and if it recline back equal to the Complement of the Latitude of the Place, it lies in the Plane of the Equinoctial, and is called therefore an *Equinoctial Dyal.*

In reſpect of the *Meridian*, a Plane is either *Direct* or *Declining.* The Plane of a *Dyal* is *Direct*, when it reſpects one of the 4 *Cardinal* Points *Directly*, or when 'tis either *parallel to the Meridian*, as are all direct *Eaſt* or *Weſt Dyals* (which therefore are properly called *Meridional*) or *perpendicular* to it, as are all *Direct*, *Erect North* and *South Dyals*, which, becauſe they lie in the Plane of the *Prime Vertical Circle*, are rightly called *Vertical Dyals* by moſt Authors.

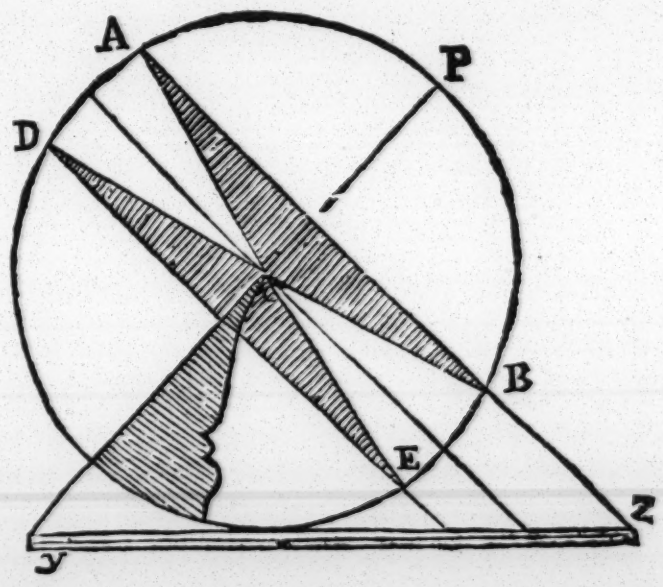
The Plane of a *Dyal* is *Declining*, when it is not directly oppoſite to any of the four Cardinal Points, but declines or deviates ſome way from the *Meridian* or the *Prime Vertical Circle.*

The Fundamental Scheme for *Dyalling*, is the Projection of the Sphere on the Plane of any particular *Horizon*, which you will find how to make under the Word *Projection.*

To find upon any *Dyal* whether the *Parallels* of the Sun's Courſes, &c. will be *Parabola's*, *Hyperbola's*, *Ellipſes* or *Circles:*

The Stile of a *Dyal* being look'd upon as the Earth's Axis, therefore upon any Point thereof (as *c*) which being deſigned for the Point to trace the Parallel by, project the Sphere.

Then the Sun being in any of the Parallels of Declination, for Inſtance, as *A B* the *Tropick* of *Cancer*, will caſt the Shadow of the Point *c* (the Earth's Center) in a ſtraight Line, ſo that when the Sun hath performed one Diurnal Revolution, the Shadow of the Point doth trace a Conical Surface *DCE*, whoſe Vertex is *C*, and is ſimilar to the Cone *A B C:* Now the Lines *CD*, *CE*, *CA*, *CB* of theſe Cones, may be conceived to be infinitely extended.



1. Then, whatever Plane is parallel to the Baſe of the Cone *D E* or *AB*, the Shadow of the Point *c* will deſcribe upon that Plane a Circle.

2. If any Plane cut either of these Cones parallel to either of the Sides, the Shadow of the Point C will describe upon that Plane a *Parabola*.

3. If a Plane cut the Cone, and likewise one of its Sides produced beyond the Vertex, the Shadow of the Point *c* will describe upon that Plane an *Hyperbola*.

As here the Plane *A B* cuts the Cone *D C E*, and also the Side *D C* produced to *z*, therefore the Parallels upon that Plane are *Hyperbola*'s.

4. If a Plane cuts both Sides of the Cone under the Vertex, the Shadow of the Point *C* will describe upon that Plane an *Ellipsis*.

DYE, in Architecture, is the Middle of the Pedestal, or that Part which lies between the Base and the Cornice; being so named, because it is frequently made in the form of a *Cube* or *Dye*, and is also called *Dado* by the *Italians*.

DYPTERON, or a *Dypterick* Figure or Order of Pillars in Architecture, is where the Temple, Edifice, &c. is environed round with a two-fold Range of Pillars in the Form of a double Portico. This *Vitruvius* tells us, *Ch.* 1. *Book* 3. was the Figure of the wonderful Temple of *Diana* at *Ephesus*, which was above 200 Years in Building, all *Asia* contributing to its Expence: These Columns were all of Marble, and 70 Feet high.

DYSESTHESIA, is a Difficulty of, or Fault in Sensation. *Blanchard.*

DYSCRACY or *Intemperature*, is when some Humour or Quality over-abounds in the Body. *Blanchard.*

DYSENTERY, is a Looseness accompanied with Gripings in the Belly, wherein Bloody and Purulent Excrements, and sometimes Membranous Pieces of the Intestines too are excerned, always, or very frequently, attended with a continual Fever and a Drought. *Blanchard.*

DYSEPULOTICA, are great Ulcers beyond Cure. *Blanchard.*

DYSOREXIA, a want of Appetite, proceeding from an ill Disposition or diminished Action of the Stomach. *Blanchard.*

DYSPATHY, is an Impatient Temper, or a Languishing under some grievous Disease or Trouble of Mind. *Blanchard.*

DYSPEPSIA, is a Difficulty of Digestion, or Fermentation in the Stomach and Guts. *Blanchard.*

DYSPHONIA, is a Difficulty of Speech from an ill Disposition of the Organs. *Blanchard.*

DYSPNOEA, is a Difficulty of Breathing, wherein the Breath is drawn often and thick, occasioned by the Stuffing of the Lungs. *Blanchard.*

DYSTHERAPEUTA, are Diseases of difficult Cure. *Blanchard.*

DYSTHRIACHISIS, is a continual Defluxion of Tears from the pricking of Hairs in the Eye-lids, which grow under the Natural Hairs. *Blanchard.*

DYSTICHIA, is a double row of Hair on the Eye-lids. *Blanchard.*

DYSTOCIA, is a Difficulty of bringing forth; or a preternatural Birth; as when the *Fœtus* comes forth obliquely, transverse, or with its Feet foremost, or when the Passages are straitned by Inflammation or otherwise, or when the *Fœtus* is very large, weak, fat, or dead. *Blanchard.*

DYSTRICHIASIS, is when the Hairs grow inverse. *Blanchard.*

DYSURIA, is a Difficulty of Urine, proceeding from an ill Disposition of the Organs, or from an Obstruction of them by the Stone, Gravel, or Viscous Clammy Humours, accompanied with an Heat of the Urine. *Blanchard.*

EAR. This curious Instrument of Hearing, is divided into the *External* and *Internal Ear*. The

EAR *External*, is composed of a Cartilage covered with a Skin very delicate, under which you meet with another Nervous Tegument, that immediately embraces the whole Cartilage; which, after some few Folds, terminates in that part of the Ear which is called the *Concha*, for its Resemblance to the Entrance of a small Shell: Besides these, it hath two Muscles;

The First is made up of certain Carneous Fibres, fixt to that part of the *Pericranium* that covers the Musculous *Crotaphytes*, and descends in a straight Line to insert it self at the upper part of the second Folding of the Ear.

The Second likewise consists of five or six Carneous Fibres, that take their Rise from the Upper and foremost part of the *Apophyses Mastoides*, and descending obliquely for about an Inch, terminate at the Middle of the *Concha*.

Arteries it hath from the *Carotides*, one Branch of which passeth behind, and the other before; and the Distribution of these is attended by Veins from the *External Jugular*.

The Hole of the Ear, is a Tube reaching from the *Concha* to the *Tympanum*, and consists partly of a Cartilage, and partly of a Bone, the Skin that covers it is furnished with an infinite Number of Glandules of a yellowish Colour, each of which hath its Tube opening into the Cavity of the Ear, and sending forth that yellow glewy Substance, which is commonly found there: At the End of this Passage is seated the Membrane, called the *Tympanum*, or *Drum*, being almost round, dry, thin, and transparent, and is inchased in a Channel cut in the Bone at the End of the Tube.

After this Membrane succeeds a Cavity called the *Barrel*, from the likeness it has to the *Barrel* of a *Drum*, being on the Sides encompassed by the Bone, closed before by that Membrane, and behind by the Surface of the *Os Petrosum*. This Barrel contains in it two *Channels*, two *Apertures*, four *Bones*, three *Muscles*, and one *Branch* of the *Nerve*.

The Channel that goes from the Ear to the Palate, is called the *Aqueduct*.

The Apertures, or Windows, are situated in the Superficies of the *Os Petrosum*, opposite to the *Tympanum*; the highest is the Oval-Window, in the Bottom of which is a small Edge whereon the Basis of the *Incus* rests; the other, which is called the Round Window, has a small Channel, in which is set a very fine, dry, and diaphanous Membrane, like that of the *Tympanum*.

The

The first of the Bones is called *Malleus*, whose Length is about $\frac{4}{12}$ of an Inch, the Diameter of its Breadth is one Third of its Length.

The Second is the *Incus*, the longest of whose Legs is joined to the *Stapes* by the Mediation of the fourth Bone.

Of the three Muscles which are contained in this Cavity, Two belong to the *Malleus*, the Third to the *Stapes*. Lastly, The Branch of the Nerve which passes behind the *Tympanum*, has been taken by some for the Tendon of the Muscle of the *Malleus*, and is a Branch of the fifth Pair.

The two Windows open into a Cavity, which is hewn in the *Os Petrosum*, called the *Labyrinth*, divided likewise into three Parts, *viz.* the *Entry of the Labyrinth*, the three *Semi-circular Canals*, and the *Concha*.

The Entry of the Labyrinth is situated behind the Oval Window, and hath Nine Apertures, *viz.* the Oval one, and the Right one, the first of which leads into the upper Part of the *Concha*; five belong to the Semi-circular Canals, and the two last transmit two Branches of the softer Portions of the *Auditory Nerve*, &c.

The *External Ear* collects the Sounds, and augments the Impression by the various Reflections the Voice undergoes in its Passage thro' the Folds of it.

The Use of the Muscles is thought to contract or dilate the *Concha*, as the Tremblings of the Air are strong or weak.

In the *Internal Ear* the *Tympanum* is stretched and made slack again by the Muscles of the *Malleus*; in the Tension of it both Muscles act, but in the Relaxation, only the External, whose Action it is to reduce it from a Concave to a Plain, as is manifest from the Insertion of the Muscles; the Determination of which Action proceeds from the various Dispositions and Appulse of the Objects, as a sharp Note is caused by a Body, whose Parts are so disposed, as to be capable of very quick Vibrations, which they as suddenly impress on the Air: On the contrary, the flat Note proceeds from the slower Strokes of a Body, with Parts that can only be so agitated; to which Differences the *Tympanum* readily complies, and does, as it were, put on their particular Character; this is delivered thence to the *Malleus*, and so forward, till at last the same Fluctuation is caused in the *Os Petrosum*, and in the *Labyrinth*.

The Aquæduct serves chiefly for the Ingress and Egress of Air to and from the Cavity, into which it opens.

From the Communication of the harder Portion of the Auditory Nerve, with the Branches of the Fifth Pair, which are distributed to the Organs of the Voice, proceeds that Sympathy between Speaking and Hearing. From the Communication of other Nerves follow the Motions of the Body, and even of the Spirits, which often accompany the Sounds we hear; as in the Effects of *Musick*, &c.

EARING, aboard a Ship, is that Part of the Bolt-Rope (or Rope wherein the Sail is sewed) which at the four Corners of the Sail is left open in the Form of a Ring: The two uppermost of which four Earings are put over the Yard-Arms to fasten the Sail to the Yard; and into the lower Earings the Tacks and Sheets are seized, or, as they call it, are there *bent unto the Clew*.

EARTH: The Surface of the whole Earth Mr. *Keil*, in his Examination of Dr. *Burnet's Theory*, makes to be 170981012 *Italian* Miles, and the *Italian* Mile is little less than the *English* one.

The Ambit of the Earth (or the Circumference of a Great Circle of it) according to the *French* Measures, is 123249600 *Paris* Feet, or $24649\frac{46}{50}$ *English* Miles.

The Mean Semi-diameter of the Earth is 19615800 *Paris* Feet, or 3933 Miles (of 5000 Feet to a Mile;) But the Earth is higher at the Equator than at the Poles by 82500 Feet or 17 Miles.

So that the Radius of the Earth may be taken in a round Number as 200000000 Feet.

The Solid Content of the Globe of the whole Earth is 30000 000000 000000 000000 Cubick Feet. . . . .

According to Mr. *Cassini*, the Earth's greatest Distance from the Sun is 22374, mean Distance 22000, and least Distance 8022 Semi-diameters of the Earth.

On Supposition that the Sun's Parallax be 32 Seconds, which is a Mean between 40 Seconds and 24 Seconds, the Earth's mean Distance from the Sun will be 54000000 of Miles. Mr. *Whiston*.

Sir *Is. Newton* takes the Earth's Diameter, seen from the Sun, to be 24 Seconds, and consequently the Sun's Parallax to be 12 Seconds; which agrees with our Accurate Astronomer Mr. *Flamstead*, and *Horrox*'s Observations; and then the Distance from the Earth to the Sun will be much greater.

The Figure of our Earth is most probably that of an *Oblate Spheroid*, swelling out towards the Equatorial Parts, and flatted or contracted towards the Poles; so that the Diameter of it at the Equator, is longer than the Axis by about 34 Miles, according to Sir *Is. Newton*; for the Polar Diameter or Axis: Is to the Equatorial one :: As 689: To 692.

If the Earth were ever in a Fluid State, its Revolution round its Axis must necessarily make it put on such a Figure; because near the Equatorial Parts must needs be the greatest Centrifugal Force, and consequently there the Fluid would rise and swell most.

And that it should be so now, seems necessary to keep the Sea in the Equinoctial Regions from overflowing the Earth thereabouts.

Experiments also made on Pendulums, which require different Lengths to swing Seconds here, and at the Equator, prove the same thing.

And if what Mr. *Cassini* says, in *Philosophical Transactions*, *Numb.* 278. is certain from Experience, *viz.* that the Degrees of one and the same Meridian on the Earth, increase about $\frac{1}{853}$ Part as you go Southward, or are longer towards the Equator in any Proportion, then the Earth must needs be of such a Figure; as indeed is that of *Jupiter*, as appears from Observation.

The Learned Dr. *Gregory*, in his *Astronomia Geometrica & Physica*, *Prop.* 52. *Lib.* 3. shews a Method to determine the Figure of the Earth exactly, and to find the Ratio of the Axis of it to its Equatorial Diameter: And demonstrates, That the Earth must be of the Figure now mentioned, *viz.* an *Oblate Spheroid*.

He shews also, That the Prolate Spheroidical Figure of the Earth, is the Reason both of the Recession of the Equinoctial Points; and also, That the Earth's Axis doth twice every Year change its Inclination to the Ecliptick, and as often return back again to its former Position. *Astron. Pag.* 77. *Lib.* 1. *Prop.* 64.

The Earth's mean Revolution, in respect of the fix'd Stars, is 23 Hours, 56 Minutes.

Captain *Halley*, in his Obſervation of *Mercury* in the Sun at St. *Helena*, 1677. tells us, That the Annual Motion of the Earth is ſo exceeding ſwift, as far to exceed that of a Bullet ſhot out of a Cannon, and to be after the Rate of 3 *Engliſh* Miles and an half in a Second, which is 210 Miles in a Minute, and 12600 Miles in an Hour.

The Axis of the Earth is inclined to that of the Ecliptick, in an Angle of 66 Degrees 30 Minutes.

And tho' in one Annual Revolution, its Axis appears to keep exactly parallel to it ſelf; yet in many Years this Poſition becomes ſenſibly changed. *Greg. Aſtron.*

The Earth doth not deſcribe an Orbit round the Sun properly by her own Center, but by the *Common Center of Gravity of the Earth and the Moon.* And this is the Reaſon of the Inequality of the Earth's Motion. *Greg. Aſtron.*

The Earth's Horizontal Parallax to an Eye at the Sun's Surface, will be ſixteen Minutes, the half of the Sun's apparent Diameter.

Our moſt Accurate Aſtronomer Mr. *Flamſtead*, found the Diſtance of the Pole-Star from the Pole, to be greater about the Summer Solſtice than at the Winter, by about 40 or 45 Seconds; and this he ſaith, he confirmed by repeated Obſervations, made for above ſeven Years ſucceſſively, as he acquaints Dr. *Wallis* in a *Latin* Letter to him in the Year 1698, which Letter is publiſhed in the Third Volume of Dr. *Wallis*'s Latin Works: And ſince that he hath told me, That he finds a ſenſible Annual Parallax in others of the fixed Stars, as well as that; and from thence he concludes (I think very juſtly) that the Earth muſt move Annually round the Sun.

As to the Reaſon of the Paralleliſm of the Earth's Axis in all Parts of its Annual Orbit, ſee the Word *Paralleliſm.*

That the Earth is nearer to the Sun in *December*, than it is in *June*; and conſequently, that its Perihelion is in the Month of *December*, is plain,

Firſt, Becauſe the Sun's apparent Diameter is then greater than at *Midſummer.*

And alſo, Becauſe the Earth moves much ſwifter then, by one 25th Part, than at *Midſummer.*

And from hence it is, that there are about eight Days more in the Summer Half-Year, from *March* to *September*, than in the Winter, from *September* to *March.*

Mr. *Whiſton*, in his *Lemmata*, proves very eaſily, That the Annual Motion belongs to the Earth about the Sun, not to the Sun about the Earth.

For when from the *Moon's Orbit*, and the *Planet's Orbits*, and *Periodical Times*, 'tis certain, That the Law of Gravitation towards the Earth and towards the Sun is the ſame; and by conſequence, all the *Periodical Times* of *Bodies* revolving about each of them, are in the ſame Proportion to one another, compared with their ſeveral Diſtances from each of them; on which *Hypotheſis* this Proportion ſuits the *Phænomena* of Nature: the ſame muſt be the true one, and to be fully acquieſc'd in.

Now 'tis known, That on the *Hypotheſis* of the *Earth*'s Annual Motion, her *Periodical Time* exactly ſuits, and is ſo between that of *Mars* and *Venus*, as the Proportion obſerved through the whole *Syſtem*; but one the other *Hypotheſis* 'tis enormouſly different: For when the Moon undoubtedly, and on this *Hypotheſis*, the Sun alſo revolves about our Earth; and when the Diſtance of the Sun is to that of the Moon, as about 10000 to 46; and the *Moon*'s Periodical Time leſs than 28 Days; the Periodical Time of the Sun is by the *Rule of Three* diſcoverable thus;

As the Cube of the *Moon*'s Diſtance, 46 equal to 97336: To (the Cube of the *Sun*'s Diſtance 10000 equal to 1000000000000, or almoſt as 1 to 10000000) :: So muſt the Square of the *Moon*'s Periodical Time, 28 Days equal to 784: Be to the Square of the *Sun*'s Periodical Time, 7840000000, whoſe Square Root 88204, are Days alſo, equal to 242 Years.

So that on the *Hypotheſis* of the *Sun*'s Revolution about the Earth, its Periodical Time muſt undoubtedly be 242 Years, which all Experience atteſts to be but a ſingle one: So that the Controverſy between the *Ptolemaick* and *Pythagorean Syſtems* of the World, is to a Demonſtration determined, and the *Earth*'s Annual Motion for ever unqueſtionably eſtabliſhed.

N. B. This Computation is upon a Suppoſition, that the Sun's Horizontal Parallax is 32 Seconds, which Mr. *Whiſton* takes as a middle Rate: But if you ſuppoſe it to be but 10 Seconds, which agrees much better with the Obſervations of our greateſt Aſtronomers, Mr. *Flamſtead* and Mr. *Caſſini*, who both make the Sun to be diſtant from us 11000 Semi-diameters of our Earth; then the Sun's Motion thro' the *Magnus Orbis*, will be found not to be performed in leſs than 597,3 Years, as any one may eaſily find by Calculation, as above.

He tells us alſo, *Lemma* 56. That if our Earth once revolved about the Sun in a Circular Orbit, whoſe Semi-diameter were equal to the Earth's Original Diſtance from the Sun, 6 Degrees paſt its Perihelion, the Annual Period was exactly equal to 12 Synodical or 13 Periodical Months. 'Tis evident, that 12 Synodical, or 13 Periodical Months, (equal to each other in this Caſe) are 355 Days, 4 Hours, 19 Minutes. 'Tis alſo evident, that the Eccentricity of the Earth's Orbit, or the Diſtance between the *Focus* and Center of its *Ellipſis*, was, according to the ancient Aſtronomers, *Hipparchus* and *Ptolemy*, $\frac{21}{1000}$ of the entire middle Diſtance. By the Moderns 'tis found ſomewhat leſs, (and thoſe who know Sir *Iſ. Newton*'s Philoſophy, will eaſily allow of ſome Diverſity in different Ages) by *Tycho* 'twas determined to be near $\frac{18}{1000}$; by *Caſſini* ſince $\frac{17}{1000}$; and laſt of all, by our moſt Accurate Obſerver Mr. *Flamſtead* $\frac{1692}{100000}$ or near $\frac{17}{1000}$, as *Caſſini* had before determined.

All which conſidered, we may very juſtly take the Middle between the Ancient and Modern Eccentricity, $\frac{19}{1000}$, for the true Original one, and about $\frac{185}{10000}$, or more nicely $\frac{1846}{100000}$, for the Difference between the Ancient Semi-diameter of the Circular Orbit and the middle Diſtance in the preſent Ecliptick one; the Point of Acceleration being about 6 Degrees paſt the *Perihelion*, not juſt at it.

Then, by the *Golden Rule*, As the Cube of 100000 (the middle Diſtance in the *Ellipſis*): To the Cube of 98154, (the Semi-diameter of the Ancient Circle) :: So is the Square of 525949, (the Number of Minutes in our preſent Solar Year): To the Square of the Number of Minutes in the Ancient Solar Year, whoſe Root being 511459 Minutes, or 355 Days, 4 Hours, 19 Minutes, appears to be exactly and ſurprizingly equal to the Lunar Year beforementioned.

Upon

Upon this *Hypotheſis* the Ancient Solar and Lunar Year were exactly commenſurate and equal; and 11 Days, 1 Hour, 30 Minutes ſhorter than the preſent Solar Year.

EARTH, which the Chymiſts call *Terra Damnata*, and *Caput Mortuum*, is the laſt of the five Chymical Principles, and is that which remains after all the other Principles are extracted by Diſtillation, Calcination, &c.

EARTH-BAGS, in *Fortification*, the ſame with Canvas-Bags, which ſee.

EARTHQUAKES: Mr. *Boyle* thinks that *Earthquakes* are often occaſioned by the ſudden fall of Ponderous Maſſes in the Hollow Parts of the Earth, whereby thoſe terrible Shocks and Shakings are produced.

The Learned Dr. *Woodward*, in his Eſſay towards a Natural Hiſtory of the Earth, gives the following Account of *Earthquakes*, which is much the beſt of any I have ſeen.

He ſuppoſes the Subterranean Heat or Fire, which is continually elevating Water out of the Abyſs, to furniſh the Earth with Rain, Dew, Springs, and Rivers, when it is ſtopped in any part of the Earth, and ſo diverted from its ordinary Courſe by ſome accidental Glut or Obſtruction in the Pores or Paſſages through which it uſed to aſcend to the Surface, becomes by this means preternaturally aſſembled, in a greater quantity than uſual, into one Place; and therefore cauſes a great Rarifaction and Intumeſcence of the Water of the Abyſs, putting it into very great Commotions and Diſorders, and at the ſame time making the like Effort on the Earth, which is expanded upon the Face of the Abyſs; and that this occaſions that Agitation and Concuſſion of it, which we call an *Earthquake*.

That this Effort is in ſome *Earthquakes* ſo vehement, that it ſplits and tears the Earth, making Cracks, and Chaſms in it ſome Miles in length, which open at the Inſtant of the Shock, and cloſe again in the Intervals betwixt them; nay, 'tis ſometimes ſo extreamly violent, that it plainly forces the ſuper-incumbent *Strata*, breaks them all throughout, and thereby perfectly undermines and ruins the Foundation of them; ſo that theſe failing, *the whole Tract*, aſſoon as ever the Shock is over, ſinks down to rights into the Abyſs underneath, and is ſwallowed up by it, the Water thereof immediately riſing up, and forming a Lake in the Place where the ſaid Tract before was.

That ſeveral conſiderable Tracts of Land, and ſome with Cities and Towns ſtanding upon them; as alſo whole Mountains, many of them very large, and of great Height, have been thus totally ſwallow'd up.

That this Effort being made in all Directions indifferently, upwards, downwards and on every ſide, the Fire dilating and expanding on all Hands, and endeavouring proportionably to the Quantity and Strength of it, to get Room, and make its way thro' all Obſtacles, falls as foul upon the *Water of the Abyſs* beneath, as upon the Earth above, forcing it forth which way ſoever it can find Vent or Paſſage, as well through its ordinary *Exits*, *Wells*, *Springs*, and the Outlets of *Rivers*; as through the Chaſms then newly open'd; through the *Canini* or *Spiracles* of *Ætna*, or other near *Vulcano's*; and thoſe *Hiatus* at the Bottom of the Sea, whereby the *Abyſs* below opens into it, and communicates with it.

That as the Water reſident in the *Abyſs*, is, in all Parts of it, ſtored with a conſiderable Quantity of Heat, and more eſpecially in thoſe where theſe extraordinary Aggregations of this Fire happen; ſo likewiſe is the Water which is thus forced out of it, inſomuch that when thrown forth, and mixed with the *Waters* of *Wells*, of *Springs*, of *Rivers*, and the *Sea*, it renders them very ſenſibly hot.

That it is uſually expelled forth in vaſt Quantities, and with great Impetuoſity, inſomuch that it hath been ſeen to ſpout out of deep *Wells*, and fly forth at the Tops of them upon the Face of the Ground; with like Rapidity comes it out of the Sources of *Rivers*, filling them ſo of a ſudden, as to make them run over their *Banks*, and overflow their *Neighbouring Territories*, without ſo much as one drop of Rain falling into them, or any other concurrent Water to raiſe and augment them.

That it ſpews out of the *Chaſms* opened by the Earthquake in great abundance, mounting up in mighty Streams to an incredible Height in the Air, and this oftentimes at many Miles Diſtance from any Sea.

That it likewiſe flies forth of the *Vulcano's* in vaſt Floods, and with wonderful Violence: That 'tis forced through the *Hiatus's* at the Bottom of the Sea with ſuch Vehemence, that it puts the Sea immediately into the moſt horrible Diſorder and Perturbation imaginable, even when there is not the leaſt Breath of Wind ſtirring, but all till then calm and ſtill, making it rage and roar with a moſt hideous and amazing Noiſe, raiſing its Surface into prodigious Waves, and toſſing and rowling them about in a very ſtrange and furious manner; overſetting Ships in the Harbours, and ſinking them to the Bottom, with many other like Outrages.

That 'tis refunded out of theſe *Hiatus's* in ſuch Quantity alſo, that it makes a vaſt Addition to the Water of the Sea, raiſing it many Fathoms higher than ever it flows in the higheſt Tides, ſo as to pour it forth far beyond its uſual Bounds, and make it overwhelm the adjacent Country; by this means ruining and deſtroying Towns and Cities, drowning both Men and Cattle; breaking the Cables of Ships, driving them from their Anchors, bearing them along with the Inundation ſeveral Miles up into the Country, and there running them aground; ſtranding Whales likewiſe, and other great Fiſhes, and leaving them at its return upon dry Land.

That theſe *Phænomena* are not new, or peculiar to the Earthquakes which have happened in our Times, but have been obſerved in all Ages, and particularly theſe exorbitant Commotions of the Water of the Globe.

This we may learn abundantly from the Hiſtory of former Times; and 'twas for this reaſon that many of the Ancients concluded rightly enough, that they were cauſed by the Impulſes and Fluctuation of Water in the Bowels of the Earth; and therefore they frequently called *Neptune*, Σεισίχθων, as alſo Κινησίχθων, Ἐνοσίγαιος, and Τιναξοχθαίνης; by all which Epithets they denoted his Power of ſhaking the Earth.

They ſuppoſed that he preſided over all Water whatever, as well that within the Earth as the Sea, and the reſt upon it; and that the Earth was ſupported by Water, its Foundations being laid thereon; on which Account it was, that they beſtow'd upon him that Cognomen Γαιήοχος, or Supporter of the Earth, and that of Θεμελιοῦχος, or *The Suſtainer of its Foundations*.

They likewiſe believed, that he having a full Sway and Command over the Water, had Power to ſtill and compoſe it, as well as to move and diſturb it, and the Earth by means of it; and therefore they alſo gave him the Name of Ἀσφάλιος, or, *The Eſtabliſher*; under which Name ſeveral Temples were

were consecrated to him, and Sacrifices offered whenever an Earthquake happen'd, to pacify and appease him, requesting that he would allay the Commotions of the Water, secure the Foundations of the Earth, and put an end to the Earthquake.

That the Fire it self, which being thus assembled and pent up, is the Cause of all these Perturbations, makes its own way also forth, by what Passages soever it can get vent, through the Spiracles of the next *Vulcano's*, through the Cracks and Openings of the Earth above mentioned, through the Apertures of Springs, especially those of the *Therma*, or any other way that it can either find or make; and being thus discharged, the Earthquake ceaseth till the Cause returns again, and a fresh Collection of this Fire commits the same Outrages as before.

That there is sometimes in Commotion a Portion of the Abyss of that vast Extent, as to shake the Earth incumbent upon it for so very large a Part of the Globe together, that the Shock is felt the same Minute precisely in Countries that are many Hundreds of Miles distant from each other; and this, even though they happen to be parted by the Sea lying betwixt them: And there want not Instances of such an Universal Concussion of the whole Globe, as must needs imply an Agitation of the whole Abyss.

That though the Abyss be liable to these Commotions in all Parts of it, and therefore no Country can be wholly exempted from the Effects of them; yet these Effects are no where very remarkable, nor are there usually any great Damages done by Earthquakes, except only in those Countries which are Mountainous, and consequently Stony and Cavernous underneath, and especially where the Disposition of the *Strata* is such, that those Caverns open into the Abyss, and so freely admit and entertain the Fire, which assembling therein, is the Cause of the Shock; it naturally steering its Course that Way where it finds the readiest Reception, which is towards those Caverns, this being indeed much the Cause of Damps in Mines. Besides, that those Parts of the Earth which abound with Strata of Stone or Marble, making the strongest Opposition to this Effort, are the most furiously shattered, and suffer much more by it, than those which consist of Gravel, Sand, and the like laxer Matter, which more easily give way, and make not so great Resistance; an Event observable not only in this, but all other Explosions whatever.

But above all, those Countries which yield great Store of Sulphur and Nitre, are, by far, the most injured and incommoded by Earthquakes; those Minerals constituting in the Earth a kind of Natural Gunpowder, which taking Fire upon this Assembly and Approach of it, occasions that murmuring Noise, that Subterranean Thunder which is heard rumbling in the Bowels of the Earth during Earthquakes, and by the Assistance of its explosive Power, renders the Shock much greater, so as sometimes to make miserable Havock and Destruction.

And 'tis for this Reason that *Italy*, *Sicily*, *Anatolia*, and some Parts of *Greece*, have been so long and so often alarm'd and harrass'd by Earthquakes, these Countries being all Mountainous and Cavernous, abounding with Stone and Marble, and affording Sulphur and Nitre in great Plenty.

That *Ætna*, *Vesuvius*, *Hecla*, and the other *Vulcano's*, are only so many Spiracles serving for the Discharge of this Subterranean Fire, when 'tis thus preternaturally assembled. That where there happens to be such a Structure and Conformation of the Interior Parts of the Earth, as that the Fire may pass freely and without Impediment from the Caverns wherein it assembles, unto those Spiracles, it then readily and easily gets out, from time to time, without shaking or disturbing the Earth: But where such Communication is wanting, or Passages not sufficiently large and open, so that it cannot come at the said Spiracles without first forcing and removing all Obstacles, it heaves up and shocks the Earth with greater or lesser Impetuosity, according as the Quantity of Fire thus assembled is greater or less, till it hath made its way to the Mouth of the *Vulcano*, where it rusheth forth sometimes in mighty Flames, with great Velocity, and a terrible bellowing Noise.

That therefore there are scarcely any Countries that are much annoyed with Earthquakes, that have not one of these Fiery Vents, and these are constantly all in Flames when any Earthquake happens, they disgorging that Fire which, whilst underneath, was the Cause of the Disaster; and were it not for these *Diverticula*, whereby it gains an *Exit*, 'twould rage in the Bowels of the Earth much more furiously, and make greater Havock than now it doth.

So that though those Countries where there are such *Vulcano's*, are usually more or less troubled with Earthquakes; yet were these *Vulcano's* wanting, they would be more troubled with them than now they are; yea, in all probability, to that Degree, as to render the Earth for a vast Space around them perfectly uninhabitable.

In one word, so Beneficial are these to the Territories where they are, that there do not want Instances of some which have been rescued and wholly delivered from Earthquakes by the breaking forth of a new *Vulcano* there, this continually discharging that Matter, which being till then barricado'd up and imprisoned in the Bowels of the Earth, was the occasion of very great and frequent Calamities.

That most of these Spiracles perpetually, and at all Seasons, send forth Fire more or less; and though it be sometimes so little that the Eye cannot discern it; yet even then, by a nearer approach of the Body, may be discovered a copious and very sensible Heat continually issuing out.

EASE, in the Sea Phrase, is the same as *slack*, or let go slacker: Thus, they say *Ease the Bowling*, *Ease the Sheet*, *i. e.* let it go slacker.

EBBING and *Flowing* of the Sea: See *Tides*.

EBULLITION: The great Boiling, Struggling or Effervescence which arises upon the mingling together of an Acid and an Alkalizate Liquor; and from hence any Intestine violent Motion of the Parts of a Fluid, occasioned by the struggling of Particles of different Natures, is called by this Name, *Ebullition*.

That a considerable *Ebullition* may be produced without Heat (*da veniam verbo*) nay, that a Degree of Cold may be produced greater than was in either of the Bodies singly, and that it shall arise purely upon their Mixture, though accompanied with a great Struggle, Tumult, Noise and Froth:

Mr. *Boyle* plainly proves from this Experiment:

He shook one Part of Oil of Vitriol into 12 Parts of common Water; the Mixture was at first sensibly warm: Then the Ball of a Thermoscope was placed within it, till the includ'd Spirit had gained the Temperament of the Mixture; but then a convenient Quantity of Volatile Salt of Sal Armoniack being

being gradually put in, to ſatiate the acid Spirits of the Mixture, the Spirit in the Thermoſcope deſcended above an Inch.

EBOLICA, are Medicines which help the Deliwery in hard Labour: Alſo Medicines which cauſe Abortives. *Blanchard.*

ECCENTRICITY, in the *Ptolemaick Aſtronomy*, is that Part of the *Linea Apſidum* lying between the Center of the Earth and of the Eccentrick, (*i. e.*) that Circle which the Sun is ſuppoſed to move in about our Earth, and which hath not the Earth exactly for its Center: And the Ancients found this muſt be ſuppoſed, becauſe the Sun ſometimes appears large, and then it is neareſt to us, and ſometimes ſmaller, and then further off.

ECCENTRICITY *Simple or Single*, in the new *Elliptical Aſtronomy*, is the Diſtance between the Center of the *Ellipſe* and the *Focus*; or between the Sun and the Center of the Eccentrick.

ECCENTRICITY *Double*, is the Diſtance between the *Foci* in the *Ellipſe*, and is equal to twice the Single Eccentricity.

ECCENTRICK *Circles*, are Circles not having the ſame Center. Of which Kind ſeveral Orbits were invented by Ancient Aſtronomers, to ſolve the Appearances of the Celeſtial Bodies.

The Eccentricks of the Planets they called alſo *Deferents*, becauſe they ſeemed to carry the Body of the Planet round in their Circumferences.

ECCENTRICK *Equation*, in the old Aſtronomy, is an Angle made by a Line drawn from the Center of the Earth, and another drawn from the Center of the Eccentrick, to the Body or Place of any Planet; the ſame with the *Proſtaphæreſis*; and is equal to the Difference (accounted in an Arch of the Ecliptick) between the Sun's or Planets real and apparent Place.

ECCENTRICK *Place of a Planet*, is that very Point of the Orbit, where the Circle of Inclination coming from the Place of a Planet in his Orbit, falls thereon with Right Angles.

In *Philoſoph. Tranſact. N.* 57. there is a Geometrick Method of Signior *Caſſini* for finding the Eccentricities of the Planets.

And in *N.* 128. there is another Direct and Geometrical Method for finding the *Aphelions*, *Eccentricities* and *Proportions* of the Orbits of the Primary Planets. By Mr. *Halley*.

ECCHOPROTICA, the ſame with *Catharticum*.

ECCHYLOMA, the ſame with *Extractum*.

ECCHYMOMA, are Marks and Spots in the Skin, ariſing from the Extravaſation of Blood. *Blanchard.*

ECCHYMOSIS, the ſame with *Ecchymoma*.

ECCOPE, the ſame with *Extirpatio*.

ECCRIMOCRITICA, are Signs to judge of a Diſtemper from particular Excretions. *Blanchard.*

ECCRISIS, is a Secretion of Excrements out of an Animal Body, or out of ſome Part of it.

ECHINUS, among the Botaniſts, is the prickly Head, Cover of the Seed, or Top of any Plant: So called from its Likeneſs to a Hedge-hog.

ECHINUS, in Architecture, is a Member or Ornament firſt placed on the Top of the *Ionick Capitals*, taking its Name from the Roughneſs of the Carving, reſembling the prickly Rind of the Cheſnut, and not unlike the Thorny Coat of a Hedge-hog.

This Ornament is made uſe of by Modern Architects in Cornices of the *Ionick*, *Corinthian* and *Compoſite* Orders, and generally ſet next to the *Abacus*, being carved with Anchors, Darts and Ovals, or Eggs; whence 'tis called *Ove* by the *French*, and *Ovolo* by the *Italians*; but the *Engliſh* Workmen commonly call it the *Quarter round*.

ECLEGMA, the ſame with a *Linctus Lambative*, *Loch*, or *Lohoch*, being a Medicine deſign'd to heal or eaſe the Lungs in Coughs, Peripneumonies, &c. being uſually compoſed of Oils and Syrups, and ſometimes Powders incorporated together into a Conſiſtence thicker than a Syrup, but not ſo thick as an Electuary.

ECLIPSE, is a Deprivation of the Light of one of the Luminaries, when by their Conjunction in the Orbit of the Sun, or in the Ecliptick, his Face, by the Interpoſition of the *Moon*'s Body, is hidden from our Sight; or when by their Oppoſition in the ſame Orbit, the *Moon*, by the Shadow of the intervening Earth, is obſcured.

So that in a Lunar *Eclipſe*, ſhe really loſes her Light, and is obſcured, by wanting the Illumination of the Sun either totally or partially. But in an *Eclipſe* of the Sun, he loſes not his Light, but only we are deprived of it in part by the Interpoſition of the *Moon*'s Body between us and the Sun: And therefore this ought rather to be called an Eclipſe of the Earth; for 'tis the Earth that is deprived of Light, and not the Sun.

A central Eclipſe of the *Moon*, is when not only the entire Body of the *Moon* is covered by the Shadow, (which is a Total one; as when it is covered by it in Part, it is called a Partial one) but alſo the Center of the *Moon* paſſes through the Center of that Circle, which is made by a Plane cutting the Cone of the Earth's Shadow at Right Angles with the Axis, or with that Line which joins the Centers of the Sun and the Earth.

For the Method of Calculation of the Eclipſes of both the Luminaries, ſee Dr. *Gregory*'s Aſtronomy, *Book* IV. *Sect.* 7, and 8; and Mr. *Flamſtead*'s Doctrine of the Sphere, in *Moor*'s Mathematicks, Part the Second.

Becauſe the Earth (or Sun) always moves in the Ecliptick, the *Moon* can never be Eclipſed, but when her *Plenilunium* happens in or near her *Nodes*, (that is, in the Interſection of the Plane of the Orbit with that of the Ecliptick.)

The Shadow of the Earth obſcuring the *Moon*, though projected into a Cone of a vaſt Length, yet reaches not ſo far as the Planet *Mars*, for he is never Eclipſed by it, tho' he be in the Plane of the Ecliptick, and at Oppoſition to the Sun.

If the *Moon* be ſo near the *Node*, that the Aggregate of the apparent Semi-diameters of the *Moon* and of the Earth's Shadow be greater than the *Moon*'s Latitude, ſhe will be Eclipſed, otherwiſe not. And becauſe the Sum of the Semi-diameter of the *Moon* and of the Earth's Shadow, is always greater than *that* of the Semi-diameters of the *Sun* and *Moon*; for the Former is never leſs than 53′, and the Latter never greater than 35′, 'tis plain, that *Lunar Eclipſes* may happen in a greater Latitude of the Moon, or when ſhe is farther from the *Node* than *Solar* ones; and in this reſpect, of one and the ſame Place upon the Earth, will more often become viſible there; though in regard to the View of the whole Earth, the Solar Eclipſes will happen more frequently.

Our moſt Accurate Aſtronomer Mr. *Flamſtead*, in the Second Part of his Excellent Doctrine of the Sphere, which is Printed in the Firſt Vol. of Sir *Jonas Moor*'s Mathematicks, gives you an Orthographick Projection of the Sphere on a Plane touching the Moon's Orbit, at Right Angles to the Line connecting the Centers of the Earth, Sun, or given Star, by Right Lines proceeding from any of them

to

to the Sphere, whereby are determined the Moon's Parallaxes in Altitude, Longitude, and Latitude; and by it he ſhews alſo how to determine the Breadth of the Semi-diameter of the Diſk of the Penumbra, and the Earth's Shadow in an Eclipſe, and how that of the Sun is made.

He teaches alſo very briefly and plainly, how the true Places of the Sun and Moon, her Latitude, Horary Diſtance, Horizontal Semi-diameters and Parallaxes may be found by Calculation; as alſo, how to find the ſame way, the Times of the mean and true Conjunctions or Oppoſitions of the Luminaries; as alſo, the principal Phaſes of a Solar Eclipſe for the Meridian of *London*, with the Longitudes from it, and the Latitudes of ſuch Places as the Eclipſe will be ſeen at, or where the ſaid Phaſes ſhall appear; that is, where the Eclipſe begins in the Vertex of the Riſing, or Ends in the Vertex of the Setting Sun: Where he riſes or ſets Centrally Eclipſed; where the Eclipſe ends in the loweſt Point of the Riſing, or begins in the Loweſt Point of the Sun Setting; where the Sun is Centrally Eclipſed in the Meridian; and to mention no more, where the Sun is Centrally Eclipſed in the Nonageſimal Degree, without the help of Nonageſimary Tables; of which he gives an Example, and demonſtrates the Reaſon of the *Calculus*.

He gives there alſo a Geometrical Conſtruction of Eclipſes, ſhewing how to find the exact Conjunction, &c. of the Luminaries, Digits then darkned, Inclination of the *Cuſps*, End of the Eclipſe, or Time when any poſſible Number of Digits ſhall be darkned, by Scale and Compaſs; all which is done with great Plainneſs, Brevity and Accuracy, and is very well worth the Mathematical Reader's Peruſal.

ECLIPSIS, in a Medicinal Senſe, is a Defection of the Spirits, or Fainting, or Swooning.

ECLIPTICK, is a great Circle of the Sphere, ſuppoſed to be drawn through the Middle of the Zodiack (which ſee) and making an Angle with the Equinoctial (in the Points of *Aries* and *Libra*) of 23°. 20′. which is the Sun's greateſt Declination.

This is by ſome called *Via Solis*, or the Way of the Sun, becauſe the Sun, in his Annual Motion, never deviates from this Line, as all the other Planets do more or leſs; from whence the Zodiack hath its Breadth. 'Tis this Line which is drawn on the Globe, and not the Zodiack; but in the New Aſtronomy, the *Ecliptick* is that Path or Way among the fix'd Stars, which the Earth appears to deſcribe to an Eye placed in the Sun, as in its Annual Motion it runs round the Sun from Weſt to Eaſt: And if you ſuppoſe this Circle to be divided into 12 equal Parts, they will be the 12 Signs, each of which is denoted or diſtinguiſhed by ſome Aſteriſm or Conſtellation.

Note, If the Spectator's Eye be ſuppoſed to be on the Earth, the Sun will appear always to be in the oppoſite Sign to what the Earth is in.

ECLYSIS, is when the Strength of the Patient is a little decayed, proceeding from a want of a ſufficient Warmth and Spirits in the Body. *Blanchard.*

ECPHRACTICUM, is a Medicine good againſt Obſtructions.

ECPHRAXIS, is a taking away of Obſtructions in any Part. *Blanchard.*

ECPHYSESIS, is a Diſeaſe in which the Patient breathes thick.

ECPHYSIS, is any Proceſs that coheres with, or adheres to a Bone.

ECPIEMA, the ſame with *Empiema.*

ECPIESMA, is a Juice ſqueezed out; alſo the Dregs which remain of any Thing that is ſqueezed; likewiſe a Fracture of the Skull, wherein the broken Parts preſs upon the Meninges or Skin of the Brain. *Blanchard.*

ECPIESMUS, is a very great Protuberance of the Eyes.

ECPLEXIS, is a Fright or Stupor.

ECPNEUMATOSIS, the ſame with *Expiration.*

ECPTOSIS, the ſame with *Luxation.*

ECPUCTICA, are condenſing Medicines: See *Incraſſantia.*

ECPYESIS: See *Empiema.*

ECRITHMUS, is a Pulſe which obſerves no Method nor Number, incident to any Age. *Blanchard.*

ECTHLIMA, is an Ulceration ariſing from a violent Compreſſion in the Surface of the Skin. *Blanchard.*

ECTHLIPSIS, is a Figure in Grammar relating to the Dimenſion of *Latin* Verſes, whereby the Letter *M*, with its preceding Vowel, is cut off, becauſe the ſucceeding Word begins with a Vowel, as in this Verſe;

O Curas Hominum! O quantum eſt in Rebus Inane!

Where the *um* in *Hominum* and *Quantum* is entirely cut off, and not ſounded before the Vowels *o* and *e*.

ECTHYMATA, are Pimples or certain breakings out in the Skin, as the Small Pox, &c. *Blanchard.*

ECTHYMOSIS, is a Commotion or Intumeſcence of the Blood; alſo a Cheerfulneſs of the Mind. *Blanchard.*

ECTILLOTICA, are Medicines which conſume Callous Parts, and pull out Hairs, &c. *Blanchard.*

ECTROPIUM, is a growing of the Eye-lids, when the lower is ſhorter than the upper. *Blanchard.*

ECZEMATA, are extreme hot, or, as it were burning Pimples: Some take *Hydroa* for *Eczemata*, but it is a Miſtake. *Blanchard.*

EDDY, is when the Water at any Place runs back, contrary to the Tide or Stream, and ſo falls into the Tide or Current again. The Seamen call alſo that *Eddy Water*, which falls back, as it were, on the Rudder of a Ship under Sail, the *Dead Water*. They call alſo an *Eddy Wind*, that which returns, or is beat back from any Sail, &c.

EDULCORATION, (*i. e.* Sweetning) is a Term uſed by the Chymiſts for the clearing of any Matter from the Salts it may be impregnated or mixed with, by waſhing it throughly in common Water.

EFFECTIONS, is a Word uſed by Geometers, in the ſame Senſe with the *Geometrical Conſtruction* of Propoſitions, and often of *Problems* and *Practices*; which, when they are deducible from, or founded upon ſome General Propoſition, are called the *Geometrical Effections* thereunto belonging.

EFFERVESCENCE, a Word much uſed by the Modern Philoſophers and Chymiſts; it expreſſes a greater Degree of Motion and Struggling of the ſmall Part of a Liquor, than we underſtand by the Word *Fermentation*, and implies a great Ebullition or Boiling up with ſome Degree of Heat; and is the uſual Term for the Effect of pouring an acid Liquor, (as ſuppoſe *Oil of Vitriol*) on an *Alkaliſate* one, as on *Oil of Tartar per Deliquium*: for a very great Commoti-

motion, ſtruggling Heat, and boiling will immediately ariſe; which may be called a great *Effervescence.*

Lemery defines it to be an Ebullition or Boiling of any Liquor without the Separation of its Parts; but that doth not fully expreſs the Meaning of the Word.

EFFLUVIUMS, are ſuch very ſmall Particles or Corpuſcles, as are continually flowing out of all mix'd Bodies.

The very great Subtilty and Fineneſs of the Effluvia of many Bodies, appears from their being able for a long time together, to produce ſenſible Effects, without any ſenſible, or at leaſt, conſiderable Diminution of the Bulk or Weight of the Body that emits them.

And that theſe *Effluviums* may conſiderably operate upon, and have great Effect on Bodies within the Sphere of their Activity, Mr. *Boyle* proves from theſe Conſiderations;

1. That the *Number* of the Particles or Corpuſcles emitted as Effluviums out of any Body, is *vaſtly great.*

2. That they are of a very *penetrating* and *pervading* Nature, and ſo can moſt eaſily inſinuate themſelves into the Bodies they operate upon.

3. That they are moved with vaſt Celerity, and oftentimes with all manner of Directions, and very various Modifications.

4. That there is often a wonderful Congruity or Incongruity of the Bulk and Shape of theſe Effluvia, to the Pores of the Bodies they penetrate into and act upon.

5. That eſpecially in Animal and Organical Bodies, theſe Effluvia may excite great Motions of one Part of the curious Engine upon another, and thereby produce very conſiderable Effects in the Animal Oeconomy.

6. That they may have ſometimes a Powder to make themſelves be aſſiſted in their Operations *by the more Catholick Agents of the Univerſe*; ſuch as Gravity, the Preſſure of the Atmoſphere, Light, Magnetiſm, &c.

EGESTION, the ſame with *Dejection.*

EJECTIONE *Cuſtodiæ*, is a Writ which lieth properly againſt him that caſteth out the Guardian from any Land during the Minority of the Heir.

EJECTIONE *Firmæ*, is a Writ that lieth for the Leſſee for Term of Years, that is caſt out before his Term expired, either by the Leſſor or a Stranger.

EIRE, or *Eyre*, in *Britton*, Cap. 2. ſignifies the Court of Juſtices *Itinerant.* And Juſtices in *Eyre*, are thoſe which *Bracton* in many Places calleth *Juſticiarios itinerantes*, of the *Eyre.* The *Eyre* alſo of the Foreſt is nothing but the *Juſtice-Seat* otherwiſe called, which is, or ſhould by Ancient Term, be held every three Years by the Juſtices of the Foreſt.

ELABORATORY: See *Laboratory.*

ELASTICK *Force*, primarily, is the Force of a Spring when bent, and endeavouring to unbend it ſelf again.

In Phyſicks, 'tis taken for the Endeavour of Springing or Elaſtick Particles, when compreſs'd or crowded into a little Room, to dilate and evolve themſelves again: Wherefore by this Name they frequently call ſuch an Exploſion of Animal Spirits as is frequent in Cramps or Convulſions. The Effect of this Power, or this Quality in Bodies, is called *Elaſticity*; and Bodies that have it, *Elaſtick Bodies.*

And as a *Soft Body* is that which when preſs'd yields to the Stroke, and loſes its former Figure, and cannot recover it ſelf again; ſo an *Elaſtick Body* is that which though it yields for a while to the Stroke, yet can afterwards recover its former Figure by its own natural Power; and if it can do this with the ſame Force as that which preſs'd upon it, we ſay 'tis perfectly *Elaſtical.*

If there were no *Elaſticity*, the Laws of Motion found by Mathematicians, about the Percuſſion of two Bodies, would hold univerſally, and be without Exception true: And the Bodies (as Mr. *Keil* obſerves in his *Introduct. ad Veram Phyſicam*, P. 151.) would move jointly that way towards which the ſtronger Body tended before the Shock or Percuſſion, and with a Celerity eaſily determinable by thoſe Laws of Motion. But becauſe there are very few Bodies without ſome Degree of *Elaſticity*, even ſoft Clay, Wax, &c. containing within them ſome Particles of Elaſtick Air; from hence it is, that Bodies which ſtrike or move one againſt another, do ſpring or leap back, and move with very different Velocities, ſometimes one way, ſometimes another.

If you imagine a String or Wire to be ſtrained, and faſtened firm at each End, then 'tis plain, that if either the Middle Part of the String (or any other) be either drawn by the Hand, or preſs'd by a Weight out of the right Poſition it was at firſt in; then if the Force that removed it, be not greater than the Elaſtick Force of the String, the String will fly back; and if the Weight or Body be not removed, drive it before it, as the String of a Croſs-bow doth the Bullet; and the acquir'd Velocity of the String will carry it beyond its firſt right Poſition towards the oppoſite Parts, and that ſo far as till the Motion that way be equal to the Elaſticity of the String; and then being quite deſtroyed, the String will return again as before; and thus ſpringing forward and backward; would (abſtractly from the Reſiſtance of the Medium) like a double Pendulum, make continual Vibrations. Thus alſo, if you ſuppoſe any Weight to fall on an immoveably fix'd and perfectly Elaſtick Body; on the Contact, the Parts of the Elaſtick Body will ſpring back or recede inwards, till the Elaſtick Force be raiſed up equal to the *Momentum* of the falling Body; and then this latter ceaſing, the Elaſtick Force will caſt the Body upwards or from it, with the ſame Velocity it came down, or was impelled againſt it, recovering again its former Figure; but if both the Bodies being Elaſtick, neither of them be fixed or moveable, then the Elaſtick Force will act equally in each Body, and produce equal Mutations of Motion.

And from this *Elaſticity* in Bodies ariſes that *Reſilition* or leaping back from one another, which we obſerve in many Bodies on their moving ſwiftly one againſt another. The uſual Method to judge whether Bodies are endowed with this Elaſtick Quality or not, is to enquire whether, on being ſtruck, they give any *Tinnitus*, or ringing Sound, or indeed any ſenſible Noiſe; for if they do, you may conclude them in ſome Meaſure Elaſtical; and that they are ſo in Proportion to the Strength and Acuteneſs of the Sound they emit.

Mr. *Keil* gives theſe Rules for the Motion of Elaſtick Bodies.

THEOREM.

If two Bodies perfectly Elaſtick ſtrike one againſt another, there will be or remain in each the ſame Relative Velocity as was before; that is, ſuch Bodies will recede from each other with the ſame Velocity that they met together with.

For the compreſſive Force or the Magnitude of the Stroke in any given Bodies, ariſes from the relative Velocity of thoſe Bodies, and is proportional to it: And Bodies perfectly Elaſtick, will reſtore themſelves compleatly to the Figure they had before the Shock: or in other Words, the Reſtitutive Force is equal to the Compreſſive, and therefore muſt be equal to the Force with which they acceded, and conſequently they muſt by Elaſticity recede again from each other with the ſame Velocity. *Q. E. D.*

COROLLARY.

Hence taking equal Times before and after the Shock, the Diſtances between the Bodies will be equal: And therefore the Diſtances of the Bodies from the common Center of Gravity will, in the ſame Times, be equal.

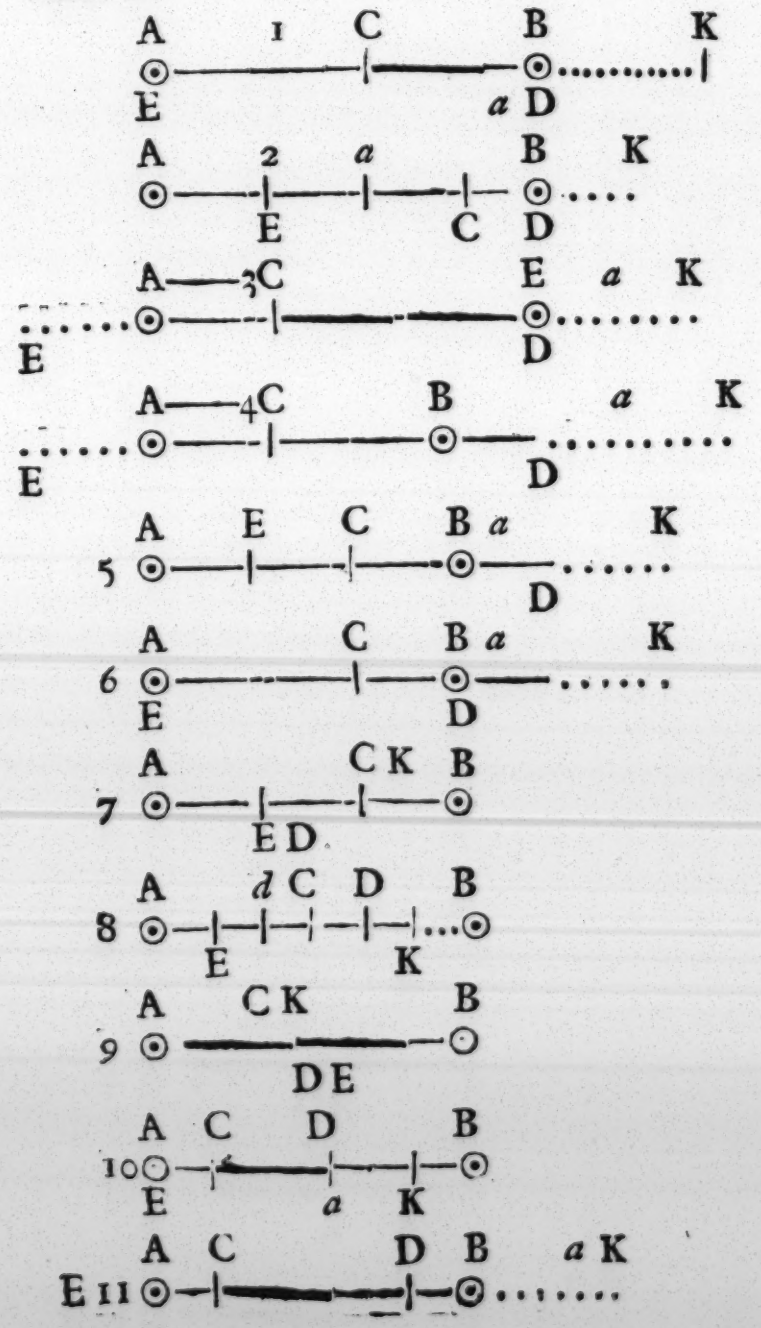
Whence the Laws of the meeting of Bodies perfectly Elaſtick are eaſily deduced, which he doth by this Problem.

PROBLEM.

To determine the Rules of the direct Meeting or Shock of Bodies perfectly Elaſtical.

One Conſtruction will ſerve for all Caſes of this Problem.

Let there be two Bodies, *A* and *B*, perfectly Elaſtical, whoſe common Center of Gravity let be *C*, and let *D* be the Point of Concourſe where the Bodies meet; make *CE* always equal to *CD*. Then I ſay, that after the Concourſe or Shock, the Right Line *CE* will expreſs the Velocity of the Body *A* from *E* towards *A*; and the Right Line *EB* will expreſs the Velocity of the Body *B*, from *E* towards *B*.



DEMONSTRATION.

Since the common Center of Gravity of any Bodies, proceeds on with the ſame uniform Progreſſion, and with the ſame Velocity both before and after the Shock and Impulſe, as he proves in *Theorem* 18; and that in a Time equal to that in which the Body *A* moves the Length *AD*; or the Center of Gravity *C* moves the Length *CD*; and after the Concourſe, the ſame Point *C* will move the Length *DK* = to *DC*. This being ſo, let *Ka* be taken equal to *CA*; then, ſince by *Cor.* of the preceding *Theorem*, taking equal Times both before and after the Impulſe, the Diſtances of the Bodies from the common Center of Gravity will always be equal; then at what time the common Center of Gravity will be in *K*, the Body *A* will be found to be in *a*; and therefore after the Impulſe, its Motion will be from *D* towards *a*, and its Velocity will be expreſſed by *Da*, which is the Length run over in that Time. But becauſe *CE* = *CD*, or to *KC*, and *Ca* = *Ka*, the Difference between the Right Lines *CE* and *CA* will be equal to the Difference between the Right Lines *KD* and *Ka*; that is, *EA* = *Da*: But the Right Line *Da* expreſſes the Velocity of the Body *A* after the Shock or Impulſe, and conſequently its Velocity will alſo be expreſſed by the right Line *EA*. Beſides, ſince the relative Velocity of theſe Bodies remains the ſame both before and after the Shock, and that the right Line *EA* denotes the Velocity of the Body *A*, the Velocity of the Body *B* muſt neceſſarily, after the Impulſe, be denoted by the Line *EB*, and the Direction of the Motion will be from *E* towards *B*.

COR. I.

Hence, if the Body *B* be at reſt, the Points *D* and *B* will be co-incident, as in the Caſe of the three firſt Lines in the Figure: and becauſe *B* : *A* :: *AB* : *CB*, therefore, by Compoſition, *B* + *A* : *AA* :: *AB* : *CB*; and doubling the conſequent Terms of the Proportion, *B* + *A* : 2 *A* :: *AB* : 2 *CB*; that is in Words, *As the Aggregate or Sum of the Bodies: Is to the Double of the moving or ſtriking Body:: So will the Velocity of the ſtriking Body be before the Shock: To the Velocity of the quieſcent Body after it.*

COR. II.

Wherefore if the Bodies *A*, *B* are equal, the Sum or Aggregate of them muſt be 2 *A*: Whence the Velocity of the Body *B*, after the Shock, ſhall be equal to *AB*, the Velocity of the Body *A* before it; and conſequently the Points *E* and *A* being co-incident, *AE*, the Velocity of the moving Body after the Impulſe or Shock, will be = 0; that is, none at all. Which alſo may be eaſily ſhewn thus; becauſe the Bodies *A* and *B* are equal, *AC* will be = *CB* = *CD* = *CE*; wherefore the Point *E* will co-incide with *A*, and conſequently the Body *A*, after the Shock, will be at reſt, and the Body *B* will move with the Velocity *EB* or *AB*.

If therefore a perfectly Elaſtick Body ſtrike directly againſt another equal to it, and which is at reſt; after the Shock the moving Body will loſe all its Motion, and the Quieſcent move on with the Velocity of the Former.

COR-

COR. III.

If the Bodies A and B are equal, and both move the ſame way, as in Line the 4th of the Figure, they will move alſo both the ſame way after the Shock, and with the mutual Exchange of their Velocities.

For ſince $CE = CD$, and $AC = CB$; $CE - AC$, that is, EA, muſt be $= CD - CB$, or to BD; and conſequently, the Velocity of the Body after the Shock, will be equal to that of B before it. Beſides, ſince $EA = BD$, EB will be $= AD$; and therefore the Velocity of the Body B after the Shock, muſt be equal to that of A before it.

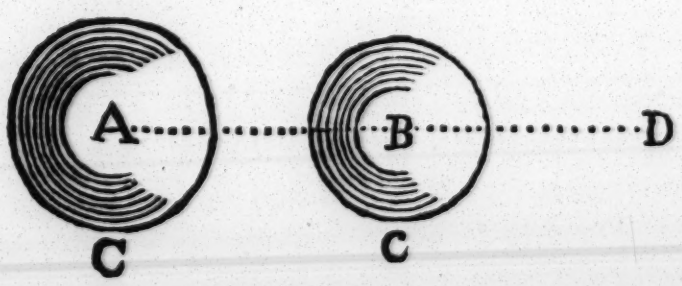
COR. IV.

If the equal Bodies B and A move with contrary Directions, as in Line the 10th of the Figure, they will alſo, after the Concourſe and Shock, move contrary ways, and with their Velocities counter changed.

For ſince $AC = CB$, and $CE = CD$, $AC - CE$; that is, AE muſt be equal to $CB - CD$, or to BD; and therefore the Velocity of the Body A, after the Shock, will be equal to that of B before it. Beſides, ſince $EA = BD$, AD will be $= EB$: But AD expreſſes the Velocity of the Body A before the Shock, and EB the Velocity of B after it; wherefore the Truth of this *Corollary* is plain.

After this he ſhews a very eaſy Method to bring theſe Theorems to Practice, by a Calculation in Numbers.

For ſuppoſe (1) the Bodies A and B both move the ſame way, and that the Velocity of the precedent Body B be c, and that of the ſubſequent A be C; wherefore the relative Velocity of theſe two Bodies will be $C - c$, and the Sum of their Motions the ſame way $AC + Bc$: Let x denote the Velocity of the ſubſequent Body A after the Concourſe and Shock; then becauſe the relative Velocity of Bodies before and after the Shock continues the ſame, the Velocity of the Body B will be expreſſed by $x + C - c$.



For the relative Velocity of Bodies is equal to that by which the Velocity of the Swifter exceeds that of the Slower; and therefore that Exceſs muſt be expreſſed by $C - c$. Wherefore, ſince the Velocity of the ſubſequent Body $A = x$, its Motion towards D muſt be Ax: And ſince the Velocity of the preceding Body $B = x + C - c$, its Motion alſo towards D muſt be expreſſed thus, $Bx + BC - Bc$; and the Sum of theſe two Motions will be equal to the Sum of the former Motions: That is, in Species, $Ax + Bx + BC - Bc = AC + Bc$; and by Tranſpoſition, $Ax + Bx = 2Bc - BC + AC$; and then by Diviſion, $x = \frac{2Bc - BC + AC}{A + B}$ = Velocity of the Body A. And ſo alſo the Velocity of the Body B is $= x +$

$C - c = \frac{AC - BC + 2Bc}{A + B} + C - c =$
$\frac{AC - BC + 2BC + AC + BC - Ac - Bc}{A + B}$
$= \frac{2AC - Ac + Bc}{A + B}$.

If BC be greater than $AC + 2Bc$, then x or $\frac{AC - BC + 2Bc}{A + B}$ will be a Negative Quantity; and conſequently the Velocity of the Body A will have a contrary Direction, and its Motion towards D will be Negative.

If the Body B be at reſt, that is, if $c = 0$, then the Velocity of the Body A after the Shock will be $+ \frac{AC - BC}{A + B}$, forwards or backwards according as the Sign + or − prevails.

If the Bodies A and B, with the Velocities C and c move contrary Ways, and conſequently meet one another directly; their Motion the ſame way will be expreſſed by $AC - Bc$, and the relative Velocity of the Bodies will be $C + c$.

Let then x ſtand for the required Velocity of the Body A after the Shock; its Motion that way, which it went before the Shock, will be expreſſed by Ax, and the Velocity of the Body B will be $x + C + c$ (for the relative Velocity of Bodies is not altered by the Shock) and then the Motion in the Body B towards D, will be $Bx + BC + Bc$; wherefore the Sum of the Motions the ſame way will be $Ax + Bx + BC + Bc$ which (by his 14th Theorem about the Laws of Motion) will be $= AC - Bc$; ſo that $Ax + Bx = AC - BC - 2Bc$, and $x = \frac{AC - BC - 2Bc}{A + B}$.

And the Velocity of the Body B will be
$\frac{AC - BC - 2Bc}{A + B} C + c =$
$\frac{AC - BC - 2Bc + AC + Ac + BC + Bc}{A + B}$
$= \frac{2AC + Ac - Bc}{A + B}$

If $BC + 2Bc$ be greater than AC, the Motion of the Body A will be backwards or a contrary way; in which Caſe x or $\frac{AC - BC - 2Bc}{A + B}$

Whatever be the Phyſical Cauſe of *Elaſticity*; Sir *Iſaac Newton*, Prop. 23. Book 2. of his admirable *Princip.* demonſtrates, That "Particles which mu-
" tually avoid or fly from one another by ſuch For-
" ces as are reciprocally proportional to the Diſtan-
" ces of their Centers, will compoſe an Elaſtick
" Fluid, whoſe Denſity ſhall be proportional to its
" Compreſſion.

And *vice verſa*, "If any Fluid be compoſed of
" Particles, that fly or avoid one another, and
" hath its Denſity proportional to its Compreſſion,
" then the Centrifugal Forces of thoſe Particles
" will be reciprocally as the Diſtances of their
" Centers.

ELATERISTS, Mr. *Boyle*'s Word, are ſuch as hold the Doctrine of *Elaterium*, or the Spring and Weight of the Air, which he defends againſt *Linus*.

ELATERIUM is the Juice of wild Cucumbers made up in a thick and hard Conſiſtence: Alſo, according to ſome, any Medicine that purges the Belly.

ELECTICA: See *Attrahentia*.

ELECTION *de Clerk*, is a Writ that lieth for the Choice of a *Clerk*, aſſigned to take and make Bonds called *Statute-Merchant*; and is granted out of the *Chancery* upon Suggeſtion made, That the *Clerk* formerly aſſigned is gone to dwell in another Place, or hath Hindrance to lett him from following that Buſineſs, or hath not Land ſufficient to anſwer his Tranſgreſſion if he ſhould deal amiſs.

ELECTRICITY, is the Quality that Amber, Jett, Sealing-Wax, *&c.* have of attracting all Kinds of very light Bodies to them, when the attracting Body is rubbed or chafed. And this is moſt probably the Effect of a *Material Effluvium* (as the Noble Mr. *Boyle* expreſſes it in his Notes on this Quality) iſſuing from, and returning to the *Electrical Body*, and aſſiſted alſo in ſome Caſes by the External Air. For the Solution of this Phænomenon there are ſeveral Hypotheſes, and all Mechanical.

1. *Cabæus* ſuppoſes, That actual Streams do iſſue out of the Electrick Body when agitated by Attrition; and that theſe do diſcuſs and repel the Ambient Air, which, after it hath been driven off a little way, makes, at it were, a little Whirl wind from the Reſiſtance which it finds in the remoter Air, to which theſe Electrick Streams did not reach: And that theſe Streams ſhrinking quickly back again to the attracting Body, do, in their Return, attract or bring along with them ſuch light and ſmall Bodies as they meet with in their way. To which Mr. *Boyle* adds, that the Gravity of the incumbent Atmoſphere ſurmounting the ſpecifick Gravity of the little rarified Atmoſphere of the Electrick Body, may probably facilitate the Tendency of the ſmall Particles of Matter towards the attracting Body.

2. Our Famous *Gilbert*, Sir *K. Digby*, *Gaſſendus*, Dr. *Brown*, and many others, ſuppoſe, That on rubbing or chafing, the Electrick Body is made to emit Rays or Files of an unctuous Nature, which, when they come to be condenſed and cooled by the Ambient Air, do loſe their Agitation, and then ſhrink back again into the Body from whence they ſally'd out; and by that means do carry along with them ſuch light and ſmall Bodies as happen to be faſtened or ſticking to their further Ends. *Gaſſendus* thinks alſo, That theſe unctuous Effluvia being emitted all manner of ways, do decuſſate frequently, or croſs one another; and by this Means do take the better hold of Straws, *&c.* into whoſe Pores they inſinuate themſelves.

3. *Des Cartes* being not able to imagine that ſo ſolid a Body as Glaſs was capable of emitting Effluvia; (tho' it is certain that two Pieces of Glaſs rubbed one againſt another, will ſend forth an unpleaſing Odour, which muſt conſiſt of material Effluvia) he had recourſe to the Operation of his *Materia Prima* for the Solution of *Electricity*; but he ſpeaks of it doubtingly himſelf, and unintelligibly to the Reader, as it appears to me; therefore I ſhall refer you to the Place it ſelf, where if you think it worth while, you may ſee what he ſaith at large. *Vid. Cartes Princip. Lib.* 4 *Chap.* 184. *p.* 210.

Mr. *Boyle*, in order to prove Electricity to be a Quality which hath, like all others, in natural Bodies, a Mechanical Original, hath given us the following Obſervations and Experiments about this *Effect*: from whence a very good gueſs may be made how *Electrical Attraction* is produc'd, *viz.*

1. That Electrical Bodies do not at all, or at beſt but very rarely *attract*, but when they are *warm'd*, and thereby ſollicited to emit Effluvia more copiouſly.

2. That theſe Bodies warm'd only by the Fire, don't attract ſo forcibly as they will when heated by rubbing; tho' if they are firſt warmed at the Fire, and then rubbed afterwards, they will attract moſt ſpeedily and powerfully. So that Heat ſeems neceſſary in general to put the Parts into Agitation; and rubbing or chafing in particular, to give them their moſt proper Modification.

3. *Terſion* (as he calls it) or *Wiping*, is almoſt univerſally neceſſary, as well as Attrition or Rubbing, to produce Electricity; for thereby the Steams or Effluvia can the better get out, when there is nothing to ſtop up, or choak the Pores of the attracting Body.

4. The Magnetical Effluvia will pervade all manner of Bodies freely; yet the Interpoſition of the fineſt Linnen or Paper will hinder the Operation of all Electrical Particles; which ſeems to confirm their being ſomething of an unctuous Nature.

5. This Effect is very much weaken'd if the Weather be thick and cloudy, and eſpecially if the South Wind blow, as *Kircher* aſſerts from his own Experience. But it always continues ſome time after it is once excited by rubbing and chafing, and doth not ceaſe in an Inſtant.

6. Electrical Bodies attract all Things indifferently, whereas the Magnet draws only Iron and Steel.

7. Our Excellent Naturaliſt ſuſpended a fine large Piece of very Electrical Amber by a Silken Thread, and then had one end of it rubbed ſtrongly on a little Cuſhion, and then he found that when the Amber was made to hang perfectly at reſt, if the Cuſhion was brought near it, tho' not to touch it, it would plainly make the Amber tend towards it, and follow it. From whence it plainly appears, that other Bodies can draw or move the Electrick one, as well as *it*, the others; and that it is by Accident only, and not from Neceſſity, that the ſmall attracted Bodies go to the Electrick one.

8. By many repeated Experiments he found this Electrical Quality to be producible and deſtructible.

9. He found alſo that a Piece of Amber did ſenſibly attract when the Air was pumped out of the Receiver; which confirms the Hypotheſis of thoſe that ſuppoſe actual Strings or little unctuous Rays to go out of the Electrical Body.

10. He found alſo, that after an Electrical Body had been well rubbed, there was a certain Nick of Time in which the light Body would inſtead of being attracted, be actually driven away from the Electrical Body, by the Effluvia going briſkly out and not yet returning again; which much confirms the Hypotheſis of *Gilbert*, *Digby*, *Brown*, *&c.* mentioned in *N.* 2. See Vol. II.

ELECTUARY, is a Medicine of a Conſiſtence, thicker than a Syrup or Linctus, and compoſed of hard things reduced to Powder, and accurately mixed with Syrups, Conſerves, Honey, *&c.*

ELEGIT, is a Writ Judicial, that lieth for him that hath recover'd Debt or Damages in the King's Court againſt one not able in his Goods to ſatisfy, and directed to the Sheriff, commanding him that he make Delivery of half the Parties Lands or Tenements, and all his Goods, Oxen and Beaſts of the Plow excepted.

ELEMENTS, is a Word uſed by Natural Philoſophers, in the ſame Senſe uſually as *Principles*; and by the Elements and Principles, or as they ſometimes call them *the Elementary Principles* of a Natural or Mixed Body', they mean thoſe ſimple Particles out of which the Mixed is compoſed, and into which 'tis ultimately reſolvable

The Word comes from L, M, N, three of the Letters of the Alphabet; and is alſo frequently uſed for the firſt Principles or Rudiments of any Science.

Thus

Thus the Propoſitions of *Euclid* are called his Elements, becauſe they contain the firſt Principles of Geometry.

ELÆOSACCHARUM, is Sugar incorporated with ſome Drops of diſtilled Oil, ſo as to make the Oil more eaſy and agreeable to be ſwallowed by the Patient.

ELEPHANTIASIS *Arabum*, of which the *Greeks* ſpeak nothing, but the *Arabians* do frequently, is a-kin to a *Varix* or crooked Swelling in the Veins, and proceeds from thence, and is only a Tumour in the Feet. *Avicenna* treats of this Diſtemper, where he ſpeaks of the *Varices*; yet *Rhaſes* differs from him, and *Haly Abbas* follows the *Greeks*, who ſay, That an *Elephas* is a Diſeaſe which corrupts all the Members of the Body, and is as it were, an *Univerſal Cancer*. But neither is he conſiſtent with himſelf, when he writes, that *Ulcers* in the Legs and Feet are called *Elephas*; and that *Elephanticus Morbus* is an Apoſtume proceeding from Melancholly in the Legs and Feet; and the Sign of it is, That the Shape of the Foot is like the Figure of an Elephant. All the reſt treat ſeparately of a *Leproſy* and an *Elephantia*, and make the latter to be a Swelling of the Feet, proceeding from Melancholly and Pituitous Blood, and the crooked Swelling of the Veins, whereby the Feet reſemble the Feet of an Elephant in Shape and Thickneſs: And this ſort of Tumour is often ſeen in Beggars who wander much. *Blanchard.*

ELEPHANTIASIS *Græcorum*, which the *Arabians* call a Leproſy: It is called alſo *Elephas*, *Elephantiaſis*, and *Elephantia*, from an Elephant, as ſome think, becauſe it makes People big like an Elephant, which is a fooliſh Notation of the Word; for the Body is no bigger, though the Diſeaſe be. Others think 'tis ſo called, becauſe the Diſtemper lying in the Legs, make them ſtiff and equal like an Elephant; or becauſe 'tis a ſtrong vehement Diſeaſe like an Elephant, with ſuch like Stuff. *Galen*, in his 14th Chapter of Tumours, ſays, that "This Diſeaſe is called a *Saturiaſmus* when firſt it "begins, becauſe it makes the Face like that of a "Satyr; for the Lips are thick, the Noſe ſwells, "the Ears Decay, the Jaws are red, the Foreherd "is ſet with Tumours like ſo many Horns." Though others think it is called *Saturiaſmus*, becauſe the Perſons afflicted are much inclined to Leachery at the beginning, as Satyrs are. *Celſus* deſcribes it thus: "The whole Body (ſays he) is ſo affect-"ed, that the very Bones may be ſaid to be cor-"rupted. The upper Parts of the Body are full "of Spots and Tumours, the Redneſs whereof is "gradually turned into Black: The Top of the "Skin is unequally thick, thin, hard, ſoft, rough, "as if it had Scales on it; the Body decays, the "Bones, Calves of the Legs, and Feet, ſwell. "When the Diſeaſe is old and inveterate, the Toes "and Fingers are hid in the Swelling, and a ſmall "Fever ariſes, which eaſily conſumes a Man "loaden with ſo many Infirmities. *Blanchard.*

ELEVATION *of a Mortar-piece or Gun*, is the Angle which the Chaſe of the Piece, or the Axis of the hollow Cylinder, makes with the Plane of the Horizon.

ELEVATION *of the Pole*, is the Heighth or Number of Degrees that the Pole, in any Latitude, is raiſed, or appears above the Horizon.

ELEVATION *of the Pole*, in Dyalling, is the Angle which the Style makes with Subſtylar Line.

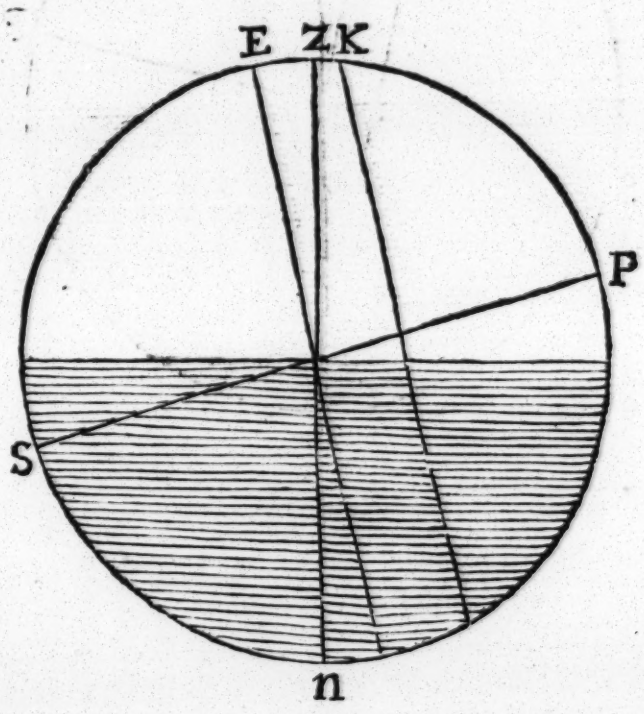
To find the Elevation *or Height of the Pole, having given the Declination and Meridian Altitude or Zenith Diſtance of the Sun or Star.*

Note, 1. If the Sun or Star have no Declination, the Zenith Diſtance is the Latitude or Heighth of the Pole; and if the Sun or Star come to the Meridian due North, the Latitude is Southerly; if it come to the Meridian South, the Latitude is Northerly.

2. If the Sun or Star be in the Zenith, the Declination is the Latitude; and if the Declination be Southerly, the Latitude is Southerly; but if the Declination be Northerly, the Latitude is Northerly.

Rule 1.

If the Declination be North or South, and the Meridian Altitude be the ſame way that the Declination is, the Difference between the Declination and Zenith Diſtance, is the Heighth of the Pole towards which the Declination is.

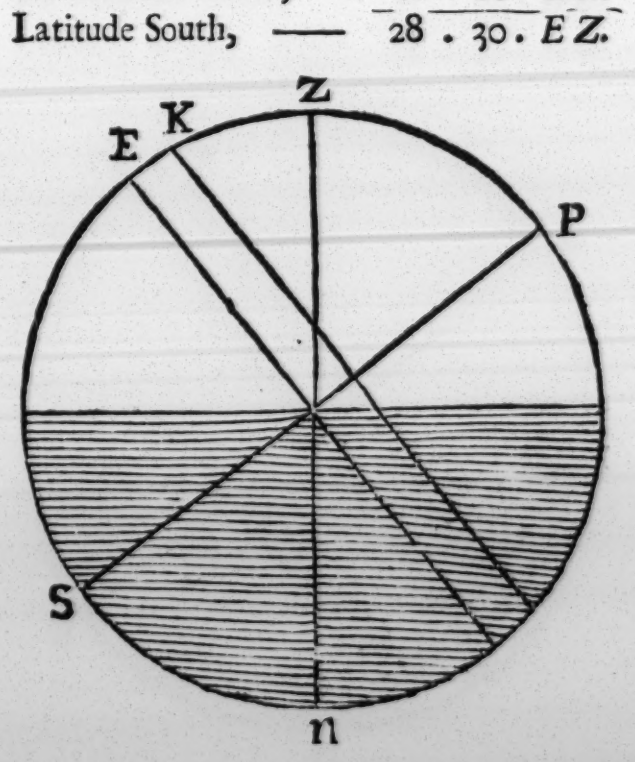


Example 1.

Declination North, —— 23°. 30′. *EK.*
Zenith Diſtance North, — 8 . 30 . *ZK.*
Latitude North, —— 15 . 00 . *EZ.*

But if the Declination be leſs than the Zenith-Diſtance, then the contrary Pole to the Declination is elevated: As,

Zenith Diſtance South, 48°. 30′. *ZK.*
Declination South, — 20 . 00 . *EK.*
Latitude South, —— 28 . 30 . *EZ.*



Example

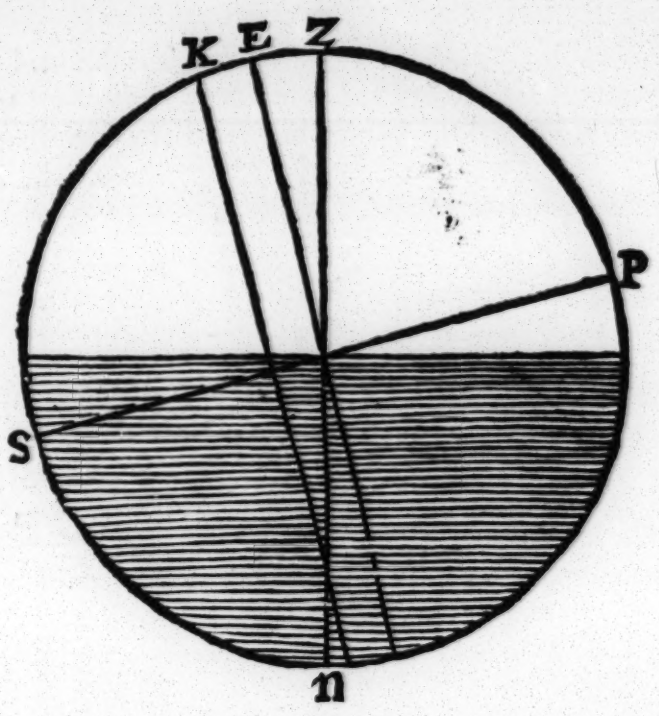
Example 2.

Zenith Distance North, 50°. 00′.
Declination North, — 15 . 00.

Latitude South, —— 35 . 00.

Rule 1.

If the Sun or Star's Declination be North or South, and the Zenith Distance be contrary to the Declination, the Sum of the Co-altitude and Declination is the *Heighth of that Pole* that the Declination is towards.



Example.

Zenith Distance South, 31°. 30′. *ZK.*
Declination North, — 20 . 00. *EK.*

Latitude North, —— 51 . 30. *ZE.*

Note, If the Declination be the same way that the Meridian Altitude is, and greater than the Meridian Altitude, then the Sun or Star may have two Meridian Altitudes in 24 Hours, *viz.* the one above the Pole, and the other below.

In such Case the Sum of the Co-declination and Altitude, is the *Heighth of the Pole* towards which the Declination is.

Example.

Declin. North 21°. 30′. its Compl. 68°. 30′.
Meridian Altitude North, —— 10 . 30.

Elevation of the North Pole, — 79 . 00.

But if the Meridian Altitude be greater than the Declination, then the Difference between the Zenith Distance and Co-declination, is the *Heighth of the Pole* towards which the Declination is.

Example.

Declination North, 22°. 30′.
Zenith Distance, — 10 . 30. North.

Latitude North, — 12 . 00.

Note, Which way soever the Meridian Altitude be, if the Meridian Altitude and twice the Co-declination be less than 180 Degrees, the Sun or Star hath two Meridian Altitudes in 24 Hours, and the Latitude is found by the 2d *Rule*.

Example.

Meridian Altitude South, — 77°. 00′.
Decl. 62°. 00′. North Compl. 28 . 00.

Sum, 133 . 00.

Which is less than 180°. 00′. Therefore,

Zenith Distance South, 13°. 00′.
Declination North, — 62 . 00.

Latitude North, — 75 . 00.

ELEVATOR, the same with *Elevatorium.*

ELEVATOR *Labii Inferioris*, is a Muscle which, with its Partner, lies within the lower Lip. They arise fleshy from the inferior Part of the Gums of the lower Jaw which belong to the *Dentes Incisorios*, and descend directly to their Implantations in the Inferior Part of the Skin of the Chin. Hence it is, when these act, they make divers Indentations in the Chin, as may be observed in living Persons, when the lower Lip is drawn upwards.

ELEVATOR *Labii Superioris*, is a Muscle which arises fleshy from the Fore-part of the *Os Quartum* of the upper Jaw, immediately above the *Elevator Labiorum*, and descends obliquely under the Skin of the upper Lip, joining with its Partner in a middle Line from the *Septum Narium*, to its Termination in the *Sphincter Labiorum*. Its Name shews its Use.

ELEVATOR *Labiorum*, is a Muscle which lies between the *Zygomaticus* and the *Elevator Labii Superioris Proprius*. It arises from the *Os Quartum* of the upper Jaw, and descends to its Insertion under the Termination of the . . . Its Name shews its Use.

ELEVATOR *Oculi*, is a Muscle of the Eye, called *Superbus* from its Moral Signification, it being one of the common Marks of a haughty Disposition to look high; wherefore its opposite Muscle is called *Humilis*. This Muscle arises sharp and fleshy near the Place where the *Optick Nerve* enters the *Orbit*; and becoming a fleshy Belly, makes a thin Tendon inserted to the *Tunica Sclerotis* on the Superior and Fore-part of the Bulb of the Eye under the *Adnata*.

ELEVATORES, or *Elevating Muscles*, are those that serve to draw the Parts of the Body upwards.

ELEVATORIUN, so called from the lifting up, is a Chyrurgeon's Instrument, wherewith Pieces of Sculls that are depressed are raised up again.

ELIXATION, is the boiling of any thing for a Medicinal Use in a proper Liquor, in order that the thing may impart its Vertue to the Liquor 'tis boiled in.

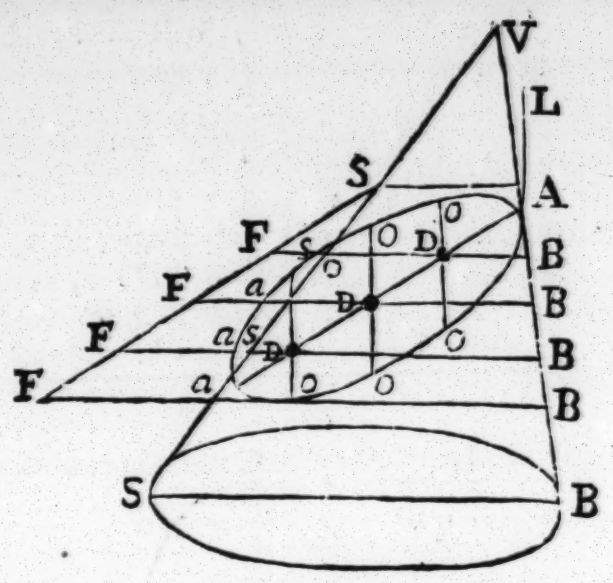
ELIXIR, the Chymist's Name for a very fine and useful Tincture; as *Elixir Proprietatis*, *Salutis*, &c.

ELIXIR *Proprietatis*, is a Tincture of Myrrh, Aloes and Saffron, drawn by Spirit of Wine and Spirit of Sulphur. This is *Paracelsus* his way, and, is really the best of any, though many others are prescribed.

ELLIPSIS, in Grammar, is that Figure whereby some Part of our Discourse is left out or retrenched: As in the Latin Expression *Paucis te volo*, in which Words *verbis alloqui* are left out. This Figure is very common in the Oriental Languages.

ELLIPSIS, in Geometry, is an Oval Figure; 'tis produced from the Section of a Cone by a Plane cutting both ſides of the Cone (but not parallel to the Baſe, for then it produces a Circle) and meeting with the Baſe produced, as *F D K E O* in the ſecond Figure following.

But firſt I will give you Dr. *Wallis*'s General and Geometrical Way of demonſtrating the General Property of the *Ellipſe*, and which he expreſſes thus.



PROP. I.

In the Ellipſe *the Squares of the Ordinates are equal to the Differences between two Rectangles, of which the Greater are as the Abſciſſæ; the Leſſer as the Squares of the Abſciſſæ.*

For,

1. The Squares of *D O* are = Rectangles *B D* × *D S* every where, becauſe *S B* is the Diameter of a Circle.

2. Drawing then *S F* parallel to *A a*, the *Latus Tranſverſum*, and producing the *B S*'s every where to *F*, the Lines *D S* will every where be = *D F* — *F S*, where the *D F*'s are all equal, becauſe *S F* parallel *A a*.

3. You will find alſo, That the Rectangles under *B D* and *D S* (= *D O q*) will be = to the Rectangle under *B D* and *D F*, deducting that under *B D* and *F S*: That is, *B D* × *D S* = *B D* + *D F* — *B D* × *F S*.

4. Alſo becauſe the *D F*'s are all equal, the Rectangle *B D F* will ſtill be as the *B D*'s; and thoſe *B D*'s, becauſe of the ſimilar Triangles *A D B*, will ſtill be as the *D A*'s, or the Abſciſſæ. Wherefore the Rectangles *B D F* will every where be as the Abſciſſæ *A O*; which is the Proof of the firſt Part.

5. But the Squares *B D* × *F S*, ſince both the *B D*'s and *F S*'s are every where as the *A D*'s, muſt be in a duplicate Ratio of, or as the Squares of the Abſciſſæ *A D*.

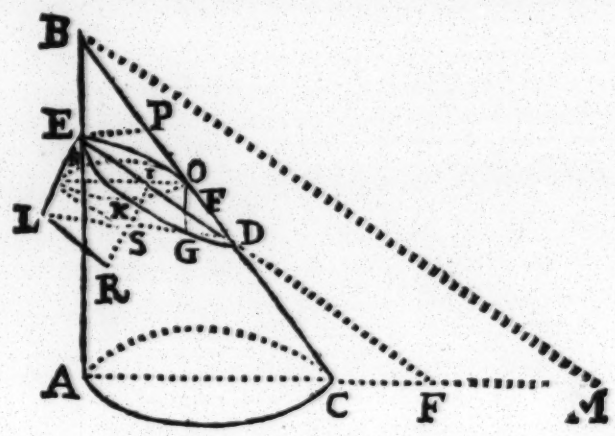
6. Wherefore, ſince the Square of the Ordinate *D O* (= *D B* × *D S*) is equal to *B D* × *D F* — *B D* × *F S* (*Prop.* 3.) the Propoſition is plain.

COROLLARY I.

Hence 'tis plain, That if you have the Right Lines *B D* and *D S*, you have the Ordinate *D O*, but *è contra*, becauſe the Lines *B D*, *D S* may vary infinitely, and yet make a Rectangle equal to *D O q*. Wherefore the Conick Writers thought to to determine the Ordinates another Way; for inſtead of *B D*, they took in the Section the Line *A D*, or the Abſciſſa; and inſtead of *A S* they ſubſtituted another imaginary Line, ſuppoſe *L A* (which they called the *Latus Rectum*) and ordered it ſo, that it ſhould be a fourth proportional reciprocally to the Lines *A S*, *B D* and *D A*: So that every where it ſhould be *B D* × *A S* = *D A* × *L A*, and conſequently the *Latus Rectum* = $\frac{BD}{AD} \times AS$, and $AS = \frac{DA}{BD} \times LA$.

PROP. II.

The Square of any Ordinate (I K) in the Ellipſis, *is equal to the Rectangle (I L) under the* Latus Rectum *(E L) and the Abſciſſa (E I) leſs, or abating out of it another Rectangle made by the ſame Abſciſſa (E D) and a fourth Proportional (R S) to the* Latus Tranſverſum, *the* Latus Rectum *(D E) and the Abſciſſa.*



Draw a Parallel to the Section, as *M B*, which note with *b*, and continue the Axis of the Section till it meet with the Diameter of the Baſe of the Cone produced in the Point *F*, and draw it on to *M*, and call *A M*, *c*.

Draw alſo the *Latus Primarium E P*, and parallel to it *N O* through any given Point, I: Call the Side of the Cone, in which the upper Vertex of the Section is, *a*. Let the Abſciſſa *E I* be noted with *e b*; and then (working by the ſimilar Triangles *B C A*, and *E I N*) according to the Rule of proportions, *N I* will be expreſſed in this Notation by *e c*. Let the produced part of the Baſe *M C* be called *d*; and the *Latus Tranſverſum*, or Tranſverſe Diameter *E D*, be called *o b*: Then will *I D* be = *o b* — *e b*.

Since the Triangles *B M C*, *D E P*, and *D E O* are all Similar, work for a fourth proportional to expreſs *E P*, and you will find it to be *o d*; and *I O* in this Notation (by the ſame Way of working) will be *o d* — *e d*.

Here alſo, as in the Parabola and Hyperbola, the Square *I K* = Right-angle *N I O*, which you will find in the *Ellipſis*, muſt be noted by *o e c d* — *e e c d*; as in the Hyperbola (you may ſee) 'tis *o e c d* + *e e c d*.

If therefore you divide *o e c d* — *e e c d* = the Square of the Ordinate *I K*, by *E I* the Abſciſſa in this Notation = *e b*, it will ſtand thus, $\frac{oecd - eecd}{eb}$, or $\frac{ocd - ecd}{b}$, which is equal to the Line *I S*, and which, with the Abſciſſa *E I* = *e b*, will make *E S* a Rectangle = to *I K* Square.

And if you work here to find the *Latus Rectum*, according to the Canon given in the Parabola, by ſaying, as *b* : *c* :: *o d* : $\frac{od\,c}{b}$, you will have $\frac{od\,c}{b}$ for

for the *Latus Rectum*, which you see is plainly one Part of the Line *I S*; and the other, *viz.* $\frac{e\,c\,d}{b}$, is a fourth Proportional to *b*, *c*, and *e d*; that is, in *Apollonius*'s way, to *o b* the *Latus Transversum*, $\frac{o\,c\,d}{b}$ the *Latus Rectum*, and *e b* the Abscissa, (for the same Quantity $\frac{e\,c\,d}{b}$ comes out both ways.)

Wherefore the Square of the *Applicate K I*, is equal to the Remainder of the Rectangle *I L*, contained under the *Latus Rectum* and Abscissa; when out of that Rectangle another is taken, which is made by the same Abscissa, and a fourth Proportional *R S* to the *Latus Transversum*, *Latus Rectum*, and the Abscissa. *Q. E. D.*

COROLLARIES.

1. Hence the Reason of the Name *Ellipsis* given to this Section is evident, because the Square of the Ordinate is less than, or defective of the Rectangle under the *Latus Rectum*, and the Abscissa.

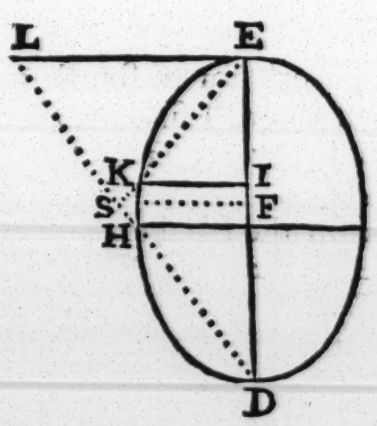
COROLLARY II.

The *Latus Rectum* here, as well as in the Parabola and Hyperbola, is found by making, As *b*, parallel to the Section: Is to *c*, the produced Diameter of the Base of the Cone :: So is *o d*, the *Latus Primarium*: To $\frac{o\,c\,d}{b}$, the *Latus Rectum E.L.*

And here, if the Quantity above and below the Line be multiplied by *b*, you will have $\frac{o\,c\,d\,b}{bb}$, a Quantity equal to the Former, but more agreeable to *Apollonius*'s Way of Expression, who gives this Canon for the *Latus Rectum*, As *b b* = the Square of the Parallel to the Section: Is to *c d* = to a Right-angle under the whole Base and the Part produced :: So is *o b* = *Latus Transversum*: To $\frac{o\,c\,d\,b}{bb}$ (or $\frac{o\,c\,d}{b}$) the *Latus Rectum*.

COROLLARY III.

Which *Latus Rectum* may be had Geometrically thus;



Having the Ordinate *K I*, and the Abscissa *E I*, find a third Proportional (*F H*) to *E I* and *K I* (= *E F*;) and then find a fourth Proportional to *I D*, (the Difference between the *Latus Transversum*, and the Abscissa) to the third Proportional *F H*, before found, and to the *Latus Transversum*; and then that fourth Proportional shall be the *Latus Rectum* sought, *L E*.

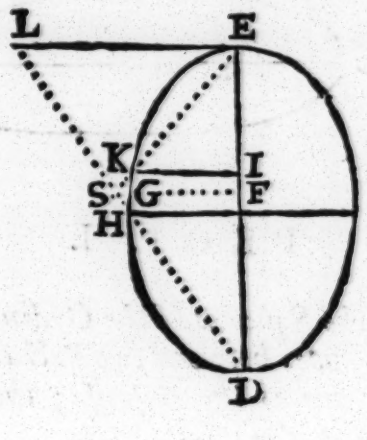
COROLLARY IV.

Hence may as many Points as you please, be found to draw an *Ellipsis*, whose *Latus Rectum* and *Transversum* are given, by giving Ordinates, and applying them to the Axis; Thus,

Take any Abscissa, as *E I*, and then make, As *D E* : *E L* :: So *D I* : *I S*. Then find a mean Proportional between this Fourth, *I S* and *E I*, which will be *I K*, the Ordinate sought, whose End *K*, when rightly applied, will always be in the Curve of the *Ellipsis*.

PROP. III.

In the Ellipsis *the Square of the Ordinates, K I, G F, are as the Rectangles D I E and D F E, made by the Lines lying between the Ordinates, and the Vertices of the* Latus Transversum.



Let *F F* be here called *i b*, as *E I* was before called *e b*; then it will be plain from what hath been said in the precedent Proposition, That the Square *G F*, the Ordinate will be in this Notation *o i c d* — *e i c d*. Also the Rectangle *D F E* will by multiplying *D F* (= *o b* — *i b*) by *F E* (= *ib*) be found to be *o i b b* — *i i b b*.

Now since, by *Prop.* 1. the Square *K I* = *o e c d* — *e e c d*, and here we have found the Square *G F* = *o i c d* — *e i c d*; it must needs be that the Square *K I* : Square *G F* :: *o e c d* — *e e c d*: *o i c d* — *e i c d*; that is, (dividing all by *c d*) as *o e* — *c e*, is to *o i* — *i i*.

But the Rectangle *D I E* : *D F E* :: *e e* — *e e*: *o i* — *i i* (for by bare Multiplication the Rectangle *D I E* will be found equal to *o e b b* — *e e b b*, and *D F E* was above found to be = *o i b b* — *i i b b*) which two Quantities divided by *b b*, will leave *o e* — *e e*, and *o i* — *i i*;) wherefore the Square *K I* : Square *G F* :: Rectangle *D I E*: Rectangle *D F E*. *Q. E. D.*

Which Proposition may be better expres'd thus.

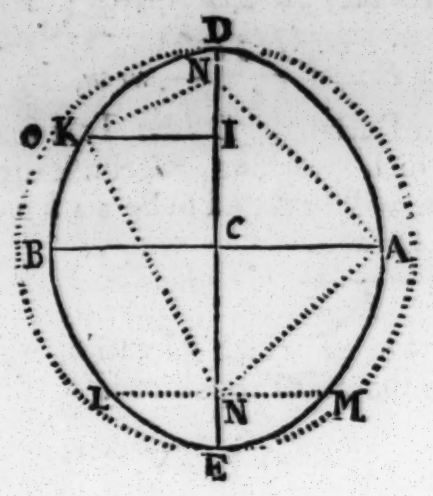
In an Ellipsis *the Squares of the Ordinates are as the Rectangles under the Segments of the Diameter, or Axis Transversus.*

Which is certainly true also in a *Circle*, where the Squares of the Ordinates are equal to such Rectangles, as being mean Proportionals between the Segments of the Diameter.

COROL-

COROLLARY I.

In any *Ellipsis*, draw an Ordinate as IK, and suppose the Focus to be in N, and the *Latus Rectum* LM applied in N at Right-angles to the Axis.



Then will the Square of $\frac{ocd}{2b}$ ($= \frac{1}{2}$ the *Latus Rectum*) = Square of LN be $= \frac{oo\,cc\,dd}{4bb}$. Wherefore by this Proposition, As Square IK : Square LN :: Rectangle DIE : Rectangle DNE; that is, $ooc\,d - eec\,d : \frac{oo\,cc\,dd}{4bb} :: oebb - eebb : \frac{oo\,cd}{4}$. Wherefore the Rectangle DNE; $= \frac{oo\,cd}{4}$.

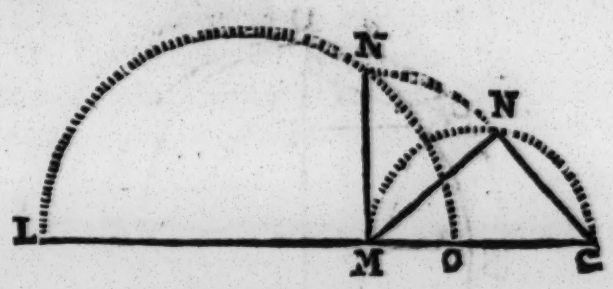
Now Rectangle DNE + the Square of CN = Square CE (by 5. *e.* 2. *Euclid*) and consequently CN Square = CE Square — Rectangle DNE: That is, $\frac{oo\,bb}{4} - \frac{oo\,cd}{4}$ (for $CE = \frac{1}{2}\,ob$.) And therefore CN, the Distance from the Center to the Focus, is equal to $\frac{\sqrt{:oo\,bb - oo\,cd}}{4}$.

COROLLARY II.

And from hence will arise this Canon for determining the Foci of an *Ellipsis* from the Square of half the *Latus Transversum*; Substract the fourth Part of the Figure (or $\frac{1}{2}$ of the Rectangle under the *Latus Rectum* and *Transversum*) and then extract the Square Root of the Remainder: That shall be the Distance of the Focus from the Center, and then substract that from half the *Latus Transversum*, and it gives EN the Distance of the Focus from the Vertex.

COROLLARY III.

Which Rule is very easy in Practice, for $\frac{oo\,bb}{4}$ is only the Square of CE (half the *Latus Transversum*) and $\frac{oo\,cd}{4}$ nothing but the Rectangle of $\frac{1}{4}$ DE into LM the *Latus Rectum* (for $\frac{ob}{4} \times \frac{ocd}{b} = \frac{oo\,cd}{4}$.)



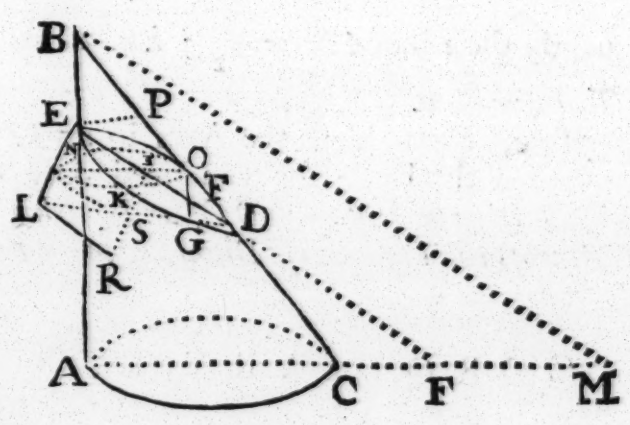
Wherefore find MN a mean Proportional between LM and $MO = \frac{1}{4}\,DE$;) then on CM ($= CE$) describe a Semi-circle, and in it apply MN, and then draw CN, which shall be the Distance of the Focus from the Center.

COROLLARY IV.

Since in *Cor.* 1. 'twas proved, that the Rectangle $DNE + CN$ Square = CE Square; that is, Rectangle $DNE = CE$ Square $- CN$ Square. Call CN Square, mm; and then will the Rectangle DNE = (CE Square) $\frac{oo\,bb}{4} - mm$: Which Notation, as one of the same Nature in the Hyperbola, will be of use hereafter.

PROP. IV.

In the Ellipsis, *The* Latus Rectum: *Is to the* Latus Transversum :: *As the Square of any Ordinate, IK: Is to the Rectangle DIE, made by the Lines intercepted between it and the Vertices of the* Latus Rectum.



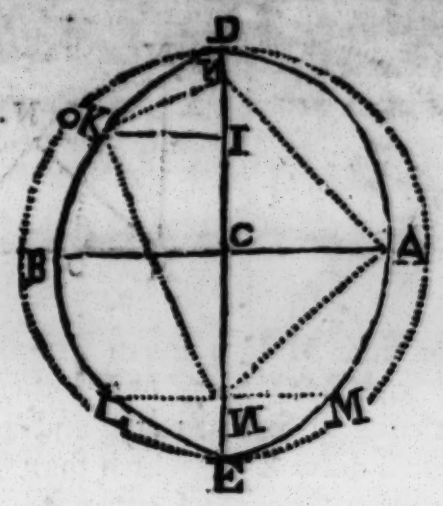
For the *Latus Rectum* is $\frac{ocd}{b}$, and the *Latus Transversum* ob; the Square of the Ordinate $oecd - eecd$, and the Rectangle DIE is $eobb - eeb$, IK is b, as hath been shewn in the former Propositions: Place therefore these four Quantities in the Form of Proportionals, *viz.*

As $\frac{ocd}{b} : ob :: oecd - eecd : oebb - eebb$.

And multiplying the Extreams and Means, you will find the same Quantity $ooebcd - oeebcd$ produced both ways, which shews they are truly proportional. *Q. E. D.*

COROLLARY I.

Wherefore, if the *Latus Rectum* and the *Axis Transversus* be given in the *Ellipsis*, 'tis easy to find the second Axe, by making, As $ob : \frac{ocd}{b} :: \frac{oo\,bb}{4}$ (= Rectangle DCE) : To $\frac{oo\,cd}{4}$ = Square AC.) Wherefore AC is known, and consequently its Double AB.



Whose Square muſt be $oocd$ = Rectangle of the *Latus Rectum* into the *Tranſverſum*; *i.e.* the Figure, as *Apollonius* calls it. Wherefore the *Axis Secundus*, and any Second Diameter, is a mean Proportional between the *Latus Rectum* and *Tranſverſum*; or to ſpeak with *Apollonius*, is *equal in Power to the Figure.*

COROLLARY II.

Since the Square of $AC = \frac{oocd}{4}$, and the Squ. of CN (the Diſtance of the Focus from the Center) $= \frac{oobb - oocd}{4}$, by *Corol.* 1. of *Prop.* 2. Put them into one Sum, and they will make $\frac{oobb}{4}$, which therefore muſt be equal to Square AN, and conſequently the Line $AN = \frac{ob}{2}$; *i. e.* to half the *Latus Tranſverſum.*

Wherefore, if you have the Axes in an *Ellipſis*, 'tis eaſy to find the Foci; for you need only *open the Compaſſes to the Diſtance DC, and ſetting one Foot in A, croſs the Tranſverſe Diameter in the Points N and N.*

COROLLARY III.

Since by *Cor.* 1. *Prop.* 2. the Rectangle DNE was proved equal to $\frac{oocd}{4}$, which, by *Cor.* preceding, $= AC\,q$, 'tis plain Rectangle $DNE = AC$ Square.

COROLLARY IV.

The Square of CE (= half the Tranſverſe Diameter) : Is to the Square of AC half the Diameter *ſecunda* :: As *Latus Tranſverſum* : To *Latus Rectum.* For $\frac{oobb}{4} : \frac{oocd}{4} :: oobb : oocd :: obb : ocd :: \frac{obb}{b} : \frac{ocd}{b} :: ob : \frac{ocd}{b}$; *i.e. Latus Tranſverſum, Latus Rectum.*

COROLLARY V.

Alſo ſince CE Square : AC Square :: ob : $\frac{ocd}{b}$; that is, by this *Prop.* As Rectangle DIE : Square IK. Therefore Square CE : Square AC :: Rectangle DIE : Square IK; that is alſo (by *Cor.* 3.) As Square CE : Rectangle DNE :: Rectangle DIE : Square IK.

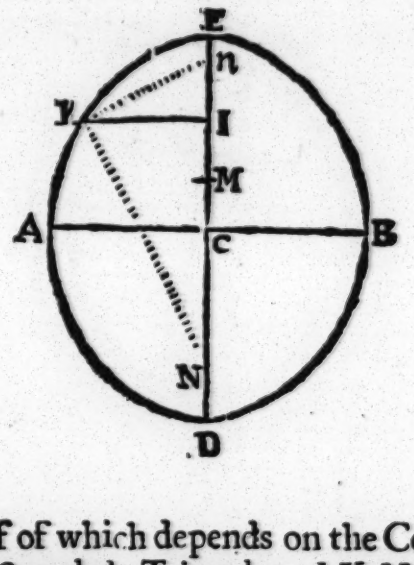
COROLLARY VI.

Wherefore there will be found a new and uſeful Way of expreſſing the Square of the Ordinate IK (which we found above in *Prop.* 1. was $oocd - eecd$) if you make, As CE Square $\left(= \frac{oobb}{4}\right)$: Rectangle $DNE = \left(\frac{oobb}{4} - mm\right.$, by *Corol.* 4. *Prop.* 2.) :: So Rectangle DIE: To a fourth Proportional; which working Algebraically by the *Rule of Three*, will be found to be $oebb - eebb - \frac{4emm}{o} \times \frac{4mmee}{oo}$

The Advantage of which Notation will ſufficiently appear in the next Propoſition.

PROP. V.

In the Ellipſis, *the Aggregate or Sum of the Right Lines KN and Kn, drawn from the ſame Point K, in the Curve of the* Ellipſis, *to both the Foci N and n, is always equal to the Tranſverſe Diameter or Axis DE.*



The Proof of which depends on the Conſideration, of the Rectangled Triangles IKN and IKn, where the Sides being given, the Hypothenuſes are eaſily had.

For if (as in *Cor.* 4. *Prop.* 2.) you call $CN = m$, then will m be $\frac{\surd : oobb - oocd}{4}$, and $IN = CI + CN = \frac{1}{2}ob - eb + m$; but In will be $= Cn - CI = m - \frac{1}{2}ob + eb$.

Wherefore the Square of $IN = \frac{1}{4}oobb - oebb + eebb + obm - 2ebm + mm$; and the Squ. of $In = \frac{1}{4}oobb - oebb + eebb - obm + 2ebm + mm$.

Now if to each of theſe Squares you add the Square of IK, which (by *Cor.* 6. of the precedent) was $oebb - eebb - \frac{4emm}{o} + \frac{4mmee}{oo}$, the Sum will be KN Square (or the Square of the Hypothenuſe) which is $= \frac{1}{4}oobb + obm + 2ebm + mm - \frac{4emm}{o} + \frac{4eemm}{oo}$.

And Square $Kn = \frac{1}{4}oobb - obm + 2ebm + mm - \frac{4emm}{o} \times \frac{4eem}{oo}$.

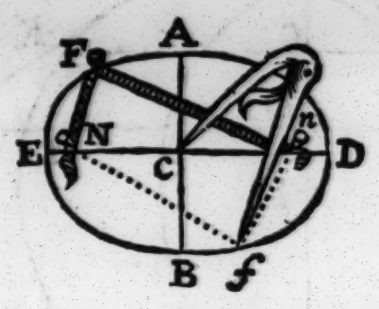
And conſequently extracting the Roots of thoſe Equations (which is very eaſy) you will have $KN = \frac{1}{2}ob + m - \frac{2em}{o}$, and $Kn = \frac{1}{2}ob - m + \frac{2em}{o}$.

Which

Which two added together, are manifeſtly equal to *o b* the Tranſverſe Diameter. *Q. E. D.*

COROLLARY I.

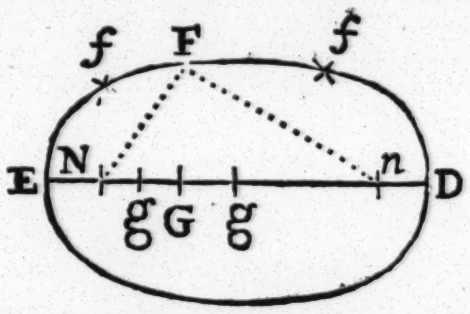
From whence ariſes the Reaſon of the *Ordinary Way* uſed by *Gardeners, &c.* to deſcribe *Ovals* or *Ellipſis*'s by two Pins in the *Tranſverſe Diameter* at *N* and *n*, and a String mov'd about them by another Pin,



as *F*; for by this Means the Point *F* will always be in the *Ellipſis*; and ſince a Circle is deſcribed by a String moving round one Pin placed in the Center, 'tis plain a Circle is an *Ellipſis*, whoſe Foci are coincident.

COROLLARY II.

Hence alſo 'tis eaſy to deſcribe an *Ellipſis* on a Plane *Geometrically*, by only *Scale* and *Compaſs*: For



having drawn the *Axis Tranſverſus D E*, and in it taken the Foci *n* and *N*; at a Diſtance, not more than half the Tranſverſe Axis, with the Compaſſes in *N* ſtrike an Ark, as *f*, and ſet the ſame Diſtance from *E* to *G*.

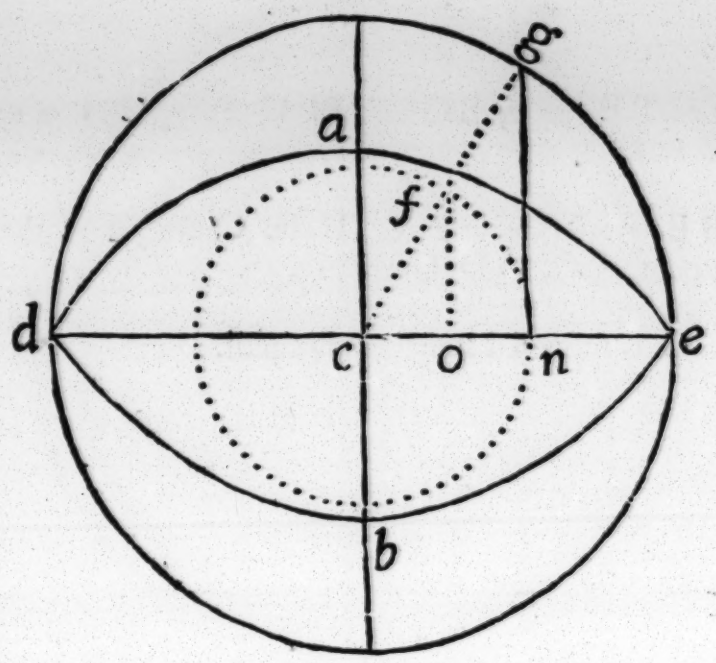
Then opening the Compaſſes to the remaining Diſtance *G D*, with one Foot in *n* croſs the Ark *f*, and that Point will be in the *Ellipſis*: And thus you may find as many Points as you pleaſe with all Readineſs imaginable.

ELLIPTICAL *Compaſſes*, is an Inſtrument made in Braſs, to draw at one Revolution of the Index, any *Ellipſis* or Oval.

ELLIPTICAL *Dyal*, is an Inſtrument made commonly of Braſs, with a Joint to fold together, and the Gnomons to fall flat, commodiouſly contrived to take little room in the Pocket. By it may be found the true Meridian, Hour of the Day, Riſing and Setting of the Sun, with ſeveral other Propoſitions of the Globe.

ELLIPTICAL *Space*, is the Area contained within the Curve of the *Ellipſis*.

The *Elliptical Space d a e b*: Is to a Circle deſcribed on the Tranſverſe Axe *d e* :: As the Conjugate Diameter, or *Axis Rectus a b* : Is to the Tranſverſe Axe *d e*.



Draw *f o*, *g n* perpendicular to *C e*.

Then will *f o* : *f c* :: *g n* : *g c*.
And therefore *f o* : *g n* :: *f c* : *g c*.
:: *a c* : *c e*.
:: *a b* : *d e*.

But this Proportion of *f o* : *g n* :: *a b* : *d e* will be true, whereever the Perpendiculars *f o* and *g n* are drawn; that is, of all the Indiviſible of the outer Circle and *Ellipſis*: Wherefore the Plane *Spaces* made out of them, muſt, in the whole, be in the ſame Proportion to one another: That is, the *Ellipſis* to the Circle, is as the Conjugate *a b*, to the Tranſverſe Diameter *d c*. *Q. E. D.*

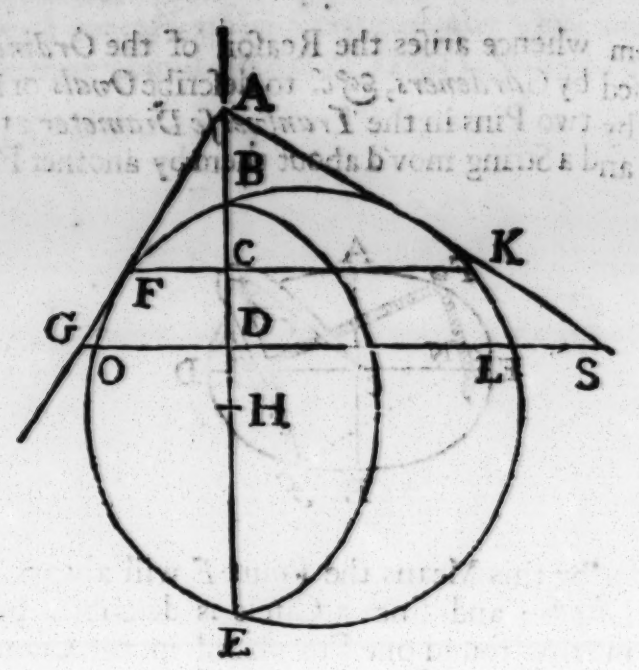
COROLLARY I.

Wherefore the *Quadrature* of the *Ellipſis* will be had, when that of the Citcle is found, and *vice verſa*.

COROLLARY II.

The *Ellipſis* is a mean Proportional between the greater and leſſer Circle; For a Circle, or any ſimilar Figure on *a b*: will be to one of the ſame Kind on *d e* :: As *a b* : To a third Proportional; *i.e.* As the *Ellipſis* : Is to the greater Circle :: So is the leſſer Circle : To it, *viz.* as *a b* to *d e*.

The Inveſtigation of the Tangent to the Ellipſe.



Let BE $= q$, BC $= x$, FC $= y$, CD $= n$, AC $= t$.

BE the Tranſverſe Ax, H the Center, FA the Tangent, FC, OD Ordinates.

CD is ſuppoſed indefinitely ſmall.

$AC^q : FC^q :: AD^q : GD^q$,	By Similar Triangles,
But $GD^q = OD^q$,	Becauſe CD is indefinitely ſmall.
Wherefore $AC^q : FC^q :: AD^q : OD^q$.	
But $FC^q : OD^q :: EC \times BC : ED \times BD$,	By the Curve's Property.
Therefore $AC^q : AD^q :: EC \times BC : ED \times BD$,	By Equality of Proportion.
$\parallel \quad \parallel \quad \parallel \quad \parallel$	

$t^2 : t^2 + 2tn + n^2 :: qx - xx : qx - x^2 + qn - 2nx - n^2$	The laſt Step in Symbols.
Wherefore $t^2\,qn - 2nxt^2 - n^2t^2 = 2tnqx - 2tnx^2 + n^2\,qx - nnxx$	By forming an Equation, and caſting off the Terms common on both Sides.
Therefore $t^2\,q - 2xt^2 - nt^2 = 2tqx - 2tx^2 + nqx + nx^2$	By dividing all by n.
And conſequently $t^2\,q - 2xt^2 = 2t\,q\,x - 2t\,x^2$	Caſting off n, or putting $n = 0$.
Wherefore $tq - 2xt = 2qx - 2xx$	By dividing all by t.
And therefore $t = \frac{2qx - 2xx}{q - 2x}$. *Q. E. I.*	By dividing by $q - 2x$.

PROPOSITION. I.

I ſay, **AC : CE :: AC : CH.**

$t : 2q - 2x :: x : q - 2x$	By the laſt Equation reſolv'd into an Analogy.
Wherefore $t : q - x :: x : \frac{q}{2} - x$	By dividing the ſecond and fourth Term by 2.
$\parallel \quad \parallel \quad \parallel \quad \parallel$	
AC : CE :: BC :: CH. *Q. E. I.*	

PROP.

PROPOSITION II.

I say, $\boxed{HC : HB :: HB : HA}$

$\frac{q}{2} - x : x :: q - x : t$ — By the laſt Step of the laſt Propoſition.

Wherefore $\frac{q}{2} - x : x :: q - x : \frac{2qx - 2xx}{q - 2x}$ — By Subſtituting the Value of t.

And therefore $\frac{q}{2} - x : \frac{q}{2} - x + x ::$
$q - x : q - x + \frac{2qx - 2xx}{q - 2x}$ } By Compounding.

That is, $\frac{q}{2} - x : \frac{q}{2} :: q - x : \frac{q^2 - qx}{q - 2x}$ — By caſting off Contradictories.

Or, $\frac{q}{2} - x : \frac{q}{2} :: q - x : \frac{q2}{q - 2x} - \frac{qxx}{q - 2}$ — By expreſſing the laſt Term in two Parts.

But $q - x : q - x + x :: \frac{q^2}{q - 2x} - \frac{qx}{q - 2x}$
$: \frac{q^2}{q - 2x} - \frac{qx}{q - 2x} + \frac{qx}{q - 2x}$ } By compounding the two laſt Terms.

That is, $q - x : q :: \frac{q^2}{q - 2x} - \frac{qx}{q - 2x}$
$\frac{q^2}{q - 2x}$ } Caſting off Contradictories.

But $q - x : \frac{q^2 - qx}{q - 2x} :: \frac{q}{2} - x : \frac{q}{2}$ — By a Step before.

Wherefore $\frac{q}{2} - x : \frac{q}{2} :: q : \frac{q^2}{q - 2x}$ — By Equality of Proportion.

And conſequently, $\frac{q}{2} - x : \frac{q}{2} :: \frac{q}{2} : \frac{q^2}{2q - 4x}$ — By Dividing the two laſt Terms by 2.

HC : HB :: HB : HA

Sir *Iſ. Newton Prop.* XI. *Prob.* 6. of *Princip. Philoſoph. Mathemat.* demonſtrates, That if any Body revolve round another in an Ellipſis, the Centripetal Force or Gravity of it will be in a Duplicate Ratio, or as the Square of its Diſtance from the *Umbilicus* or *Focus*.

ELMINTHES, or *Helminthes*, are little Worms bred in the Guts; eſpecially that called *Rectum*, or the Lowermoſt, the Strait or Great Gut.

ELODES, or *Helodes*, a ſort of Fever accompanied with a violent and perpetual Sweating.

ELONGATION, in Aſtronomy, ſignifies the Removal of a Planet to the furtheſt Diſtance it can be from the Sun, as it appears to an Eye placed on the Earth; but this is moſt commonly taken notice of in *Venus* and *Mercury*.

The utmoſt Elongation of *Venus* can be but 45 Degrees, and that of *Mercury* but of 30 Degrees; which is the Reaſon this Planet is ſo rarely ſeen.

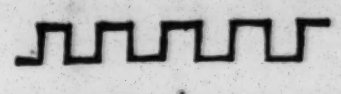
ELONGATION, in Chirurgery, is an imperfect Luxation, occaſioned by the ſtretching or lengthening of the Ligaments of any Joint. *Blanchard.*

ELOPEMENT, is when a married Woman departs from her Huſband and dwells with an Adulterer; for which, without voluntary Reconcilement to the Huſband, ſhe ſhall loſe her *Dowry*; nor ſhall the Huſband in ſuch caſe be compelled to allow her any *Alimony*.

ELYTHROIDES, or *Vaginalis*, is a ſecond proper Tunick which immediately involves the *Teſtes*.

EMANCIPATION, a Term in the *Roman* Law, ſignifying the ſetting free of a Son from the Subjection of his Father; which was ſo hard by the *Roman* Law, that (they ſay) before a Son could be releaſed from ſuch Subjection, he ſhould be ſold (imaginarily) three times by his natural Father to another Man; and this Perſon the Lawyers called *Pater Fiduciarius*, a Father in Truſt; after this he was to be bought again by the natural Father, and then on his manumitting of him he became Free. Now they called this imaginary Sale *Mancipatio*, and conſequently, the ſetting of any Perſon free from it, *Emancipation*. *Blount.*

EMBATTELED, or *Crenelle*, a Term in Heraldry, when the Out-line of any *Ordinary* is of this Figure,



which represents the Battlements of a Wall or Castle.

EMBLEMENTS (in Law) are the Profits of Lands which have been sowed; but sometimes it is taken more largely, for any Profits that arise and grow naturally from the Ground, as Grass, Fruit, Hemp, &c. If the Tenant for Life sow the Land, and afterwards die, the Executor of the Tenant for Life shall have the *Emblements*, and not he in Reversion: But if a Tenant for Years sow the Lands, and before he hath reaped his Term expires, there the Lessor, or he in Reversion, shall have the *Emblements*.

EMBOLISM, is the Excess of the *Solar Year* above the *Lunar*, whereby the *Lunations* happen every subsequent Year, eleven Days sooner than in the foregoing; which, when they amount to thirty Days, make a new Month, called the *Emboliſmical Lunation* or *Emboliſmatical Month*; which must be added, to make the common *Lunar Year* equal to the *Solar*.

EMBOLUS, is the Sucker of a Pump or Syringe; which, when the Pipe of the Syringe is close stopt, can't be drawn up, but with the greatest Difficulty; and when forced up by main Strength, will, on being let go, return again with great Violence.

The *Aristotelians* attribute this Effect to the common Notion of Nature's Abhorrence of a *Vacuum*. But Mr. *Boyle* found, that in his exhausted Receiver the Sucker would be as easily drawn up, tho' the Orifice of the Pipe were close stopt, as it would be when open in the common Air. From whence it seems plain, that the Difficulty of drawing back this *Embolus* or Sucker, when the End of the Syringe is stopt, arises from the Pressure of the Atmosphere on the external End of the Sucker; which having at the other End no *Counter-pressure*, nor Spring of the Air to balance it, must press with all its Weight and keep down the Sucker; but when by pumping the Air out of the Receiver, this Pressure, or its equivalent Spring of the Air is taken away, there is nothing to keep down the Sucker, and so it may be easily drawn up. He found also, That when the Sucker could *in vacuo* thus easily be drawn back, yet on the Re-admission of the Air it would be forc'd in again, and raise along with it a considerable Weight, which was suspended at the external End of the Sucker. *Vid. Continuation of Physico-Mechan. Exp.* Part 1.

EMBRACEUR, or *Embrasour*, (in Law) is he that when a Matter is in Trial between Party and Party, comes to the Bar with one of the Parties (having received some Reward so to do) and speaks in the Case, or privily labours the Jury, or stands there to over-look and survey them, thereby to put them in Fears and Doubt of the Matter, the Penalty whereof is 20 *l.* and Imprisonment at the Justice's Discretion. But Persons learned in the Law may speak in the Case of their Clients.

EMBRASURE, in Architecture, is the Enlargement made in the Walls, to give more Light and greater Convenience to the Windows and Doors of a Building.

EMBRASURES, in Fortification, are the Holes in a Parapet, through which the Cannons are pointed to Fire into the Moat or Field: They are generally 12 Foot distance from one another; every one of them being from 6 to 7 Foot wide without, and about 3 within; their Height above the Platform is 3 Foot on that Side toward the Town, and a Foot and a half on the other Side toward the Field, that so the Muzzle may be sunk on occasion, and the Piece brought to shoot low.

EMBROCATION, (from ἐμβρέχω; *Irrigation*, or Wetting) is a kind of Fomentation, wherein the fomenting Liquor is let distil, drop by drop, or very slowly, upon the Part of the Body to be fomented.

EMBRYO, is the *Fœtus* in the Womb of the Mother, before its Members come to be distinctly form'd.

EMBRYOTHLASTES, an Instrument with which Chirurgeons break the Bones of a dead Child, that it may be the more easily taken out of the Womb.

EMBRYOTOMY, the Anatomical Dissection of an *Embryo* or *Fœtus*.

EMBRYULCUS, an Iron Hook with which Chirurgeons pull a dead *Fœtus* out of the Mother's Womb.

EMERGENT, the same with *Emersion*.

EMERSION, in Astronomy, is the Time when any Planet that is eclipsed begins to *emerge* or get out of the Shadow of the eclipsing Body. When any Body also, lighter in Specie than Water, being thrust violently down into it, rises again, 'tis said to *emerge* out of the Water; and this is the most proper Signification of the Word.

EMETICK, or *Vomitive Medicines*, are those which with their pungent Particles contract the Fibres of the Stomach upwards, and so eject at the Mouth whatsoever is offensive to the Stomach, as is the commonly received Notion. But Dr. *Purcel*, in his Book of *Vapours*, *p.* 39. supposes that Vomiting is caused by Salts, which prick and corrode the Nerves of the Stomach, from whence the Spirits flow to the Brain in great quantity; and either by the Proximity of the Origin of those Nerves, or by the Angle of Incidence, they are forced into the Nerves belonging to the Diaphragm, and the Muscles of the lower Belly; both which contracting themselves, squeeze the Stomach into a less compass, and so make it eject its Contents: and though some part of the Matter may go downwards by the *Pylorus*, yet the far greater Quantity must go upwards, because when the Diaphragm is contracted, it forces down the Liver, and makes it compress the *Pylorus*, and hinder any Thing from passing out that way; and this Account he confirms by the Experiments of Dr. *Chirac*, an eminent Anatomist at *Montpellier* in *France*, and of his own made upon Dogs, above twenty times: And how he solves the Difficulty of the Muscles of the Diaphragm, and of the Abdomen contracting themselves both at the same time, when they are really Antagonists to one another, you will see in his Book, *p.* 43.

EMETICK *Tartar*, is only Cream or Crystal of Tartar powder'd and mix'd with a quarter part of *Crocus Metallorum*, and then the Mixture is boiled in an earthen Pan in a sufficient Quantity of Water, for about 8 or 9 Hours: It must be stirred about continually, and new Water put in as the Former boils away. The hot Liquor at last is strained through a woolen Cloth, and then about half of it is gently evaporated; the rest is set to cool; and it will shoot into Crystals. 'Tis a fine, gentle, yet certain Vomitive. The Dose from 3 or 4 Grains to 10 or 12.

EMMENAGOGUES, are Medicines which excite the Menses.

EMMOTON, is a Liquid Medicine which is injected into Ulcers.

EMOLLIENTIA, softning Things, are such as with a moderate Heat and Moisture dissolve those Parts which before cohered close; and dissipating others, make them loose and soft.

EMPALEMENT, according to our Learned Dr. *Grew*, is the outmoſt Part of the Flower of a Plant encompaſſing the Foliation of the Attire: 'Tis compounded of the three general Parts of all Plants, the Skin, the Cortical, and the Ligneous Bodies, each Empaler being (whether conſiſting of one or more Pieces) as another Leaf, and is deſigned to be a Guard and a Band to the Flower where it is weak and tender; and therefore ſuch Plants as have Flowers with a firm and ſtrong Baſis, as Tulips, &c. have no Empalement, nor need any.

EMPANEL, in Law, ſignifies the Writing and Entring the Names of a Jury into a Parchment Schedule or Roll of Paper by the Sheriff, which he hath ſummon'd to appear for the Performance of ſuch publick Service as Juries are employ'd in.

EMPARLANCE, in Common Law, ſignifies a Deſire or Petition in Court of a Day, to pauſe what is beſt to do: And 'tis called by the Civilians *Petitionem induciarum.*

EMPASMA, the ſame with *Catapaſma.*

EMPATTEMENT, according to ſome, is the ſame with *Talus* in Fortification; which ſee.

EMPERICKS, are the ſame with Mountebanks, or bold ignorant Pretenders to the Practice of Phyſick. However *Emperical* Medicines, as ſome are pleaſed to call the very beſt in Uſe, are by no Means totally to be ſlighted, nor that Practice of this Art, which is built on Experience, to be condemn'd; but only the daring Attempts of ſuch ignorant Pretenders as are no way qualify'd to judge of the Symptoms of a Diſeaſe, nor the peculiar Circumſtances of their Patient's Temper and State of Body.

EMPHATICAL, is uſed in two Senſes; when any thing is ſpoken with great Earneſtneſs and Emotion of Mind, we ſay, 'twas ſpoken very *Emphatically*, or with a great *Emphaſis*. 'Tis uſed alſo by the old Natural Philoſophers for thoſe *Apparent* Colours (as they would call them) which are often ſeen in Clouds before the Riſing, or after the Setting of the Sun, or thoſe in the Rain-bow, &c.

And theſe, becauſe they are not permanent or laſting, they will not allow to be true Colours: But ſince theſe *Emphatical Colours* are Light, modified chiefly by Refraction, and with a Concurrence of Reflections, and ſome other accidental Variations; and being the proper Objects of Sight, and capable as truly to affect it as other permament Colours are, there is no reaſon for excluding them from the Number of true and genuine Colours, ſince all other Colours are only Modifications of Light as theſe are.

EMPHRACTICK, the ſame with *Emplattomena*, or *Emplaſticks.*

EMPHRAXIS, is an Obſtruction in any Part.

EMPHYSEMA, is an Inflammation or a windy Swelling or Blowing up any Part of the Body. *Blanchard.*

EMPHYTON *Thermon*, or *Calor Innatus*, is the innate Heat, or Heat firſt ſuppoſed to be produc'd in the Fœtus from the Parent's Semen, which afterwards, when Reſpiration is begun, and the Fœtus ſubſiſts of it ſelf, decays forſooth, by Degrees. Many Philoſophers and Phyſicians call this Heat an *innate* or *native Spirit*, and ſay that it conſiſts of three Parts, of a *primogenial Moiſture*, an *innate Spirit*, and *Heat*. Whence *Fernelius* defines *innate Heat* to be a *grimogenial Moiſture every way qualified with an innate Spirit and Heat*. Blanchard.

EMPIRICAL *Medicine*, now-a-days called *Quacking*, is a practiſing Phyſick, without enquiring either into the Nature of the Diſeaſe, or of the Medicines employed to cure them; but depending ſolely on the Authority of experienc'd Medicines, which are uſually apply'd too univerſally, in all Caſes and Circumſtances alike. *Acron Agrigentinus* was the firſt Author of it, who neglecting the Reaſons of Things, contented himſelf with bare Experience.

Quacks firſt flouriſhed amongſt the *Egyptians*; from this Trade came *Mountebanks*; and thoſe that now practice Phyſick after this bold and heedleſs rate, are called *Empericks.*

EMPLASTRUM, a Plaiſter, is a Medicine applied outwardly to the Skin, ſpread upon Linnen or Leather: It is commonly made of Oils, or of thoſe Things which are of a like Conſiſtence with Oil; as Swine's-greaſe, Butter, ſlimy, viſcous Extractions from Gums, Roots, &c. Alſo of Powder and Wax, are theſe Things which are of a like Conſiſtence with Wax, as Roſin, Pitch, Gum, &c. The Maſs whereof being yet hot, is formed into a *Cylindrical* Figure. *Blanchard.*

EMPLASTICKS, } are Salves which ſo
EMPLATTOMENA, } conſtipate and ſhut up the Pores of the Body, that Sulphurous Vapours cannot paſs. *Blanchard.*

EMPNEUMATOSIS, is an alternate Dilatation of the Thorax, whereby the external Air is continually breathed in, and by the Wind-pipe and the Lungs, is communicated to the Blood to accend it. *Blanchard.*

EMPORIUM, is often uſed for the *common Senſory* in the Brain.

EMPROSTHOTONUS, is a continual Contraction of the Muſcles of the Neck towards the Foreparts. *Blanchard.*

EMPYEMA, properly ſo called, is a Collection of purulent Matter in the Cavity of the *Thorax*; but largely taken, ſignifies the ſame in the *Abdomen* too. *Blanchard.*

EMPYREUMATA, are little Feveriſh Remains after a *Criſis*; alſo that thick viſcous Matter which ſubſides to the Bottom in diſtilled Waters. *Empyreuma* ſignifies alſo that Taſte and Smell of the Fire which in Diſtillations affects ſome Oils, Spirits and Waters, by reaſon of their being drawn off by too great a Degree of Heat.

EMRODS: See *Hæmorrhoids.*

EMULGENT *Veſſels*, are the two large Arteries and Veins which ſpring, the Former from the deſcending Trunk of the *Aorta* or great Artery, the Latter from the *Vena Cava.* They are both inſerted into the Kidneys, and the *Emulgent Arteries* carry the Blood (with the *Serum*) to them, and the *Emulgent Veins* bring it back again after the *Serum* is ſeparated from it by the Kidneys.

EMULSION, is a Liquid Medicine to be taken inwardly, of the Form and Colour of Milk, whence comes its Name (*Quaſi Lacmentiens.*)

EMUNCTORIES, are the Cavities into which the Excrements of an Animal Body are emptied, as the pituitous Humour of the Brain, into the Noſtrils; the yellow thickiſh Humour, which we call Ear-wax, into the Ears; the Excrements, into the Bowels; the Urine, into the Bladder, &c.

ENÆMON, is a Medicine which ſtops the Blood, or which, by binding, cooling or drying, cloſes the Paſſages of the Veſſels which were open; ſtops or diminiſhes the Fluidity and violent Motion of the Blood. *Blanchard*

ENÆOREMA, is that Craſs Subſtance which is ſuſpended in the Middle of the Urines, call'd the *Hypoſtaſis Urinæ. Blanchard.*

ENALLAGE, a Figure in Grammar, whereby there is a Change either of a Pronoun, as when a Poſſeſſive is put for a Relative, as *Suus* for *Ejus*; or

of a Verb, when one *Mood* or *Tense* is put for another, &c.

ENALURON, the Term in Heraldry for a Bordure charged with *Martlets*, or any Kind of Birds: Thus they say, he beareth *Argent*, a *Bordure Azure*, charged with an *Enaluron of Martlets*; meaning, that there are *Martlets* all round the *Bordure*.

ENARTHROSIS, is (in Anatomy) a kind of Jointing, when the Cavity that receives it is deep, and the Head of the Bone that is inserted is oblong, as may be seen in the Huckle-bone and its Cavity; in the principal Bone of that Part of the Foot which immediately succeeds the Leg, with the Bone call'd *Cymbiforme*.

ENCATHIS, or *Encanthis*, is the *Caruncula Lacrymalis*; which see.

ENCAUMA, or *Epicauma*, is a deep, hard, and crusty Ulcer of the Eye. *Blanchard.*

ENCIENTE a *French* Term, in Fortification, signifying the whole Enclosure, Circumference, or Compass of a Fortified Place, whether composed of Bastions or not

ENCEPHALOS, is whatsoever is within the Compass of the Skull, as the Brain, the *Cerebellum*, the *Medulla Oblongata*, &c.

ENCHARAXIS: See *Scarificatio.*

ENCHEIRESIS *Anatomica*, is a Readiness in Dissections, when an Anatomist shews the Parts of a Body dexterously and expeditiously.

ENCHYMONA, is an Afflux of the Blood, whereby the external Parts are render'd black and blue; as in the Scurvy, Blood-shot Eyes, &c. Also an Afflux of the Blood by the Quickness and Suddenness of its Motion, as in Anger and Joy. *Blanchard.*

ENCHYTA, or *Infundibulum*, is an Instrument wherewith Liquids are instilled into the Eyes, Nostrils and Ears.

ENCHYSMA, the same with *Clyster.*

ENCOPE, is an Incision of any Part, as in a Gangrene, &c.

ENCRANIUM, the same with *Cerebellum.*

ENCROACHMENT, or *Accroachment*, in Common Law, signifies an unlawful gaining upon the Right or Possessions of another.

END *for End:* When a Cable, Hawser or other Rope of a Ship is run clear off from the Block or Place it was wound about, they say at Sea, *'Tis run out End for End.*

ENDECAGON; a plain Figure in Geometry, of eleven Sides and Angles.

ENDEIXIS, is an Indication of Diseases, whereby is shewn what is to be done: As for Example, a *Plethora*, or too great Fulness of Blood, indicates the opening of a Vein. *Blanchard.*

ENDEMICAL, *Endemial*, or *Endemious Disease*, is what some call *Morbus Vernaculus*, & *Communis*; that is, a Disease which always infects a great many in the same Countrey, proceeding from some Cause peculiar to the Countrey where it reigns: Such is the Scurvy to the *Hollanders*; intermitting Fevers to the Inhabitants of our Submarine and Marshy Places, &c.

ENDITEMENT, or *Indictment*, in Common Law, is the same with *Accusatio* in the Civil Law, tho' in some Points it differs. It may be thus defined: An *Indictment* is a Bill or Declaration made in Form of Law (for the Benefit of the Commonwealth) exhibited as an Accusation of one for some Offence, either Criminal or Penal, unto Jurors, and by their Verdict found and presented to be true, before an Officer, having Power to punish the same Offence. It is always at the Suit of the King, and differs from an Accusation in this, that the *Preferrer* is no way tied to the Proof thereof, upon any Penalty, if it be not proved, except there appear Conspiracy.

ENDORSE, a Term in Heraldry, signifying the $\frac{1}{3}$ Part of a *Pale*; and some say it is not used but when the *Pale* is between two of them; but this *Guillim* finds fault with as too bold a Saying.

He beareth *Or*, an Endorse Gules.

ENDORSED, when two Lions are born rampant, and turning their Backs to each other, the Heralds say they are *Endorsed*; but if their Faces be towards each other, they call it *Combatant.*

ENDOWMENT, signifies the giving or assuming of a Dower to a Woman; also the setting or severing of a sufficient Portion for a Vicar towards his perpetual Maintenance when the Benefice is appropriated; and such a Vicarage is called a *Vicarage Endow'd.*

ENDOWMENT *de la plus belle part*, is where a Man dying, seized of some Lands holden in Knight's Service, and other some in Soccage, the Widow is sped of her Dower, rather in the Soccage Lands, than those holden in Knight's Service, as being *le plus belle part*, the fairer Part.

ENEMA, the same with *Clyster.*

ENERGETICAL *Bodies* or *Particles*, are such as are eminently active, and which produce manifest Operations of various Natures, according to the various Circumstances and Motions of such Bodies or Particles.

ENERGY, in a Medicinal Sense, is an Agitation or Operation of the Animal Spirits and Blood.

ENFANS *Perdans*, the same with *Forlorn Hope* in an Army; which see.

ENFILADE, in Fortification, signifies a Situation of Ground which discovers a Post according to the whole Length of a Right Line, so that it can be scoured with the Cannon, and rendred almost Defenceless: Wherefore to

ENFILE or *Enfilade* the Curtain or Rampart, is to sweep the whole Length of it with the Cannon.

ENFRANCHISE, to make Free, to incorporate a Man into a Society or Body-politick, or to make one a Free *Denizon.*

ENGINE, in the general, is any Mechanick Instrument composed of Wheels, Screws of Pulleys, in order to lift, cast, or sustain any Weight, or to produce any considerable Effect which cannot so easily be obtained by the bare Application of Men's Hands without such help; such as Warlike *Engines*, *Engines* to raise Water, Cranes, &c.

And here I think it proper to give the Reader a Description of two very useful *Engines*, which are the Invention of one of our own Nation, *Thomas Savery*, Esq; a Gentleman very skilful in all Things of this Nature, and now Treasurer to the Sick and Wounded Office.

The First is an *Engine* to row Ships and Boats at Sea, or in a River, when there is a stark Calm or very little Wind.

A Description of this the Inventor published in the Year 1698, with his Answers to the Objections raised against it by Mr. *Dummer*, and others: And the Thought is so natural, and the Manner of its working so plain and easy, that 'tis an amazing thing to one that there is no more use made of it.

He fits a Wheel to the Drum-head of the Capstan, whose Teeth turn a Trundle-head; through which is run an Iron Bar that reaches clear a-cross, and goes through the Sides of the Ship: and on its Ends, without Board, at a convenient Distance from the Ship's

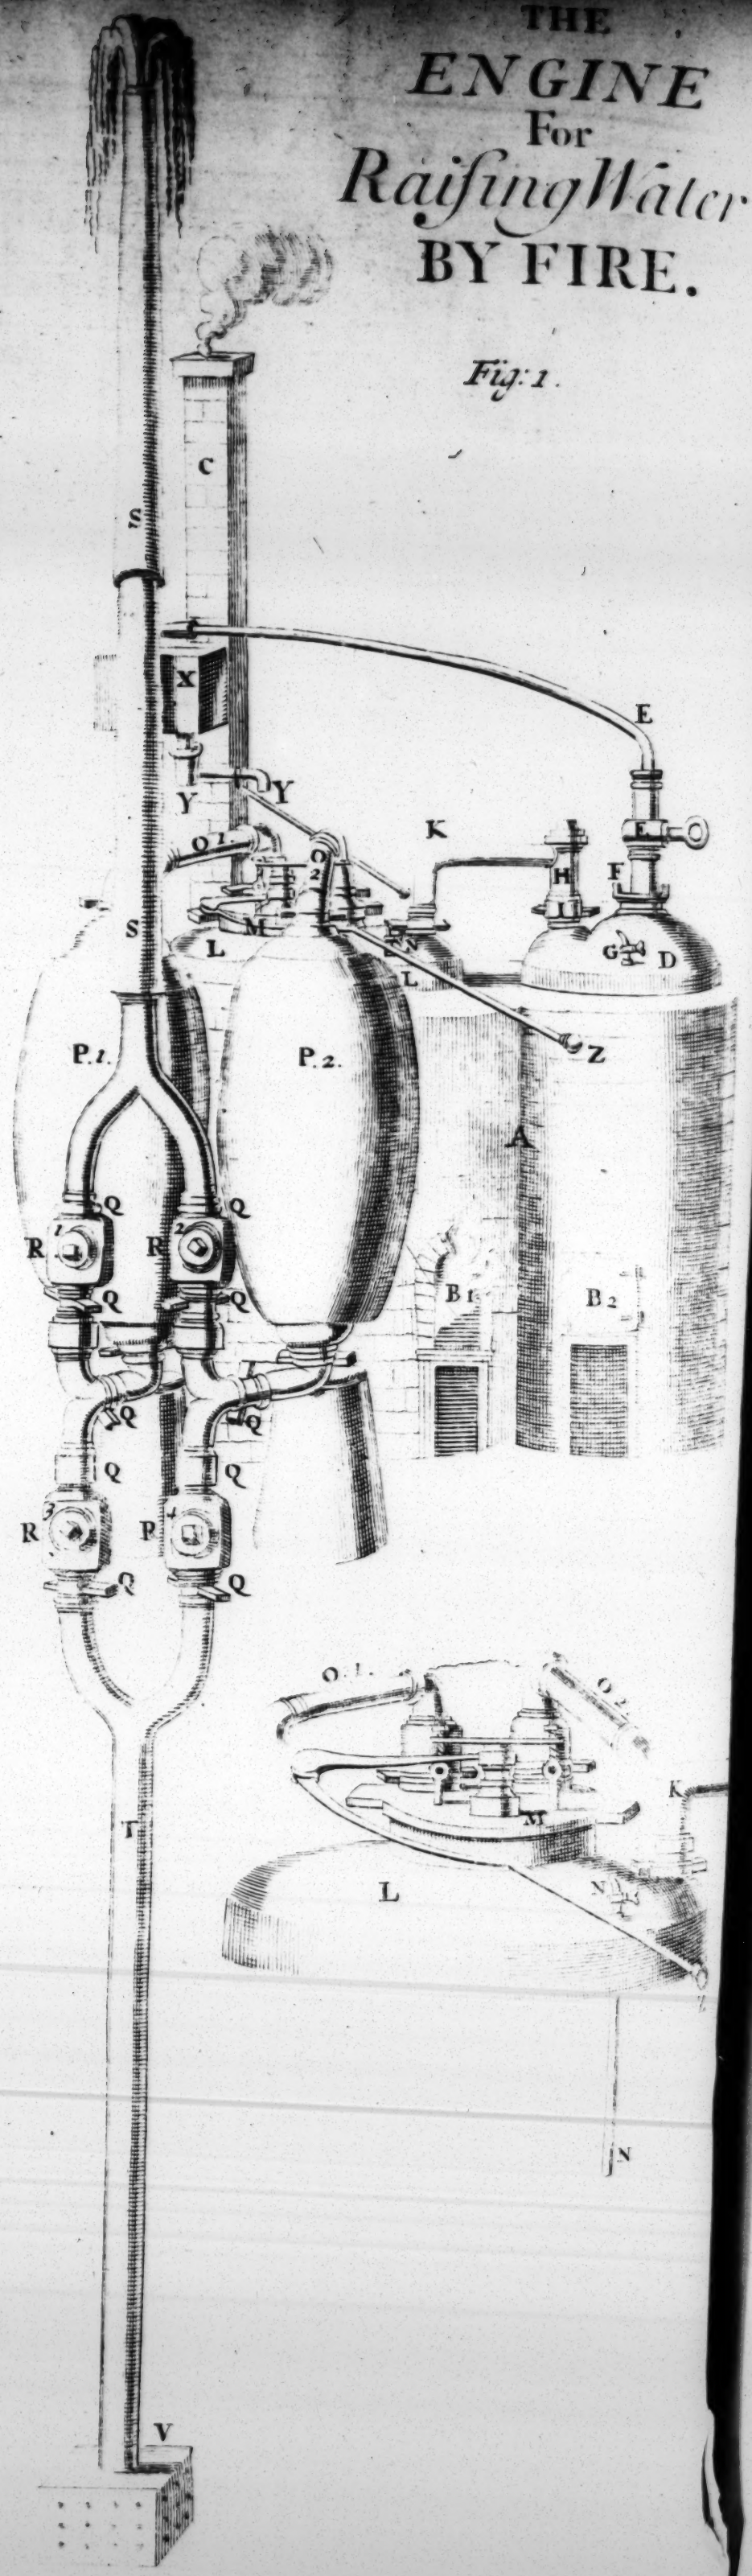
THE
ENGINE
For
Raising Water
BY FIRE.

Fig. 1.



The
ENGINE
Working in a
HINT. Place this at the word Engine

B. Lens Adin. I. Short Sculp.

Ship's Sides, are faſtened two Drum-heads like that on the Capſtan, in which are fitted, to take out at pleaſure, 6 or 8 Paddles; and at the outermoſt Ends of the Paddles is faſtened an Iron Pin with an Head to it; by which Means, and by the help of a Cord, taking an half turn round about all theſe Pins, both the Paddles may be *ſwifted* or ſtrain'd, and ſtrengthned ſo, that they ſhall all work proportionably; and alſo the Paddles may with a Luff Tackle be the more handily and eaſily lifted in and out, in order to be fitted into or taken out of the Drum-heads of the Bar: See the Figure annexed.

Now here if the Men will but work, if there be enough of them, and the Paddles be made proportionably large, according to the number of the Men that can be brought to work at the Capſtan; I cannot ſee but that the *Engine* will give the Veſſel freſher Way than any Oars can do, work'd by the ſame, or a far greater number of Hands, as the Experiments that have been tried do abundantly ſhew, according to the beſt Information I can get of the Matter.

The other *Engine* is for raiſing Water by the Force of Fire, in which he hath ſhewed as great Ingenuity, Depth of Thought, and true Mechanick Skill, as ever diſcovered it ſelf in any Deſign of this Nature.

The Deſcription of this Engine is as follows.
See the Figure.

A denotes two Furnaces, whoſe Fire-places are *B*, 1, 2, and their Funnel or Chimney *C*.

In theſe two Furnaces are placed two Veſſels of Copper, which he calls *Boylers*, the one a larger, as *L*, the other a ſmaller, as *D*.

Theſe Boylers have each a *Gage Pipe*, as *G* and *N*, of which *G* goes within eight Inches of the Bottom, but *N* reaches only half way down the great Boyler.

By theſe Pipes, before the *Engine* can work, you muſt firſt fill the ſmall Boyler quite full, and the great Boyler two Thirds full of Water: Then light the Fire at *B* 1, and make the Water in *L* boil, by which Means the Steam of it being quite confined, muſt needs be wonderfully compreſſed, and therefore will, on the opening of a Way for it to iſſue out (which is done by turning *Z* the Handle of the Regulator from you) ruſh with a great Force thro' the *Steam Pipe O*, 1, into the Receiver *P* 1, driving all the Air before it, and forcing it up into the Force-Pipe through the Clack *R*, 1, as you will perceive by the Noiſe and Ratling of the Clack. And when all the Air is thus driven out, the Receiver *P*, 1, will be very much heated by the Steam: When you find that it is throughly emptied, and is grown very hot, as you may both ſee and feel, then pull the Handle of the Regulator towards you, by which Means you will ſtop the Steam-Pipe *O*, 1, ſo that no more Steam can yet come into it, but you will open it a Way into *O*, 2, and by that Means fill the Receiver *P*, 2, with the Steam, as the other was before. While this is doing, let ſome cold Water be poured on the Receiver *P*, 1, by which Means the Steam there being coo'ed, and condenſed, and contracted into a very little Room, and conſequently preſſing but very little (if at all) on the Valve or Clack *R*, 1, at the Bottom of the Receiver, *P*, 1. There is nothing there to counterbalance the Preſſure of the Atmoſphere on the Surface of the Water in the lower Part of the Sucking-Pipe *T*; wherefore it will be preſſed up, and aſcend into, and fill the Receiver *P*, 1, driving up before it, as it riſes, the Clack or Valve *R*, 1, which afterwards falling down again and ſhutting cloſe, hinders the Deſcent of the Water that Way.

Then (the Receiver *P*, 2, being in the mean time emptied of its Air) turn the Handle of the Regulator from you, and the Force of the Steam coming from the Boyler, will be all upon the Surface of the Water contained in the Receiver *P*, 1, where it gravitates or preſſes hard upon it, and ſtill increaſes its Spring or Elaſticity till it comes to over-balance, or exceed the Weight of the Water in the Receiver, which then it will neceſſarily drive up through the Paſſage *Q*, *R*, 1, *Q*, *Q*, into the Force-pipe *S*, and at laſt diſcharge it out at the Top, as you ſee in the Figure.

After the very ſame Manner, tho' alternately, is the Receiver *P*, 2, filled with and emptied of Water; and by this Means a conſtant Steam is kept continually running out at the Top of the Force-pipe *S*, and ſo the Water is raiſed very eaſily from the Bottom of the Mine, *&c.* to the Place where it is deſigned to be diſcharged.

Only I ſhould add, That after the *Engine* begins to work, and the Water is riſen into and hath filled the Force-Pipe *S*, then it fills the little Ciſtern *X*, and by that Means feeds the Pipe *YY*, which he calls the *Condenſing-Pipe*, becauſe Water is conveyed down from thence to cool the Receivers when throughly heated by the Steam, in order to make them *Suck* (as 'tis uſually called) the Water out of the Well up into the Receiver.

Alſo a little above that Ciſtern goes the Pipe *E*, which conveys Water from the Force-pipe into *D* the leſſer Boyler, which is there placed to repleniſh the greater Boyler *L* when the Water in it begins to be almoſt conſumed. Now when there is need of doing this, turn the Cock *E* ſo, that there can be no Communication between the Force-pipe *S*, and the leſſer Boyler *D*; and putting in a little Fire at *B*, 2, the Water there will grow preſently hot; and when it boils, its own Steam, which hath no vent out, preſſing on its Surface, will force the Water up the Pipe *H*, through *K*, into the great Boyler *L*, and ſo long will it run till the Surface of the Water in the Boyler *D*, get to be as low as the Bottom of the Pipe *H*; and then the Steam and Water will run together, and by its Noiſe and rattling of the Clack *I*, will give him that works the *Engine* ſufficient Aſſurance that *D* hath emptied and diſcharged it ſelf into *L*, and carried in as much Water as is then neceſſary; after which, by turning the Cock *I* again, you may let new cold Water out of *S* into *D* the leſſer Boyler, as before: And thus will there be a conſtant Motion, and a continual Supply of the *Engine* without fear of Decay or Diſorder.

Alſo to know whether *L* want repleniſhing or not, you need only turn the Cock *N*, and if Water come out, there is no need to repleniſh; but if Steam only come, you may conclude there is: And the like will the Cock *G* do in reference to the leſſer Boyler *D*, ſhewing when 'tis neceſſary to ſupply that with freſh Water from *S*; ſo that in working the *Engine* there is very little Skill or Labour required, it being only to be injured by either a ſtupid or wilful Neglect.

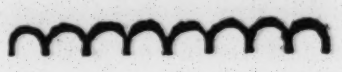
Of the Uſes and Application of this Engine, the Reader will find a full Account in the Inventor's Book called the *Miner's Friend*.

ENGIZOMA, is a Blow upon the Skull, wherewith the Bone deſcends to the inner Membrane of the Brain, and preſſes upon it. Alſo an Inſtrument in ſuch like Caſes. *Blanchard.*

ENGONASIS *Herculis*, the Name given by Aſtronomers to one of the Northern Conſtellations, containing about 48 Stars.

ENGONIOS, is the bending of the Arm or Leg.

ENGRAILED, a Term in Heraldry, when a Bordure, &c. is formed by a Line of this Shape;



and the little Arches turn outward from the Center of the Eſcutcheon; for if they turn the other way, 'tis called *Invected.*

ENGYSCOPE, the ſame with a *Microſcope*, being an Inſtrument to view ſmall Bodies diſtinctly; and 'tis ſo called, becauſe it brings the Eye much nearer to theſe ſmall Bodies, and conſequently makes them appear to us to have larger Parts and Dimenſions than they had before: See *Microſcope.*

ENHARMONICAL, } a Term in Muſick, u-
ENHARMONICK, } ſually applied to the laſt of the three kinds of Muſick, abounding in *Dieſis*, which are the leaſt ſenſible Diviſion of a Tone: See *Dieſis.*

ENIGMA, or *Riddle*, is an obſcure Allegory, where the Natural Senſe of the Words are not preſently perceptible, being, in Appearance, frequently Contradictory.

ENIXUM-SAL, is the Chymical Term for what they otherwiſe call a *Neutral Salt*, which participates both of the Nature of an *Acid* and an *Alkali*; as *Common Salt*, *Nitre*, *Allum*, *Vitriol*, &c.

ENNEADECATERIDES, the ſame with the *Golden-Number*, which ſee; or the *Cycle of the Moon.*

ENNEAGON, is a Polygon of Nine equal Sides.

ENNEATICAL *Days*, ſignifies every ninth Day of a Sickneſs, which ſome will ſuppoſe doth bring ſome great Alteration in the Diſeaſe.

ENNEATICAL *Years*, are every ninth Year of ones Life, which, by ſome weak Men, are thought to bring a great Mutation of Fortune along with them.

ENNEEMIMERIS, is one kind of the *Cæſura* of a *Latin* Verſe, where, after the fourth Foot, there is an odd Syllable ending a Word, which helps to make the next Foot with the following Word; as in this Inſtance,

Ille latus Niveum Molli fultus Hyacintho.

Where all the four kinds of the *Cæſura* occur.

ENORTHROSIS: See *Diarthroſis.*

ENQUEST, is taken for an Inquiſition by a Jury, which is the moſt uſual Trial in all Cauſes both Civil and Criminal within this Realm; for in Cauſes Civil, after Proof is made on either Side of ſo much as each Party thinketh good for himſelf; if the Doubt be in the Fact, it is referr'd to the Diſcretion of twelve indifferent Men, empanell'd by the Sheriff for that Purpoſe; and as they bring in their Verdict, ſo Judgment paſſeth; for the Judge ſaith, The Jury findeth the Fact thus, and the Law is thus. For the *Enqueſt* in Criminal Cauſes, ſee *Jury.*

ENS, or *Being*, is whatever hath any kind of Being or Exiſtence; for that which hath no Exiſtence nor Eſſence, is really nothing at all. This the Schools, (who make a great Variety of Beings) call *Ens Reale*, and *Ens Poſitivum*, to diſtinguiſh it from their *Ens Rationis*, which is only an imaginary thing, a Creature of the Brain, and exiſts no where but in the Underſtanding.

ENS PRIMUM, according to the Cant of *Paracelſus*, is the moſt Efficacious Part of any natural mixt Body, Vegetable, Animal, or Mineral, which he pretends to have been able to ſeparate from them, and with it to effect prodigious things towards the Renovation and Reſtoration of Youth: And though he delivers his Proceſſes ſo obſcurely, as to encourage no Body to try them; yet Mr. *Boyle* gives us a Proceſs of Mr. *L. F.* Chymiſt to the *French* King, whereby the *Ens Primum*, or Eſſence of any Vegetable, may eaſily be obtained, as he had tried himſelf, and is as follows.

Gather, at a convenient Seaſon of the Year, and Time of the Day, *Balm*, for Inſtance, or ſome other fitting Herb (for all Plants cannot this way be turned into Water) beat it to a ſoft Maſs or Pulp in a Marble Mortar, and then putting it into a Bolt-head hermetically ſealed, digeſt it for 40 Days in a Dunghil, or ſome Analogous Heat: After this take out the Matter, which will now be much more liquid than before, and ſeparating from it the Dregs or groſſer Parts, digeſt it anew in a gentle Bath, that the remaining groſſer Parts alſo may ſubſide; filtrate it, and then add to it the fix'd Salt drawn from the former Dregs dried and calcined. To this prepared Liquor add equal Parts of the Liquor of good Sea Salt, well purified, melted, and then let it run *per Deliquium.* Seal up then the Mixture in a Bolt-head, and let it be expoſed to the Sun for ſix Weeks longer; at the End of which Term there will ſwim upon the Liquor the *Ens Primum* of the Plant in a liquid tranſparent Form, ſometimes of a Green, and ſometimes of a Reddiſh Colour, according to the Nature of the Plant thus managed.

M. *Boyle* ſays, That Mr. *L. F.* aſſured him once in the preſence of another Virtuoſo, to whom he appealed for the Truth of the Fact, as having been made acquainted with the Operation, That a ſpecial Friend of his thus drawing the Eſſence of Balm, tried it upon himſelf for about a Fortnight, taking it according to *Paracelſus* his Deſcription; before the End of which Time the Nails of his Hands and Feet came off without pain, being ſucceeded by a Sett of new ones; and convinced him ſo far of the Efficacy of it, that he having no need of any ſuch help, left off taking it; and tried it no farther; but that giving it to an old Woman of 70 Years of Age, who ſerved in the Houſe, it produced the *Menſes* again, and that ſo copiouſly, as wonderfully to ſtartle the old Woman.

Nay, he told Mr. *Boyle* farther, on his enquiring why he did not try it on Beaſts, That he gave of it, tho' but in a little quantity, as having not much of it left, to an old Hen, who on the ſixth Day began to moult her Feathers till ſhe grew ſtark naked; but before a Fortnight was paſſed, received others in their room, which were fairer and better coloured than the former Feathers.

This is an odd Relation, but however 'tis eaſy to make Trial of Matter of Fact; and I wonder no one hath attempted all this while to proſecute a thing which is ſo eaſy to effect, and whoſe Succeſs would reward ſufficiently the Explorer's Pains and Time, if it will do.

ENS *Veneris*, is a Sublimation of equal Parts of the Powder of *Cyprus Vitriol*, calcined till 'tis of a dark Colour, and of Salt-Armoniack into the Form of a Yellow Flower; and they are so called from some Particles of Copper which they have carried away from the Vitriol: The Chymists calling Copper *Venus*.

Mr. *Boyle* commends them as an admirable Medicine in the Rickets, obstinate Cachexies, Loss of Appetite, and all Obstructions. Their Dose is from six Grains to a Scruple.

ENSCONCED: See *Insconced*.

ENSIFORMIS *Cartilago*, or *Mucronata*, is the lowest Part of the *Sternum*, or the Breast Bone; and because of its pointed triangular Shape, 'tis called *Mucronata* and *Ensiformis*: 'Tis about an Inch long, and on the Out-side of it there is formed a Cavity in the Breast called *Scrobiculus Cordis*, or the Heart-Pit; and a gnawing Pain which is sometimes felt here, is called *Cardialgia*, the Heart-burn: But this Pain proceeds not from the Heart, but from the upper Orifice of the Stomach, which lies under this Cartilage, and hath the Name of *Cardia*, because of its great Consent with the Heart, as some fancied formerly.

ENTABLATURE, or *Entablement*, a Term in Architecture, signifying the *Architrave*, *Frise*, and *Cornice* of a *Pillar*, being, in effect, the Extremity of the Flooring, which is either supported by Pillars, or by a Wall, if there are not Columns.

ENTAYLE, in common Law, signifies *Fee-tail*, or *Fee-intailed*, or Abridged.

ENTELECHIA, a *Greek* Word used by *Aristotle* to express the Human Mind: They tell us, that *Hermolaus Barbarus* went to the Devil to know the Meaning of it; and either the Devil for him, or his own great Understanding, renders it *Perfectihabia*; by which his Readers are much the wiser.

The Ancient Commentators on *Aristotle* interpret it by the Word *Actus*, and mean by it a kind of *Substantial Form*, by which Action is produced in the Body.

The Modern Peripateticks come nearer to what perhaps was *Aristotle*'s Meaning; for they make a kind of Motion and happy Modification of Matter qualifying the Whole, to be able to perform such Acts as are proper to it: And thus *Cicero* in his *Tuscul. Quest.* renders *Entelechia, quadam quasi Continuata & perennis Motio.*

ENTERENCHITA, is a Clyster-Pipe, which is also called *Siphon* and *Syringa*.

ENTEROCELE, or *Hernia Intestinalis*, is the fall of the *Intestines*, especially of the *Ilium*, thro' the Processes of the *Peritoneum*, dilated into the Groins, or outward Skin that covers the *Scrotum*. *Blanchard*.

ENTEROEPIPLOCELE, a sort of Rupture, in which the Guts and Caul fall down into the *Scrotum* together. *Blanchard*.

ENTEROMPHALUS, or *Hernia Umbilicalis*, a Rupture of the Navel, or the Bunching out of the Guts at the Navel, which is common with Teeming Women.

ENTERPLEDER, in Common Law, signifies as much as *Cognitio præjudicialis* in the Civil; that is, the discussing of a Point incidentally falling out before the principal Cause can take end. For Example, Two several Persons being found Heirs to Land, by two several Offices in one County, the King is brought in doubt to which of them Livery ought to be made, and therefore first they must *Interplead*: that is, formally try between themselves who is the right Heir.

ENTHYMEME, is a Syllogism perfect in the Mind, but imperfect in the Expression; because some one of the Propositions is suppressed, as being too clear and common, and easily supplied by the Understanding of those with whom we discourse: As, *Every Right-lined Triangle hath all its three Angles just equal to two Right ones; therefore it will be so in an Isoceles*; where the Proposition, that an *Isoceles is a Right-lined Triangle*, is omitted, as being sufficiently known, and therefore it would have been impertinent to have inserted it.

ENTIRE *Tenancy*, is contrary to *Several Tenancy*, signifying the sole Possession in one Man, whereas the other signifieth Joint or Common in more.

ENTOYRE, the Term in Heraldry to Blazon a Bordure when it is charged with things without Life, such as *Bezants*, *Plates*, &c.

ENTRING-LADDER, in a Ship, is of two Sorts; one is used by the Ship's Sides in a Harbour, or in fair Weather, for Persons to go in and out of the Ship; the other is made of Ropes with small Staves for Steps, and is hung out of the *Gallery* to enter into the Boat, or to come Aboard the Ship from thence, when the Sea runs so high, that they dare not bring the Boat to the Ship's Side for fear of *Staving* of her.

ENTRUSION, in Law, signifies a violent or unlawful Entrance into Lands or Tenements, being utterly void of a Possessor, by him that hath no Right unto them.

ENTRUSION *de gard*, is a Writ that lies where the Infant within Age, entred into his Lands, and held his Lord out; for in this Case the Lord shall not have the Writ *de communi Custodia*, but this.

ENTRY, a Term in Law, signifies properly the taking Possession of Lands or Tenements: 'Tis used also for a Writ of Possession.

And in the Plea of Entry there be three Degrees.

First, Where a Man demandeth Lands or Tenements of his own Seisin, after the Term is expired.

The Second is, Where one demandeth Land or Tenements, lett by another after the Term is expired.

The Third, Where one demandeth Lands or Tenements of that Tenant that had *Entry* by one to whom some Ancestor of the Plantiff did lett for a Term now expired; according to which Degrees, the Writs for more fit Remedy are varied.

A Writ of *Entry* differeth from an Assise, because it lieth for the most part against him who entred lawfully, but holdeth against Law; whereas an Assise lieth against him that unlawfully disseised: Yet sometimes a Writ of *Entry* lieth upon an Intrusion.

There are Five Things which put the Writ of *Entry* out of the Degrees, *viz.* *Intrusion*, *Succession*, *Disseisin* upon *Disseisin*, *Judgment*, and *Escheat*.

1. *Intrusion*, is where the Disseisor dies seised, and a Stranger abates.

2. *Succession*, is when the Disseisor is a Man of Religion, and dies, or is disposed, and his Successor *Enters*.

3. *Disseisin* upon *Disseisin*, is when the Disseisor is disseised by another.

4. *Judgment*, is when one recovers against the Disseisor.

¶. *Eſcheat*, is when the Diſſeiſor dies without Heir, or doth Felony, whereby he is Attaint, by which the Lord *Enters*, as in his *Eſcheat*.

ENTRY *ad Communem Legem*, is a Writ which lies where Tenants for Term of Life, Tenant for Term of another's Life, Tenant by the Courteſy, or Tenant in Dower, aliens and dies, he in the Reverſion ſhall have this Writ againſt whomſoever is in.

ENTRY *ad terminum qui præteriit*, lies where a Man Leaſes Land to another for Term of Years, and the Tenant holds over his Term, the Leſſor ſhall have this Writ.

ENTRY *cauſa Matrimonij prælocuti*, is a Writ which lies where Lands or Tenements are given to a Man upon Condition, That he ſhall take the Donor to his Wife within a certain Time, and he eſpouſes another, or otherwiſe diſables himſelf that he cannot take her according to the ſaid Condition; then the Donor and her Heirs ſhall have the ſaid Writ againſt him, or againſt whoever elſe is in the ſaid Lands.

ENTRY *in caſu Proviſo*, lies if Tenant in Dower aliens in Fee, or for Term of Life, or for another's Life living the Tenant in Dower, he in the Reverſion ſhall have this Writ.

ENTRY *in caſu conſimili*, is a Writ that lies where Tenant for Life, or Tenant by the Courteſy aliens in Fee, he in the Reverſion ſhall have this Writ.

ENTRY *ſine aſſenſu Capitali*, lies where an Abbot, Prior, or ſuch as has Convent or Common Seal, aliens Lands or Tenements of the Right of the Church, without the Aſſent of the Convent or Chapter, and dies, then the Succeſſor ſhall have this Writ.

ENVELOPE, in Fortification, is a Mount of Earth, ſometimes raiſed in the Ditch of a Place, and ſometimes beyond it, being either in form of a ſimple *Parapet*, or of a ſmall *Rampart* bordered with a Parapet. Thoſe *Envelopes* are made when one would only cover the weak Places with ſingle Lines, without any Deſign of advancing toward the Field, which cannot be done but by Works that require a great deal of Breadth; ſuch as *Horn-works*, *Half-Moons*, &c.

Theſe *Envelopes* are ſometimes called *Sillons*, *Contregards*, *Conſerves*, *Lunettes*, &c.

ENUNCIATION, with the Logicians, is the ſame as a Propoſition.

ENURNY, the Herald's Term for a *Bordure* of a Coat of Arms being charged with any kind of Beaſts.

ENVY, is by ſome well enough defined to be an Uneaſineſs of the Mind, cauſed by the Conſideration of a Good we deſire, obtained by one we think ſhould not have had it before us.

EPACMASTICA, is a Fever that commonly grows ſtronger. *Blanchard.*

EPACT, is uſed for a Number, whereby we note the Exceſs of the common *Solar Year* above the *Lunar*, and thereby may find out the Age of the Moon every Year: For the *Solar Year* conſiſting of 365 Days, the *Lunar* but of 354, the *Lunations* every Year get 11 Days before the *Solar Year*; but thereby in 19 Years the *Moon* compleats 20 times 12 *Lunations*, or gets up one whole *Solar Year*; and having finiſhed that Circuit, begins again with the *Sun*; and ſo from 19 Years to 19 Years: For the firſt Year afterwards, the *Moon* will go before the *Sun* but a 11 Days; the ſecond Year 22 Days, which is called the *Epact* of that Year; the third Year 33 Days; but 30 being an entire Lunation, caſt that away, and 3 ſhall be that Year's *Epact*, the next Year 14; and ſo on, adding Yearly 11 Days, and caſting away 30, when the Number amounts to more.

To find the Epact, *having the* Prime *or* Golden Number *given, you have this*

RULE.

Divide by 3, *for each one left add Ten.*
30 *reject*; *the* Prime *makes* Epact *then.*

Example.

Anno 1701, *Golden Number* 11, divided by 3, leaves 2; therefore 10 times 2, which is 20, added to 11, makes 31, from which take 30, the Remainder is 1, the *Epact* for the Year 1701.

EPANORTHOSIS, is a *Greek* Word, the ſame with *Correctio* or *Emendatio* in *Latin*; and ſignifies a Pathetical Form of Speech, in which the firſt Expreſſion appearing too weak, the Speaker ſtill endeavours to correct or mend it, by uſing ſtronger ways of ſpeaking.

EPAPHALESIS, is an irritated or repeated *Phlebotomy*. *Blanchard.*

EPAR: See *Hepar*.

EPARMATA, are Tumours of the Glandules, called *Parotes*, behind the Ears. *Blanchard.*

EPAULE, in Fortification, is the Shoulder of the Baſtion, or the Angle of the *Face* and *Flank*; whence that Angle is often called the Angle of the *Epaule*.

EPAULEMENT, in Fortification, is a *Side-work* made either of Earth thrown up, of Bags of Earth, Gabions, or of Faſcines and Earth, of which latter make the *Epaulments* of the *Places of Arms* for the Cavalry behind the Trenches are. Sometimes the Word

EPAULMENT is uſed for a *Demi-Baſtion*; and ſometimes it ſignifies a *Square Orillon*, which is a Maſs of Earth almoſt Square, faced and lined with a Wall, and deſigned to cover the Cannon of a *Cazematte*.

EPENTHESIS, in *Grammar*, is the Addition of a Vowel or Conſonant in the Middle of a Word; but if it be prefix'd, 'tis called *Prothesis*, if added at the End *Paragoge*.

EPHELÆUM, is the Place from the *Hypogaſtrium*, or Part of the *Abdomen*, to the Secret Parts. *Blanchard.*

EPHELIS, or *Ephellides*, is *Freckles* in the Face, Neck, or Hands, &c.

EPHELCIS, is that bloody Subſtance which is brought up in ſpitting of Blood: Alſo a Shell or Cruſt that is brought over Ulcers. *Blanchard.*

EPHEMERA, or *Diaria*, is a continued Fever which laſts but a Day; if it laſts above a Day, it is called *Synochus Simplex*. *Blanchard.*

EPHEMERIS, thoſe Books or Journals which contain the Daily Motions of the *Planets*, and other Circumſtances relating thereto, for every Day in the Year, are called an *Ephemeris*, or *Ephemerides*.

EPHIALTES, or *Incubus*, the *Night-Mare*, is a depraved Imagination, whereby People aſleep fancy that their Wind-pipe is oppreſs'd by ſome ſuperincumbent Body; and that their Breath is ſtopp'd: This ſeems to proceed from Compreſſion of the *Cerebellum*, when the Ventricles are too full of Moiſture; for if thoſe who are thus affected lie upon their Backs, then the whole Bulk of the Brain lies upon

upon the *Cerebellum*; whereupon all the Pores and Paſſages being ſtop'd by ſo much Weight, the Spirits are hindred from influencing the Nerves called *Per vagum*, and the *Intercoſtal Nerve*; which being thus deſtitute of Spirits, the Lungs are oppreſſed and flag, and cannot perform their Office. *Blanchard.*

EPHIDROSIS, is Sweating.

EPHIMERIS, or *Ephimerides*, is a Diary or Daily Regiſter of the Motions and Places of the Heavenly Bodies, eſpecially ſhewing their Place at Noon: The ſame with *Ephemeris*.

EPHIPTIUM, or *Sella Equina*, or *Turſica*, is Part of the Bone *Sphenoides*, wherein the *Pituitary* Gland is placed.

EPIALA, a kind of continual Fever, wherein both Heat and Cold is felt at the ſame time. *Blanchard.*

EPICARPIUM, is a Medicine applied outwardly like a Plaiſter or a *Cataplaſm*; applied to the Pulſe or Wriſt of the Hand to drive away intermitting Fevers.

EPICAUMA, is a cruſty Ulcer that ſometimes happens to the Black of the Eye.

EPICERASTICA, are Medicines which obtund and temperate ſharp Humours.

EPICHEIRESIS, the ſame with *Encheireſis*.

EPICHEREMA, is a kind of Complex Argumentation conſiſting of many Propoſitions depending one upon another, whereby at laſt ſome particular Point is made out: As when *Cicero*, in his Oration *pro Milone*, argues, That thoſe who lay in wait to deprive a Man of his Life, or of his Money, may, by the Law of Nature, of Nations, and by common Practice, be juſtly ſlain: And therefore, ſince it appears that *Clodius* did by ſeveral Acts prove himſelf to be in ſuch a Deſign, 'twas lawful for *Milo* to kill him. 'Tis a kind of *Sorites*, which ſee.

EPICRASIS, is a gradual Evacuation of ill Humours in the Blood.

EPICUREAN *Philoſophy*, was the Natural Philoſophy firſt taught by *Epicurus* and *Democritus*, and afterwards delivered in Verſe by *Lucretius*: It is much the ſame with the preſent Mechanical Philoſophy, which ſee.

EPICYCLE, a little Circle whoſe Center is in the Circumference of a greater; or a ſmall Orb, which being fixed in the Deferent of a Planet, is carried along with its Motion, and yet with its own peculiar Motion, carries the Body of the Planet faſtened to it round about its proper Center, which Ancient Aſtronomers attribute to all the Planets, for ſolving their Appearances, except the Sun.

EPICYEMA, is a Superfœtation.

EPIDEMICK *Diſeaſe*, is one proceeding from a common Cauſe, ſpreading it ſelf over divers Countries at divers times; ſuch are the Plague, Malignant Fevers, &c.

EPIDERMIS: See *Cuticula*.

EPIDIDYMIS, or *Epididymida*, or *Pariſtata*, in Latin *Supergeminalis*; it is a winding Veſſel, making a Figure like the Winding of crooked Veins that are ſwoln with ill Blood, and is affixed to the Back of the Teſticles: Its greater Globe is annexed to the Teſticles, conſiſting of one Veſſel or Paſſage above five Ells long: The leſſer Globe is connected to the Veſſel that carries the Seed. *Blanchard.* See *Teſtes*.

EPIGASTRICK *Artery*, is ſaid by ſome to be a Branch of the *Iliack Artery*; and diſtributes it ſelf amongſt the Muſcles of the *Epigaſtrius*.

EPIGASTRIUM, is the Fore-part of the *Abdomen* or *lowermoſt* Belly, whoſe upper Part is called *Hypochondrium*, the middle Part *Umbilicalis*, and the lowermoſt *Hypogaſtrium*.

EPIGLOTTIS, is the fifth Cartilage of the *Larynx*, the Cover of the Opening of the Wind-pipe: It is alſo called *Sublinguium*: See *Cion*.

EPIGONATIS, is the Whirl-bone of the Knee.

EPILEPSY, or *Morbus Caducus*, is the Falling-Sickneſs, becauſe that the Perſons affected fall down on a ſudden; or *Herculeus*, becauſe it is hard to be cured; alſo *Lues Deifica*, *Sonticus*, *Comitialis*, *Sacer*, &c.

EPINYCTIDES, are Pimples that ſend forth Matter, and are painful, eſpecially in the Night. *Blanchard.*

EPIPAROXYSMUS, is when a Patient endures more Fits in a Fever than uſual, which happens in inordinate Converſe. *Blanchard.*

EPIPEDOMETRY, in Mathematicks, ſignifies the meaſuring of Figures that ſtand on the ſame Baſe.

EPIPHONEMA, is an *Exclamation* containing ſome Sentence, or great Senſe, placed at the End of a Diſcourſe; being a preſſing and lively Reflection upon the Subject whereof we ſpeak.

EPIPHORA, in general, ſignifies a Defluxion of Humours into any part; but is more ſpecially applied to denote the Defluxion of a thin Rheum from the Eyes, which is commonly called involuntary Weeping, and flows continually from the Corners of the Eyes.

EPIPHYSIS, *Appendix*, *Adnaſcentia*, *Additamentum*, ſignify one Bone that grows to another by ſimple and immediate Contiguity, though not with ſo even a Surface, but with ſome kind of Ingreſs of one Bone into the Cavity of the other, like that Coarticulation wherewith the Bones form the Joints, but without any Motion. *Blanchard.*

EPIPHYLLOSPERMOUS *Plants*, are the ſame with the *Capillaries*, which bear their Seed on the Back-part of their Leaves: See *Capillaries*.

EPIPLASMA, the ſame with *Cataplaſma*.

EPILOCELE: See *Enteroepiplocele*.

EPIPLOIS *dextra*, a Branch of the *Cœliack* Artery, which runs through the Right Side of the inner or hinder Leaf of the Caul, and the *Colon* that is next to it.

EPIPLOIS *poſtica*, is a Branch of the *Cœliac* Artery, ſpringing out of the lower end of the *Splenica*, and running to the hinder Leaf of the *Omentum*, and the *Colon* annexed to it.

EPIPLOIS *ſiniſtra*, is a Branch of the *Cœliac* Artery, and is beſtowed on the Lower and Left Side of the *Omentum*.

EPIPLOMPHALUM, is a Navel Rupture, when it jets out by reaſon of the Inteſtines or Caul bearing too hard upon it.

EPIPLOON, *Omentum*, or *Reticula*, the Caul, is a Cover ſpread over the Inteſtines, ariſing from the bottom of the little Ventricle, and the Back of the Gut *Colon*; to wit, from the Doubling of the *Peritonæum*: It is ſhaped like a Net, or a Fowler's Bag; and abounds with ſeveral Sanguinary Veſſels. Its Uſe is to cheriſh the Stomach and the Guts with its Fat. *Blanchard.*

EPISARCIDIUM, the ſame with *Anaſcara*.

EPISEMASIA, is the very Time that a Diſeaſe firſt ſeizes a Perſon; and is properly called *Significatio*. *Blanchard.*

EPISION, is the Place of the Secret Parts, or *Aqualiculus*. *Blanchard.*

EPISPASTICKS, the ſame with *Attrahentia*, or Bliſters.

EPISPHÆRIA, are Windings and Turnings in the outer Subſtance of the Brain, that the Sanguiferous Veſſels may paſs more ſecurely. *Blanchard.*

EPISTO-

5. *Eſcheat*, is when the Diſſeiſor dies without Heir, or doth Felony, whereby he is Attaint, by which the Lord *Enters*, as in his *Eſcheat*.

ENTRY *ad Communem Legem*, is a Writ which lies where Tenants for Term of Life, Tenant for Term of another's Life, Tenant by the Courteſy, or Tenant in Dower, aliens and dies, he in the Reverſion ſhall have this Writ againſt whomſoever is in.

ENTRY *ad terminum qui præteriit*, lies where a Man Leaſes Land to another for Term of Years, and the Tenant holds over his Term, the Leſſor ſhall have this Writ.

ENTRY *cauſa Matrimonij prælocuti*, is a Writ which lies where Lands or Tenements are given to a Man upon Condition, That he ſhall take the Donor to his Wife within a certain Time, and he eſpouſes another, or otherwiſe diſables himſelf that he cannot take her according to the ſaid Condition; then the Donor and her Heirs ſhall have the ſaid Writ againſt him, or againſt whoever elſe is in the ſaid Lands.

ENTRY *in caſu Proviſo*, lies if Tenant in Dower aliens in Fee, or for Term of Life, or for another's Life living the Tenant in Dower, he in the Reverſion ſhall have this Writ.

ENTRY *in caſu conſimili*, is a Writ that lies where Tenant for Life, or Tenant by the Courteſy aliens in Fee, he in the Reverſion ſhall have this Writ.

ENTRY *ſine aſſenſſu Capitali*, lies where an Abbot, Prior, or ſuch as has Convent or Common Seal, aliens Lands or Tenements of the Right of the Church, without the Aſſent of the Convent or Chapter, and dies, then the Succeſſor ſhall have this Writ.

ENVELOPE, in Fortification, is a Mount of Earth, ſometimes raiſed in the Ditch of a Place, and ſometimes beyond it, being either in form of a ſimple *Parapet*, or of a ſmall *Rampart* bordered with a Parapet. Thoſe *Envelopes* are made when one would only cover the weak Places with ſingle Lines, without any Deſign of advancing toward the Field, which cannot be done but by Works that require a great deal of Breadth; ſuch as *Horn-works*, *Half-Moons*, &c.

Theſe *Envelopes* are ſometimes called *Sillons*, *Contregards*, *Conſerves*, *Lunettes*, &c.

ENUNCIATION, with the Logicians, is the ſame as a Propoſition.

ENURNY, the Herald's Term for a *Bordure* of a Coat of Arms being charged with any kind of Beaſts.

ENVY, is by ſome well enough defined to be an Uneaſineſs of the Mind, cauſed by the Conſideration of a Good we deſire, obtained by one we think ſhould not have had it before us.

EPACMASTICA, is a Fever that commonly grows ſtronger. *Blanchard.*

EPACT, is uſed for a Number, whereby we note the Exceſs of the common *Solar Year* above the *Lunar*, and thereby may find out the Age of the Moon every Year: For the *Solar Year* conſiſting of 365 Days, the *Lunar* but of 354, the *Lunations* every Year get 11 Days before the *Solar Year*; but thereby in 19 Years the *Moon* compleats 20 times 12 *Lunations*, or gets up one whole *Solar Year*; and having finiſhed that Circuit, begins again with the *Sun*; and ſo from 19 Years to 19 Years: For the firſt Year afterwards, the *Moon* will go before the *Sun* but a 11 Days; the ſecond Year 22 Days, which is called the *Epact* of that Year; the third Year 33 Days; but 30 being an entire Lunation, caſt that away, and 3 ſhall be that Year's *Epact*, the next Year 14; and ſo on, adding Yearly 11 Days, and caſting away 30, when the Number amounts to more.

To find the Epact, *having the* Prime *or* Golden Number *given, you have this*

RULE.

Divide by 3, *for each one left add Ten.*
30 *reject*; *the* Prime *makes* Epact *then.*

Example.

Anno 1701, *Golden Number* 11, divided by 3, leaves 2; therefore 10 times 2, which is 20, added to 11, makes 31, from which take 30, the Remainder is 1, the *Epact* for the Year 1701.

EPANORTHOSIS, is a *Greek* Word, the ſame with *Correctio* or *Emendatio* in *Latin*; and ſignifies a Pathetical Form of Speech, in which the firſt Expreſſion appearing too weak, the Speaker ſtill endeavours to correct or mend it, by uſing ſtronger ways of ſpeaking.

EPAPHALESIS, is an irritated or repeated *Phlebotomy*. *Blanchard.*

EPAR: See *Hepar*.

EPARMATA, are Tumours of the Glandules, called *Parotes*, behind the Ears. *Blanchard.*

EPAULE, in Fortification, is the Shoulder of the Baſtion, or the Angle of the *Face* and *Flank*; whence that Angle is often called the Angle of the *Epaule*.

EPAULEMENT, in Fortification, is a *Side-work* made either of Earth thrown up, of Bags of Earth, Gabions, or of Faſcines and Earth, of which latter make the *Epaulments* of the *Places of Arms* for the Cavalry behind the Trenches are. Sometimes the Word

EPENTHESIS, in *Grammar*, is the Addition of a Vowel or Conſonant in the Middle of a Word; but if it be prefix'd, 'tis called *Prothesis*, if added at the End *Paragoge*.

EPHELÆUM, is the Place from the *Hypogaſtrium*, or Part of the *Abdomen*, to the Secret Parts. *Blanchard.*

EPHELIS, or *Ephellides*, is *Freckles* in the Face, Neck, or Hands, &c.

EPHELCIS, is that bloody Subſtance which is brought up in ſpitting of Blood: Alſo a Shell or Cruſt that is brought over Ulcers. *Blanchard.*

EPHEMERA, or *Diaria*, is a continued Fever which laſts but a Day; if it laſts above a Day, it is called *Synochus Simplex*. *Blanchard.*

EPHEMERIS, thoſe Books or Journals which contain the Daily Motions of the *Planets*, and other Circumſtances relating thereto, for every Day in the Year, are called an *Ephemeris*, or *Ephemerides*.

EPHIALTES, or *Incubus*, the *Night-Mare*, is a depraved Imagination, whereby People aſleep fancy that their Wind-pipe is oppreſs'd by ſome ſuperincumbent Body; and that their Breath is ſtopp'd: This ſeems to proceed from Compreſſion of the *Cerebellum*, when the Ventricles are too full of Moiſture; for if thoſe who are thus affected lie upon their Backs, then the whole Bulk of the Brain lies upon

upon the *Cerebellum*; whereupon all the Pores and Paſſages being ſtop'd by ſo much Weight, the Spirits are hindred from influencing the Nerves called *Per vagum*, and the *Intercoſtal Nerve*; which being thus deſtitute of Spirits, the Lungs are oppreſſed and flag, and cannot perform their Office. *Blanchard.*

EPHIDROSIS, is Sweating.

EPHIMERIS, or *Ephimerides*, is a Diary or Daily Regiſter of the Motions and Places of the Heavenly Bodies, eſpecially ſhewing their Place at Noon: The ſame with *Ephemeris*.

EPHIPTIUM, or *Sella Equina*, or *Turſica*, is Part of the Bone *Sphenoides*, wherein the *Pituitary* Gland is placed.

EPIALA, a kind of continual Fever, wherein both Heat and Cold is felt at the ſame time. *Blanchard.*

EPICARPIUM, is a Medicine applied outwardly like a Plaiſter or a *Cataplaſm*; applied to the Pulſe or Wriſt of the Hand to drive away intermitting Fevers.

EPICAUMA, is a cruſty Ulcer that ſometimes happens to the Black of the Eye.

EPICERASTICA, are Medicines which obtund and temperate ſharp Humours.

EPICHEIRESIS, the ſame with *Encheireſis*.

EPICHEREMA, is a kind of Complex Argumentation conſiſting of many Propoſitions depending one upon another, whereby at laſt ſome particular Point is made out: As when *Cicero*, in his Oration *pro Milone*, argues, That thoſe who lay in wait to deprive a Man of his Life, or of his Money, may, by the Law of Nature, of Nations, and by common Practice, be juſtly ſlain: And therefore, ſince it appears that *Clodius* did by ſeveral Acts prove himſelf to be in ſuch a Deſign, 'twas lawful for *Milo* to kill him. 'Tis a kind of *Sorites*, which ſee.

EPICRASIS, is a gradual Evacuation of ill Humours in the Blood.

EPICUREAN *Philoſophy*, was the Natural Philoſophy firſt taught by *Epicurus* and *Democritus*, and afterwards delivered in Verſe by *Lucretius*: It is much the ſame with the preſent Mechanical Philoſophy, which ſee.

EPICYCLE, a little Circle whoſe Center is in the Circumference of a greater; or a ſmall Orb, which being fixed in the Deferent of a Planet, is carried along with its Motion, and yet with its own peculiar Motion, carries the Body of the Planet faſtened to it round about its proper Center, which Ancient Aſtronomers attribute to all the Planets, for ſolving their Appearances, except the Sun.

EPICYEMA, is a Superfœtation.

EPIDEMICK *Diſeaſe*, is one proceeding from a common Cauſe, ſpreading it ſelf over divers Countries at divers times; ſuch are the Plague, Malignant Fevers, &c.

EPIDERMIS: See *Cuticula*.

EPIDIDYMIS, or *Epididymida*, or *Pariſtata*, in Latin *Supergeminalis*; it is a winding Veſſel, making a Figure like the Winding of crooked Veins that are ſwoln with ill Blood, and is affixed to the Back of the Teſticles: Its greater Globe is annexed to the Teſticles, conſiſting of one Veſſel or Paſſage above five Ells long: The leſſer Globe is connected to the Veſſel that carries the Seed. *Blanchard.* See *Teſtes*.

EPIGASTRICK *Artery*, is ſaid by ſome to be a Branch of the *Iliack Artery*; and diſtributes it ſelf amongſt the Muſcles of the *Epigaſtrius*.

EPIGASTRIUM, is the Fore-part of the *Abdomen* or *lowermoſt* Belly, whoſe upper Part is called *Hypochondrium*, the middle Part *Umbilicalis*, and the lowermoſt *Hypogaſtrium*.

EPIGLOTTIS, is the fifth Cartilage of the *Larynx*, the Cover of the Opening of the Wind-pipe: It is alſo called *Sublinguium*: See *Cion*.

EPIGONATIS, is the Whirl-bone of the Knee.

EPILEPSY, or *Morbus Caducus*, is the Falling-Sickneſs, becauſe that the Perſons affected fall down on a ſudden; or *Herculeus*, becauſe it is hard to be cured; alſo *Lues Deifica*, *Sonticus*, *Comitialis*, *Sacer*, &c.

EPINYCTIDES, are Pimples that ſend forth Matter, and are painful, eſpecially in the Night. *Blanchard.*

EPIPAROXYSMUS, is when a Patient endures more Fits in a Fever than uſual, which happens in inordinate Converſe. *Blanchard.*

EPIPEDOMETRY, in Mathematicks, ſignifies the meaſuring of Figures that ſtand on the ſame Baſe.

EPIPHONEMA, is an *Exclamation* containing ſome Sentence, or great Senſe, placed at the End of a Diſcourſe; being a preſſing and lively Reflection upon the Subject whereof we ſpeak.

EPIPHORA, in general, ſignifies a Deflexion of Humours into any part; but is more eſpecially applied to denote the Deflexion of a thin Rheum from the Eyes, which is commonly called involuntary Weeping, and flows continually from the Corners of the Eyes.

EPIPHYSIS, *Appendix*, *Adnaſcentia*, *Additamentum*, ſignify one Bone that grows to another by ſimple and immediate Contiguity, though not with ſo even a Surface, but with ſome kind of Ingreſs of one Bone into the Cavity of the other, like that Coarticulation wherewith the Bones form the Joints, but without any Motion. *Blanchard.*

EPIPHYLLOSPERMOUS *Plants*, are the ſame with the *Capillaries*, which bear their Seed on the Back-part of their Leaves: See *Capillaries*.

EPIPLASMA, the ſame with *Cataplaſma*.

EPILOCELE: See *Enteroepiplocele*.

EPIPLOIS *dextra*, a Branch of the *Cœliack* Artery, which runs through the Right Side of the inner or hinder Leaf of the Caul, and the *Colon* that is next to it.

EPIPLOIS *poſtica*, is a Branch of the *Cœliac* Artery, ſpringing out of the lower end of the *Splenica*, and running to the hinder Leaf of the *Omentum*, and the *Colon* annexed to it.

EPIPLOIS *ſiniſtra*, is a Branch of the *Cœliac* Artery, and is beſtowed on the Lower and Left Side of the *Omentum*.

EPIPLOMPHALUM, is a Navel Rupture, when it jets out by reaſon of the Inteſtines or Caul bearing too hard upon it.

EPIPLOON, *Omentum*, or *Reticula*, the Caul, is a Cover ſpread over the Inteſtines, ariſing from the bottom of the little Ventricle, and the Back of the Gut *Colon*; to wit, from the Doubling of the *Peritonæum*: It is ſhaped like a Net, or a Fowler's Bag; and abounds with ſeveral Sanguinary Veſſels. Its Uſe is to cheriſh the Stomach and the Guts with its Fat. *Blanchard.*

EPISARCIDIUM, the ſame with *Anaſcara*.

EPISEMASIA, is the very Time that a Diſeaſe firſt ſeizes a Perſon; and is properly called *Significatio*. *Blanchard.*

EPISION, is the Place of the Secret Parts, or *Aqualiculus*. *Blanchard.*

EPISPASTICKS, the ſame with *Attrahentia*, or Bliſters.

EPISPHÆRIA, are Windings and Turnings in the outer Subſtance of the Brain, that the Sanguiferous Veſſels may paſs more ſecurely. *Blanchard.*

EPISTO-

EPISTOMIA, are the utmoſt Gapings and Meetings of Veſſels.

EPISTROPHEUS, or *Cardo*, is the ſecond Vertebræ of the Neck; ſo called from turning, becauſe the Head turns upon it. *Blanchard.*

EPISTYLE, in Architecture, is a Maſs of Stone, or Piece of Timber laid upon the Capital of a Pillar.

The Ancient *Grecians* frequently made uſe of this Word, to ſignify that which we call the *Architrave.*

'Tis the firſt Member of the *Entablature*, and is uſually broken into two or three Diviſions, which the Architects call *Faſciæ*, Swathes, Fillets, Bands, or Liſts.

EPITHEME, is a Medicine of a Liquid Form, externally to be applied to ſome particular Part.

EPITRITUS, a Foot of a Latin Verſe conſiſting of four Syllables; of which the *Grammarians* reckon four kinds.

The Firſt is compounded of an *Iambus* and a *Spondæus*, as *Salutantes*, where the firſt Syllable is ſhort, and all the reſt long.

The Second is made out of a *Trochæus* and a *Spondæus*; as *Concitati*, where the firſt Syllable is long, the ſecond ſhort, and the two laſt long.

The Third is compounded of a *Spondæus*, and an *Iambus*; as *Communicans*, where the two firſt Syllables are long; the third ſhort, and the laſt long.

The Fourth conſiſts of a *Spondæus* and a *Trochæus*; as *Incantare*, where the three firſt Syllables are long, and the laſt ſhort.

EITROPE, is a Figure in Rhetorick, whereby we freely grant a thing that might be deny'd, to obtain another that we deſire.

EPNEUMATOSIS, the ſame with *Expiratio.*

EPOCHA, or *Epoche*, in Chronology, ſignifies ſome remarkable Occurrence, from whence ſome Nations date and meaſure their Computation of Time.

The *Julian Epocha* takes its Name from *Julius Cæſar*'s Reformation of the *Roman* Calendar; which was done 45 Years before Chriſt, in the 708 Year from the building of *Rome*, and in the 731 Olympiad.

The *Ethiopick Abyſſyn*, or as ſome call it, the *Diocletian Epocha*; others the *Æra* of the Martyrs, becauſe it bore Date with a very ſevere Perſecution: This *Epocha* began *Aug.* 29. *A. D.* 284. and in the firſt Year of the Emperor *Diocletian.* 'Tis uſed by the *Egyptians* and *Abyſſynes.*

The *Turkiſh* or *Arabick Epocha*, which they call the *Hegira*, bears Date from *Mahomet*'s Flight from *Mecca*, *A. D.* 622. *July* 16.

The *Perſick* or *Jeſdegerdick Epocha*, takes its Date either from the Coronation of the laſt *Perſian* King *Jeſdegerdis*, or *Jeſdagerdis*, as ſome ſay; or from his being conquered rather by *Ottoman* the *Saracen*, which was *June* 16. *A. D.* 632.

EPOMIS, is the upper part of the Shoulder, called alſo *Acroneum.*

EPOMPHALUM, is a Plaiſter, or any ſuch thing, applied to the Protuberances of the Navel.

EPULIS, is an Excreſcence in the Gums, which is ſo large, as ſometimes to hinder the opening of the Mouth.

EPULETICK *Medicines*, are the ſame with *Cicatrizantia.*

EQUABLE *Motions*, are ſuch as always continue the ſame Degree of Velocity, and are neither accelerated nor retarded; but if there be an Acceleration or Retardation of the Velocity of two or more Bodies, and it be exactly and uniformly the ſame in them both or all, they ſay ſuch Bodies are

EQUABLY Accelerated or retarded.

EQUALITY, is the exact Agreement of two things in reſpect of Quantity.

EQUANIMITY, is an even, equal, calm Frame of Mind and Temper under good or bad Fortune; whereby a Man appears to be neither Diſpirited, Soured, nor rendred Uneaſy by Adverſity; nor puffed up, nor overjoy'd with Proſperity.

EQUATION, or the *Total Proſtaphæreſis*, in the Ptolemaick Theory of the Planets, is the Difference between the Planets *mean* and *true* Motion; or the Angle made by the Lines of the true and mean Motion of the Center: But the

EQUATION or *Phyſical Proſtaphæreſis*, is the Difference between the Motions of the Center of the *Epicycle* in the *Equant*, and in the *Eccentrick*; as the

EQUATION, or *Optical Proſtaphæreſis*, is the Angle made by two Lines drawn from the Center of the *Epicycle* to the Centers of the World, and of the *Eccentrick.*

EQUATION *of the Orbit*, is the ſame with the *Total Proſtaphæreſis*, or *Equation Total.*

EQUATION, in Algebra, is a mutual comparing of two equal things of different Denominations; as $3s. = 36d.$ 10 Crowns $= 2l.\ 10s. = 500s. = 6000d. = 2400$ Farthings, &c. $a = b + d$, $36 = \frac{c + R}{2}$, &c.

The *Terms of an Equation*, are the ſeveral Quantities or Parts of which any Equation is compoſed, connected together by the Signs + and —: As in this Equation $a = b + c$, the Terms are a, b, and c, where 'tis ſuppoſed, that ſome Quantity repreſented by a, is equal to the Sum of b and c, or to b and c added together.

Whenever any Queſtion or Problem is propoſed in Algebra, we always ſuppoſe the thing *ſought* or *required* to be *known* or *done*; and then by putting the Letter a, or ſome other Vowel (moſt now uſe the laſt Letters of the Alphabet z, x, y) for the unknown Quantity, or for the Thing ſought, and Conſonants for whatever is *known* or *given*, in order to diſtinguiſh one from the other: The Queſtion or Problem is firſt throughly conſidered, and then duly ſtated; and after this judiciouſly compared, transformed, and varied by Addition, Subſtraction, Multiplication, Diviſion, Extraction of Roots, &c. according as the Nature of the Thing and the Rules of Art direct: till at laſt the Quantity ſought, or at leaſt ſome Power of it, becomes equal to ſome *known* or *given* Quantity, and ſo is it ſelf of conſequence diſcovered.

After a Queſtion is duly ſtated, 'tis proper to conſider whether it be ſubject to any *Limitations* or not: To which end the Writers of Algebra give theſe general Rules.

1. If the Quantities ſought or requir'd, are more than the number of the given Equations, the Queſtion is capable of innumerable Anſwers: See *Kerſey*'s *Algebra*, p. 301. Vol. 1.

2. But if the given Equations, independent one upon another, are juſt as many as the Quantities ſought, then the Queſtion hath only one certain and determinable number of Anſwers.

3. If the Quantities ſought or required, are leſs in number than the given Equations, the Queſtion is yet more limited, and is ſometimes diſcoverable to be impoſſible to be reſolved, by reaſon of ſuch Equations being inconſiſtent with each other.

Equations, in order to be reſolved, muſt firſt be prepared and reduced; which may be done by the following Rules.

1. If the Quantity ſought, or any Part or Degree of it be in Fractions, let all be reduced to one common Denomination, and then omitting the Denominators, let the Equation be continued in the Numerators only; *v. gr.* $\frac{a+b}{c} + d = 100 = B$. Then firſt, $\frac{a+b+cd}{c} = B$, and then $a + b + cd = cB$. Or if $a - b = \frac{aa+cc}{a} + b + b$; multiply all by d, and it will ſtand thus, $ad - db = aa + cc + db + db$. Or if $a - 75 = \frac{3}{4}bb + c - g$; multiply all by 4, then $4a - 300 = 3bb + 4c - 4g$. This is called by *Vieta*, *Iſomeria*, and by others *Converſion*.

2. When there is an intermixture of Quantities, known and unknown, in any Equation, let all the unknown Quantities (by Tranſpoſition) be made to poſſeſs only one Side of the Equation, and all the known ones another.

Tranſpoſition is always done by putting the Quantity over to the other Side with a contrary Sign to what it had before. The Demonſtration of which Rule depends on that Axiom, That if to, or from Equals, you add or ſubſtract Equal, the Sums or Remainder will be equal.

Thus, Suppoſe $a - 34 = 60$, then $a = 34 + 60 = 94$: Or if $a + b - d = b + c + e$, then $a - e = c + d$. If $4a - 300 = 3bb + 4c - 4g$, then $4a = 300 + 3bb + 4c - 4g$. If $36 + 44 = a - 60$, then $a = 140$.

3. If the higheſt Power or Species of the unknown Quantity, be multiplied into any known Quantity or Quantities, let the Whole be divided by ſuch known Quantity or Quantities.

Thus, If $5aa = 30000$, $aa = \frac{30000}{5} = 6000$.

If $ba + da = 100$, then $a = \frac{100}{b+d}$.

If $dee + dde = z$, then $ee + de = \frac{z}{d}$

This is called ſometimes *Depreſſion*, and by *Vieta*, *Paraboliſmus*.

4. If all the known Quantities happen to be multiplied into any Degree of the unknown one, let all be brought down (by Diviſion) to the loweſt Degree thereof that can be.

As if $aaaa + baaa = zzaa$, then by Diviſion of all by aa, $aa + ba = zz$.

If $aa + ab - ac = ad - fa$, then $a + b - c = d - f$, by Diviſion, and $a = d - b + c - f$, by Tranſpoſition.

If $ea + 9e - 7e = 15e + 34e - 10e$, then will $e + 9 - 7 = 15 + 34 - 10$, by Diviſion.

And $e + 2 = 39$; therefore, by Tranſpoſition, $e = 37$. This Rule is that which *Vieta* calls *Hypobibaſmus*.

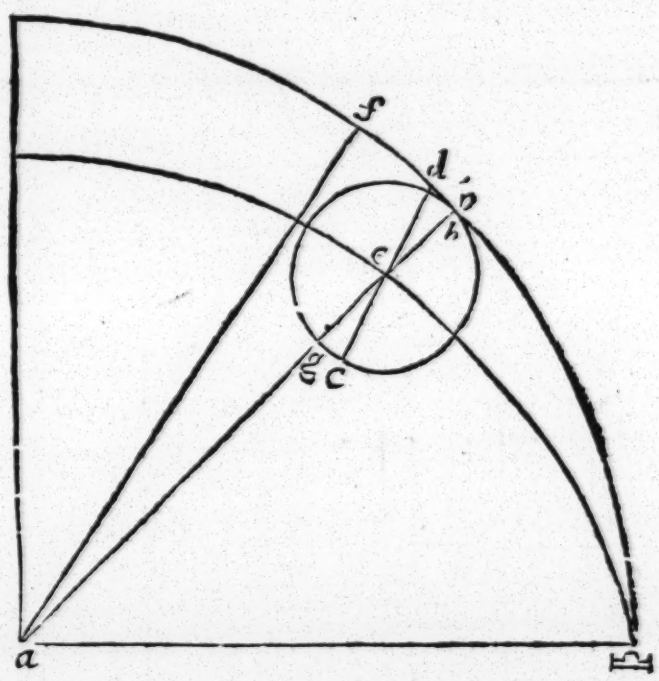
5. If any one Member of the Equation be a Surd Root, all muſt be raiſed up to that Power, and then the Equation continued.

Thus, if $\surd : ba + b = c$, then, by Tranſpoſition, $\surd : ab = c - b$, and by this Rule $cc - 2bc + bb = ab$: And by Rule the Third, $a = \frac{cc - 2bc + bb}{b}$.

EQUATION (*Annual*) of the mean Motion of the Sun and Moon, and of the Moon's *Apogee* and *Nodes*.

The *Annual Equation* of the mean Motion of the Sun, depends upon the Eccentricity of the Earth's Orbit round him; and is $16\frac{11}{12}$ ſuch Parts, of which the mean Diſtance between the Sun and the Earth is 1000: from whence, by ſome, 'tis called the *Equation of the Center*; and this, when greateſt, 1 Deg. 56'. 20". The greateſt *Annual Equation* of the Moon's mean Motion is 11'. 40". of its Apogee 20'. and of its Node 9'. 30". And theſe four Annual Equations are always mutually proportionable to one another; ſo that when any of them is at the Greateſt, the three others alſo will be Greateſt; and when any one Leſs, the reſt diminiſh in the ſame Ratio: Wherefore, the *Annual Equation* of the Center (of the Sun) being given, the other three correſponding *Equations* will be given; ſo that one Table (*i. e.* of the *Central Equation*) may ſerve for all.

EQUATION *of Time*, or of *Natural Days*, in Aſtronomy, as the Noble *Tycho* hath aſſerted, and our Famous Mr. *Street* demonſtrated, is the Difference between the Sun's true Longitude, and his right Aſcenſion.



Let the Center of the Sun be ſuppoſed at *a*, and of the Earth at *e*: Let ♎ *e* repreſent the Earth's Longitude in the Ecliptick, and ♎ the like Arch projected into the Equator: Let ♎ *b* be the Earth's (or Sun's) right Aſcenſion in its true Place; *g h* is a Diameter of the Equinoctial, and Meridian of the Earth's apparent Diurnal Revolution; *a b* is the Semi-diameter of the true Meridian and Equinoctial ſuppoſed in the Heavens; and *g h* is ſuppoſed to be parallel to *a b*, tho' they appear here but as one Line. Let *c d* be drawn parallel to *a f*, and be alſo a Diameter of the Equinoctial and Meridian of the mean or equal Revolution. It will then be plain, that *c e g*, which is the Angle of the Earth's Libration, muſt be equal to *b a f*, the Difference of Longitude and right Aſcenſion; and conſequently muſt be the true Equation of Time, or the Difference between the *equal* and *apparent* Time.

Dr. *Wallis* thus accounts for the Inequality of Natural Days.

The Natural Day is meaſured not only by one entire Converſion of the *Equinoctial* or 24 *Equinoctial* Hours, (which is indeed taken to be performed in equal Times) but increaſes by ſo much, as anſwers to that Part of the *Sun*'s (or *Earth*'s Annual Motion) as is performed in that Time. For when that Part of the *Equinoctial*, which (with the Sun) was at the Meridian Yeſterday at Noon, is come thither again to Day: It is not yet Noon, (becauſe

(becauſe the Sun is not now at the Place where Yeſterday he was, but is gone forward about one Degree more or leſs) but we muſt ſtay till that Place where the Sun now is, comes to the Meridian, before it be now Noon.

This Additament (above the 24 *Equinoctial Hours*, or entire Converſion of the *Equinoctial*) is upon a double Account unequal.

Firſt, Becauſe the Sun, by reaſon of its *Apogæum* and *Perigæum*, doth not at all Times of the Year, diſpatch in one Day an equal Arch of the *Ecliptick*; but greater Arches near the *Perigæum*, which is about the Middle of *December*; and leſſer near the *Apogæum*, which is about the Middle of *June*; as will appear ſufficiently by the *Tables* of the Sun's Annual Motion.

Secondly, Though the Sun ſhould in the *Ecliptick* move always at the ſame rate, yet equal Arches of the *Ecliptick*, do not in all Parts of the *Zodiack* anſwer to equal Arches of the *Equinoctial*, by which we are to eſtimate Time; becauſe ſome Parts of it, as the two Solſtitial Points, lie nearer to a parallel Poſition to the *Equinoctial* than others; as theſe about the two *Equinoctial* Points, where the *Ecliptick* and *Equinoctial* do interſect: Whereupon an Arch of the *Ecliptick* near the Solſtitial Points, anſwers to a greater Arch of the *Equinoctial*, than an Arch equal thereto near the *Equinoctial* Points; as doth ſufficiently appear by the Table of the Sun's Right Aſcenſion.

If you imagine another Sun to move in the Heavens in an equal Emotion, not in the *Ecliptick*, but in the *Equinoctial*; the Difference between their coming to the Meridian every Day (or to any one and the ſame Hour-circle) will be the *Equation of Time*. And becauſe the true Sun, and that Point of the Equator where his right Aſcenſion ends, come always to the Meridian together, the *Equation of Time* may be defined to be that Space of Time which is paſſed over, while an Arch of the Equator, comprehended between the extreme Point of the true Sun's Aſcenſion, and the Place of the feigned Sun, paſſes over the Meridian: And if this Arch be turned into Time, it gives the true *Equation of Time*. Dr. *Greg. Aſtron.*

Mr. Flamſteed's *Tables of* Equation of Natural Days.

EQUATOR: See *Equinoctial.*

EQUICRURAL: See *Iſoſceles.*

EQUICULUS, or *Equus minor*, a Conſtellation in the Northern Hemiſphere, conſiſting of 4 Stars.

EQUILATERAL *Triangle*: See *Triangle.*

EQUILIBRIUM, in Mechanicks, is when the two Ends of a Balance hang ſo exactly even and level, that neither doth aſcend or deſcend, but do both keep in a Poſition parallel to the Horizon; which is occaſioned by their being both charged with an equal Weight.

EQUIMULTIPLES, are Numbers or Quantities multiplied by one and the ſame Number or Quantity: See *Propoſition*, N°. 13.

EQUINOCTIAL, (in the Heavens) or Equator on the Earth, is a great Circle, whoſe Poles are the Poles of the World. It divides the Globe into two equal Parts; that is, the Northern and Southern Hemiſpheres. It paſſes through the Eaſt and Weſt Points of the Horizon: and at the Meridian is raiſed as much above the Horizon, as is the Complement of the Latitude of the Place.

Whenever the Sun cometh to this Circle, it maketh equal Days and Nights all round the Globe, becauſe he then always riſes due Eaſt, and ſets due Weſt, which he doth at no other time of the Year, whence it hath its Name. All Stars alſo which are under this Circle, or which have no Declination, do always riſe due Eaſt, and ſet full Weſt, &c.

All People living under this Circle, (which, in Geography, is called the Line) have their Days and Nights equal: At Noon the Sun is in their Zenith, or directly over their Heads, and caſts no Shadow.

From this Circle (on the Globes) is the Declination or Latitude accounted on the Meridian.

And the Circles which run through each Degree of Latitude or Declination, are called Parallels of Latitude or Declination.

Through this Equinoctial all the Hour-Circles are drawn at Right Angles to it, and through the Poles of the World, at every 15th Degree, on the Celeſtial Globe.

And the Equator on the Terreſtrial Globe is divided by the Meridians into 36 equal Parts.

The Natural Day is meaſured by the Revolution of the Equator, and is ended when the ſame Point of the Equator comes again to the ſame Meridian, which is in 24 Hours.

Wherefore ſince the Equator (as all great Circles are) is divided into 360 Degrees, each Hour muſt be $\frac{1}{24}$ of that Number, or 15 Degrees; therefore 1 Degree of the Equator will contain 4 Minutes of an Hour; and 15 Minutes of a Degree, will make a Minute of an Hour, or 60 Seconds; and conſequently 4 Seconds anſwer to one Minute of a Degree.

Hence the following Tables are made for converting Degrees and Minutes, &c. of the Equinoctial into Time, and *Vice verſa.*

TA-

TABLE I.

To convert Parts of the Equinoctial into Time.

Degrees.	Hours.	1
Minutes.	1	2
Seconds.	2	3
Thirds.	3	4
1	0	4
2	0	8
3	0	12
4	0	16
5	0	20
10	0	40
15	1	0
30	2	0
60	4	0
90	6	0
180	12	0
360	24	0

Whose Use is this:

Suppose you would readily know how many Hours, Minutes and Seconds, *&c.* there are in 19 Degrees, 13 Minutes, 7 Seconds of the Equator.

	H.	′	″	‴
Against 15 Degrees, in the first Table, you find	1	0	0	0
Against 4 Degrees	0	16	0	0
Also against 10 Minutes you will find	0	0	40	0
And against 3 Minutes	0	0	12	0
Then against 5 Seconds you will find	0	0	0	20
And against 2 Seconds you have	0	0	0	8
Add all up together, and it makes	1	16	52	28

TABLE II.

To convert Time into Parts of the Equinoctial.

Hours	Degr.	Minut.	Degr.	1
		Second	1	2
		Thirds	2	3
		Fourth	3	4
1	15	1	0	15
2	30	2	0	30
3	45	3	0	45
4	10	4	1	0
5	75	5	1	15
6	90	6	1	0
9	135	10	2	30
12	180	20	5	0
15	225	30	7	30
18	270	40	10	0
21	315	50	12	30
24	630	60	15	0

Again, for the Use of this Table.

Suppose you would find how many Degrees, Minutes, Seconds, *&c.* of the Equator, answer to 23 Hours, 25 Minutes, 17 Seconds, and 9 Thirds.

	H.	′	″	‴
Against 21 Hours, in the Table, you find	315	0	0	0
Against 2 Hours	30	0	0	0
Against 20 Minutes you have	5	0	0	0
And against 5 Minutes	1	15	0	0
Then against 10 Seconds you find	0	2	30	0
And against 5 Seconds	0	1	15	0
Against 2 Seconds	0	0	30	0
Then against 6 Thirds there is	0	0	1	30
And against 3 Thirds you have	0	0	0	45
All which added rightly together, make	351	19	17	15

EQUINOCTIAL *Colure*: See *Colure*.

EQUINOCTIAL *Dial*, is that whose Plane lies parallel to the *Equinoctial*.

To make this Dial, is no more than with 60 Degrees of your Line of Chords to describe a Circle, wherein draw two Diameters crossing each other at Right-Angles; then divide this Circle into 24 equal Parts or Hours, which subdivide as you please.

Note, That every Hour is 15 Degrees, therefore the Half-hour will be 7 Degrees, 30 Minutes, and the Quarter 3 Degrees, 45 Minutes.

That being done, ſet up a ſtraight Pin perpendicular to the Plane in the Center of the Circle, and place the Plane parallel to the Equinoctial, and the Meridian Line true North and South, and the Dial is fitted.

Theſe Dials are commonly ſet up in a Frame to be elevated to any Latitude.

EQUINOCTIAL *Orient*: See *Orient*.

EQUINOCTIAL *Occident*: See *Occident*.

EQUINOXES, are the preciſe Times in which the Sun enters into the firſt Point of *Aries* and *Libra*; for then moving exactly under the *Equinoctial*, he makes our Days and Nights equal. This he doth twice a Year, about the 10th of *March*, and 12th of *September*; which therefore are called the *Vernal* and *Autumnal Equinoxes*.

It is found by Aſtronomical Obſervation, That the Equinoctial Points (which are the firſt Points of the Signs *Aries* and *Libra*,) go backward every Year 50 Seconds.

And our admirable Sir *Iſaac Newton*, taking the Matter into Conſideration according to his Principles, found, by Calculation, That they muſt recede 49 Minutes, 58 Seconds, which is ſurprizingly near the Truth.

The Space from the *Vernal* to the *Autumnal Equinox*, is 8 or 9 Days longer than from the *Autumnal* to the *Vernal*, by reaſon of the Poſition of the *Perihelion* of the Earth's Orbit near the *Winter* Solſtice.

EQUINUS *Barbatus*, a kind of Comet, called alſo *Equinus Ellipticus*, *Equinus Quadrangularis*: See *Hippeus*.

EQUIPOLLENCE, in Logick, is when there is an *Equivalence* or Agreement, either as to the Nature of the Thing, or as to the Grammatical Senſe of any two, or more Propoſitions; or in plain Words, when two Propoſitions ſignify one and the ſame thing, tho' they expreſs it after different manners, they are properly ſaid to be *Equipollent*.

EQUITY, is the Virtue of treating all other Men according to common Reaſon and Juſtice, or as we would be gladly treated our ſelves, when we underſtand rightly what is our due.

EQUITY, in the Law, uſually ſignifies the *Court of Chancery*, where Controverſies are ſuppoſed to be determined according to the exact Rules of *Equity* and Conſcience, by mitigating the Rigor of the Common Law, tho' even by the Common and Statute Law there is alſo an *Equity*. *Æquitas ſequitur Legem*, is an old Maxim in Law; but from the great Increaſe of Suits in *Chancery*, ſome have thought fit to give it this Conſtruction, That in all Cauſes after a Man has been at Law, he muſt go into *Equity*.

EQUIVALENCE *in Things*, is that which expreſſes an Agreement in Nature or Circumſtances, between any two Things propoſed.

EQUIVOCAL, in Logick, is that which hath a doubtful or double Signification.

Any Equivocal Word, is that which contains more Significations than one, or that which ſerves for ſeveral Notions: See *Homonymous*.

EQUIVOCAL Generation, is the Production of Plants without Seed: Inſects or Animals without Parents in the Natural Way of Coition between Male and Female.

The Learned World begins now to be ſatisfied, that there is nothing like this in Nature; and ſince the Uſe of Microſcopes, and a more particular Application to Enquiries of this Kind, a prodigious Number of Plants have been diſcovered to have *Seeds*; and of Animals (*Inſects*) have been found to be produced Univocally, or in the ordinary way of Generation, which before were thought to be Equivocally produced. See *Vol.* II.

ERASED, the Herald's Word, expreſſing any thing violently torn off from its proper Place; and 'tis uſed in Contradiſtinction to Couped, which ſignifies a Thing clean cut off.

ERECT Declining Dials, are thoſe whoſe Planes are not directly oppoſite to any of the four Cardinal Points, but Decline from the Meridian or Prime Vertical Circle.

For the drawing of the Hour-Lines on theſe Dials, there is given the Latitude of the Place, and the Declination of the Plane, in order to find,

Firſt, The Height of the Style above the Plane.

Secondly, The Diſtance of the Subſtyle from the Meridian.

Thirdly, The Inclination of the Meridians, or Difference of the Meridians; which are all the Requiſites neceſſary to be known before the Dial can be deſcribed.

1. To find the Style's Height above the Plane, ſay,

As the Radius is to the Co-ſine of the Plane's Declination:
So is the Co-ſine of the Elevation of the Pole, to the Sine of the Style's Height.

2. To find the Subſtyle's Diſtance from the Meridian, ſay,

As the Radius is to the Sine of the Plane's Declination:
So is the Co-Tangent of the Elevation of the Pole, to the Tangent of the Subſtyle's Diſtance.

3. To find the Inclination of the Meridians, ſay,

As the Radius is to the Co-Tangent of the Declination:
So is the Sign of Elevation of the Pole, to the Co-Tangent of the Inclination of the Meridians.

Theſe being found; Then with a Line and Plumet, let fall a Perpendicular to the Horizon, and that ſhall be the Meridian or Hour Line of 12.

Then if your Plane decline {Weſtward, / Eaſtward,} place the Subſtyle's Diſtance (from the Line of Chords) to the {Right / Left} Hand of the Meridian.

Alſo having found the Inclination of the Meridians, find what Angle each Hour makes at the Pole with the Subſtyle, by ſubſtracting 15 Degrees for each Hour that is between the Subſtyle and Meridian, as long as it can be done from the Inclination of the Meridians; and by adding 15 Degrees for the other Hours.

And with the Hour-Angles at the Pole, find the Hour-Arches by this Proportion.

As the Radius: Is to the Sine of the Style's Height :: So is the Tangent of the Hour-Angle: To the Tangent of the Hour-Arch.

Of theſe Hour-Angles and Hour-Arches frame a Table, as was ſhewed in making a Horizontal-Dial.

Example

Example.

A *South Erect Dial, Declining Eaſtward* 45 Degrees, 00 Minutes. Latitude 51 Degrees, 32 Minutes.

The Requiſites may be found by the foregoing Canons, *viz*

The Height of the Style,	26	06
Subſtyle's Diſtance from the Meridian,	29	21
Inclination of Meridians,	51	57

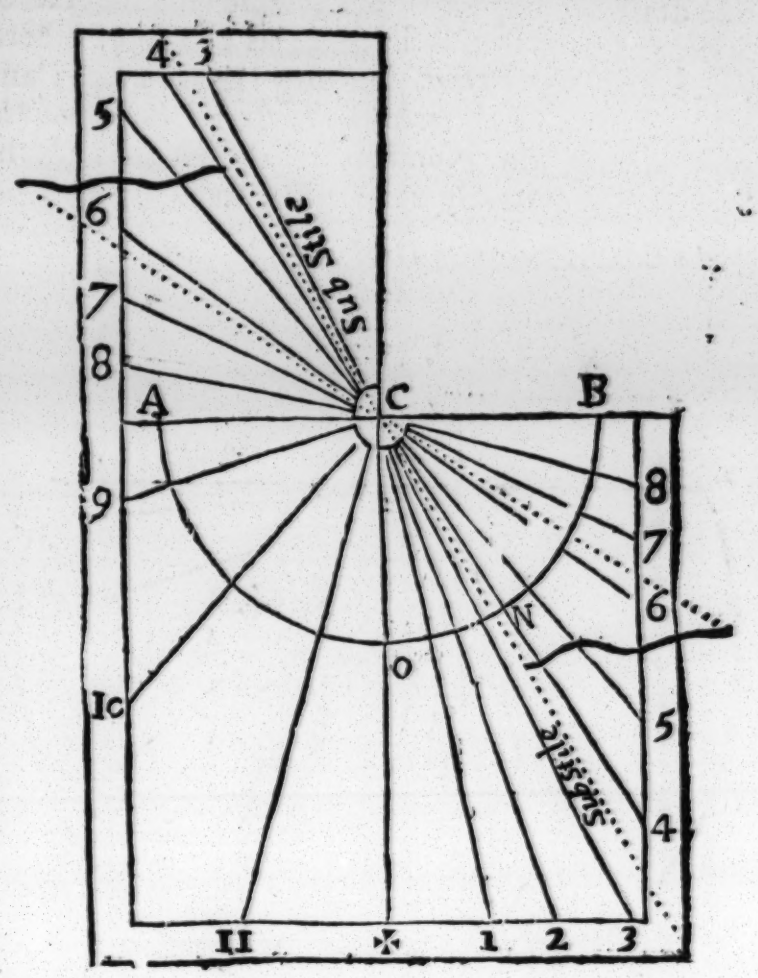
Now, ſince the *Inclination of Meridians* is leſs than 60 Degrees, and greater than 45 Degrees, 'tis certain the *Subſtyle* muſt be between 8 and 9 of the Clock.

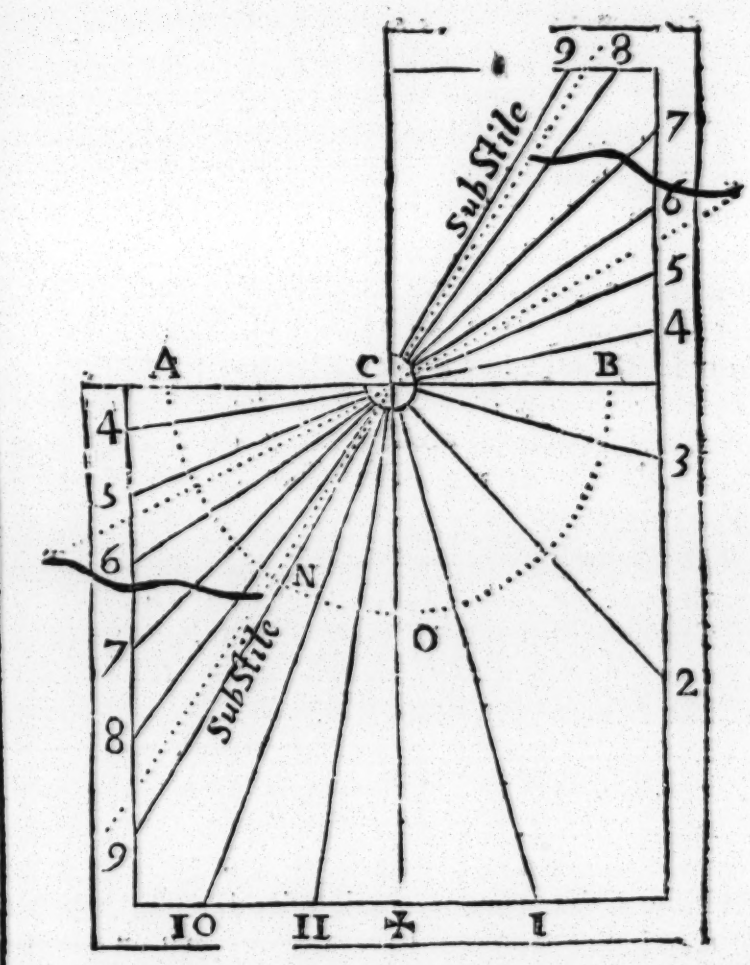
Then the *Hour-Angles at the Pole* are alſo found by ſubducting 15 Degrees from the *Inclination of Meridians* (ſuppoſed to be ſet againſt 12) the Remainder will be for the Hour 11; and from that Angle againſt 11, ſubſtract 15 Degrees, the Remainder ſet againſt 10; and from that Remainder ſubduct 15 Degrees, the Reſidue ſet againſt 9; and that becauſe 'tis leſs than 15 Degrees, take the Difference to 15 Degrees, which ſet againſt 8; then by continual Addition of 15 Degrees, you'll have the Numbers againſt the remaining Hours.

Laſtly, Find the *Hour-Arches* according to the Canon given for that Purpoſe: *viz.* by the continual Addition of the Sine of the *Style's Height*, 26 Degrees, 6 Minutes to the Tangent of every *Hour's Diſtance from the Subſtyle*, and that will give new Tangents of the *Hour-Arches*, as in the following Table.

The Eaſt Decliner.

Hurs	*Angles at Pole.* D.	M.	*Hour Arches.* D.	M.
3	83	3	74	31
4	68	3	47	31
5	53	3	30	20
6	38	3	19	01
7	23	3	10	37
8	8	3	3	34
Subſtyle	*Subſtyle*		*Subſtyle*	
9	6	57	2	26
10	11	57	10	3
11	36	57	18	19
12	51	57	29	21
1	66	57	45	58
2	81	57	72	27





To deſcribe the Dial.

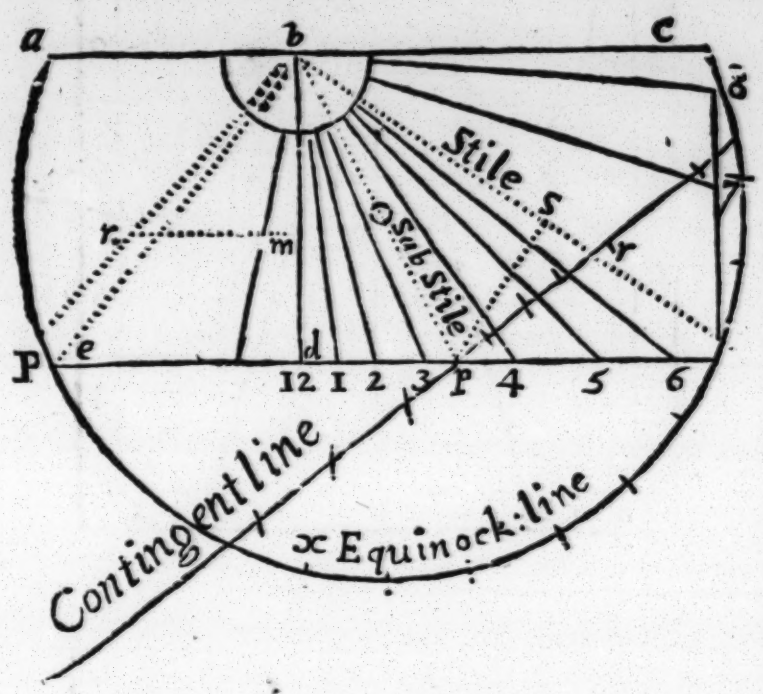
Firſt draw the *Horizontal Line ACB*, and at Right-angles to it the *Meridian CO* 12; then with 60 Degrees of your Line of Chords, from *C* deſcribe the Semi-circle *AOB*; and ſet off 29 Degrees, 21 Minutes (the *Diſtance of the Subſtyle from the Meridian*) from *O* to *N*, on the Weſt Side of the Meridian, becauſe the Plane declines Eaſt. Set off alſo the ſeveral Hour Arches (as) 10 Degrees, 37 Minutes for 7 and 5 a Clock, 18 Degrees, 19 Minutes for 11 and 1 a Clock, *&c.* both ways from the *Subſtyle* on the Circle *NRO*; and draw Lines from the Center *C* through theſe ſeveral Points: So you'll have the true Hour Lines deſired.

Then from your Chords, ſet off the *Style's Height* 26 Degrees, 6 Minutes from *N* to *R*; and a Right-line

line drawn through *R* from *C*, repreſents the Axis or Sryle, and your *Dial* is finiſhed; as alſo three others, *viz.* a *South Erect Dial, declining Weſt* as much; and a *North Erect Dial, declining Eaſt and Weſt* as much, only placing the Numbers of the Hours and the Style repreſentatively upon each Plane.

An Erect Declining Dial may be Geometrically made thus:

Having given the Elevation of the Pole, and Declination of the Plane;



Firſt draw two Lines interſecting each other at Right-angles: From the Point of Interſection, ſuppoſe *b*, make the Angle *e b d* equal to Elevation of the *Equator*; make another *n b d* equal to the Declination of the Plane. Draw *d e* perpendicular to the Meridian; from any Point taken at pleaſure, ſuppoſe *d*, make *b n = d e*; from *n* let fall a Perpendicular to the Meridian *n m*; let this Perpendicular *n m* be transferred, and ſet upon the former Perpendicular on the other Side of the Meridian equal to *d p*.

Let the *Subſtyle* be drawn through *b* and *p*; unto which, in the point *p*, draw a Perpendicular for the *Contingent*, as *p r*: Then from *b*, through *r*, draw the Style, whoſe Altitude above the Subſtyle ſhall be equal to the Angle *p b r*.

From *p* to the Style, let fall the Perpendicular *p s*; make *p o* on the Subſtyle equal to *p s*: From *o*, at any Diſtance, deſcribe the Equinoctial Circle, which divide into 24 or 48 parts, beginning your Diviſion in that part of the Circle, *W*, which is cut by the Ruler applied to *o* and *x*, which is the point of Interſection of the *Contingent* and the *Meridian*.

Make points in the *Contingent*, where 'tis cut by a Ruler applied to the Center *o*, and every Diviſion; through which points, from the Center *b*, draw the Hour-Lines.

ERECT *Declining Planes*: See *Dial Planes*.

ERECT *Direct Planes*: See *Dial Planes*.

ERECT *Direct Eaſt or Weſt Dials*: See *Direct Erect Eaſt or Weſt Dials*.

ERECT *Direct South or North Dials*: See *Prime Vertical*.

ERECTORES *Penis*, by ſome called *Erigentes*, by others *Directores*, by *Spigelius*, *Collaterales Penis*; are a pair of Muſcles ariſing Fleſhy from the outward Knob of the *Os Iſchium*, below the Beginning of the Cavernous Bodies of the *Penis*, in whoſe thick Membranes they are inſerted: Their Uſe is to help to erect the *Penis*, which they do by pulling towards the *Oſſa Pubis*, whereby its greateſt Vein is compreſt, and the refluent Blood denied its paſſage under thoſe Bones, and therefore the *Penis* muſt ſwell.

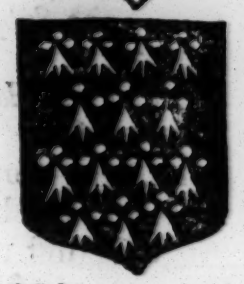
ERICHTHONIUS: See *Auriga*.

ERIDANUS, or *Radus*, a Southern Conſtellation conſiſting of 28 Stars.

ERMENOIS, is when the Field is Or, and the Powdering is Sable.

ERMIN, in Heraldry, ſignifies a Coat where the Field is Argent, and the Powdering is Sable.

And on the contrary,



ERMINES, is when the Field is Sable, and the Powdering Argent.

ERODENTIA, are Medicines which grow and prey upon the Fleſh with their Acute Particles. *Blanchard.*

ERPES: See *Herpes*.

ERRHINES, are Medicines deſigned to purge away pituitous Humours from the Head, without making the Patient ſneeze, tho' to be taken up the Noſe. They are either *Liquid*, *Soft*, or *Solid*.

The *Liquid* are made of the Juices of *Cephalick*, cleanſing Herbs, extracted by Wine or other Liquors; to which Spirit of Wine is ſometimes added; or of a Decoction of fit Simples, to which are added ſometimes Juices, Honey, Syrup, and Powders too.

The *Soft* is made of Powders, with Honey, Oil, or Juices, boiled to a kind of Ointment.

The *Solid* is given either in form of a Powder, and that has place eſpecially in Medicines which provoke Sneezing; or in form of a Pellet, and it is called *Naſale*, and is prepared of fit Powders mixed with viſcid Extractions from Seeds, Gums, Roots, *&c.* with Wax, or with Turpentine. *Blanchard.*

ERRONES, or *Erratick*, or *Wandring Stars*; the ſame with the *Planets*.

ERROR, in Law, ſignifies a Fault in pleading, or in the Proceſs, and thereupon the *Writ of Error* is brought to remedy this Overſight; which *Writ* is that which lieth to redreſs falſe Judgments given in any Court of Record.

There is likewiſe a *Writ of Error* to reverſe a Fine or Recoveries; and for redreſſing and preventing *Errors* in Fines and Recoveries: *Vide* the Statute 23 *Car.* 1. *C.* 3. for inrolling them; and *vide* 16th of *Car.* 2. *C.* 4.

ERYSIPELAS, is a Swelling of a bright yellowiſh Colour, inclining to Red (whence its Name is derived) poſſeſſing the Skin, and going no deeper, attended with a pricking Pain, but not beating; it hath a Sympatomatick Fever accompanying it uſually; it is apt to ſpread, and ſometimes bliſters the Skin: If the Skin be preſſed with the Finger, it yieldeth, and the Redneſs vaniſhes for a time.

ERYSIPELATODES, is a Swelling like the former, tho' with eaſier Symptoms; and therefore may be taken for a kind of *Baſtard Eryſipelas*; in it the Skin is of a more dark Colour.

ERYTHREMATA, are red Spots like Fleabites, commonly in Peſtilential Fevers. *Blanchard.*

ERYTHROIDES, is the Red Membrane of the Teſticles, the firſt of the proper Tunicks. *Blanchard.*

ESCALADE, or *Scalade*, is a furious Attack upon a Wall,

Wall, or a Rampart, carried on with Ladders to mount up upon it, without going on in form, breaking Ground, or carrying on of Works to ſecure the Men.

ESCARP: See *Scharp*.

ESCHAR, is a Cruſt, or hard Skin, Rind, or Shell brought over any Ulcer, or raiſed with a red hot Searing-Iron.

ESCHAROTIE, is a Searing-Iron, actual Fone, a Cautery, or the like, which burns the Skin and Fleſh into a cruſty Subſtance. *Blanchard.*

ESCHEAT, in Law, ſignifies any Lands or other Profits that fall to a Landlord within his Manor by way of Forfeiture, or the Death of his Tenant, dying without Heir General or Special, or leaving his Heir within Age, and Unmarried. *Mag. Charta, Chap.* 31.

ESCHEATOR, is an Officer who takes notice of the King's Eſcheats in the Country, and certifies them into the Exchequer.

ESCOCHEON *of Pretence*, is an Ineſcocheon, or little Eſcocheon, which a Man that hath married an Heireſs, and hath Iſſue by her, may bear over his own Coat of Arms, and in it the Arms of his Wife; and the ſurviving Iſſue will beat both Coats Quarterly.

ESCOUADE, is uſually the third part of the Company of Foot; 'tis ſo divided for mounting of Guards, and for the more convenient relieving one another: 'Tis equivalent to a *Brigade* of a Troop of Horſe.

ESCUTCHEON (from *Scutum* a Shield) is the Coat or Field on which any Arms are born in Heraldry; 'tis uſually of this Form: And in it the Heralds give divers Names to ſeveral Points or Places: Thus, the Point D, they call the *Dexter Chief*; C, is the *Middle Chief*; and S, the *Sinifter Chief Point*; H, is called the *Honour Point*; and F, the *Feſſe Point*; N, is called the *Nombril Point*; and *d*, the *Dexter-Baſe*; B, the *Middle*; and *s*, the *Sinifter Baſe-Point*.

ESPAULEMENT, the ſame with *Epaulement*, a Work in Fortification made on the Side of a Baſtion, of either Earth thrown up, Gabions, Faſcines, &c. And thoſe Epaulements which are for the Places of Arms for the Cavalry behind the Trenches, are uſually made only of Faſcines and Earth. This Word ſignifies alſo ſometimes a *Demi-Baſtion*; and ſometimes 'tis uſed for a Square Orillon, or a Square Maſs of Earth, faced or lined with a Wall, deſigned to cover the Cannon of a *Cazemate*.

ESPAUL, or *Epaule*; (which ſee in Fortification, the ſame with the Shoulder of a Baſtion, or the *Angle of the Shoulder*; which ſee.

ESPLEES, a Term in Law, ſignifying the full Profit that the Ground or Land yieldeth.

ESPLENADE, a Term in Fortification, the ſame with the Glacis of the Counterſcarp originally; but now 'tis uſually taken for the empty Space between the Glacis of a Cittadel, and the firſt Houſes of the Town.

ESSENCE, is that which conſtitutes the peculiar Nature of any thing, and makes it be what it is. Thus the Eſſence of a Circle is, that its Radii, or Semi-diameters be all equal; the Eſſence of a Square is, that it have 4 Right-angles, and 4 equal Right-lined Sides.

ESSENCE alſo, in Chymiſtry, ſignifies the *Balſamick* part of any thing ſeparated from the thicker Matter, ſo that whenever this is done by means of Extraction, the *Balſamick* part is called *Eſſence*, by way of Eminence; ſometimes thickned Juices are called *Eſſences*: But 'tis better to call theſe by their own Name, to avoid Confuſion. Some call Compounds of Oil and Sugar *Eſſences*; but it is an Abuſe of the Word. *Blanchard.*

ESSENDI *quietum de Tolonia*, is a Writ that lieth for Citizens and Burgeſſes of any City or Town, that hath a Charter or Preſcription, to exempt them from Toll through the whole Realm, if the ſame happen to be any where exacted of them.

ESSENTIAL *Properties*, are ſuch as neceſſarily depend on the Nature and Eſſence of any thing. Thus 'tis the Eſſential Property of every Rectilineal Triangle, to have the Sum of its 3 Angles equal to 2 Right ones. And of every Rectangled Triangle to have the Square of the Hypotenuſe equal to the Sum of the Squares of the Legs.

ESSENTIAL *Salt* of Plants is thus drawn: The Plant is pounded in a Mortar, and its Juice extracted and filtrated, which after that is ſet in a Cellar, or ſome ſuch cool Place to Cryſtallize, and the Salt will ſhoot out into Cryſtals every way. This Salt is the true or *Eſſential Salt* of the Plant: for here is no change at all made in it by the force of Fire, but the means of drawing it are eaſy and natural.

ESSERE, *Sora*, and *Sare*, are little Puſhes or Wheals, ſomething red and hard, which quickly infect the whole Body with a violent itching, as if one were ſtung with Bees, or Waſps, or Flies, or Nettles; yet they vaniſh after a little time, and leave the Skin as ſmooth and well colour'd as before. It differs from an *Epinychis* in this, that an *Epinychis* ſweats out Matter, but an *Eſſere* does not. *Blanchard.*

ESSOYNE, in Law, ſignifies the Allegation of an Excuſe from him that is ſummon'd to appear, and anſwer to an Action Real, or to perform Suit to a Court Baron upon juſt Cauſe of Abſence. This the *Civilians* call *Excuſatio.*

The Cauſes that ſerve to *Eſſoyne* any Man ſummon'd, are divers; but drawn chiefly to 5 Heads: Whereof

The Firſt is, *Ultra Mare*, whereby the Defendant ſhall have 40 Days.

The Second, *De Terra Sancta*, where the Defendant ſhall have a Year and a Day, and theſe muſt be laid in the beginning of the Plea.

The Third is called, *Malo Veniendi*, call'd alſo *Common Eſſoyne.*

The Fourth is, *De malo lecti.*

The Fifth, *De Servitio Regis.*

ESSONIO *de malo lecti*, is a Writ directed to the Sheriff, for the ſending of 4 lawful Knights to view one that hath *Eſſoyn'd* himſelf, *De malo lecti.*

ESTIVAL *Occident*: See *Occident.*

ESTIVAL *Orient*: See *Orient.*

ESTIVAL *Solſtice.*

ESTOPPEL, (in Law) ſignifies as much as an Impediment, or Bar of an Action, growing from his own Fact, that hath, or otherwiſe might have had this Action.

ESTREAT, in Law, is uſed for the true Copy or Duplicate of an Original Writing.

For Example, Of Amerciaments or Penalties ſet down in the Rolls of a Court, to be levied by the Bayliff, or other Officer, of every Man for his Offence.

ESTREPE, in Law, is to make Spoil by a Tenant for Life in Lands, or Woods, to the Prejudice of him in Reverſion.

And

And *Eſtrepament* ſignifies the Spoil made by Tenant for Life upon any Lands or Woods, to the Prejudice of the Reverſioner.

ESURINE *Salts*, are ſuch as are of a corroding, fretting, and eating Nature; they abound in the Air of Places ſituate near the Sea ſide, and where great Quantities of Coal are burnt; as appears from the ſpeedy ruſting of the Iron-Bars in the Windows, *&c.* of Houſes built in ſuch Places.

ETAPPE, in the Art of War, is the Allowance of Proviſions and Forage, which Soldiers have in their March thro' the Kingdom to or from Winter-Quarters. Wherefore the

ETAPPIER, is he that contracts with any Country, or Territory, for furniſhing Troops in their March with Proviſions and Forage.

ETATE *probanda*: See *Ætate probanda*.

ETCHING, is a way uſed in making Prints, by drawing with a Needle upon a Copper-plate covered over with a Ground of Wax, *&c.* and well blacked with the Smoke of a Link, that it may take off the Figure of the Drawing or Print, which having its back-ſide Tinctured with white Lead, will by running over the ſtrucken-out Lines with a *Stift*, impreſs the exact Figure on the Black or Red Ground; which Figure is afterwards with Needles, drawn deeper quite thro' the Ground, and all the *Shadows* and *Hatchings* put in: and then a Wax Border being made all round the Plate, there is poured on a ſufficient Quantity of well-tempered *Aqua-Fortis*, which inſinuating into the Stroaks, made by the Needles in the *Ground*, eats the Figure of the Print or *Drawing* into the Copper-Plate. There is no certain Time in which this is done, but uſually the *Aqua-Fortis* will eat deep enough in about half an Hour. *Brown's Ars Pictoria.*

ETHERIAL *Oil*, ſo the Chymiſts call a very fine or exalted Oil, or rather Spirit that is inflammable; as *Oil of Turpentine*, *&c.*

ETHICKS, is that Art which teaches us to ſeek out thoſe Rules and Meaſures of Human Actions, that lead to true Morality and Happineſs; and which acquaints us with the Means to practice them.

The Writers upon it uſually divide it into two Parts;

The First contains an Account of the Nature of Moral Good and Evil. And

The other Enumerates the ſeveral Virtues in which the Practice and Exerciſe of Morality conſiſts; and which are the proper Means for us to obtain true Felicity, the End of all Moral Actions.

ETHMOIDALIS, is a Suture that ſurrounds a Bone of that Name, and ſeparates it from the Bones which are about it.

ETHMOIDES, is a Bone which reſembles a Sieve, placed above the inner part of the Noſe, and full of little Holes to receive the Serous and Pituitous Humours from the ſoft Pappy Proceſſes of the Brain. *Blanchard.*

ETYMOLOGY, is that part of *Grammar*, which teaches the Original of Words, in order the better to diſtinguiſh and eſtabliſh their true Signification.

EVANID, ſo ſome call thoſe Colours which are not of very long duration, as thoſe in the Rainbow, in Clouds before and after Sun-ſet, *&c.* Theſe alſo are called *Fantaſtical* and *Emphatical* Colours; which ſee.

EVAPORATION, in Chymiſtry, is when any Liquor is ſet over a gentle Heat, that the Fire may gently carry off ſome of the Moiſture, and yet not leſſen the Quantity of the Matter the Liquor is impregnated with; to *Evaporate to a Pellicle*: See *Pellicle*.

EUCHYMIA, is a good Temper of the Blood, or other Juices, or Fluids in an Animal Body.

EUCRASIA, is a good Temper of the Parts of the Body.

EVECTION, or *Libration* of the Moon, is an Inequality in her Motion, by which, at or near the Quarters, ſhe is not in that Line which paſſeth thro' the Center of the Earth to the Sun, as ſhe is at her Syzygies, or Conjunction and Oppoſition, but makes an Angle with that Line of 2 Degrees 50 Minutes, according to the Obſervation of *Tycho* and *Bullialdus*.

The Moon revolving uniformly about her Axis, in a Month's time, makes her Day to be of a Month in length; and her Face always is turned the ſame way towards the lower *Umbilicus* of her Orbit; and for that Reaſon, and the Poſition of the *Umbilicus*, deviates this way and that way a little from the Earth: which is her *Libration in Longitude*: But her Libration in Latitude, is occaſioned by the Inclination of the Moon's Axis to the Plane of the Orbit.

EVEN *Number*, is that which may be divided into two Parts; as 4, 10, 40, *&c.* are *Even Numbers*, foraſmuch as each of them may be divided into two equal Parts.

EVENLY *Even*, is that which an *Even Number* doth meaſure by an *Even* one; as 32 is ſaid to be a Number *Evenly Even*, becauſe 8, an *Even Number*, doth Meaſure it by 4, which is likewiſe an *Even Number*.

EVENLY *Odd*, is that which an *Even Number* doth meaſure by an *Odd* one; as 30, which 2 or 6, *Even Numbers*, do meaſure by 15 or 5 *Odd Numbers*.

EUEXIA, is a good ſound Habit of Body.

EVOLUTION, is uſed by Dr. *Pell*, and others, for the Extraction of Roots out of any Powers; and ſo is directly contrary to Involution; which ſee.

EVOLUTION, in *Tacticks*, is the Motion made by a Body of Men in changing their Poſture, or Form of drawing up; either to make good the Ground they are upon, or to poſſeſs themſelves of another; that ſo they may attack the Enemy, or receive his Onſet more advantageouſly: And theſe *Evolutions*, are *Doubling of Ranks, or of Files, Countermarches*, and *Wheelings*.

EUPEPSIA, a good and eaſy Digeſtion.

EUPHORIA, is the well-bearing of the Operation of a Medicine; that is, when the Sick Perſon finds himſelf eas'd or reliev'd by it; then they ſay it wrought upon the Patient *cum Euphoria*.

EUPNOEA, is a right natural Reſpiration.

EUPORIA, is an eaſy Preparation of Medicines, or the Eaſineſs of their Operation. *Blanchard.*

EURYTHMY, in Architecture, ſignifies the exact Proportion between all the Parts of a Building.

EUSARCOS, is one that is well fleſhed. *Blanchard.*

EUSTOMACHUS, is a good Stomach; as alſo Meat convenient for it.

EUSTYLE, in Architecture, is a kind of Edifice where the Pillars are placed at a moſt convenient diſtance one from another; the *Intercolumniations* being all juſt two Diameters and a quarter of the Pillar, except thoſe in the middle of the Face before and behind, which are in diſtance three Diameters.

EUTHANASIA, is a ſoft quiet Death, or an eaſy Paſſage out of this World.

EUTROPHIA, is a due Nouriſhment of the Body.

EXACERBATIO: See *Paroxyſmus*.

EXA-

EXACTION, in Law, is a Wrong done by an Officer or one pretending to have Authority in taking a Reward or Fee for that which the Law allows not. The Difference between *Exaction* and *Extortion* is this:

Extortion, is where an Officer extorts more than his Due.

Exaction, is where he wrests a Fee or Reward where none is due.

EXÆRESIS, is an Extraction of things out of the Body, that are hurtful to it.

EXAGOON, the same with *Hexagon*.

EXAMINERS *in Chancery*, are two Officers that *Examine*, upon Oath, Witnesses produced on either side, upon such Interrogatories as the Parties to any Suit do exhibit to that purpose; and sometimes the Parties themselves are by particular order examined also by them.

EXANASTOMOSIS, is an opening of the Extremity of the Vessels. *Blanchard.*

EXANTHEMA, is a certain Efflorescence upon the Skin of the Head, like those which appear in the Skin of the whole Body. It is described two ways by *Sennertus*; one is, that at least it changes the colour of the Skin, as in continued malignant Fevers, wherein the Skin is spotted as with Flea-bites; the other is, when certain little Swellings break out of the Skin, which may be call'd *Papillæ*. *Blanchard.*

EXARTHREMA, the same with *Luxatio*.

EXARTICULATION: See *Dislocation*.

EXCENTRICK, the same with *Eccentrick*.

EXCEPTIO, is the incorporation or mixture of dry Powders with some Moisture or other. Thus Electuaries are made, Powders and Pulps are mixt with Honey or Syrup; and the Powder of Pills with Syrup, Honey, Wine or Juice.

EXCEPTIVE *Propositions*, are those where a Thing is affirmed of the whole Subject, except some one of the Inferiors of the Subject, by adding a Particle of Exception, which denotes that what is predicated does not agree with that Inferior, which visibly includes two Judgments, and renders those Propositions composed in Sense. As if one should say, None of the Sects of the ancient Philosophers, except that of the *Platonic*, have acknowledg'd God to be Incorporeal. The Covetous Man does nothing well, but when he dies.

EXCHANGE, in Common Law, is as much as *Permutation* with the *Civilians*. It hath a peculiar Signification, and is used for that Compensation which the Warranter must make to the Warrantee, Value for Value, if the Land warranted be recovered from the Warrantee.

EXCHEQUER, is the Court or Place to which are brought all the Revenues belonging to the Crown.

This Court consists, as it were, of two Parts, whereof one dealeth Specially, in the hearing and deciding of all Causes appertaining to the Prince's Coffers: The other is called, *The Receipt of the Exchequer*, which is properly employ'd in the receiving and paying Money. It is also a Court of Record, wherein all Causes touching the Revenues of the Crown are handled.

EXCISION, the cutting out, or cutting off of any part of the Body.

EXCLAMATION, is a violent Extension of the Voice, when the Mind comes to be disturbed and agitated with some furious Impulse or Passion.

EXCLUSIVE *Propositions*, are those which denote, that a Predicate so agrees with its Subject, as to agree with that alone, and no other: Whence it follows, that they include two various Judgments, and by consequence are composed in Sense. Which is expressed by the Word (*only*) or some such like Words: Thus, *Virtue only makes Nobility, nothing else renders a Man truly Noble.*

EXCOMMUNICATO *Capiendo*, is a Writ directed to the Sheriff, for the Apprehension of him who standeth obstinately excommunicated Forty Days; for such a one not seeking Absolution, hath, or may have, his Contempt certified into the *Chancery*; whence issueth this Writ for the laying of him up without Bail or Mainprise, until he conform himself.

EXCOMMUNICATO *Deliberando*, is a Writ to the under Sheriff, for the Delivery of an Excommunicate Person out of Prison, upon Certificate of the Ordinary of his Conformity to the Jurisdiction Ecclesiastical.

EXCOMMUNICATO *Recipiendo*, is a Writ whereby Persons excommunicated being for their Obstinacy committed to Prison, and unlawfully delivered thence before they have given Caution to obey the Authority of the Church, are commanded to be sought for, and laid up again.

EXCORIATION, is when the Skin is rubb'd or torn off, or fretted away from any part of the Flesh.

EXCORTICATION: See *Decortication*.

EXCREMENTS, of an Animal Body, are whatsoever is separated from the Aliments after Concoction, and is to be thrown out of the Body; as the Moisture of the Mouth, Spittle, Snot, Milk, Bile, Sweat, the Wax of the Ears, the Excrements of the Belly and Bladder. *Blanchard.*

EXCRESCENCE, any sort of Swelling, and more particularly a Fleshy Tumour.

EXCRETION, the separating of Excrements or Excrementitious Humours from the Aliments and Blood.

EXECUTION, in Common Law, signifies the last Performance of an Act: As of a *Fine*, or of a *Judgment*, that of a *Fine*, is the obtaining Possession actually of things contained in the same by vertue thereof, which is either by Entry into the Lands, or by Writ.

There are two sorts of *Executions*, one *Final*, another with a *Quousque* tending to an End.

An *Execution Final*, is that which maketh Money of the Defendant's Goods, or extendeth his Lands, and delivereth them to the Plaintiff; for this the Party accepteth in Satisfaction, and this is the End of the Suit, and all that the King's Writ commandeth to be done.

The other Sort with a *Quousque* is tending to an End, and not Final, as in the Case of a *Capias ad Satisfaciendum*, &c. This is not Final, but the Body of the Party is to be taken, to the intent and purpose to satisfy the Defendant; and his Imprisonment is not absolute, but until the Defendant do satisfy: So that the Body is but a Pledge for the Debt.

EXECUTIONE *facienda*, is a Writ commanding Execution of a Judgment.

EXECUTIONE *facienda in Withernamium*, is a Writ that lieth for the taking of his Cattle, who formerly hath convey'd out of the Country the Cattle of another; so that the Bayliff having Authority from the Sheriff to replevy the Cattle so convey'd away, could not execute his Charge.

EXECUTOR, is he that is appointed by any Man in his Last Will and Testament, to have the disposing of all his Substance, according to the Contents of the said Will. This *Executor* is either *Particular* or *Universal: Particular*, as if this or that thing

tendinous, but chiefly fleshy Origination from the *Ulna*, immediately below the beginning of the *Extensor primi Internodii*, or between it and the Indicator; as also from the Ligament between the last named Bone and the *Radius*, whence descending obliquely, becoming Tendinous as it marches in a proper *Sinus* on the inferior *Appendix* of the *Radius*, wherein it's enclosed by its Annular Ligament, and passes over the two Tendons of the *Radialis extensor*, to its Insertion at the superior part of the third Bone of the Thumb. When this acts, it does not only extend the Thumb, but brings it somewhat backwards, insomuch that some Persons can place it on the superior and back part of the *Ossa Metacarpi*.

EXTENSOR *minimi digiti*, is a Muscle which arises partly Tendinous at the Extremity of the external *Apophysis* of the *Os Humeri*; and partly Fleshy from the superior part of the *Ulna*, between the *Extensor Communis Digitorum*, and *Musculi Ulnaris Extensor*, and becoming Tendinous as it passes under the *Ligamentum Annulare* at the *Carpus*, it is there divided into two, sometimes three Tendons, which are united in one at its Insertion to the superior part of the third Bone of the Little Finger. Its Name declares its Action.

EXTENSOR *Pollicis Pedis Brevis*, is a Muscle of the great Toe, arising Fleshy from the fore part of the *Os Calcis*, being dilated into a Belly, soon becomes a long slender Tendon, passing obliquely over the upper part of the Foot, and is inserted to the superior part of the second Bone of the great Toe, which it extends or pulls upwards.

EXTENSOR *Pollicis Pedis Longus*, is a Muscle of the great Toe, which takes its Beginning large and fleshy, from the fore part of the *Fibula*, from immediately below its superior *Appendix*, to four Finger's Breadth above the inferior one, and descending under the *Ligamentum Annulare* of the *Tarsus*, between the Tendon of the *Tibialis Anticus* and those Tendons of *Extensor Pedis Longus*, and marching along the superior part of the Foot, is inserted to the upper part of the second Bone of the Great Toe. Its Name intimates its Use to be, to extend the Toe.

EXTENT, in Law, hath two Significations, sometimes signifying a Writ or Commission to the Sheriff for the valuing of Lands or Tenements; sometimes the Act of the Sheriff upon this Writ. But it frequently signifies the Estimate or Valuation of Lands, which, when done to the utmost Value, was said to be in the full *Extent*.

EXTERGENT *Remedies*: See *Abstergent*.

EXTERIOR *Polygon*: See *Polygon exterior*.

EXTERIOR *Talus*: See *Talus*.

EXTERNAL *Angles*: See *Angles external*.

EXTERNUS *Auris, vel Luxator externus*, is a Muscle which lies in the upper part of the *Meatus Auditorius*, having a short fleshy Body, with a long slender Tendon. It arises from the external and superior Margin of the *Meatus Auditorius*, soon becoming a slender Tendon, passes directly to the upper part of the *Membrana Tympani*, on which it descends for some space to its Insertion in the long Process of the *Malleus*, where it is contiguous to the said Membrane. This draws the *Manubrium* of the *Malleus*, together with the *Membrana Tympani*, forwards.

EXTIRPATIONE, is a Writ Judicial that lyeth against him, who, after a Verdict found against him for Land, &c. doth maliciously overthrow any House upon it, &c. And 'tis either *ante Judicium*, or *post Judicium*.

EXTINGUISHMENT, in Law, is an Effect of Consolidation; as if a Man have a Yearly Rent due to him out of any Lands, and afterwards purchase the same Lands; now both the Property and Rent are consolidated or united into one Possessor, and therefore the Rent is said to be *extinguished*. Also, where a Man hath a Lease for Years, and afterwards buyeth the Property; this is a Consolidation of the Property and the Fruits, and is an *Extinguishment* of the Lease. So if a Man have a High-way Appendant, and after purchase the Land whereon the High-way is, then the High-way is *extinct*; and so it is of Common Appendant.

EXTIRPATION, is the cutting off, or out of the Body any Part; tho' cutting off a Part is more properly called *Amputation*.

EXTORTION, a Law Term, signifying an unlawful or violent wringing of Money, or Money-worth from any Man: As also, the Exaction of unlawful Usury, winning by unlawful Games, and all taking more than is due.

EXTRACT, is that pure, unmix'd, and efficacious Substance, which, by the help of some Liquor, is separated from the duller and more unactive parts of Plants, &c. This Extract is usually of the Consistence of a stiff Electuary. All Extracts of Vegetables are made after the following manner.

Bruise the Body, or powder it grosly, and then let it steep warm a convenient while in some proper Water, as from 12 Hours a Day, &c. according to the Nature of the Plant; at least, let the Liquor just boil, and then press it hot thro' a Cloth; after this evaporate the filtered Liquor to its due Consistence.

Thus are the Extracts of Rhubarb, Gentian, Wormwood, &c. made.

EXTRA *Judicial*, in Law, is when Judgment is given in a Cause or Case not depending in that Court where such Judgment is given, or wherein the Judge has not Jurisdiction.

EXTRACTION, is a separating of the subtle Part of a mixed Body, from the more gross: For Example, when the Strength of any Medicine is extracted by Spirit of Wine, that which is left after the Evaporation of the *Menstruum*, is called the *Extract*.

EXTRACTION *of Roots*, in Mathematicks, is the Method of finding out the true Root of any Number of Quantity given: See *Square Root*, *Cube Root*, &c.

In Philos. Trans. N°. 240. *the Ingenious Mr.* Abr. de Moivre *gives the following Method of Extracting the Root of an Infinite Equation.*

THEOREM.

If $az + bz^2 + cz^3 + dz^4 + ez^5 + fz^6$, &c. $= gy + by^2 + iy^3 + ky^4 + ly^5 + my^6$, &c.

Then will z be $= \frac{g}{a}y + \frac{h - bAA}{a}y^2 + \frac{i - 2bAB - cA^3}{a}y^3 + \frac{k - bB^2 - 2bAC}{a}y^4 + \frac{l - 2bBC - 2bAD - 3cAB^2 - 3cA^2C - 4dA^3B - eA^5}{a}y^5 + \frac{m - 2bBD - bCC - 2bAE - cB^3 - 6cABC - 3cA^2D - 6dA^2B^2 - 4dA^3C - 5eA^4B - fA^6}{a}y^6$, &c.

For

For the understanding of this Series, and in order to continue it as far as we please, it is to be observed,

1. That every Capital Letter is equal to the Coefficient of each preceding Term: Thus, the Letter B is equal to the Coefficient $\frac{b - b A^2}{a}$.

2. That the Denominator of each Coefficient is always a.

3. That the first Member of each Numerator, is always a Coefficient of the Series $g y + b y^2 + i y^3$, &c. *viz.* The first Numerator begins with the Coefficient g, the second Numerator with the second Coefficient b, and so on.

4. That in every Member after the first, the Sum of the Exponents of the Capital Letters is always equal to the Index of the Power to which this Member belongs: Thus, considering the Coefficient $\frac{k - b B^2 - 2 b A C - 3 c A^2 B - d A^4}{a}$ which belongs to the Power y^4, we shall see that in every Member $b B^2$, $2 b A C$, $3 c A^2 B$ d, A^4 the Sum of the Exponent of the Capital Letters is 4. (Where it may be taken notice of, that by the Exponent of a Letter, is meant the Number which expresses what Place it has in the Alphabet: Thus 4 is the Exponent of the Letter *D*.) Hence is derived this Rule for finding Capital Letters of all the Members that belong to any Power.

Combine the Capital Letters as often as you can make the Sum of the Exponents equal to the Index of the Powers to which they belong.

5. That the Exponents of the same Letters which are written before the Capitals, express how many Capitals there are in each Member.

6. That the Numeral Figures or *Uncia* that occur in these Members, express the Number of Permutations, which the Capital Letters of each Member are capable of.

For the Demonstration of this,

Suppose $z = Ay + By^2 + Cy^3 + Dy^4$, &c. Substitute this Series in the room of z, and the Powers of this Series in the room of the Powers of z; there will arise a new Series: Then take the Coefficients which belong to the several Powers of y, in this new Series, and make them equal to the corresponding Coefficients of the Series $g y + b y^2 + i y^3$, &c. and the Coefficients A, B, C, D, &c. will be found much as is determined in the *Theorem*.

This *Theorem* might have been made much more general, by supposing

$$a z^{n} + b z^{n+1} + c z^{n+2,} \text{ \&c.} = g y^{m} + h y^{m+1} + i y^{m+2,} \text{ \&c.}$$

Then all the Powers of the Series $Ay + By^2 + Cy^3$, &c. designed by the universal Indices, must have been taken successively.

This *Theorem* may be applied to what is called *the Reversion of Series*; such as finding the *Number* from its *Logarithm* given; the *Sine* from its *Ark*; the *Ordinate* of an Ellipsis from an *Area*, given to be cut from any Point in the Axis.

But to make a particular Application of it, we'll suppose this Problem was to be solved, *viz.* The Chord of an Ark being given, to find the Chord of another Ark that shall be to the first as n to 1.

Let y be the Chord given, z the Chord requir'd: Now the Ark belonging to the Chord y, is $y + \frac{y^3}{6 d d} + \frac{3 y^5}{40 d^4} + \frac{y y^7}{112 d^6}$; and the Ark belonging to the Chord z, is $Z + \frac{z^3}{6 d^2} + \frac{3 z^5}{40 d^4} + \frac{5 z^7}{112 d^6}$, &c. The first of these Arks is to the 2d, as i to n; therefore multiplying the Extremes and Means together, we shall have this Equation, $Z + \frac{z^3}{6 d^2} + \frac{3 z^5}{40 d^4} + \frac{5 z^7}{112 d^6}$, &c. $= n y + \frac{n y^3}{6 d^2} + \frac{3 n y^5}{40 d^4} + \frac{5 n y^7}{112 d^6}$, &c.

Compare these Two Series with the Two Series of the *Theorem*, and you'll find $a = 1$, $b = 0$, $c = \frac{1}{6 d^2}$, $d = 0$, $e = \frac{3}{40 d^4}$, $f = 0$, $g = n$, $h = 0$, $i = \frac{n}{6 d^2}$, $k = 0$, $l = \frac{3 n}{40 d^4}$ $m = 0$, &c.

Hence $z = n y + \frac{n - n^3}{6 d^2} y^3$, &c. Or $n y + \frac{1 - n^2}{2 \times 3 d^2} y^2 A$, &c. supposing A to denote the whole preceeding Term, which will be the same Series as Sir *Isaac Newton* has first found.

On the same Method this general Problem may be solved.

The Abscissa corresponding to a certain Area in any Curve being given, to find the Abscissa, whose corresponding Area shall be to the first in a given Ratio.

The Logarithmetick Series might also be found, without borrowing any other Idea, than that Logarithms are the Indices of Powers.

Let the Number, whose Logarithm we imagine, be $1 + z$; suppose its Logarithm to be $a z + b z^2 + c z^3$, &c.

Let there be another Number $1 + y$: Therefore its Logarithm will be $a y + b y^2 + c y^3$, &c.

Now if $1 + 2 = \overline{1 + y}^{n}$, it follows,

That $a z + b z^2 + c z^3$, &c. : $a y + b y^2 + c y^3$, &c. :: n : 1.

That is, $a z + b z^2 + c z^3$, &c. $= n a y + n b y^2 + n c y^3$, &c.

Therefore we may find the Value of z, expressed by the Powers of y.

Again, since $1 + z = \overline{1 + y}^{n}$; therefore $z = \overline{1 + y}^{n} - 1$.

That is, $z = n y + \frac{n}{1} \times \frac{n - 1}{2} y^2 + \frac{n}{1} \times \frac{n - 1}{2} \times \frac{n - 2}{3} y^3$, &c.

Therefore z is doubly expressed by the Power of y: Compare these Two Values together, and the Coefficients a, b, c, &c. will be determined, except the first (a) which may be taken at Pleasure, and gives accordingly all the different Species of Logarithms.

The

The following Converging Series for the Extracting of the Roots *of all* Equations, *whether Simple or Adfected, the late Mr.* Waſtel *of the* Navy-Office *ſent me, and deſired me to Publiſh.*

Let $\begin{cases} A = \text{to any Abſolute Number.} \\ N = \text{to any Number aſſumed.} \\ n = \text{to the Exponent of any Power.} \\ l, p, q, r, s, \&c. \text{ the ſeveral Coefficients in any Equation.} \end{cases}$

Then, in any Equation, it will be

$$\pm 1 \times x^{n \pm} \quad p \times x^{n-1 \pm} \quad q \times x^{n-2 \pm} \quad r \times x^{n-3 \pm} \quad S, \&c. = A.$$

And we have univerſally,

$$x = \frac{A + 1 \times n-1 N^{n \pm} \quad p \times n-2 N^{n-1 \pm} \quad q \times n-3 N^{n-2 \pm} \quad r \times n-4 N^{n-3 \pm}, \&c.}{\pm 1 \times N^{n-1 \pm} \quad p \times n-1 N^{n-2 \pm} \quad q \times n-2 N^{n-3 \pm} \quad r \times n-3 N^{n-4 \pm}, \&c.}$$

In which Series obſerve,

I. That the ſame Sign in the given Equation, muſt be in the *Theorem* or *Series* reſpectively.

II. Any Term which is wanting in the Equation, muſt be omitted in the Series.

III. The Quotient at every Operation muſt be made a new *N*.

IV. That it terminates in the Root, or falls into a Series, if it be a *Surd*.

V. Such Series will be produced (in Number of Places) by a Geometrical Progreſſion from Unity, (whoſe Ratio is two) each Operation.

VI. The nearer *N* is taken to the true Root, the ſooner it will converge to it.

And in his Edition of *Parſon's Arithmetick*, *Book* 2. *Chap.* 21. you may ſee a further Account of this Series, and the ſame exemplified in Numbers.

EXTRAMUNDANE *Space*, is the infinite, empty, void Space, which is by ſome ſuppoſed to be extended beyond the Bounds of the Univerſe, and conſequently, in which there is really nothing at all.

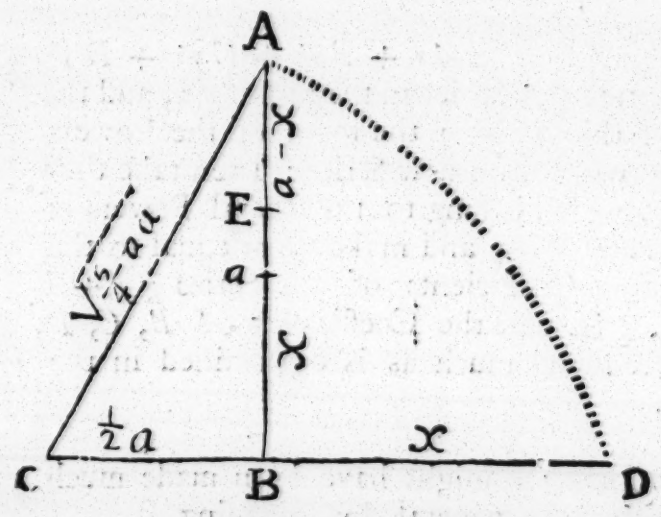
EXTRAVASATED, in Anatomy, is whatever is put or let forth out of the Veſſels, as Blood out of the Veins or Arteries, into the Cavities of the Body, &c.

EXTREME *and mean Propartion*, in Geometry, is when a Line is ſo divided, that the whole Line is to the greater Segment, as that Segment is to the other.

Or, as *Euclid* expreſſes it, when 'tis ſo divided, that the Rectangle under the whole Line, and the leſſer Segment, ſhall be equal to the Square of the greater Segment.

The Invention whereof is as follows.

Let the given Line be $AB = a$, and for the greater Segment put x; the leſſer will be $a - x$.



Then by the Hypotheſis

$$a : x : a - x \div.$$

Therefore $aa - ax = xx$, conſequently $aa = zx + ax$.

And by adding $\frac{1}{4}\,aa$ on each Side, to make $xx + ax + \frac{1}{4}\,aa$ a compleat Square,

The Equation will ſtand thus;

$$\frac{5}{4}\,aa = xx + xa + \frac{1}{4}\,aa.$$

Now

Now ſince the latter is exactly a Square, its Root $x + \frac{1}{2}a = \sqrt{\frac{5}{4}aa}$; and by Tranſpoſition it will be $\sqrt{\frac{5}{4}aa} - \frac{1}{2}a = x$; which laſt Equation is a Canon to find x.

For at the Foot of $AB = a$, ſet at Right Angles $CB = \frac{1}{2}a$: Then draw CA, the Square of which is equal $ABq + CBq = \frac{5}{4}aa$. And therefore $AC = \sqrt{\frac{5}{4}aa}$; make $CD = CA$.

From whence $CB = \frac{1}{2}a$ being taken as the Caſe requires, there remains $BD = x$; which transfer into AB, it ſhall find the Point E, where AB is cut according to *Extreme and Mean Proportion.*

The Synthetical Demonſtration *whereof*, Euclid *gives in the* 11. *e.* 2.

This cannot be done exactly in any Numbers; but if you would have it tolerably near, add together the Square of any Number, and the Square of its half, and extract as near as you can the Square Root of the Sum; from whence taking half the whole Number, the Remainder is the greater Part.

EXTUBERANCES, are Swellings forth, or Riſings up in the Fleſh, or other Parts of the Body.

EXULCERATION, is a Solution of Continuity, proceeding from ſome gnawing Matter, and in ſoft Parts of the Body is attended with a loſs of their Quantity; it differs from an Abſciſſe which commonly follows a Criſis.

EXUVIÆ, the Shells, and other Marine Bodies, which are found every where in the Bowels of the Earth, and which were certainly left there at the Univerſal Deluge, becauſe they are now proved by Dr. *Woodward* and others, to be the Real Spoils of once living Animals, and not Stones, or Natural Foſſils; he very properly calls them the *Exuviæ* of Animals.

EYE, is the wonderful Organ of Sight: The Eyes are placed in two large Cavities, which they call *Orbitæ*, hollowed out of the Bones of the Skull on each Side of the Noſe; which *Orbitæ* are inveſted on their Inſide with their *Pericranium*, and to it the Feet and Origines of the Muſcles adhere firmly. Theſe are the firſt containing Part of the Eye; the next are the *Palpebræ*, or Eye-lids; which ſee under *Palpebræ.*

The Eye hath four Tunicles; of which one is called *Common*, and the other Three *Proper.*

The Common Tunicle is called *Adnata*, and this ſprings from the *Pericranium*, and is ſpread over all the White of the Eye, above the *Sclerotica*, reaching as far as the *Iris.* By this the Eye is kept firmly within its Orbit, from whence it is alſo called *conjunctiva.* It is of very exquiſite Senſe, and has many Capillary Veins and Arteries creeping through it, which are moſt conſpicuous in an Opthalmy, or Inflammation of the Eye. Under this Tunicle are Tendons of the Muſcles extended and expanded to the Circumference of the *Iris*, which increaſes its Whiteneſs; and ſome take them for a ſecond Tunicle, calling it *Innominata.*

The *Proper* Tunicles of the Eye are Three, according to the threefold Subſtance of the Optick-Nerve. For this Nerve (as all the other) conſiſts of Two Tunicles ſpringing from this, the *Dura* and *Pia Mater*, and an inner Marrowy Subſtance.

From the *Dura Mater* ſpringeth the utmoſt Coat of the Nerve; and from the Tunicle that is ſpread next under the *Adnata*, called *Sclerotica* from its Hardneſs; but in its fore Part where it covereth the *Iris* and *Pupilla*, it is named *Cornea*, from its tranſparency, tho' ſometimes this latter Name includes the whole Tunicle, as well behind and on the Sides, as before.

That which lieth next under the *Cornea*, is much thinner than it, and is called *Choroides*, from its reſembling the Membrane *Chorion*, wherein the *Fœtus* is included in the Womb. Its forepart is otherwiſe called *Uvea*, becauſe it is ſomewhat of the Colour of a Grape. This ſprings from the *Pia Mater*, and is ſpread from the Bottom or Center of the Eye behind, all over the Eye to the *Pupilla*; to whoſe Circumference when it is come, it becomes double, making with one Part the *Iris*, with the other the *Ligamentum ciliare.*

On the Inſide it is of a duſkiſh Colour (in Man) but blacker on the Outſide. But where it makes the *Iris*, it is of divers Colours, reſembling the Rainbow, from whence it borrows its Name: Yet in ſome it is more Blue, in others Black, in others Grey.

This Tunicle is perforated before as wide as the *Pupilla* (or Sight of the Eye) to permit the Rays of viſible Species to paſs into the Cryſtalline Humour.

Next unto which Cryſtalline Humour lies the *Ligamentum ciliare*, the ſecond Part of the duplicated *Uvea.* This conſiſts of ſlender Filaments, or Fibres (like the Hairs of the Eye-lids) running like ſo many Black Lines from the Circumference of the *Uvea* to the Sides of the Cryſtalline Humour, which they encompaſs and widen, or conſtringe as there is Occaſion, by contracting or opening the *Foramen* of the *Uvea.*

The third Tunicle is made of the Medullar Subſtance of the Optick Nerve, and is called *Retina*, or *Retiformis*, (Net-like:) This ſeemeth to be the principal Organ of Sight. For as Dr. *Briggs* well argues, neither the Cryſtalline Humour, through which the Rays paſs much refracted, nor the Tunicle *Choroides*, are at all fit for this Uſe: For this latter Part (as riſing from the *Pia Mater*) cannot communicate the Impreſſions of the Rays to the Medullar Part of the Brain, which it does not at all touch: Whereas the Medullar Fibres of the *Retina* have Communication therewith, as ſpringing therefrom, and therefore can well perform that Office. The Fibres of this Tunicle are extended from the Bottom or inner Center of the Eye, where the Optick Nerve enters it, as far as the *Ligamentum ciliare*, (to which it affords Animal Spirits for the Continuance of its Motion.) If one take this *Tunica Retina*, and put it into warm Water, ſhaking it a little, to waſh off the mucous Subſtance that cleaves to it, and then hold it up to the Light, theſe Filaments will appear very numerous, like the Threads of the fineſt Lawn.

Next to the Tunicles of the Eyes, are the Humours contained in them to be conſidered; and theſe are in Number Three, *viz. Aqueus*, *Cryſtallinus*, and *Vitreus.* The ſecond weighs as much again as the firſt, and yet not ſo much as the third by a ſixth Part. The Cryſtalline is the moſt denſe of Conſiſtence by much; and the Glaſſy more denſe than the Watry.

The *Aqueous* Humour is outermoſt, being pellucid and of no Colour (as neither are the other Two.) It fills up that Space that is betwixt the *Cornea* and the Cryſtalline Humour before. If any thickiſh Particles ſwim in it, then Gnats, Flies, Spiders-Webs, and the like, will ſeem to be flying before the Eyes: But if thoſe Particles grow ſtill thicker, and cloſe together, ſo as to make a Film, and this be ſpread before the Hole of the *Pupilla*, then is the Sight quite taken away, which Diſeaſe is call'd a Cataract.

This

This Humour is very clear and thin, and therefore eaſily diſſipable; but by which way its Expence ſhould be ſupplied, is difficult to determine. Some think it is fed by the Arteries, out of which this Water iſſues through I know not what Glands; others derive it from the Nerves, and a third Sort from the Lympheducts.

But Dr. *Anthony Nuck* refutes all theſe Opinions.

The firſt, from the Non-appearance of any Glands.

The ſecond, from the no (or at the moſt a very ſmall quantity of) Liquor that at any time can be obſerved in the Nerves; whereas if the *Tunica cornea* be prick'd, and all or the greateſt Part of this Aqueous Humour be let out, he has found by repeated Experiments, that it will be recruited again in Six Hours Space.

The third Opinion he refutes from the general Office of Lympheducts; which is, to bring back from the Circumference to the Center, and not contrarily, becauſe the Valves wherewith they every where abound, cannot admit of that Motion. Wherefore exploding all theſe Opinions, he eſtabliſhes a new one of his own, upon the Score of the new Veſſels that he has obſerved to terminate in the *Tunica cornea*, (which he calls *Ductus Oculorum aquoſi*, which we ſhall deſcribe from him by and by) affirming, That theſe Ducts are the Conduits by which this Humour is fed, and that they ſupply it ordinarily with ſeveral Drops daily, becauſe of the continual Tranſpiration of it, by Pores looking from within outwards. As to the Particles of this Humour, from ſeveral Experiments he has made, he thinks it is demonſtrable:

1. That it contains in it a very limpid and pellucid Water.

2. Viſcid and Tenacious Particles.

3. A Salt and an Acid.

4. Earthy Particles.

5. That it wants not alſo its Volatile Spirit.

The *Cryſtalline Humour* (ſo called from its being as clearly tranſparent as Cryſtal) is placed betwixt the Aqueous and the Vitreous, but not exactly in the Middle or Center of the Eye, but rather towards its Fore-part. It is incloſed in the Boſom, as it were, of the Vitreous Humour, and is flattiſh on the Fore-ſide, but rounder behind. It is more bright and thick than either of the other two.

It has been the common Opinion, That it has been incloſed in a proper Membrane, which is called either *Cryſtallina* from its Tranſparency, or *Aranea* from its moſt fine Contexture. But Dr. *Briggs*, a very accurate Anatomizer of the Eye, denies any ſuch Tunicle, affirming, That it is meerly adventitious when the Humour is expoſed for ſome time to the Air, or is gently boil'd.

As to the Collection or Reception of the Rays of things viſible, this Humour is the primary Inſtrument of Sight; tho', as was ſaid before, the *Tunica Retina* is the Principal as to Perception, becauſe through it the Rays are communicated to the common Senſory.

The Third and laſt Humour of the Eye is the *Vitreous*, ſo called, becauſe it is the like to molten Glaſs. This is thicker than the Aqueous, but thinner than the Cryſtalline, and much exceeds them both in Quantity, for it fills up all the inner or hinder Hemiſphere of the Globe of the Eye, and a pretty deal towards the lateral Superficies of the former. It is round behind, but hollow in the middle forwards, to receive the Cryſtalline into its Boſom. This Humour is alſo ſaid to be ſeparated from the other Two by a proper Tunicle called *Vitrea*, which the aforeſaid Ingenious Author likewiſe denies.

The Eyes have Arteries from the *Carotides*, which beſtow Twigs on their Muſcles, and on their Tunicles: and theſe are accompanied with Veins ſpringing from the Branches of the Jugulars. As for their Nerves, they either aſſiſt the Senſe of Seeing, and are called the Optick Nerves, which we have reckon'd from the Second Pair; or ſerve for the moving of them, being inſerted into their Muſcles; and to this Purpoſe ſerve the third and fourth Pair, as ſome Twigs of the Fifth.

As to the Lympheducts, beſides theſe Veſſels, Dr. *Anthony Nuck*, whom we cited but juſt now, has diſcovered a fifth Sort of Veſſel, called by him, *Ductus oculorum aquoſi*, which he believes to recruit the continual Conſumption of the watry Humour of the Eye.

He ſays, They are of an uncertain Number, and may be plainly diſcern'd to run along the *Tunica Sclerotica*, and to penetrate at length the *Cornea*, where their Orifices have ſuch a Valve as the Ureters have in the Urinary Bladder, or the *Porus bilarius* in the *Veſica fellea*.

In the *Tunica Sclerotica*, and *Cornea*, they are of a duſky Colour, but not before they arrive thereat. They admit of a Probe of a pretty Bigneſs, and are of a ſtronger Make than Lympheducts.

He has taken great Pains to trace them to their Origin, but has not yet been able to follow them farther than the Optick Nerve: So that he knows not whether their Riſe may be from ſome Gland not yet diſcovered, or whether the *Glandula pituitaria* may not ſend forth ſome Shoots that conſtitute theſe Ducts.

The Action of the Eyes is *Viſion:* (See that Word) Which is very well defined by *Diermerbroek*, *viz.* That it is a Senſe whereby from the various Motion of viſible Rays collected in the Cryſtalline and Vitreous Humours, and darting upon the *Tunica Retina*, the Colours of viſible Objects are perceived, with their Site, Diſtance, Greatneſs, Figure, and Number; the Medium of which Perception is the Light.

EYE, in a Ship; the Hole wherein the Ring of the Anchor is put into the Shank, is called the *Eye of the Anchor*; and the Compaſs, or Ring, which is left of the *Strap* to which any *Block is ſeized*, is called alſo the *Eye of the Strap*.

EYE, in Architecture, is the middle of the *Voluta* of the *Ionick* Chapiter, which is cut in the Form of a little Roſe.

EYE-LIDS: See *Palpebræ*.

FACE, in Architecture, is a flat Member, which hath a great Breadth, and ſmall Projecture; as in Architraves, &c. It is alſo taken for the Front, or Exterior part of a great Building, which immediately preſents it ſelf to view.

FACE *of a Baſtion*, or *of the Bulwark*, is the moſt advanced Part of a Baſtion toward the Field, or the Diſtance comprehended between the Angle of the Shoulder, and the flanked Angle.

FACE *of a Place*, is the Curtain together with the two Flanks raiſed above it, and the two Faces of the Baſtion that look towards one another, and flank'd the Angle of the Tenacle.

FACIES *Hypocratica*, is when the Noſtrils are ſharp, the Eyes hollow, the Temples low, the Laps of the Ears contracted, and the Lobes inverſed, the Skin above the Forehead hard and dry, the Complexion pale, livid, of a leaden Colour, or black. *Blanchard.*

FACTITIOUS, ſignifies made by Art, and is uſually taken in oppoſition to the Word Natural: Thus Soap is a factitious Body, or Concrete, made by Art; but *Fullers-Earth* is a natural Concrete, form'd in the Bowels of the Earth by the Author of Nature.

FACTORS: In Multiplication the Multiplicand and Multiplicator are often called *Factors*, becauſe they do *Facere Productum*, make or conſtitute the Product.

FACULÆ, are certain bright or ſhining Parts, which the Modern Aſtronomers have ſometimes obſerved upon, or about the Surface of the Sun; but they are but very ſeldom ſeen.

FACULTY, in Law, is uſed for a Privilege or Special Power granted unto a Man by Favour, Indulgence, and Diſpenſation, to do that which by the Common Law he cannot do.

FACULTY is a Power or Ability to perform any Action. The Ancients uſually reckon three ſorts of Faculties, *Natural*, *Vital*, and *Animal*; and according to their Doctrine, the

Natural Faculty, is that by which the Body is nouriſhed and augmented, or another like it generated: So that it may be diſtinguiſh'd into the three Faculties that perform their Functions of *Nutrition*, *Growth*, and *Generation*: And the firſt of theſe was alſo ſubdivided into the *Attractive*, *Retentrix*, *Concoctrix*, and *Expultrix Faculty*.

Vital Faculty, is that which preſerves Life in the Body, and performs the Functions of *Pulſe* and *Reſpiration*.

Animal Faculty, is that by which the Soul performs the Functions of *Imagination*, *Reaſoning*, *Memory*, *Senſe*, and *Motion*.

But theſe, like moſt other Diſtinctions of the Ancient Philoſophers, are both uſeleſs and ill grounded.

FÆCES: See *Excrements*. 'Tis alſo taken for the groſs Subſtance that ſettles after Fermentation, or remains after Diſtillation.

FAINT, or *Feynt Action*, is as much as *Feigned Action*, *viz.* ſuch an Action, as though the Words of the Writ be true, yet for certain Cauſes he hath no Title to recover thereby; whereas in a falſe Action the Words of the Writ are falſe.

FAINT *Viſion*: See *Viſion*.

FAIT (in Law) a Deed, which is a Writing ſealed and delivered, to prove and teſtify the Agreement of the Parties whoſe Deed it is; and conſiſts of three principal Points, *Writing*, *Sealing*, and *Delivery*.

By *Writing* is ſhew'd the Parties Name to the Deed, their Dwelling-places, Degrees, Thing granted, upon what Conſideration, the Eſtate limited, the Time when granted, and whether Simply, or upon Condition, &c.

Sealing, is a further Teſtimony of their Conſents, as appears by theſe Words, *In witneſs whereof*, &c. *In cujus rei teſtimonium*, &c. without which the Deed is inſufficient.

Delivery, tho' it be ſet laſt, it is not the leaſt; for after a Deed is Written and Sealed, if it be not Delivered, it is to no purpoſe: And therefore in all Deeds care muſt be taken, that the *Delivery* be well proved.

FAKE, is one Round or Circle of a Cable quoiled up out of the way: The Seamen will ask (as a Cable is veered out) how many *Fakes* there are left, that is, how much is behind unveered out.

FALCATED, the Aſtronomers ſay the Moon, or any Planet appears *falcated*, when the enlightned Part appears in the Form of a Sickle, or Reaping-hook; which is while ſhe is moving from the Conjunction to the Oppoſition, or from New Moon to Full; but from Full to a New again, the enlighten'd part appears *gibbous*, and the Dark *falcated*.

FALCON: See *Faucon*.

FALCONET: See *Fauconet*.

FALL, the Seamen call that part of the Rope of a Tackle which is haled upon, the *Fall*. Alſo a Ship is ſaid to

FALL *off*, when being under Sail, ſhe keeps not ſo near the Wind as ſhe ſhould do. They ſay alſo that a Ship hath

FALLS when ſhe is not *Fluſh*, but hath Riſings of ſome Parts of her Decks more than others.

FALLING-SICKNESS: See *Epilepſy*.

FALLOPIAN *Tubes*, or the *Tubæ Fallopianæ* in Anatomy, are two ſlender Veſſels ſituated on each ſide the *Uterus*, whoſe uſe is to afford a Paſſage to a more ſubtil part of the *Genitura Maſculina* towards the *Ovaria*, to impregnate the Eggs that afterwards are to drop into them from thence; and when they are, as it were, ripen'd, to convey them along their inner Cavity to the *Uterus*.

Theſe *Tubæ* are about four or five Fingers breadth long, and their Subſtance is compoſed of two Membranes which come from the external and internal ones of the Womb; they have the ſame Arteries, Veins, Nerves, and Lymphatick, as the *Ovaria* have. They take their Name from their firſt Diſcoverer *Fallopius*.

FALSE *Attack*: See *Attack*.

FALSE BRAYE, in Fortification, is a ſmall Mount of Earth four Fathom wide, erected on the Level round the Foot of the Rampart, on that ſide towards the Field, and ſeparated by its Parapet from the *Berme*, and the Side of the Moat. 'Tis made uſe of to Fire upon the Enemy, when he is already ſo far advanced, that you cannot force him back from off the Parapet of the Body of the Place: And alſo to receive the Ruins which the Cannons make in the Body of the Place.

FALSE *Claim*, (in Law) is where a Man claims more than his due.

FALSE *Impriſonment*, is a Treſpaſs committed againſt a Man, by *Impriſoning* him without lawful Cauſe.

FALSO *Judicio*, is a Writ that lieth for *falſe Judgment*, given in the County, Hundred, Court-Baron, or other Courts, being no Courts of Record, be the Plea Real, or Perſonal.

FALSE *Poſition*: See *Poſition*.

FALSO *retorno brevium*, is a Writ which lies againſt the Sheriff, for Falſe returning of Writs.

FALX, in Anatomy, is one of the three Proceſſes made by the doubling of the *Dura Mater*; it riſes by a narrow Beginning from the *Criſta Galli*, to which it is faſtned; and as it approaches the Hinder part of the Head, it grows broader and broader, till it terminate where the *Longitudinal Sinus* ends. It divides the *Cerebrum* into two Hemiſpheres, near as deep as the *Corpus Calloſum*. 'Tis called *Falx* from its reſembling a Sickle.

FAMES *Canina*: See *Cynodes Orexis*.

FANCY: See *Phantaſy*, or *Imagination*.

FANTASTICAL *Colours*, the ſame with thoſe called *Emphatical*; which ſee.

FARCIMINALIS *Tunica*, the ſame with the *Allantoides*.

FARTHELL; *Farthelling* is the ſame with what the Seamen now call *Furl* or *Furling*; which is taking up their Sails and binding them cloſe to the Yards.

FASCIA *Lata*, vid. *Membranoſus Muſculus*.

FASCIA, a Term in Architecture, as the *Faſcia's* of the Architrave; which are the three Bands of which it is compoſed.

Vitruvius admits no *Faſcia*'s in the *Tuſcan* or *Dorick* Orders; but is not imitated by any in that particular Circumſtance.

FASCIÆ, in the Planet *Mars*, are certain rows of Spots parallel to the Equator of that Planet, which look like Swathes or Fillets wound round about his Body.

FASCIALIS, a Muſcle ſo called: See *Sartorius*.

FASCIATION, is a binding of Swathes about a Limb that is to be cured.

FASCICULUS: See *Manipulus*.

FASCINES, or *Faggots*, in Fortification, are ſmall Branches of Trees, or Bavins bound up in Bundles; which being mix'd with Earth, ſerve to fill up Ditches, to make the Parapets of Trenches, &c. Some of them are dipt in melted Pitch or Tar, and being ſet on fire, ſerve to burn the Enemies Lodgments or other Works.

FASHION-PIECES, are thoſe two Timbers which deſcribe the Breadth of the Ship at the Stern, and are the outermoſt Timbers of the Stern, on each ſide, except aloft, where the Counters are.

FASTIDIUM *Cibi*, the ſame with *Anorexia*.

FASTIGIUM, the ſame with *Fronton*; which ſee.

FATT of Animals, the learned Dr. *Grew* takes to be a curdling or coagulating of the Oily Parts of the Blood, either by ſome of its own Saline Parts; or by the Nitrous Parts of the Air mingled therewith: And hence it is, that ſome Animals, as Coneys, and Field-Hares, grow fat in Froſty Weather, the Oily Parts of the Blood being then ordinarily coagulated with a greater Abundance of Nitrous Parts received from the Air into their Bodies; and for the ſame Reaſon it is, that the Fat of Land Animals is hard; whereas that of Fiſhes is ſoft, and runs all to Oil, becauſe the Water in which they live, hath but few Nitrous Parts in it, in compariſon of Air.

And that which induced him to make theſe Concluſions, was this Experiment:

He took Oil-Olive, and poured upon it highly rectified Spirit of Nitre, and then digeſted them together for ſome Days: By degrees the Oil became of the Colour and Conſiſtence of Marrow, and at laſt *congealed*, or hardned into a white Fat or Butter, which would diſſolve only by the Fire like the Fat of Animals: And he obſerved, that this Oil hardned into Fat moſt, upon the Exhalation of ſome of the Sulphureous Parts of the Spirit of Nitre; which Exhalation was effected by unſtopping the Glaſs, after ſome time of Digeſtion, and ſuffering the Oil to diſſolve and thicken divers times by ſucceſſive Heat and Cold. And from hence he infers, That the *true congealing Principle, is a Spirit of Nitre ſeparated from its Sulphur*: And he ſays, If we would get this, we might congeal Water in the midſt of Summer. *Power of Mixture, Lect.* 1. p. 233.

FAT, in the Sea Phraſe, is the ſame with Broad. Thus, if the *Truſſing in*, or *Tuck* of a Ships Quarter under Water be deep, they ſay ſhe hath a *Fat Quarter*.

FACUS and *Frumen*, the ſame that *Pharynx*.

FAUCON, a ſort of Cannon, whoſe Diameter at the Bore is $5\frac{1}{4}$ Inches, Weight 750 Pound, Length 7 Foot, Load $2\frac{1}{4}$ Pound, Shot $2\frac{1}{2}$ Diameter, and $2\frac{1}{2}$ Weight.

FAUCONET, a ſort of Ordnance, whoſe Diameter at the Bore is $4\frac{1}{2}$ Inches, Weight 400 Pounds, Length 6 Foot, Load $1\frac{1}{4}$ Pound, Shot ſomething more than two Inches Diameter, and $1\frac{1}{4}$ Pound weight.

FAVUS: See in *Achor*.

FAYLING *of Record*, is when an Action is brought againſt one who pleads any Matter or *Record*, and avers to prove it by Record; and the Plaintiff ſaith, *Nul tiel Record*, whereupon the Defendant hath a Day given him to bring it in, at which Day he fails, or brings in ſuch a one as is no bar to this Action; this is ſaid to be *failer of Record*.

FAYNT-PLEADER, in Law, ſignifies a Falſe, Covenous, or Colluſory Manner of Pleading, to the Deceit of a third Party.

FEALTY, in Law, ſignifies an Oath taken at the Admittance of every Tenant, to be true to the Lord of whom he holdeth his Land.

FEAVER, is a Fermentation, or inordinate Motion of the Blood, and a too great Heat of it, attended with Burning, Thirſt, and other Symptoms, whereby the Natural Oeconomy or Government of the Body is variouſly diſturb'd.

Feavers, in general, may be divided into two ſorts, *viz. Continual*, or *Intermittent*: *Continual Feaver* is that whoſe Fit is continued for many Days, having its Times of Remiſſion, and of more Fierceneſs, but never of Intermiſſion.

Intermittent Feavers, commonly called *Agues*, have certain Times of Intermiſſion, beginning, for the moſt part, with Cold or Shivering, ending in Sweat, and returning exactly at ſet Periods.

As for the ſeveral Subalteran Spices of *Continual* and *Intermitting Feavers*, you will find them particularly enumerated in the Books of Phyſicians.

FEAZING, at Sea, is the ravelling out of the Cable or any great Rope at the Ends.

FEBRIFUGE, is a Medicine which will cure an intermitting Feaver: Thus we ſay the *Cortex Peruvianus*, or *Jeſuits-Bark*, rightly given, is the moſt certain *Febrifuge*.

FECULÆ, are Dregs that ſubſide in the Squeezing of certain Vegetables; as in *Briony*, &c.

FEE, *Feudum vel Feodum*, in Common Law, ſignifies, as Sir *Henry Spelman* defines it, a Right which the Vaſſal hath in Land, or ſome immoveable thing of his Lord's, to uſe the ſame, and take the Profits thereof Hereditarily, rendring unto his Lord ſuch Feudal Duties and Services as belong to Military Tenure, the meer Propriety of the Soil always remaining to the Lord.

This Word *Fee* is ſometimes uſed with us for the Compaſs or Circuit of a Manor or Lordſhip; alſo for a Perſonal Right Incorporeal, as to have the keeping of Priſons in *Fee*. And 'tis taken for a Reward or Wages given to one for the Execution of his Office: As alſo, for that Conſideration given a Serjeant at Law, or Counſellor, or a Phyſician, for their Counſel and Advice in their Profeſſion.

FEE-ABSOLUTE, or *Fee-ſimple*, is that of which we are ſeized in theſe general Words, *To us and our Heirs for ever.*

FEE-CONDITIONAL, or *Fee-Tail*, is that whereof we are ſeized to us and our Heirs with Limitation; that is, the Heirs of our Bodies, &c. And this *Fee-Tail* is either *General* or *Special:*

General, is where Land is given to a Man, and the Heirs of his Body.

Fee-Tail Special, is that where a Man and his Wife be ſeized of Lands, to them and the Heirs of their Bodies.

FEE-FARM, in a Legal Senſe, ſignifies Lands held of another in *Fee*, that is, in Perpetuity to himſelf and his Heirs, for ſo much Yearly Rent as it is reaſonably worth, more or leſs, ſo it be the Fourth Part of the Worth: *Old Tenures.*

FEE-SIMPLE: See *Fee-Abſolute.*

FEE-TAIL: See *Fee-Conditional.*

FIELD, in Heraldry, is the whole Surface of any Eſcutcheon or Shield, being ſuppoſed to be overſpread with ſome Metal, Furr, or Colour, and containing the Charge, if there be any. In Blazoning a Coat, you muſt always begin with the Field: See *Blazon.*

FELLOWSHIP, or *Partnerſhip*, in Arithmetick, is a Rule of very great Uſe to balance Accounts amongſt Merchants and Owners of Ships; for when any Number of Perſons put together a general Stock, ſo that it be required to give to every one his proportional Share of the Loſs or Gain:

The *Golden Rule* ſeveral ways repeated, will fully anſwer ſuch Queſtions.

For, *As the whole Stock* (or general Antecedent): *Is to the Total thereby gain'd or loſt* (which is the general Conſequent) :: *So each Man's particular Share: Is to his proper Share of Loſs or Gain.*

Wherefore let the ſeveral Moneys of every Partner be gathered into one Sum, which makes the Firſt Term, the common Gain or Loſs the Second; every Man's particular Share the Third; working the *Golden Rule* ſo many ſeveral times as there are Partners.

There be two Parts of this Rule, *without Time*, and *with Time.*

Fellowſhip without Time.

Example I.

A, B, *and* C *freight a Ship with Wine*; viz. A *lays out* 1342 l. B, 1178 l. C, 630 l. *the whole* 212 *Tun of Wine is ſold at* 32 l. *a Tun. What ſhall each Man receive?*

Firſt find out the Price received, by multiplying 212 by 32, which makes 6784: Then add up the ſeveral Stocks, 1342 *l.* 1178 *l.* and 630 *l.* which makes 3150 *l.* and the Work ſtands thus;

3150 : 6784 ::
- 1342 : Anſwer 2890,1994
- 1178 : Anſwer 2537,0014
- 630 : Anſwer 1356,800

Proof 3150 — 6784

Example II.

A *hath Half a Ship*, B *a Quarter*, C *one Sixteenth, and* D *three Sixteenths: The Maſter of the Ship brings an Account, and clears* 120 l. *How much muſt each Perſon have?*

Account the Ship is 16, and the Gain 120 *l.*

16 : 120 ::
- 8 : Anſwer 60
- 4 : Anſwer 30
- 1 : Anſwer 7, 5
- 3 : Anſwer 22, 5

16 — 120

Fellowſhip with Time.

Example I.

A Ship's Company take a Prize of 300 l. *which is to be divided amongſt them, according to their Pay and Time they have been on Board: The Officers and Midſhip-men* 5 *Months, and the Sailors* 3 *Months: The Officers one with another,* 40 s. per *Month*; *the Midſhip-men* 30 s. per *Month*; *and the Sailors* 22 s. per *Month: There were* 6 *Officers,* 12 *Midſhip-men*, 84 *Sailors: What muſt each Party have of the Prize?*

For a general Stock I begin firſt with the Officers, which are 6, and that multiplied by the Rate of 40 *s.* gives 240, which multiplied by 5 Months, make 1200 *s.*

After the ſame Faſhion I find the Midſhip-men's Stock 1800 *s.* and the Sailor's 5544 *s.* All added together make 8544 *s.* for the whole Stock, and the Work ſtands thus:

8544 : 300 ::
- 1200 : Anſwer 42,1232
- 1800 : Anſwer 63,2029
- 5544 : Anſwer 194,6629

} 299,999 = 300

Which Decimals reduced, give for

Officers	42	2	2
Midſhip-men	63	4	1/4
Sailors	194	13	5

Example II.

A, B, C *enter into Partnerſhip, the Firſt of* January, *for a whole Year*; A *the ſame Day diſburſed* 100 l. *whereof he received back again upon the firſt of* April 20 *l.* B *payeth on the firſt of* March 60 l. *and more the firſt of* Auguſt 100 l. C *payeth the firſt of* July 140 l. *but the firſt of* October *withdraweth* 40 l. *At the Year's End their clear Gain is* 142 l. *How much therefore ought every particular Perſon to have?*

Anſwer.

A 51 *l.* B 55 *l.* C 36 *l.* which makes the whole Gain 142 *l.* without Conſideration of Intereſt. For A 100 into 3, is 300 *l.* and 80 into 9 = 720, in all 1020 *l.* for A: For B, 60 into 10, is 600, and 100 into 5, is 500, in all 1100 for B: For C, 140 into 3, is 420, and 100 in 3, is 300; into all 720 for C.

Now 1020 + 1100 + 720 = 2840 for the General Antecedent, and the Gain 142 for the General Conſequent; then the Rule ſtands thus;

$$2840 : 142 :: \begin{cases} 1020 : \text{Anſwer } 51 \\ 1100 : \text{Anſwer } 55 \\ 720 : \text{Anſwer } 36 \end{cases}$$

142 *l.*

FELO *de ſe*, is he that commits Felony by Murthering of himſelf.

FELONY, in Common Law, is accounted any Offence, that is in Degree next *Petit-Treaſon*, and compriſeth divers Particulars, as Murther, Theft, killing of a Man's Self, Sodomy, Rape, wilful burning of Houſes, and ſuch like.

The Difference between *Felony* and lighter Offences, is this, That the Puniſhment thereof is Death; yet not in all Caſes: For *Petit-Larceny*, which is the ſtealing of any Thing under Value of Twelve Pence, is *Felony*, becauſe the Indictment againſt ſuch a one muſt have theſe Words *Felonice cepit*; and yet this is not puniſhed by Death, though it be loſs of Goods. Any other Exception I know not, but that a Man may call that Felony, which is under Petit-Treaſon, and puniſhed by Death. And of this may be reckon'd two ſorts, one lighter, that for the firſt time may have the benefit of the Clergy, another that may not.

FEMOREUS: See *Crureus*.

FEMUR, and *Femen*, the Thigh, the Part from the Buttocks to the Knee; it is ſo called *à ferendo* from bearing, becauſe it holds up, and ſuſtains an Animal. It conſiſts but of one Bone, but that the greateſt and longſt in the whole Body, whoſe external and fore Part is gibbous or riſing, but the internal hinder Part flat and bending. Grammarians make *Femen* to be the hinder fleſhy Part; and *Femur* the former outward Part. *Blanchard*.

FEND, (for defend) is the Sea Word for ſaving a Boat from being daſh'd againſt the Rocks, Shore, or Ship's Sides. This they call *Fending the Boat*; and accordingly

FENDERS with them ſignifies any Pieces of old Cable Ropes or Billets of Wood, which they hang over the Ship's Side to keep other Ships from rubbing againſt her: Boats have the ſame, as alſo little ſhort Staves, called by this Name of Fenders, with which they keep the Boat from beating and ſtaving againſt the Ship's Side.

FENESTRA *Ovalis*, is a Hole in the Barrel of the Ear, whereon the Baſis of the *Stapes* ſtands: It is the Entry to the *Veſtibulum*.

FENESTRA *Rotunda*, is a Hole in the Barrel of the Ear, which leads to the *Cochlea*, and is covered by a fine Membrane, inchaſed in a Rift of this Hole.

FEOD: See *Fee*.

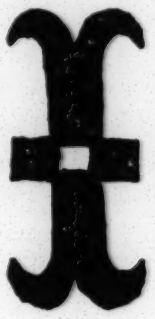
FEODARY.

FEOFFEE, is he that is infeoffed, or to whom the Feoffment is ſo made.

FEOFFMENT, in Common Law, ſignifies any Gift or Grant of any Honours, Caſtles, Manors, Meſſuages, Lands, or other corporeal and immoveable Things of like Nature unto another in *Fee-Simple*; that is, to him and his Heirs for ever, by the Delivery of Seiſin, and the Poſſeſſion of the Thing given, whether the Gift be made by Deed or Writing: And when it is in Writing, 'tis called, *The Deed of Feoffment*; and in every *Feoffment*, the Giver is called the *Feoffer*, or *Feoffator*.

And the proper Difference between a Feoffer and a Donor, is, that the Feoffer gives in Fee-Simple, the Donor in Fee-Tail.

FEOFFOR, is he that Infeoffs, or makes a Feoffment to another, of Lands or Tenements in Fee-Simple.



FERDEMOULIN, a Bearing in Heraldry of this Figure. It repreſents the Iron-Ink, or Ink of a Mill; and is born by the Name of *Bevertham*, and alſo by the Name *Turner*.

FERMENTATION, is an eaſy, gentle, ſlow Motion of the Inteſtine or inward Particles of a mix'd Body, ariſing uſually from the Operation of ſome Active Acid Matter which rarifies, exalts, and ſubtilizes the ſoft and ſulphureous Particles, as when *Leaven* or *Yeaſt* rarifies, lightens, and ferments *Bread*, or *Wort*, &c. And this Motion differs much from that uſually called *Ebullition* or *Effervеſcence*, which is a violent boiling and ſtruggling between an Acid and an Alkali, when mix'd together.

Hence any gentle Motion of the Parts of the Blood, or Juices in the Body, occaſioned by ſomething which helps to *clarify*, exalt, and ſubtilize them, and to reduce them into an Healthful and Natural State, is called by this Name of *Fermentation*, as well as in the expreſſed Juices of Fruits, &c. *Lemery* confounds Efferveſcence and Fermentation together, but I think erroneouſly.

FERRUGINOUS, that which hath in it ſomething of the Nature of Iron; as thoſe Waters have which are otherwiſe called *Chalybeate*, ſuch as thoſe of *Tunbridge Wells*, &c.

FERULÆ, which the Surgeons call *Splinters*, are little Chips or Planes, which are made of differrent Matter, according to the Nature and Neceſſities of the Places to which they are applied, as of Barks of Trees, of the Bark of the Herb *Sagapene*, in Latin, *Ferula*; whence they have their Name: They are made of Firr, Paper glew'd together, Leather, &c. which are apply'd to Bones that have been looſened or disjointed, after they are ſet again. *Blanchard*.

FESSE,

FESSE, one of the Honourable Ordinaries in Heraldry, repreſenting a broad Girdle, or Belt of Honour, which Knights at Arms were anciently girded withal: It poſſeſſeth the Center of the Eſcutcheon, and contains in Breadth one third part thereof; thus.

He beareth *Azure*, a *Feſſe Or*, by the Name of *Eliott*.

The *Feſſe* is divided into the *Barr*, and the *Claſett* of the *Barrulet*; which ſee.

Feſſe Point, is the very middle Point: See the Word *Eſcutcheon*.

FEUDE. *Littleton* makes a *Feude* a Tenure: The *Civilians* define it to be a Grant of Lands, Honours or Fees made either to a Man at the Will of the Lord, or Sovereign, or for the *Feudatory*'s (*i. e.* the Perſon to whom the Grant is made) own Life, or to him and his Heirs for ever; upon Condition that he and his Heirs (in Caſe where the *Feude* is perpetual) do acknowledge the Giver and his Heirs to be their Lord and Sovereign, and ſhall bear Faith and true Allegiance to him and his for the ſaid *Tenure*, and ſhall do ſuch Service to him and his for the ſame, as is between them covenanted, or is proper to the Nature of a *Feude*.

And hence the laſt Volume or Tome of the Civil Law, is called the

FEUDES: That is, the Books of Cuſtoms and Service that the Subject or Vaſſal doth to his Prince or Lord for the Lands, Tenures, or Fees that he holdeth of him.

This Part of the Civil Law was not much in uſe in the Old Emperors Time; but it ſeems to be acknowleged by *Juſtinian* in his Novels; where he calls them : Some derive them from the ancient *Clienteles* among the *Romans*, before Chriſt's Time, as *Badæus* in particular: Others bring them from the Practice of *Alexander Severus*, who to encourage them to perpetual Service in his Wars, divided the Lands of the Enemy amongſt his Soldiers. So *Lampridius* in the Life of *Alexander Severus*.

But others refer it to the Time of *Conſtantine the Great*, who ſettled the Lands out of which the Soldiers had formerly their Wages, on them and their Heirs for ever, provided they found and maintained for ever ſuch a Number of Soldiers.

But let its Original be what or when it will, it came but late into the Body of the Civil Law, and to conſtitute, as it doth now, a particular Volume of it.

The Compilers or Collectors of it, were *Obertus de Horto*, and *Giraldus Compagiſtus*, two Senators of *Milan*, who drew it partly from the *Civil Law*, and partly from the ancient Cuſtoms of *Milan*, but without any good Form or Order. For the Original of *Feudes*, ſee *Cujacius*, and Sir *Henry Spelman*'s *Gloſſary*.

FIBRA *Auris*, the ſame with *Lobus Auris*.

FIBRÆ, *Fibres*, by the Anatomiſts are accounted little round oblong Veſſels, and are either *Muſculous* or *Nervous*.

The *Nervous*, are ſuch as have no Valves, and by which the Spirits flow conveniently from the Nerves to the ſeveral Parts.

The *Muſculous* Fibres receive the Blood from the Arteries, and diſcharge themſelves into the Veins, and have a great many Valves: They are called Long, Round, or Oblique, from their Form and Situation. Some ſmall Threads interwoven with Trees and Leaves, are called Fibres too; and ſo are the ſmall Threads which ſtick to their Roots, and which faſten the ſmall Roots to the Earth: Alſo, thoſe Strings which go from the bottom of the bulbous Roots are called by this Name; and in general, it ſignifies any ſmall Strings which compoſe the Texture of any Part of an Animal or Vegetable Body.

FIBULA, a Term in Surgery, as the Ancients mention it; for if there be a Wound in the Fleſh, ſays *Celſus*, that gapes, and cannot eaſily be cloſed, it is improper to ſew it, you muſt apply a *Fibula*: But becauſe this way of cloſing the gaping of Wounds by *Fibula*'s was uſual amongſt the Ancients, they have not been at all ſolicitous in deſcribing either their Matter or Form. *Guido* tells us, That they made theſe *Fibula*'s of Iron Circles as it were, or Semicircles crooked backward on both ſides; the Hooks whereof being faſtned on both ſides to the gaping Wound, anſwered exactly one another; but ſince this muſt be an inſupportable Pain to the poor Patient, it is hardly credible, that they meant any ſuch thing by their *Fibula*'s.

The Opinion of *Fallopius* is more probable, who tells us, That it was only ſewing up the Wound with a Needle and Thread, which is commonly uſed at this Day.

Sanctorius writes thus, We need not diſcourſe much of *Fibula*'s, ſince the uſe of them is almoſt out of doors; and tho' the Ancients have not deſcrib'd them, yet they forbear not to acquaint us how to uſe them, as *Argenterius* falſly imagines: For not only Phyſicians, but ſome of the Ancients knew the Form of them, ſince *Corn. Celſus* has inform'd us, That *Fibula*'s as well as *Sutures*, were made of a Needleful of ſoft untwiſted Silk or Thread, wherewith they ſewed the gaping Lips of the Wound together.

Some call *Acia*, or this Needleful of Thread, *Vinculum*, *Ligatura*, *Colligatio*, *Obligatio*, *Ligamentum*; all which ſignifies tying or binding. Whoever would be further inform'd in this Particular, may conſult the Incomparable *Rhodius*, in his Diſcourſe about *Acia*. *Blanchard*.

FIBULA, or *Focile minus*, in Greek περόνη, is the leſſer and outer Bone of the Leg; it ſeems to join the Muſcles of the Leg like a Button or Claſp, in Latin *Fibula*; it is the hinder Bone betwixt the Knee and the Feet, ſmaller than the other Bone called *Tibia*, and faſtened outwardly to it, as the Bone called *Radius* in the Arm is to the Cubit; its round Head does not extend as far as the Knee upward, but receives the lateral Knob of the *Tibia* in a ſmall Sinus which it hath in its inner Side; downwards it goes farther than the other Bone called *Tibia*, and therefore is altogether as long a Bone as that, tho' much ſmaller. They part in the Middle, becauſe the Muſcles that extend the Feet and Toes are placed there; in which Interval a ſlender, broad, membranous Ligament joins them together lengthways: It is joined likewiſe to the *Tibia*, by its lower End, which is received into a ſmall Sinus of it; and then it extends into a large Proceſs which forms the outward Ankle, embracing the external Side of the *Aſtragalus*.

FICHANT *Flank*: See *Flank*.

FICHANT *Line of Defence*: See *Fixed Line of Defence*.

FICUS,

FICUS, are the external Protuberances of the *Anus*, otherwiſe called the *Piles*. They are alſo ſometimes called *Mariſcæ*, and *Sycoſes*.

FIDD, an Iron Pin uſed at Sea to ſplice or faſten Ropes together. 'Tis made tapering and ſharp at one end. There are alſo Fidds of Wood, which are much larger than the Iron ones. The Pin alſo in the Heel of the Topmaſt, which bears it upon the Cheſs-trees, is called a Fidd. There is alſo a *Fidd Hammer*, whoſe Handle is a *Fidd*, or made tapering into that form.

FIELD-*Fort*: See *Fortin*.

FIERI *facias*, is a Writ Judicial that lieth at all times within the Year and Day, for him that hath recovered in an Action of Debt or Damages, to the Sheriff, to command him to levy the Debt or the Damages of his Goods againſt whom the Recovery was had.

FIFTH, a term in Muſick, the ſame with *Diapente*; which ſee.

FIGHTS, in a Ship, are the waſte Cloths which hang round about her in a Fight, to hinder the Men from being ſeen by the Enemy; and they call thoſe Bulkheads afore or abaft the Shift which are put up for Men to ſtand ſecure behind and Fire on the Enemy in caſe of Boarding, *Cloſe Fights*.

FIGURAL, or *Figurate Numbers*, are ſuch as do or may repreſent ſome Geometrical Figure, in relation to which they are always conſidered; and are either *Lineary*, *Superficial*, or *Solid*; which ſee.

FIGURATE *Deſcant*: See *Deſcant*.

FIGURATIVE *Speeches*, are ways of expreſſing our ſelves, in which we uſe an improper Word, which Cuſtom has applied to another Subject.

FIGURE, in Phyſicks or Natural Philoſophy, is the Surface or terminating Extreams of any Body.

FIGURE, in Conicks, according to *Apollonius*, is the Rectangle made under the *Latus Rectum* and *Tranſverſum* in the *Hyperbola* and *Ellipſis*.

FIGURE, in Geometry, is a Space compaſſed round on all Sides, and are either *Rectilineal*, *Curvilineal* or *Mixt*.

FIGURES, in Arithmetick, are the 9 Digits or Numeral Characters, 1, 2, 3, 4, 5, 6, 7, 8, 9, and 0.

FIGURES in Diſcourſe, are extraordinary ways of Speaking, different and remote from ſuch as are Ordinary and Natural, and they are either *Grammatical* or *Rhetorical*.

FIGURES *Curvilineal*, are ſuch as have their Extremities crooked, as *Circles*, *Ellipſis*'s, &c.

FIGURES *Grammatical*, are uſed in Conſtruction, when we digreſs from the common and ordinary Rules, as by omitting ſome Word; and leaving it to thoſe to whom we ſpeak, to ſupply it.

FIGURES *Mixt*, are ſuch as are bounded partly by right Lines, and partly by crooked ones, as a *Semicircle*, *Segment of a Circle*, &c.

FIGURES *Plane*, (or *Plane Surfaces*) are ſuch as are terminated and bounded by right Lines only.

FIGURES *Rectilineal*, are thoſe that have their Extremities all right Lines, as *Triangles*, *Quadrilaterals*, &c. *Polygons* Regular, Irregular, &c.

FIGURES *Rhetorical*, ſerve ſometimes to expreſs the Commotions and violent Agitations of the Mind in our Paſſions or warm eager Diſcourſes; and ſometimes only to embelliſh and adorn our Speech, or to move the Audience the more pathetically.

FILACER, is an Officer in the *Common-Plea's*, ſo called, becauſe he Files thoſe Writs whereon he makes Proceſs. There are fourteen of them in their ſeveral Diviſions and Counties. They make out all original Proceſs, as well Real, as Perſonal and Mixt; and in Actions merely Perſonal, where the Defendants be Return'd or Summon'd, there goeth out the Diſtreſs infinite until Appearance: if he be Returned *nihil*, there Proceſs of *Capias* infinite, if the Plaintiff will; or after the third *Capias* the Plaintiff may go to the *Exigenter* of the Shire, where his Original is grounded, and have an Exigent or Proclamation made.

FILAMENTS, little, thin, ſlender Rags like Threads, ſuch as ſometimes appear in Urine: Alſo the ſmall Fibres or Threads which compoſe the Texture of the Muſcles, &c. or other Parts of any Animal or Vegetable Body, are ſometimes called by this Name.

FILE, or *Label*, in Heraldry is of this Form, tho' ſometimes of more and ſometimes of fewer Points. 'Tis ſometimes born as a Charge in a Coat Armour, of which *Guillim* gives many Inſtances: But 'tis uſually the difference or mark of Diſtinction which the Elder Brother bears in his Coat during his Father's Life.

Some diſtinguiſh *File* and *Label*; calling the File the upper Horizontal Line, and the Label the Point that iſſues from it.

FILE, in Military Language, is a row of Men ſtanding one behind or below another from the Front to the Rear.

FILET, a little Member in Architecture, which appears in the Ornaments and Mouldings, and is otherwiſe called *Liſtel*.

FILLET, in Heraldry, is a 4th part of the Ordniary called a *Chief*, and is placed in the chief Point of the Eſcutcheon.

FILTRATION, is the paſſing a Liquor (in order to its Purification) through a woollen Cloth, or uſually through a Coffin of brown Paper; and this the Chymiſts mean when they direct you to *Filtrate* any thing.

The moſt exact way of Filtration, is to take a long piece of linnen or woollen Cloth, and dipping one end of it in the Liquor to be Filtrated, hang the other (which muſt be the longer end) over the brims of the Veſſel, and you will ſee the Liquor riſe up and run over the brims through the Body of the *Filtre*; and it will do ſo very pure, and free from all Dregs.

The Cauſe of the aſcent of Liquors in the *filtre*, is generally ſaid to be, that the Liquor ſwelling thoſe parts of the *filtre* that touch it, by entring into the Pores of the Threads of which it is compoſed, doth raiſe them up, make them touch, and wet thoſe that are next above them; and theſe again the next Threads, and ſo on till you come to the brims of the Veſſel, and then the Liquor runs over and deſcends in the other part of the Filtre, which hangs down, by its own natural Gravity.

But 'tis certain that in very ſlender glaſs Pipes, whoſe Cavities are not much larger than Hairs, Water or any Fluid (but Quickſilver) will aſcend in them to a conſiderable height, as ſoon as ever you dip their ends into it; and in Pipes or Tubes of much larger Bores, the Liquor will be higher (ſomething) within the Tube than without it. And yet here the ſwelling of the parts of the glaſs Pipe cannot be urged as the Reaſon for the aſcent of the Water in them.

If alſo you fill a Pipe of a moderate Bore with the powdered *Calx* of a Metal, (as Mr. *Boyle* tried it with *Minium* or Lead) and then immerſe the lower end of this Tube in Water, the Water ſhall gradually ariſe in the Tube till it attain the height of 30 or 40 Inches; and yet it cannot be ſaid that any of the Particles of this Metalline Powder, are ſwelled at all by the Water.

Therefore

Therefore the true Cauſe of the aſcent of Water in a Philtre, is probably this: That every Philtre being compoſed of a great Number of long ſmall ſolid Bodies, which lie very cloſe together, the Air getting in between them, loſes much of its preſſure, and cannot gravitate there ſo ſtrongly as it doth on the Fluid without them: Wherefore the Parts of the Water between the Threads of the Filtre muſt be preſſed upwards, and aſcend till they come ſo high, as by their Weight to counter-balance the general preſſure on the other Parts of the Surface of the Water.

FIMBRIATED, a Term in Heraldry, ſignifying that an Ordinary is edged round with another of a different Colour, as thus.

He beareth *Or*, a *Croſs*, *Patee Gules Fimbriated Sable.*

FINAL *Cauſes*, are ſuch great, wiſe, and good Ends as God Almighty, the Author of Nature, had in Creating and Proportioning, in Adapting and Diſpoſing, in Preſerving and Continuing, all the ſeveral Parts of the Univerſe. On this Subject the Honourable Mr. *Boyle* hath a very good Diſcourſe: And that good Mathematician Mr. *Keil* of *Oxford*, in his Refutation of *Burnet*'s *Theory of the Earth*, ſhews that Final Cauſes are the beſt Principles for Men to regulate their Philoſophical Theories and Speculations by.

FINE, in common Law, hath divers Applications; for ſometimes 'tis uſed for a formal or ceremonious Conveyance of Lands or Tenements, or of any Things inheritable, being *in eſſe tempore finis*, to the end to cut off all Controverſies. Others define it to be a *final* Agreement had between Perſons concerning any Lands or Rent, or other thing whereof any Suit or Writ is between them hanging in any Court. A Fine hath in it five eſſential Parts.

1. The Original Writ taken out againſt the Cogniſor.

2. The King's Licence, giving the Parties Liberty to accord · for which he hath a *Fine* called *the King's Silver*, being accounted a Part of the Revenue of the Crown.

3. The Concord it ſelf, which thus beginneth *Et eſt concordia talis*, &c.

4. The Note of the *Fine*, which is an abſtract of the original Concord, and beginneth in this manner: *Scil. Inter R. Querentem* & S. & E. *uxorem ejus, deforciantes*, &c.

5. The Foot of the *Fine* which beginneth thus: *Hæc eſt* finalis *concordia facta in curia Domini Regis apud* Weſtmonaſterium *a die Paſchæ in quindecim dies, anno*, &c. So as the Foot of the *Fine* includeth all, containeth the Day, Year, and Place, and before what Juſtice made.

This Word *Fine* ſometimes ſignifies a Sum of Money paid for an Income to Lands or Tenements let by Leaſe; and ſometimes, an Amends, Pecuniary Puniſhment or Recompence upon an Offence committed againſt the King and his Laws, or againſt the Lord of the Mannor.

FINE *adnullando levato de Tenemento quod fuit de antiquo domenico:* Is a Writ to the Juſtices for the diſanulling of a *Fine* levied of Lands holden in Ancient Demeſne to the Prejudice of the Lord.

FINE *capiendo pro terris*, &c. Is a Writ lying for one that upon Conviction by a Jury, having his Lands and Goods taken into the King's Hands, and his Body committed to Priſon, obtaineth Favour for a Sum of Money, &c. to be remitted his Impriſonment, and his Lands and Goods to be re-delivered unto him.

FINE *force*, ſignifies an abſolute Neceſſity or Conſtraint not avoidable; as when a Man is conſtrained to do that which he can no way avoid, we ſay, He doth it *de fine force.*

FINE *levando de Tenementis tentis de Rege in Capite*, &c. is a Writ directed to the Juſtices of the *Common Pleas*, whereby to licence them to admit of a *Fine* for Sale of Lands holden *in Capite.*

FINE *non capiendo pro pulchre placitando*, is a Writ to inhibit Officers of Courts to take *Fines* for fair Pleading.

FINE *pro rediſſeiſina capienda*, &c. is a Writ that lieth for the Releaſe of one laid in Priſon for a *Reſeiſin*, upon a reaſonable *Fine.*

Fines *for Alienation*, are reaſonable Fines paid to the King by his Tenants in Chief, for Licence to *Alien* their Lands.

FINITE, is what hath fix'd and determined Bounds or Limits ſet to its Power, Extent or Duration.

FINITOR, the ſame with *Horizon*; and 'tis ſo called, becauſe the Horizon finiſhes or terminates your Sight, View, or Proſpect.

FIRMAMENT, by ſome Aſtronomers is taken for the Orb of the Fixed Stars, or an Eighth Heaven: But more properly, 'tis that Space which is expanded or arched over us above in the Heavens.

FIRMNESS or *Solidity*, Mr. *Boyle* deſcribes to conſiſt principally in this, that the Particles compoſing ſuch Bodies as we call Firm or Solid, are pretty groſs; and either are *ſo much at Reſt*, or are ſo *Intangled* one with another, that there is a mutual Cohæſion of their Parts; and that they cannot flow from, ſlide over one another, or diffuſe themſelves every way from one another, as the Parts of Fluid Bodies can; and conſequently the Figure of Firm or Solid Bodies, ought rather to be attributed to the Connexion of the Parts that compoſe them, than to the Impreſſions of outward Bodies.

And in his Hiſtory of Firmneſs, he proves by Experiments, and good Conſiderations upon them, the ſeveral Parts of the above given Deſcription. As,

1. He ſhews the *Groſſneſs* of *Parts* are (*cæteris paribus*) requiſite to Firmneſs or Solidity, becauſe *Minuteneſs* he had before proved, was neceſſary to the Parts of Fluid Bodies.

2. Reſt alſo, and *juxta Poſition* of Parts, he demonſtrates by many Experiments, are in a Degree abſolutely requiſite to produce this Effect. And,

3. The Preſſure and Weight of the Incumbent Atmoſphere he judges contributes much toward it, becauſe of the ſtrong Adherence of two Pieces of Poliſhed Glaſs, or Marble together, in the open Air, which will immediately ſeparate in the exhauſted Receiver.

4. The Texture of the Bodies, and the Figures of their Parts many contribute much to this Effect; as if they be of an hooked Form, or any way entangled one in another, they muſt be disjoined with difficulty, and conſequently will be in the Form of a Solid.

And 'tis a very ſurprizing Experiment, that two Parts of Spirit of Wine, mixed with one of Spirit of Hartſhorn, or Urine (both highly rectified) will, in a Minute, unite into a conſiſient Body, or white *Coagulum*; which ſome call *Offa alba.*

FIRST MOVER: See *Primum Mobile.*

FISHES, are Pieces of Timber uſed to ſtrengthen the Maſts or Yards aboard of a Ship, when they begin to fail in a Streſs of Weather. They both nail the Fiſhes on with Iron Spikes, and alſo *wou'd* them, as they call it; that is, winding Ropes hard round about

about them. There is also a Tackle called *The Fish*, which hangs at the End of the *David* by the *Strap* of the *Block*, in which is the Runner of the Fish-hook; by which Means the Fluke of the Anchor is haled up to the Ship's *Bow*, or *Chainwaile*. Perhaps this Tackle was called a Fish, from that which the Ancients called the *Dolphin*, which was a pointed and vastly heavy Piece of Iron, and which they used to heave up by a Tackle to a good Height, and then, when they come near enough to the Enemy's Ship, let it fall at once, which would break or pierce a Hole through the Bottom of the Enemy's Vessel, and sink her.

FISSURA *Ossis*, is the Term for a Cleft or a Fracture of a Bone lengthways.

FISSURES, the several *Layers* or *Strata*, of which the Body of our Terrestrial Globe is composed, are distinguished from one another, and divided Horizontally or Parallelly by some Interruptions which they call *Fissures*; and these are intersected again by other Fissures, which, by reason of their Situation, are called *Perpendicular Fissures*: See *Woodward's Nat. Hist. of Earth*, P. 10.

FISTULA, is a long Cavity, strait or winding about, in any Part of the Body, being a narrow and callous Ulcer of difficult Cure, proceeding usually from an Apostеme. *Blanchard.*

Fistula's differ from winding Ulcers in this, that *Fistula's* are callous and hard, but Ulcers are not. *Blanchard.*

FISTULA *Lachrymalis*, is when the *Punctum Lachrymale*, the little Hole in the Bone of the Nose, through which the Liquid Matter of the Tears passes to the Nostrils, is grown hard and callous from an Ulcer of the *Caruncula* (which are *Glandules* placed at the greater Corners of the Eye) by which means there happens a continual Defluxion of Tears. *Blanchard.*

FISTULA *Pulmonis*, in some Writers, is the same with the *Aspera Arteria.*

FISTULA *Sacra*, is that Part of the Back-bone which is perforated. *Blanchard.*

FISTULA *Urinaria*, the same with the *Urethra.*

FITCHEE, the Term in Heraldry, when the lower Part of any Cross is sharpened into a Point, thus.

Azure a *Cross Potent Fitchee.*

FIXED *Line of Defence*, in Fortification, is drawn along the Face of the Bastion, and terminates in the *Courtine.*

FIXED *Signs* of the Zodiack, according to some, are *Taurus*, *Leo*, *Scorpio*, and *Aquarius*. And they are so called, because the Sun passes them respectively in the Middle of each Quarter, when that particular Season is more settled and fixed than under the Sign that begins or ends it.

FIXITY, or *Fixtness*, is the opposite Quality to *Volatility*; and the Excellent Mr. *Boyle* reckons these Qualifications following to be the most conducing for the rendring of a Portion of Matter Fixt.

1. That its Corpuscles be singly of a proportionate large Bulk or Grossness, so as to be too big and unweildy to be carried up by Heat, or to be buoyed up in the Air.

2. That these Corpuscles have also a proportional Degree of Ponderousness or Solidity.

3. That their Figure and Make also be such as renders them unfit for Avolation, either from their Shape, being branched, crooked, hooked, *&c.* so that they be entangled one with another, and cannot easily be extricated, loosened, or separated: And therefore whatever will produce these three Requisites in any Body, will render it of a fixt Nature.

4. To these may be added also the bringing the Corpuscles or Particles of any Body to touch one another in a considerably larger Part of their Surface.

FIXT *Nitre*, is Salt-petre melted in a Crucible, and then made to flame, by throwing in a Spoonful of Powder of Coals; and this is repeated till no Flame nor Denotation arise: After this 'tis cooled, powdered, and dissolved in Water, and then evaporated into a fine white Salt. 'Tis a Salt much like that of Tartar, and is used, like it, to help draw Tinctures out of Vegetables. Some Chymists give it the Name of *Alkahest*, because 'tis, as they say, a kind of Universal Dissolvent. If this Salt be exposed to the Air in a cool Place, it will all dissolve into a Water, or as they say, run *per Deliquium*; and this is called, *The Liquor of Fixt Nitre.*

FIXED *Stars*, are such as do not, like the Planets or *Erratick Stars*, change their Positions or Distances in respect of one another.

Because these *Fixed Stars* have no sensible Parallax arising from the Annual Motion of the Earth, they are justly esteemed to be at such an immense Distance, as to have no sensible Effect on our Earth.

The Honourable Mr. *Roberts* hath a pretty Discourse about the Distance of the *Fixed Stars*, which is published in *Philos. Transf. N.* 209. The Substance of which is as follows.

Since the *Pythagorean System* of the World has been revived by *Copernicus*, (and now by all *Mathematicians* accepted for the *True one*) there seemed Ground to imagine, that the Diameter of the Earth's Annual Course (which according to our best Astronomers, is at least 40000 Times bigger than our Earth's) might give a sensible Parallax to the *Fixed Stars*, though the other could not, and thereby determine their Distance more precisely.

But though we have a Foundation to build on, so vastly exceeding that of the Ancients, there are some Considerations may make us suspect, that even this is not large enough for our Purpose.

Mr. *Hugens* (who was very exact in his Astronomical Observations) tells us, he could never discover any visible Magnitude in the *Fixed Stars*, tho' he used Glasses which magnify the apparent Diameter above a hundred Times.

Now, since in all likelihood the *Fixed Stars* are Suns (perhaps of a different Magnitude) we may, as a reasonable *Medium*, presume they are generally about the Bigness of our Sun.

Let us then (for Example) suppose the *Dog-star* to be so.

The Distance from us to the Sun being about a hundred Times the Sun's Diameter, it is evident, that the Angle under which the *Dog-star* is seen in Mr. *Hugens*'s Telescope, must be near the same with the Angle of its Parallax to the Sun's Distance, or Semidiameter of the Earth's Annual Course; so that the Parallax to the whole Diameter can be but double such a Quantity, as even to Mr. *Hugens*'s nice Observation, is altogether insensible.

The

The Diſtance therefore of the Stars ſeems hardly within the reach of any of our Methods to determine; but from what has been laid down, we may draw ſome Concluſions that will much illuſtrate the prodigious vaſtneſs of it.

1. That the Diameter of the Earth's Annual Orb (which contains at leaſt 160 Millions of Miles) is but as a Point in Compariſon of it; at leaſt it muſt be above 6000 Times the Diſtance of the Sun: For if a Star ſhould appear through the aforeſaid Teleſcope half a Minute broad (which is a pretty ſenſible Magnitude) the true apparent Diameter would not exceed 18 third Minutes, which is leſs than the 6000 Part of the apparent Diameter of the Sun, and conſequently the Sun's Diſtance not the 6000 Part of the Diſtance of the Stars.

2. That could we advance towards the Stars 99 Parts of the whole Diſtance, and have only $\frac{1}{100}$ Part remaining, the Stars would appear little bigger to us than they do here; for they would ſhew no otherwiſe than they do through a Teleſcope, which magnifies an hundred-fold.

3. That at leaſt Nine Parts in Ten of the Space between us and the *Fixed Stars*, can receive no greater Light from the Sun, or any of the Stars, than what we have from the Stars in a clear Night.

4. That Light takes up more time in travelling from the Stars to us, than we in making a *Weſt-India* Voyage (which is ordinarily performed in ſix Weeks:) That a Sound would not arrive to us from thence in 50000 Years, nor a Cannon Bullet in a much longer Time. This is eaſily computed by allowing (according to Sir *Iſaac Newton*) ten Minutes for the Journey of Light from the Sun hither; and that a Sound moves about 1300 Foot in a Second. But Sir *Iſaac Newton* doth not allow above 968 Feet for the Motion of Sound in a Second of Time: And the *Florentine* Academicks make it about 1000 Feet.

Our Learned and Accurate Mr. *Flamſtead* ſaith, he hath diſcovered a ſenſible Parallax of the Earth's Annual Orbit in reſpect of the *Fixed Stars*; of which he publiſhed an Account in a Letter to Dr. *Wallis*, in the Year 1698. which is Printed in the Third Volume of *Wallis*'s Mathematical Works in *Latin*.

FLAGS, on Board a Ship, are Colours, Ancients, or Standards which the Admirals of a Fleet bear on their Tops. The Admiral in Chief carries his on his *Main-Top*, the Vice Admiral his at the *Fore-Top*, and the Rere-Admiral his at his *Miſſen-Top*.

FLAIR, the Seamen ſay that the Work doth *flair over*, when a Ship being houſed in near the Water, a little above that the Work hangs over a little too much, and ſo is let out broader aloft than the due Proportion will allow.

FLAMMA *Vitalis*; ſome do ſuppoſe that there reſides in the Heart of Animals ſuch a fine and kindled, but mild Subſtance, as they call a *Vital Flame*; and to its Preſervation they judge the Air taken in by Reſpiration to be neceſſary, as it is to the Conſervation of ordinary Flame.

The Excellent Mr. *Boyle*, by ſeveral Experiments purpoſely made in his exhauſted Receiver, about the Relation between Flame and Air, found that the Vital Flame of Animals (if the Life may be ſo called) did ſurvive or outlaſt the Flame of Spirit of Wine, or of a Wax or Tallow Candle; ſince the Animals would remain alive and well for 3 or 4 Minutes after the Receiver was evacuated, whereas no common Flame would laſt there one Minute.

The Light of Glow-worms that Noble Gentleman found alſo would preſently be deſtroyed by the Exhauſting Motion of the Air, by his Engine, as it would be re-produced again by its Admiſſion into the Receiver.

FLANCH, an Ordinary in Heraldry, formed by an Arch-line, which begins at the Corners of the *Chief*, and ends in the *Baſe* of the Eſcutcheon, thus.

He beareth *Ermin*, two *Flanches Vert*.

Flanches are always born by Pairs: The *Flanch* bends in more than the Flaſk.

FLANK, in Fortification, is that Part of the Baſtion which reaches from the Courtine to the Face, and defends the oppoſite Face, the Flank, and the Curtain.

There is alſo the Oblique or Second Flank, which is that Part of the Courtine where they can ſee to ſcour the Face of the oppoſite Baſtion; and is the Diſtance between the Lines *Razant* and *Fitchant*.

The *Low*, *Covered*, or *Retired Flank*, is the Platform of the Caſemate, which lies hid in the Baſtion.

The *Flanks* of a Battalion, or an Army are its Sides.

They uſe alſo the Word *to Flank* an Army; that is, to diſcover and fire upon its Sides.

Any Fortification which hath no Defence right forwards, is on that Account Faulty and Defective; and to render it compleat, one Part muſt be made *to flank* another. The Courtine therefore is the ſtrongeſt Part of any Fortified Place, becauſe it is *flanked* by the two *Flanks* at its Ends.

FLANK, is alſo a Term of War, ſignifying one Side of a Battalion of an Army; as to attack the Enemy in Flank, is to diſcover and fire upon them on one Side.

FLANK *of the Courtine*, or *Second Flank*, is that Part of the Courtine between the Flank and the Point, where the *Fitchant Line of Defence* terminates.

To FLANK, in general, is to diſcover and fire upon the Side of any Place; but to

FLANK *a Place*, is to diſpoſe a Baſtion, or other like Work, in ſuch a manner, that there ſhall be no Part of it but what is defended; ſo as you may from thence play upon Front and Rear: For any Fortification that hath no Defence, but juſt right forwards, is Faulty; and to render it compleat, one Part ought to be made to Flank the other: Hence the Courtine is always the ſtrongeſt Part of any Place, becauſe 'tis *flanked* at each End.

Fitchant FLANK, is that from whence a Cannon playing, fireth its Bullets directly in the Face of the oppoſite Baſtion.

FLANK *Razant*, is the Point from whence the Line of Defence begins, from the Conjunction of which with the Courtine, the Shot only razeth the Face of the next Baſtion, which happens when the Face cannot be diſcovered but from the Flank alone.

Retired FLANK, or the *Lower* or *Covert Flank*, is that Exterior Part thereof which advanceth to ſecure the Innermoſt; which advanced Part, if it be rounded, is called the *Orillon*; ſo that this *Flank Retire*, as the *French* call it, is only the Platform of the *Caſemate*, which lies hid in the Baſtion.

Simple FLANKS, are Lines which go from the *Angle of the Shoulder* to the *Courtine*, and whoſe

principal Function is the Defence of the Moat and Place.

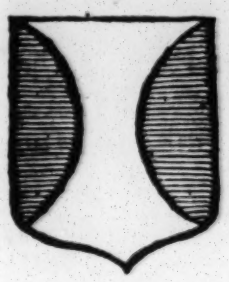
FLANK'D, or *Double Tenaille*: See *Tenaille*.

FLANKING *Line of Defence*: See *Rasant Line of Defence*.

FLANKING *Angle*: See *Angle*.

FLANK'D *Angle*, is the Angle formed by the two Faces of the Bastion, and so forms the Point of the Bastion.

FLASK, is in Heraldry an *Ordinary* made by one Arch-line drawn downwards to the *Base Point*: It seems to be the Representation of a Bow, when bended; and they are always born double, thus,



The Field is *Or*, Two *Flasks Azure*.

Some Heralds say, The *Flask* is a Reward for a Man of Virtue and Learning, who hath deserved well of his Prince in an Embassy.

FLAT; to *flat* a Ship, is to hale in the Fore-sail by the Sheet, as near to the Ship's Sides as may be, which is called, *Flatting in the Fore-sail*. This is done when a Ship will not fall off from a Wind without it, though the Fore-sheet was haled aft.

FLAT *Bastion*: See *Bastion*.

FLAT-BOTTOM'D *Moat*: See *Moat*.

FLAT *Crown*: See *Corona*.

FLATUS, are Effervescencies excited in the Body from Wind let in, or from Flatulent Meats, or from the Bile and Pancreatick Juice mixed together, whence Wind and Noise.

FLEDWIT, a Term in Law, signifying a Discharge or Freedom from Amerciaments, where one having been an Outlaw'd Fugitive, cometh to the Peace of our Lord of his own accord.

FLEMESWITE, in Law, signifies the Liberty to challenge the Cattel, or Amerciaments of your Man, a Fugitive.

FLESH, of any Animal Body, is by Anatomists defined to be a Similar and Fibrous Part, soft and thick: Of this they reckon five Kinds.

1. Musculous, Fibrous, or Fistular Flesh, such as is the Substance of the Heart, and other Muscles.

2. *Parenchymous* Flesh, as that of the Lungs, Liver, and Spleen was thought to be by the Ancients; but since the Use of Glasses 'tis plainly discovered that there is no such thing as a *Parenchyma*, properly speaking, but that all the *Viscera*, as well as other Parts of the Body, are *Vascular*, and nothing but *Plexus*, or Net-work of small Vessels and Canals.

3 *Viscerous*, such as the Flesh of the Stomach and Guts.

4. *Glandulous*, as that of the *Tonsils*, the *Pancreas*, the Breasts, &c.

5. *Spurious*, so they call the Flesh of the Lips, Gums, the *Glans* of the *Penis*, &c. because 'tis of a Constitution different from all the rest.

FLEXOR *Carpi Radialis*, is a Muscle of the Wrist, which ariseth Tendinous from the Internal Extuberance of the *Os Humeri*, becoming Fleshy, adheres strictly to the *Pronator Radij Teres*, and in half its Oblique Progress to the *Carpus* it becomes a flat Tendon, which passeth over the Annular Ligament, and is inserted to the upper Part of the *Os Metacarpi*, which sustains the Fore-finger: Its Name shews its Use.

FLEXOR *Carpi Ulnaris*, is a Muscle of the Wrist, which arises Tendinous from the same Tubercle of the Shoulder-bone, with the *Flexor Radialis*; as also from the superior and external Part of the *Ulna*, where the *Musculus Perforans* doth arise; and continuing Fleshy according to the length of the *Ulna*, is partly inserted by a short strong Tendon into the fourth Bone of the *Carpus*, and partly into the *Os Metacarpi*, which sustains the Little-finger. Its Name declares its Use.

FLEXOR *Secundi Internodii Digitorum Pedis*: See *Perforatus Pedis*.

FLEXOR *Tertii Internodii Digitorum Pedis*: See *Perforans*.

FLEXOR *Tertii Internodii*, or *Longissimus Pollicis*, is a Muscle of the Thumb, which is observed to have a *twofold* Beginning;

The First and Superior of which ariseth acutely from the Internal Extuberance of the *Os Humeri*, between the *Perforatus* and *Perforans*, becoming a Fleshy Belly, and then Tendinous, joins with the middle Tendon of its other larger Head.

The Second or Inferior Origin of this Muscle (is that Part of it which is commonly described) arising with a double Order of Fleshy Fibres for some space on the *Radius*, from immediately below its Superior Part, which uniting in a middle Line or Tendon (not unlike the *Fibrillæ* of a Feather, joining to their *Stamina*) which passing over the Articulation of the *Carpus*, becomes entirely Tendinous, as it runs over the *Flexor primi & secundi Internodii* to its Implantation at the Superior Part of the third Bone of the Thumb.

FLEXOR *Pollicis Brevis*, is a Muscle of the great Toe, which ariseth from the Superior Part of the *Os Cuneiforme Medium*, and running over the Termination of the *Musculus Peroneus*, is implanted into the *Ossa Sesamoidea* of the Great Toe, who are likewise tied to the Superior Part of the second Bone of the said Toe which bends it.

FLEXOR *Pollicis Pedis Longus*, is a Muscle of the Great Toe, which is a direct Antagonist to the *Extensor Longus*: It arises opposite to it from the Back-part of the *Fibula*, with a double Order of Fleshy Fibres, running to a middle Tendon (like the *Flexor tertii internodii Pollicis Manus*) which ceaseth to be Fleshy as it passes over the Juncture, and runs through a Channel on the Internal Part of the *Os Calcis*, under the Tendon of the *Musculus Flexor Digitorum Longus Perforans*, over the *Flexor Pollicis Brevis*, and is inserted to the upper End of the second Bone of the Great Toe: Its Use is to bend the Toe.

FLEXOR *primi & secundi Ossis Pollicis*, is a large disgregated Fleshy Muscle, arising from the *Ligamentum Transversale Carpi*, Bones of the *Carpus*, at the Basis of the *Mons Lunæ*, and *Os Metacarpi* of the Middle Finger, whence it passes to its Insertion partly to the *Ossa Sesamoidea* of the second Internode, and partly to the first Bone of the Thumb: This (as *Vesalius* writes) may be divided into Three. Its Actions are various, according to the Diversity of its *Series* of Fibres; so it bends the first or second Bones of the Thumb, either directly or obliquely towards the *Carpus* and *Vola Manus*.

FLIE, that Part of the Mariner's Compass on which the 32 Winds are drawn, and to which the Needle is fastened underneath, they call the *Flie*.

FLOATING-BRIDGE, is a Bridge made in form of a Redoubt, consisting of two Boats covered with Planks, which ought to be so solidly Framed, as to bear both Horse and Cannon.

FLOND, or *Figurative Descant*, a Term in Musick. See *Descant*.

FLOOR,

FLOOR, in a Ship, ſtrictly taken, is ſo much only of her Bottom as ſhe doth reſt upon when ſhe lieth on Ground; and therefore thoſe Ships that have long, and withal broad Floors, lie on the Ground with moſt Security, and are not apt to *Seel* (that is, to fall on the one Side;) whereas the other which are *Cranck by the Ground*, (as the Sea Phraſe is) that is narrow in the Floor, cannot be grounded without Peril either of being overthrown, or, at leaſt, of wronging her Sides. And note, the Word *Overthrown* is uſed when a Ship is brought to be *trimmed a-ground*, and ſo by ſome Miſchance doth fall over on her Side; but when a Ship at Sea is turned over on the one Side, ſhe is ſaid to be *Over-ſet*.

FLORY, a Term in Heraldry, when the Out-lines of any Ordinary are drawn, as if trimm'd with, or in the Form of Flowers.

Thus this Croſs they call a *Croſs-Flory*.

FLOTSON, or *Flotzam*, is a Word proper to the Sea, ſignifying any Goods loſt by Shipwreck, and floating and ſwimming upon the Top of the Water; which, with *Jetſon*, and *Lagon*, and others, are given to the Lord Admiral by his Letters Patent.

Jetſon, is a thing caſt out of the Ship, being in danger of Wreck, and beaten to the Shore by the Waters, or caſt on the Shore by the Mariners.

Lagon, or *Lagan*, or *Ligan*, is that which lieth in the Bottom of the Sea.

Shares, are Goods due to more by Proportion.

FLOWER *of a Plant*: According to Dr. *Grew*, the *Flowers of Plants* have commonly theſe three Parts;

The *Empalement*, the *Foliation*, and the *Attire*; which Words ſee.

And Mr. *Ray* reckons, that every perfect Flower muſt have the *Petala*, the *Stamina*, the *Apices*, and the *Stylus*: Wherefore whatever Flower wants any of theſe, is to be look'd upon as in that reſpect imperfect.

In moſt Plants there is a *Perianthium*, *Calix*, or Flower-Cup, of a ſtronger Conſiſtence than the Flower it ſelf, and deſign'd to ſtrengthen and preſerve it; it compaſſes the Flower about at the Bottom.

Mr. *Ray* divides alſo the perfect Flowers of Plants (now reckoning them perfect if they have the *Petala* without the *Stamina*) into Simple Flowers, which are not compoſed of other ſmaller ones, and which uſually have but one ſingle Style.

2. *Compounded*, *Aggregated*, or *Compoſite Flowers*, which are ſo compounded of many little *Floſculi*, as that they all make but *one Flower*.

Simple Flowers are *Monopetalous*, which have the Body of the *Flower* all of one entire Leaf, tho' ſometimes cut or divided a little way into many ſeeming *Petala* or Leaves, as in *Borage*, *Bugloſs*, &c. Or,

Polypetalous, which have diſtinct *Petala*, and thoſe falling off ſingly, and not altogether, as the ſeeming *Petala* of the *Monopetalous Flowers* always do.

And both theſe he divides into

Uniform and *Difform* } *Flowers*.

The former have the right and left Hand Parts, and the forward and backward Parts of the *Flower* all alike.

But thoſe he accounts to have a *Difform Flower*, which have no ſuch Regularity: as in the *Flowers* of *Sage*, *Dead-nettle*, &c.

A *Monopetalous Difform Flower* alſo, he divides into,

1. *Semifiſtular*; *i. e.* ſuch whoſe upper Part reſembles a Pipe cut off Obliquely, as in the *Ariſtolochia*.

2. *Labiate*, and this either with one Lip only, as in the *Acanthum* and *Scordium*: Or with two Lips, as in the far greateſt Part of the *Libiate Flowers*. And here the upper Lip of the Flower ſometimes is turned upwards, and ſo turns the Convex Part downwards, as in the *Chamæciſſus*, &c. But moſt uſually the upper Lip is Convex above, and turns the hollow Part down to its Fellow below, and ſo repreſents a kind of *Helmet* or *Monk's Head*. And from hence theſe are frequently called *Galleate*, *Cucullate*, and *Galericulate Flowers*, as you will find in Books of Botany: And in this Form are the *Flowers* of the *Lamium*, and moſt *Verticillate Plants*. Sometimes alſo the *Labium* is entire, and ſometimes jagged or divided.

3. *Corniculate*; *i. e.* ſuch hollow Flowers as have on their upper Part a kind of *Spur*, or *Little Horn*; as in the *Linaria*, *Delphinum*, &c. And the *Corniculum* or *Calcar* is always impervious at the Tip or Point.

Compounded Flowers are either,

1. *Diſcous*, or *Diſcoidal*, that is, whoſe little *Floſculi* are ſet together ſo cloſe, thick, and even, as to make the Surface of the Flower plain and flat; which therefore, becauſe of its round Form, will be like a *Diſcus*: Which Disk is ſometimes *Radiated*, when there are a Row of *Petala* ſtanding round in the Disk like the Points of a Star, as in the *Metricaria*, *Chamæmelum*, &c.

Sometimes *Naked*; *i. e.* having no ſuch radiating Leaves round the Limb of its Disk; as in the *Tanacetum*.

2. *Planifolious*, which is compoſed of plain Flowers ſet together in Circular Rows round the Center, and whoſe Face is uſually indented, notched, uneven, and jagged; as the *Hieracia*, *Sonchi*, &c.

3. *Fiſtular*, which is compounded of many long, hollow, little Flowers like Pipes, all divided into large Jaggs at the Ends.

Imperfect Flowers, becauſe they want the *Petala*, are called *Stamineous*, *Apetalous*, and *Capillaceous*.

And thoſe which hang pendulous by fine Threads like the *Juli*, are by *Tournefort* called *Amenta-ceous*, we call them Cat's-Tails.

The ſame Writer uſes alſo the Term *Campani-formis* for ſuch Flowers as are in the Shape of a Bell; and *Infundibuliformis* for ſuch as are in the Form of a Tunnel.

He diſtinguiſhes alſo ſome *Difform Monopetalous Flowers* by the Name of *Perſonati*; by which he means ſuch as expreſs the gaping Mouths of ſome *Animals*; and diſtinguiſhes *theſe* from what he calls *Labiati*, in that the *Stylus* or *Piſtillum* of theſe doth not end in a *Capſula Seminalis*, as it doth in *thoſe*.

FLOWER-DE-LIS, the Mark of Difference in *Heraldry* for the Sixth Brother of any Family: 'Tis alſo often born as Coat Armour.

FLOWER *of Sulphur or Brimſtone*, is made by putting the Sulphur groſly powdered into a Glaſs Body placed in a ſmall open Fire, and having put over, or into its Neck, another Veſſel of Earth of the ſame Form, but unglazed, the Fire will ſublime the Flowers, and make them adhere to the upper Veſſel, which muſt be changed every half Hour.

FLOWERS: That fine mealy Matter which in Sublimations in Chymiſtry is carried up into the Head and *Aludels*, and adheres to them in the Form of a fine Powder, the Chymiſts call *Flores* or Flowers: See *Aludels*.

FLOWN-SHEETS: The Seamen ſay a Ship ſails with *Flown-Sheets*, when her Sheets are not *haled home*, or cloſe to the Blocks: They ſay alſo, *Let fly the Sheet!* When in a great Guſt of Wind, for fear the Ship ſhould over-ſet, or *ſpend* her Top-maſts, they would have the Sheet *go a-main*, or as far as it will run, becauſe then the Sail will hold no Wind; and when the Sheets are thus let go, they ſay, *Her Sheets are Flown.*

FLUID *Body:* The Excellent Sir *Iſ. Newton* defines a *Fluid Body* to be that whoſe Parts eaſily give Place, and move out of the way on any Force impelled upon them, and by that means do ſo very eaſily move over one another; which is a much better Definition than that of *Des Cartes*, That a Fluid is a Body whoſe Parts are in continual Motion; becauſe 'tis neither apparent that the Parts of all Fluids are ſo; nor that the Parts of ſome Solid Bodies are not ſo.

FLUIDITY ſeems to conſiſt in this, That Parts of any Bodies being very fine and ſmall, are ſo diſpoſed by Motion and Figure, as that they can eaſily ſlide over one another's Surfaces all manner of ways: It ſeems requiſite alſo, as Mr. *Boyle* obſerves, That they ſhould be variouſly and ſeparately agitated to and fro, and that they ſhould touch one another but in ſome Parts only of their Surfaces: And that Excellent Gentleman, in his Hiſtory of Fluidity, intimates, That the Conditions requiſite to conſtitute a Fluid Body are chiefly theſe Three:

1. The *Littleneſs of its Parts:* Thus we ſee the Fire, by dividing Metal into Parts very fine and ſmall, will melt them, and make them Fluid. And Acid Menſtruums after the ſame manner diſſolve them and ſuſpend them in Liquor; and Fire will turn the hard Body of common Salt almoſt all of it into a Liquor, by Diſtillation; though 'tis not improbable, that the Shape and Figure of theſe ſmall Parts may conduce much towards producing this Quality of *Fluidity*: For we find in the Diſtillation of Oil Olive (which is a Fluid made only by Preſſure) that moſt of the Oil will by the Action of the Parts of the Fire, (note, it muſt be done in a Retort) be turned into a kind of conſiſtent Subſtance like Butter.

2. It ſeems requiſite to Fluidity, that there be ſtore of vacant Places interſperſed between the Corpuſcles of the Fluid Body; for elſe there will not be room for each Particle to continue its Motion and Agitation on the Surfaces of the neighbouring ones. For,

3. The chief Condition requiſite to conſtitute a Fluid Body, is, That its Particles be agitated variouſly, and apart, either by their own proper Motion, or by ſomething of Subſtance which tumbles them up and down by its Paſſage through them. That this Qualification chiefly is requiſite to Fluidity, you may gather from that common Experiment of putting Powder of Alabaſter, or of common Plaiſter of *Paris*, finely ſifted in a flat-bottom'd Veſſel over the Fire; for in a little time the dry Powder will boil like Water, and imitate all the Motions of a boiling Liquor; it will tumble variouſly over in great Waves like that, it will bear ſtirring with a ſtick or Ladle like that, without reſiſting, as it will do when cold; nay, if you ſtir it ſtrongly near the Side of the Veſſel, its Waves will apparently daſh up againſt the Sides; but yet if you take any of it out, and lay it ſpeedily on a Piece of White Paper, you will ſee 'tis nothing but a dry Powder.

So that from hence 'tis plain, there is a real Difference between a *Fluid Body* and a *Wetting Liquor*; for not only this boiling Powder, and melted Metals, but the Air, *Æther*, and even Flame it ſelf, are properly Fluid Bodies, though not moiſt Liquors.

This noble Gentleman found alſo, That by blowing the Smoak of Roſemary into a Glaſs Pipe, and then holding the Pipe (when filled) upright, the Surface of the Smoak would accommodate its ſelf to a level Situation; and which way ſoever you inclined the Tube, the Superficies of the Smoak would lie parallel to the Horizon; and when the Glaſs was much inclined, would run along it like Water.

Whence he infers, That in order to the rendring a Body Fluid, there is no need that its Parts ſhould be ſo cloſely condenſed as thoſe of Water are.

Dr. *Hooke*, in his *Micrograph. P.* 12. hath a pretty Experiment or Two to prove this Account of Fluidity, *viz.* that of a Diſh of Sand ſet on a Drum-head briskly beaten by the Sticks, or on the upper Stone of a Mill, turning ſwiftly round on the (empty) lower one; it will in almoſt all Reſpects emulate the Properties of a Fluid Body. For a heavy Body will immediately ſink in it to the Bottom, and a light one emerge to the Top: each Grain of Sand hath a conſtant vibrating and dancing Motion; and if a Hole be made in the Side of the Diſh, the Sand will ſpin out like Water: See *Vol.* II.

FLUOR *Albus*, or *Fluor Uterinus*, is a continual Evacuation of corrupt Humours from the Womb, or the Pores in the *Vagina*. *Blanchard.*

FLUORES, a Word uſed by the Modern Mineral Writers for ſuch ſoft tranſparent ſparry kinds of Mineral Concretions, as are frequently found

found among Oars and Stones in Mines and Quarries.

FLUSH; when the Deck of a Ship is even from Stem to Stern, without any Falls or Risings, they say her Deck lies *Flush* Fore and Aft.

FLUX and *Reflux* of the Sea: See *Tide*.

FLUX-POWDERS, or as the *French* call them, *Fondants*, are Powders prepared to facilitate the Fusion of the harder Metals, and to melt Oars in order to discover what Proportion of Metal they hold or contain.

Powder of Antimony alone is a very good Flux in many Cases, and by it you may readily melt Iron or Steel in a Crucible, with an ordinary Charcoal Fire.

Mr. *Boyle* gives an Account of a *Flux-Powder* he used which was composed of *Tartar*, *Sulphur*, and *Arsenick*.

FLUXION, the same with *Catarrh*.

FLUXIONS. Sir *Isaac Newton*, in his Admirable *Princip. Phil. Math. P.* 250. lays down this *Lemma*.

That the Moment *of any generated Quantity, is equal to the Moments of all the several generating Terms, multiplied into the Indices of their Powers, and into their Coefficients continually.*

Let a, b, c, &c. represent the Moments of any Quantities A, B, C, &c. increasing or decreasing by a perpetual *Fluxion*; then will the Moment or Mutation of the Rectangle AB be $Ab + aB$; and of the Content of ABC, the Moment will be $ABc + AbC + aBC$: and of the Powers A^2, A^3, A^4, the Moments will be $2aA$, $3aA^2$, $4aA^3$; and the Moments of $A^{\frac{1}{2}}, A^{\frac{3}{2}}, A^{\frac{1}{3}}, A^{\frac{2}{3}}, \frac{1}{A}, \frac{1}{A^2}, \frac{1}{A^{\frac{3}{2}}}$, will be $\frac{1}{2}aA^{-\frac{1}{2}}$, $2aA^{\frac{1}{2}}$, $\frac{1}{3}aA^{-\frac{2}{3}}$, $\frac{2}{3}aA^{-\frac{1}{3}}$, $-aA^{-2}$, $-2aA^{-3}$, and $-\frac{1}{2}A^{-\frac{3}{2}}$ respectively.

And generally, the Moment of any Power, suppose $A^{\frac{n}{m}}$, will be $\frac{n}{m}aA^{\frac{n-m}{m}}$, &c.

The Demonstration of which Lemma is this.

CASE I.

Suppose any Rectangle, as AB, made or increased by a perpetual Motion; and from the Sides AB, let there be subtracted the $\frac{1}{2}$ Moments, as $\frac{1}{2}a$ and $\frac{1}{2}b$: Then it will stand $A - \frac{1}{2}a$, and $B - \frac{1}{2}b$. Multiply them into each other, and there will arise $AB - \frac{1}{2}aB - \frac{1}{2}bA + \frac{1}{4}ab$.

Suppose also A and B increased by the half Moments, as $A + \frac{1}{2}a$, and $B + \frac{1}{2}b$; and that those thus augmented Quantities were multiplied by one another; then there will arise $AB + \frac{1}{2}aB + \frac{1}{2}Ab + \frac{1}{4}ab$ for the Product: From which subducting the former Rectangle $AB - \frac{1}{2}aB - \frac{1}{2}bA + \frac{1}{4}ab$, the Difference will be $aB + Ab$. Q. E. D. Which is the first Instance.

CASE II.

Let AB be $=$ to G: This multiplied by C, gives GC, or ABC; and its Moment, by the last *Case*, will be $gC + Gc$; that is, (if instead of G and g, you had put AB and $AB + Ab$) $aBC + AbC + ABc$. And thus it will ever be in the Quantities produced by continual Multiplication of unequal Factors.

CASE III.

Let A, B, and C, be all equal; and then the Moment of A^2, or of the Rectangle AB, will be $2aA = aB + Ab$; and the Moment of ABC or A^3, will be $3aA^2 = aBC + AbC + ABc$. And in the like manner if n represent the Index of any Power of A, the Moment of A^n will be naA^{n-1}. Q. E. D.

CASE IV.

Wherefore, since $\frac{1}{A}$ multiplied by $A = 1$, the Moment of $\frac{1}{A}$ multiplied by A, together with $\frac{1}{A}$ multiplied by a, will be the Moment of 1, that is, nothing.

Further, the Moment of $\frac{1}{A}$, or A^{-1}, is $-\frac{a}{A^2}$. And generally, since $\frac{1}{A^n}$ multiplied by $A^n = 1$, the Moments of $\frac{1}{A^n}$ multiplied by A^n, together with $\frac{1}{A^n}$ multiplied by naA^{n-1}, will be nothing. And consequently the Moment of $\frac{1}{A^n}$, or A^{-n}, will be $-\frac{a}{A^{n+1}}$. Q. E. D.

CASE V.

And since $A^{\frac{1}{2}}$ into $A^{\frac{1}{2}}$, produces A, the Moment of $A^{\frac{1}{2}}$ into $2A^{\frac{1}{2}}$, will be a (by *Case* 3.) and therefore the Moment of $A^{\frac{1}{2}}$ will be $\frac{a}{2A^{\frac{1}{2}}}$, or $2aA^{-\frac{1}{2}}$.

And generally, if $A^{\frac{m}{n}}$ be put equal to B, A^m shall be equal to B^n; and consequently $maA^{m-1} =$ to nbB^{n-1}, and maA^{-1} equal to nbB^{-1}, or $\frac{nb}{A^n}$: And therefore $\frac{m}{n}aA^{\frac{m-n}{n}}$ is equal to $\frac{b}{A^{\frac{m}{n}}}$; *i. e.* is equal to the Moment of $A^{\frac{m}{n}}$. Q. E. D.

CASE VI.

Wherefore the Moment of any generated Quantity $A^m B^n$, is the Moment of A^m multiplied by B^n, together with the Moment of B^n multiplied into A^m; that is, $maA^{m-1} + nbB^{n-1}$. And this whether the Indices of the Powers be Integers or Fractions, Affirmative or Negative.

And the same Reason holds in the Products of any Numbers multiplied by themselves continually as long as you please, or to as high Powers as you will. *Q. E. D.*

On which Foundations the Algorithm of Fluxions, according to our way of Notation, may be thus

thus eſtabliſhed; as I have before ſhewed in a good meaſure at the End of my *Algebra*, *Pag.* 115.

Where I ſhew, That by *the Doctrine of Fluxions*, we are to underſtand the Arithmetick of the *infinitely ſmall* Increments or Decrements of *indeterminate* or *variable Quantities*; or as ſome call them, the *Moments* or *infinitely ſmall Differences* of ſuch variable Quantities. Theſe infinitely ſmall Increments or Decrements our incomparable Sir *Iſaac Newton* calls very properly by this Name of *Fluxions*: For, as indeterminate and variable Quantities, *viz.* ſuch as in the Generation of Curvilineal and other Figures, by Local Motion, are continually increaſing or diminiſhing, he rightly denominates *Flowing Quantities*, as being ſuch as are perpetually augmented or leſſened, by the Flux or Motion of a *Line*, *Surface*, &c. So he calls the *Celerity* or *Velocity* of the Augmentation or Diminution of theſe *Flowing Quantities* by the Name of *Fluxions*. And becauſe all Figures may be conceived to be generated by Local Motion, as is now very commonly ſuppoſed among Geometers, therefore 'tis much more natural to conceive the infinitely ſmall Increments or Decrements of the variable and *flowing Quantities* under the Notion of *Fluxions*, than under that of *Moments*, or infinitely ſmall *Differences*, as *Leibnitz*, *Niewentiit*, and the Noble Author of *Analyſe des Infiniment Petits* chuſe rather to take them; though even that Way alſo is not without its Uſe in many Caſes.

The Excellent Sir *Iſaac Newton* ſuppoſes the *Abſciſſa* of a Curve, or any other flowing or variable Quantity to be uniformly augmented; and therefore for its *Fluxion* he puts 1 or Unity; and the other flowing Quantities he denotes uſually by the Letters v, x, y, z, and expreſſes their *Fluxions* by only repeating the ſame Letters with Points or Pricks over their Heads; thus, $\dot{v}$, $\dot{x}$, $\dot{y}$, $\dot{z}$, which are the Fluxions of the former flowing Quantities. And this Method is much more natural and ſhorter than *Niewentiit*'s, or the *French* one with the Differential d multiplied into the flowing Quantity, to denote the Fluxion.

And becauſe theſe *Fluxions* themſelves are alſo Indeterminate and Variable Quantities, and do continually increaſe or decreaſe, or grow greater or leſſer; therefore he conſiders the Velocities with which they do ſo increaſe or diminiſh, as the *Fluxions* of the former *Fluxions*: And thoſe may be called *Second Fluxions*, and are noted with Two Points over them; thus, $\ddot{y}$, $\ddot{x}$, $\ddot{z}$. And if you go on again, and conſider the perpetual Augmentation or Diminution of *theſe*, as their *Fluxions* alſo, you may make third, fourth, or fifth Fluxions, &c. which will be noted thus, $\dddot{y}$, $\dddot{x}$, $\dddot{z}$; $\ddddot{y}$, $\ddddot{x}$, $\ddddot{z}$; $\dddddot{y}$, $\dddddot{x}$, $\dddddot{z}$; and ſo on *ad Infinitum*. If the flowing Quantity be a Surd or a Fraction, he thus expreſſes its Fluxion; let the Surd be $\sqrt{:a-b}$, its Fluxion is $\frac{\dot{\sqrt{:a-b}}}{2\sqrt{:a-b}}$; and the Fluxion of the Fraction $\frac{xx}{d-y}$ is $\frac{\dot{x}x+x\dot{x}}{d-y}:\frac{xx}{d-y}$: See Dr. *Wallis*'s *Algebra*, *Lat. Edit. Pag.* 392.

The main Buſineſs of the Algorithm or Arithmetick of Fluxions conſiſts in theſe two Things:

I. *From the Flowing Quantity given, to find the Fluxion.*

II. *From the Fluxion, to find the Flowing Quantity.*

As to the former of theſe, the Learned Dr. *Wallis*, in the Place above-mention'd (from Sir *Iſaac Newton*'s Papers) gives this general Rule.

> *Let each Term of the Equation be multiplied ſeparately by the ſeveral Indexes of the Powers of all the Flowing Quantities contain'd in that Term: And in every ſuch Multiplication let one Root or Letter of the Power be changed into its proper Fluxion: So ſhall the Aggregate of all the Products connected together by their proper Signs, be the Fluxion of the Equation deſired.*

And all the Caſes of it are demonſtrated by Sir *Iſaac Newton* in the *Lemma* above delivered, which I ſhall exemplify by particular Inſtances.

I. In the General; To expreſs the Fluxions of ſimple variable Quantities, as was ſaid before, you need only uſe the Letter or Letters which expreſs them, with a ſmall Point over their Heads:

Thus, the Fluxion of x is $\dot{x}$, and the Fluxion of y is $\dot{y}$, and the Fluxion of $x+y+v+z$, is $\dot{x}+\dot{y}+\dot{v}+\dot{z}$, &c.

And (inverſely) the *Flowing Quantities* in this Caſe, will be eaſily had from the Fluxions, by only writing the Letters without the Points over them.

N. B. For the Fluxion of Permanent Quantities, when any ſuch are in the Equation, you muſt imagine o or a Cypher; for ſuch Quantities can have no Fluxions, properly ſpeaking, becauſe they are without Motion, or Invariable.

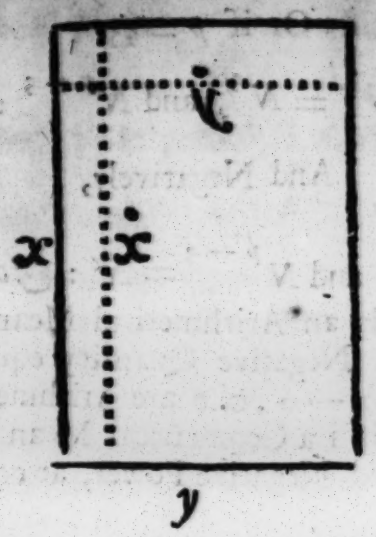
II. To find the Fluxions of the Products of two or more variable or flowing Quantities: *Multiply the Fluxion of each Simple Quantity by the Factors of the Products, or the Product of all the reſt, and connect the laſt Products by their proper Signs; the Sum or Aggregate is the Fluxion ſought.*

Thus, the Fluxion of xy is $\dot{x}y+x\dot{y}$; and the Fluxion of xyz, is $\dot{x}yz+x\dot{y}z+xy\dot{z}$; and the Fluxion of $xvyz$, is $\dot{x}vyz+x\dot{v}yz+xv\dot{y}z+xvy\dot{z}$; and the Fluxion of $a+x$ × by $b-y$ (the common Product being $ab+bx-ya-xy$) will be $b\dot{x}-y\dot{a}-x\dot{y}-\dot{x}y$.

Demonſtration of Rule 2.

Suppoſe xy = to any Rectangle made or increaſed by a perpetual Motion or Fluxions of either of the Sides x or y along the other; and let the Moments or Fluxions of the Sides be $\dot{x}$ and $\dot{y}$: By which we underſtand the *Velocity* with which either Side moves to form the Rectangle.

From



From the Sides ſubduct the half Fluxions of thoſe Sides, and it will ſtand thus; $x - \frac{\dot{x}}{2}$, and $y - \frac{\dot{y}}{2}$.

Multiply theſe one into another, and the Product will be $xy - \frac{y\dot{x}}{2} - \frac{x\dot{y}}{2} + \frac{\dot{x}\dot{y}}{4}$:

Then to the Sides add the half Moments or Fluxions, and it will be thus; $x + \frac{\dot{x}}{2}$, and $y + \frac{\dot{y}}{2}$: Which multiplied alſo into one another, will produce $xy + \frac{y\dot{x}}{2} + \frac{x\dot{y}}{2} + \frac{\dot{x}\dot{y}}{4}$

After which ſubſtract the former Product from this laſt, and the Difference will be only $x\dot{y} + \dot{x}y$, the Fluxion of xy, according to the Rule.

The Inverſe of this Rule finds alſo (in this Caſe) the *Flowing Quantity* from the *Fluxion*, *viz.* if each Member of the Fluxion be divided by the Fluxionary Quantity or Letter, or by changing the Fluxionary Letter into that proper Flowing Quantity of which it is the Fluxion; for then the Quotes connected by their proper Signs, will be the Flowing Quantities ſought: Only if the Letters be all exactly the ſame, the Flowing Quantity will be a Simple one, whoſe Parts are not to be connected together by the Signs + and —, as in the firſt three Examples of this Rule.

III. To find the Fluxion of any Fraction. *Multiply the Fluxion of the Numerator by the Denominator, and after it place (with the Sign —) the Fluxion of the Denominator to the Numerator, and divide the whole by the Square of the Denominator.*

Thus, the Fluxion of $\frac{x}{y}$ is $\frac{\dot{x}y - x\dot{y}}{yy}$; for ſuppoſe $\frac{x}{y} = z$, then will $x = yz$; which equal Quantities will have equal Fluxions; therefore $\dot{x} = \dot{y}z + z\dot{y}$, and $\dot{x} - z\dot{y} = z\dot{y}$; and dividing all by y $\frac{\dot{x} - x\dot{y}}{y} = \dot{z} =$ (becauſe $\frac{x}{y} = z$) $\frac{y\dot{x} - x\dot{y}}{yy}$: Wherefore this laſt is the Fluxion of the Fraction $\frac{x}{y} = z$; becauſe z being $= \frac{x}{y}$, $\dot{z}$ will be equal to the Fluxion of $\frac{x}{y}$. And the Fluxion of $\frac{a}{x}$ will be $\frac{-\dot{x}a}{xx}$; for the Permanent Quantity a having no Fluxion, there can be no Product of the Fluxion of the Numerator into the Denominator, as there would have been, had a been x, z, or any other Variable Quantity.

Alſo the Fluxion of $\frac{x}{a}$ will be $\frac{\dot{x}a}{aa}$, and the Fluxion of $\frac{x}{a+x}$, will be $\frac{\dot{x}a + \dot{x}x - \dot{x}a}{aa + 2ax + xx}$ or $\frac{\dot{x}a}{aa + 2ax + xx}$; becauſe $-\dot{x}x$ and $+\dot{x}x$ deſtroy one another: Alſo the Fluxion of $\frac{1}{x}$ or x^{-1}, is $\left(\frac{-\dot{x}}{x^2.}\right)$ Here alſo the Reverſe of the Rule ſerves to find the Flowing Quantity from the Fluxion: As if the Flowing Quantity of the Fraction were required, $\frac{\dot{x}y - x\dot{y}}{yy}$; Firſt multiply it by the Square of the Denominator, and it will be $\dot{x}y - x\dot{y}$; from which take away $-x\dot{y}$, which was placed after it, and it will be $\dot{x}y$; omit the Point and 'tis xy, which, becauſe y is the Denominator of a Fraction, will at laſt be $\frac{x}{y}$.

Before the Fluxions of any Power, whether perfect or imperfect, can be found, the following way of Notation muſt be well underſtood.

If a Series of Geometrical Progreſſionals be in this Order,

1. x. xx. x^3. x^4. x^5. x^6. x^7. &c.

Their Indexes or Exponents will be in Arithmetical Progreſſion, and ſtand thus;

0, 1. 2. 3. 4. 5. 6. 7.

But if they are Fractions, as

$\frac{1}{x}$ $\frac{1}{x}$ $\frac{1}{x^3}$ $\frac{1}{x^4}$ $\frac{1}{x^5}$ $\frac{1}{x^6}$ $\frac{1}{x^7}$.

Then their Exponents will be Negative, and ſtand thus, — 1. — 2. — 3. — 4. — 5. — 6. — 7.

For if you ſuppoſe $x = 2$, then will $\frac{1}{x} = \frac{1}{2}$, and $\frac{1}{xx} = \frac{1}{4}$, and $\frac{1}{x^3} = \frac{1}{8}$, &c.

Or if you expreſs the Geometrical Series by means of the Exponents, it will ſtand thus, x^{-1}, x^{-2}, &c. and if it were expreſſed thus, x^0, then it will be $x^0 = 1$; becauſe 2 is the Denominator of the Ratio, in which Unity is not affected. Thus alſo $\frac{1}{x^4} = x^{-4}$, and $\frac{1}{x^3} = x^{-3}$; and $1 = x^0$, $x^1 = x$, $x^2 = xx$, &c.

Alſo the Exponent of $\sqrt{:}\, x$ will be $\frac{1}{2}$, becauſe as $\sqrt{:}\, x$, is a Mean Proportional between 1 and x; ſo $\frac{1}{2}$, is an Arithmetical Mean between 0 and 1.

And the Exponent of $\sqrt[3]{:}\, x$ will be $\frac{1}{3}$, becauſe as $\sqrt[3]{:}\, x$ is the firſt of the two Mean Proportionals between 1 and x; ſo $\frac{1}{3}$ is the firſt of the two Arithmetical Means between 0 and 1.

For ſince 1. x. x^2. x^4. x^8. are continually Proportional, therefore their Cubes or any other Roots, will

will be alſo continually Proportional; that is, $\sqrt{}:1$ $(=1).\ \sqrt[3]{}x.\ \sqrt[3]{}:xx.\ \sqrt[3]{}xxx\ (=x)\ \&c.$

So alſo,

$1.\ x.\ xx.\ x^3.\ x^4.\ x^5.\ \&c.$: Wherefore the Roots of the 5th Power of thoſe Quantities will be $\&c.$;

That is,

$\sqrt[5]{}1.\ \sqrt[5]{}x.\ \sqrt[5]{}x^2.\ \sqrt[5]{}x^3.\ \sqrt[5]{}x^4.\ \sqrt[5]{}x^5\ (=x.)$

Alſo, for the ſame Reaſon, the Exponent of $\sqrt[5]{}:x^4$, will be $\frac{4}{5}$.

N.B. Always place the Index of the Letter (or Power) over that of the Radical Sign.

Thus, in Fractions, the Exponent of $\frac{1}{x}$ will be -1, of $\frac{1}{\sqrt{}:x^3}$ will be $-\frac{3}{2}$, of $\frac{1}{\sqrt[3]{}:x^5}$ will be $-\frac{5}{3}$, of $\frac{1}{\sqrt{}:x^7}$ will be $-\frac{7}{2}$, $\&c.$

N.B. $\sqrt{}:x$ and $x^{\frac{1}{2}}$, or $\sqrt[3]{}:x$ and $x^{\frac{1}{3}}$, or $\sqrt[5]{}:x^4$, and $x^{\frac{4}{5}}$, are only two different ways of Notation for one and the ſame thing, the former in the *old*, the latter in the *new* way.

So likewiſe $\frac{1}{x}$ and x^{-1} are all one; and $\frac{3}{x}$ is x^{-3}, $\&c.$

The way of reading or expreſſing Quantities ſo denoted is thus; x^{-3} is Unity divided by the Cube of x, and if it were $x^{-\frac{7}{3}}$, it muſt be read, Unity or One, divided by the Cube Root of the 7th Power of x.

Note alſo, That the Sum of any two Exponents of two Numbers or Quantities, in any Geometrick Progreſſion, makes the Exponent of the Product of thoſe two Terms.

Thus, $x^{\frac{1}{2}+\frac{2}{3}}$, or $x^{\frac{7}{6}}$, is the way of expreſſing the Product of $x^{\frac{2}{3}}$ into $x^{\frac{1}{2}}$, and $x^{-\frac{1}{3}+\frac{1}{5}}$, or $x^{-\frac{2}{15}}$, is the Product of $x^{-\frac{1}{3}}$ into $x^{\frac{1}{5}}$.

Alſo $x^{-\frac{1}{3}-\frac{1}{3}}$, or $x^{-\frac{2}{3}}$, is the Product of $x^{-\frac{1}{3}}$ into it ſelf, or the Square of $x^{-\frac{1}{3}}$.

And the Difference between the Exponents of any two Terms, is the Exponent of the Quotient ariſing by Diviſion of the greater by the leſs.

Thus, $x^{\frac{1}{2}-\frac{1}{3}}$ or $x^{\frac{1}{6}}$ is the Exponent of the Quotient of $x^{\frac{1}{2}}$ by $x^{\frac{1}{3}}$, $\&c.$

Let p repreſent the Exponent of N any Number at pleaſure; and let $p=1$.

Then will $N^p = N^1$, $N^{p+1} = N^2$, and $N^{p+2} = N^3$, $N^{p+3} = N^4$, $\&c.$

Or if $p=33$.

Then will $N^p = N^3$, and $N^{p+3} = N^6$, $\&c.$

And Negatively,

$N^{-p} = N^3$, and $N^{p+3} = N^6$: $\&c.$

Alſo, as 0 is an Arithmetical Mean between a Poſitive and a Negative Quantity equally diſtant from it; (*i. e.*) $-6.0.6$ are Arithmetically Proportional: So is 1 a Geometrical Mean between an Affirmative and Negative Power, at equal Diſtances from it.

That is, $N^{-p}.\ 1.\ N^p\ \&c.$

Wherefore $1 = N^{-p} \times N^p$. And dividing all by N^p, $\frac{1}{N^p} = N^{-p}$.

So that $\frac{1}{N^{2p}}$ is all one with N^{-2p}.

And to add ſome Examples of Multiplication and Diviſion in this way,

$\frac{1}{x} \times \frac{1}{\sqrt[3]{}x^5} = x^{-1} \times x^{\frac{5}{3}} = x^{-\frac{3}{3}} \times x^{\frac{5}{3}} = x^{-\frac{8}{3}}$

$= \frac{-1}{x^{\frac{8}{3}}} = \frac{1}{\sqrt[3]{}x^8}$, $\&c.$

And $\frac{1}{\sqrt[3]{}x^5}$ divided by $\frac{1}{x}$ will ſtand in this Notation; thus, $\frac{1}{x}) \frac{1}{\sqrt[3]{}x^5}\ (=x^{-1})\ x^{-\frac{5}{3}}\ (=x^{-\frac{1}{3}})$

$x^{-\frac{5}{3}} = (x^{-\frac{2}{3}} = \frac{1}{\sqrt[3]{}xx}$, $\&c.$

IV. This being well underſtood, there is this general Rule for the finding the Fluxion of any Power, whether Perfect or Imperfect, *viz. Multiply the Power (firſt brought one Degree lower) by the Index of that firſt Power; and then, that Product by the Fluxion of the Root.*

Thus the Fluxion of xx will be $2x\dot{x}$, for $xx = x \times x$; but the Fluxion of $x \times x = \dot{x}x + x\dot{x} = 2\dot{x}x$, $\&c.$ and the Fluxion of x^3 will be $3xx\dot{x}$. That of x^8 will be $8x^7\dot{x}$, $\&c.$ or if m expreſs the Index of any Power, as ſuppoſe x^n, then its Fluxion will be $mx^{m-1}\dot{x}$, or $m\dot{x}x^{m-1}$: For x^m brought one Degree lower (m being a general Index) muſt be x^{m-1}; then that $\times$ by m the Index, makes mx^{m-1}; and this laſt by the Fluxion of the Root produces $mx^{m-1}\dot{x}$.

If the Power be produced from a Binomial, $\&c.$ as ſuppoſe $xx + 2xy + yy$, its Fluxion will be $2x\dot{x} + 2\dot{x}x + 2\dot{x}y + 2y\dot{y}$, by working according to this Fourth and the Second Rules.

If the Exponent be Negative, as ſuppoſe x^{-m} or $\frac{1}{x^m}$, its Fluxion will be $-mx\dot{x} - m - 1$: Or if you would do it by way of Fraction, $\frac{-mx^{m-1}\dot{x}}{x^{2m}}$, for

(for the Square of x^m is as well x^{2m} as x^{m2}) or according to Sir *Is. Newton*'s Way, which is yet ſhorter, $\frac{-mx}{x^{m+1}}$: See *Caſe* 4. *P.* 252. of his *Principia*.

If the Power be Imperfect, *i. e.* if its Exponent be a Fraction, as ſuppoſe $\sqrt[n]{}: x^m$; or in the other Notation $x^{\frac{m}{n}}$, let us ſuppoſe $x^{\frac{m}{n}} = z$: Then if you raiſe up each Member to the Power of n, it will ſtand thus, $x^m = z^n$; the Fluxion of which will be, by this general Rule, $mx^{m-1}\dot{x} = nz^{n-1}\dot{z}$. Wherefore $\dot{z}$ will be $= \frac{m\dot{x}x^{m-1}}{nz^{n-1}}$ (by dividing both Parties by nz^{n-1};) and $\frac{m\dot{x}x^{m-1}}{nz^{n-1}} = \frac{m}{n}x^{\frac{m}{n}-1}\dot{x}$, or $\frac{m}{n}\dot{x}\sqrt[n]{}\, x^{m-n}$, by putting instead of nz^{m-1}, its Value $nx^{m\frac{m}{n}}$: So that to find the Fluxion of any kind of Power, you muſt proceed thus:

Multiply the Power given by its Index or Exponent, and then that Product by the Fluxion of the Root of the Power given; and after that, ſubduct One or Unity from the Index of the Power.

As for the Fluxions of *Surd Quantities*, Mr. *Hayes* gives the following Examples in his Treatiſe of Fluxions lately printed, which will make the thing plain to any one that will render himſelf ready at the Practice of this Art.

RULE V.

To find the Fluxions of Surd Quantities.

Let it be requir'd to find the Fluxion of $\sqrt{2rx - xx}$, or $\overline{2rx - xx}|^{\frac{1}{2}}$. Suppoſe $\overline{2rx - xx}|^{\frac{1}{2}} = z$; then is $2rx - xx = \dot{z}z$; and conſequently $r\dot{x} - x\dot{x} = z\dot{z}$; and by Diviſion, $\frac{r\dot{x} - x\dot{x}}{z} = \dot{z} =$ (by Subſtitution) $\frac{r\dot{x} - x\dot{x}}{\sqrt{2rx - xx}} =$ to the Fluxion of $\sqrt{2rx - xx}$

Let it be required to find the Fluxion of $\overline{ay - xx}|^3$; for $\overline{ay - xx}^3$ put z, and then $ay - xx = z^{\frac{1}{3}}$, and $a\dot{y} - 2x\dot{x} = \frac{1}{3}z^{-\frac{2}{3}}\dot{z}$: And multiplying by 3, $3a\dot{y} - 6x\dot{x} = z^{-\frac{2}{3}}\dot{z}$; and conſequently, $3az^{\frac{2}{3}}\dot{y} - 6z^{\frac{2}{3}}x\dot{x} = \dot{z}$ equal (ſubſtituting $\overline{ay - xx}|^2 = z^{\frac{2}{3}}$) $3a^3y^2\dot{y} - 6a^2x^2y\dot{y} + 3ax^4\dot{y} - 6a^2y^2x\dot{x} + 12ayx^3\dot{x} - 6x^5\dot{x} =$ to the Fluxion of $\overline{ay - xx}^3$.

The Fluxions of imperfect Powers may be alſo inveſtigated by (*Art.* 20.) the General Rule, and expreſs'd otherwiſe, and more briefly thus:

The Fluxion of $\overline{2rx - xx}|^{\frac{1}{2}}$, is equal $\frac{1}{2} \times \overline{2rx - xx}| - \frac{1}{2} \times 2r\dot{x} - 2x\dot{x} = \frac{r\dot{x} - x\dot{x}}{\sqrt{2rx - xx}}$.

The Fluxion of $\overline{ay - xx}|^3$, is $= 3 \times \overline{ay - xx}|^2 \times a\dot{y} - 2x\dot{x}$; which being reduced, will be found equal to the Fluxion thereof formerly found.

The Fluxion of $\sqrt{xy + yy}$, is $= \frac{1}{2} \times \overline{xy + yy}|^{\frac{1}{2}} \times y\dot{x} + x\dot{y} + 2y\dot{y}$ (*Article* 15.) $\frac{y\dot{x} + x\dot{y} + 2y\dot{y}}{2\sqrt{xy + yy}}$. The Fluxion of $\sqrt{a^4 + axyy}$ is $= \frac{1}{2} \times \overline{a^4 + axyy}| - \frac{1}{2} \times \overline{ay^2}\dot{x} + 2axy\dot{y} = \frac{ay^2\dot{x} + 2axy\dot{y}}{2\sqrt{a^4 + axyy}}$.

The Fluxion of $\sqrt{ax + xx + \sqrt{a^4 + axyy}}$ is $=$ (by the *Art.* 20. Rule, and the preceding Example)

$$= \tfrac{1}{2} \times \overline{ax + xx + \sqrt{a^4 + axyy}}^{\frac{1}{2}} \times a\dot{x} + 2x\dot{x} + \frac{ay^2\dot{x} + 2axy\dot{y}}{2\sqrt{a^4 + axyy}}$$

$$= \frac{a\dot{x} + 2x\dot{x}}{2\sqrt{ax + xx + \sqrt{a^4 + axyy}}} + \frac{ay^2\dot{x} + 2axy\dot{y}}{2\sqrt{ax + xx + \sqrt{a^4 + axyy}} \times z2\sqrt{a^4 + axyy}}$$

The Fluxion of $\frac{\sqrt{ax + xx}}{\sqrt{xy + yy}}$, is (*Art.* 14. 20. (finding the Fluxions of the Numerator and Denominator) $\frac{a\dot{x} - 2x\dot{x}}{3\sqrt[3]{ax + xx}^2} \times \sqrt{xy + yy} \times \frac{y\dot{x} + x\dot{y} + 2y\dot{y}}{2\sqrt{xy + yy}} \times \sqrt[3]{ax + xx}$ $\div xx + yy$.

To find the Fluxions of Quantities compounded of Rational and Surd Quantities: Let it be requir'd to find the Fluxion of $\frac{bx^2 + cax + ea^2}{x\sqrt{xx + aa}} = z$. Put $bx^2 + cax + ea^2 = p$, and $\sqrt{xx + aa} = q$. Then the given Quantity is $pq = z$, and the Fluxion thereof is $\dot{p}q + q\dot{p} = \dot{z}$: But $\dot{q}$ is $= \frac{x\dot{x}}{\sqrt{xx + aa}}$ and $\dot{p}$ is $= 2bx\dot{x} + ca\dot{x}$; therefore in the Equation $\dot{p}q + q\dot{p} = \dot{z}$, if in place of p, q, $\dot{p}$, $\dot{q}$, we reſtore the Quantities they repreſent, we ſhall have $\frac{bx^3 + cax^2 + ea^2}{\sqrt{xx + aa}} \times x\dot{x} + 2bx \times \sqrt{xx + aa} \times \dot{x} + ca \times \sqrt{xx + aa} \times \dot{x} = \dot{z}$. Which being reduc'd to one Denomination, gives $\frac{3bx^3 + 2acx^2 + ea^2x + 2ba^2x + xa^3 \times \dot{x}}{\sqrt{xx + aa}} = z =$ to the Fluxion of the given Quantity.

RULE VI.

To find the Fluxions of Powers, *where the* Exponents of those Powers *are themselves* Fluent Quantities. *By Mr.* Humphry Ditton, *Master of the New Mathematical School in* Christ's Hospital.

Let z, y, x, and v be flowing Quantities; the Varieties that may happen here, are reducible to these following Cases.

It is either z^y, z^{y+x}, z^{yx}, $z^{\frac{y}{x}}$, $z^{\frac{x}{y}}$; in which last Case x is the Exponent of y, as y it self is also of z.

CASE I.

Let z^y be proposed, and suppose $z^y = v$, then $\overline{z + \dot{z}|^{y+\dot{y}} = v + \dot{v}}$, but $\overline{z + \dot{z}|^{y+\dot{y}} = z^{y+\dot{y}} + y z^{y+\dot{y}-1}\dot{z}}$ (rejecting all the consequent Terms of the Series in which any Powers or Products of Fluxions would be found) *ergo* $v + \dot{v} = z^{y+\dot{y}} + y z^{y+\dot{y}-1}\dot{z}$, and $z^{y+\dot{y}} + y z^{y+\dot{y}-1}\dot{z} - v = \dot{v}$, but $v = z^y$; from whence $z^{y+\dot{y}} + y z^{y+\dot{y}-1}\dot{z} - z^y = \dot{v}$, is for that reason the Value of the Fluxion required.

CASE II.

2. Let $z^{y+z} = v$, then $\overline{z + \dot{z}|^{y+\dot{y}+x+\dot{x}} = v + \dot{v}}$, but $\overline{z + \dot{z}|^{y+\dot{y}+x+\dot{x}} = z^{y+\dot{y}+x+\dot{x}} + y z^{y+\dot{y}+x+\dot{x}-1}\dot{z} + x z^{y+\dot{y}+x+\dot{x}-1} z}$; *ergo* $z^{y+\dot{y}+x+\dot{x}} + y z^{y+\dot{y}+x+\dot{x}-1}\dot{z} + x z^{y+\dot{y}+x+\dot{x}-1} z - z^{y+x} = \dot{v}$.

CASE III.

3. Let $z^{yx} = v$, then $v + \dot{v} + \overline{z + \dot{z}|^{yx+y\dot{x}+x\dot{y}} = z^{x+y\dot{x}+x\dot{y}+xy\dot{x}} z^{yx+y\dot{x}+x\dot{y}-1}\dot{z}}$, from whence arises $z^{yx+y\dot{x}+x\dot{y}} + xyx\, z^{yx+y\dot{x}+x\dot{y}-1}\dot{z} - z^{yx} = \dot{v}$.

CASE IV.

4. Let $z^{\frac{y}{x}} = v$, then $v + \dot{v} = \overline{z + \dot{z}|^{\frac{y}{x} + \frac{\dot{y}x - x\dot{y}}{xx}}} = z^{\frac{yx+x\dot{y}}{xx} - \frac{y\dot{x}}{xx}} z^{\frac{yx+x\dot{y}-y\dot{x}-1}{xx}}\dot{z}$, thence $z^{\frac{yx+x\dot{y}-y\dot{x}}{xx}} = z^{\frac{yx+x\dot{y}-y\dot{x}}{xx}} + \frac{y}{x}$ $z^{\frac{yx+x\dot{y}-y\dot{x}-1}{xx}}\dot{z} - z^{\frac{y}{x}} = \dot{v}$.

CASE V.

Lastly, Let $z^{\frac{x}{y}} = v$, the Fluxion of $y^x = y^{x+\dot{x}} + xy^{x+\dot{x}-1}\cdot y - y^x$; *ergo* we have $v + \dot{v} = z^{\frac{x}{y} + \frac{x+\dot{x}}{y} + \frac{x\dot{y}}{yy} - \frac{x+\dot{x}-1}{y-1}}\dot{z} = z^{\frac{x}{y}} + \frac{x+\dot{x}}{y} + \frac{x\dot{y}}{yy} - \frac{x+\dot{x}-1}{y-1}\dot{z}$; and thence it is plain, that $v = z^{\frac{x+\dot{x}}{y} + \frac{x\dot{y}}{yy} - \frac{x+\dot{x}-1}{y-1}\dot{z}} - z^{\frac{x}{y}}$.

Next for the Rule *Inversely*, to find the Flowing Quantity belonging to the Fluxion of any Power, whether Perfect or Imperfect, proceed thus:

I. Take the Fluxionary Letter or Letters out of the Equation.

II. Augment the Index of the Fluxion by 1 or Unity.

III. Divide the Fluxion by the Index of its Power so increased by Unity.

Examples.

If $3\dot{x}\dot{x}\dot{x}$ were proposed; by taking away $\dot{x}$, it will be $3\dot{x}\dot{x}$; and by increasing its Index by Unity, it will be $3\dot{x}\dot{x}\dot{x}$: Then dividing it by 3. its now (augmented) Index, the Quotient will be $\dot{x}\dot{x}\dot{x}$, the Flowing Quantity required.

Again:

Suppose $\frac{n}{m}\dot{x}x^{\frac{n}{m}-1}$ a Fluxion proposed: By taking away the Fluxionary $\dot{x}$, it will be $\frac{n}{m}x^{\frac{n}{m}-1}$: By augmenting the Index by Unity (*i. e.* taking away -1) it will be $\frac{n}{m}\dot{x}^{\frac{n}{m}}$: And lastly, by dividing the remaining Part of the Fluxion by $\frac{n}{m}$, prefixed to, or multiplied into $\dot{x}$, the Quotient will be $x^{\frac{n}{m}}$: Which is the Flowing Quantity sought.

You will find Examples enough of this *Inverse Method*, the *Calculus Integralis*, or *Summatory Arithmetick*, in Mr. *Hayes*'s Book of Fluxions. *Sect.* 4.

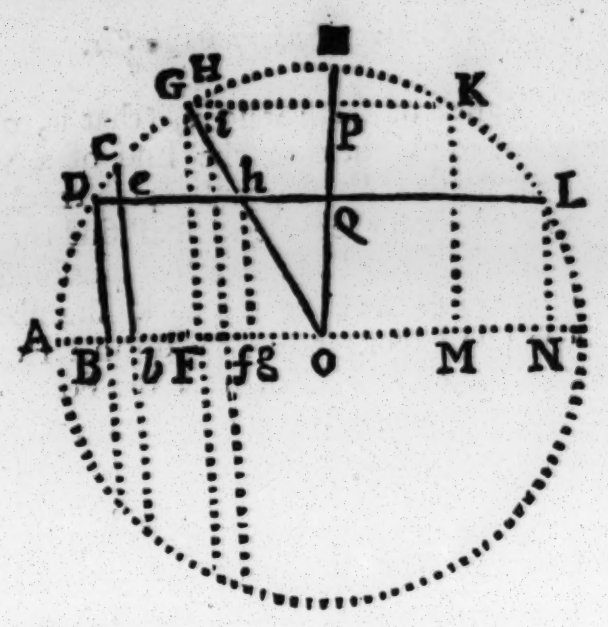
Some Instances of the Proportions of Fluxions in various Curves, by Mr. H. Ditton.

Let x and v express Abscisses, y and z the Correspondent Ordinates universally: Then in the Circle we have $\dot{y} : \dot{z} :: \frac{r\dot{x} - x\dot{x}}{y} : \frac{r\dot{v} - v\dot{v}}{z}$: And supposing the Abscisse to flow uniformly, and consequently $\dot{x} = \dot{v}$, we have $\dot{y} : \dot{z} :: ry = xz : ry - vy :: r - x : \frac{ry - vy}{z}$; *viz.* the Fluxions Ce, Hi, are to one another, as BO to GO; the Point g being ever determined by the Perpendicular hg, let fall from h the Intersection of the Radius OG, with the Line Dh.

'Tis certain that $gO = \frac{ry = vy}{z}$, from the Similar Triangles GFO, hgO; for $hg = DB = y$, and $z : r - v :: y : \frac{ry - vy}{z}$.

$AC = r$

$AC = r$ $CF = z$ $Hi = z$
$AB = x$ $DB = y$ $OF = u$
$AF = v$ $Ce = j$ $OB = x$



In the Parabolick Curves, putting p the Parameter $= 1$, then $y = x^n$, and $z = v^n$, then $\dot{y} : \dot{x} :: n x^{n-1} : n v^{n-1} :: v^{n-1} : y^n :: \frac{v^{n-1}}{y^n} : \dot{z}$.

Therefore in the common Parabola, $\dot{y} : \dot{z} :: \frac{1}{y} : \frac{1}{z} :: z : y$, that is, the Fluxions of the Ordinates are reciprocally as the Ordinates.

Therefore if an Hyperboloid be form'd from the Parabola; that is, one whose Ordinates (to the Convex Side of the Curve, and parallel to one of the Asymptotes) be a Series of Reciprocals to the Subsecundans; and one Asymptote being the Axe of the Parabola, and the other the Vertical Tangent of the Parabola; then the Fluxion of the Parabolical Ordinates shall be as the corresponding Ordinates in the Hyperboloid.

In the Vulgar Cycloid, the corresponding Circular Ordinates being called s and t, from the Nature of the Cycloid $\dot{y} = \dot{s} + \dot{c}$, and $\dot{z} = \dot{t} + \dot{C}$, the Quantities c and C expressing the Circular Arches. But from the Nature of the Circle $\dot{s} + \dot{c} = \frac{2r\dot{x} - x\dot{x}}{s}$, and $\dot{t} + \dot{c} = \frac{2r\dot{v} - v\dot{v}}{t}$, so that $\dot{y} : \dot{z} :: \frac{2r - x}{s} : \frac{2r - v}{t} :: \frac{}{2r - x} \times t : \frac{}{2r - v} \times s$. So that the Fluxions of the Cycloidick Ordinates, are in the Ratio compounded of the Segments of the Diameter directly, and the Circular Ordinates Inversely, or as the Rectangles under those Segments, and the Ordinates alternately taken.

In the Circle putting c, C, the Fluxions of the Curve corresponding to the Equal Fluxions of the Absciffes $\dot{x}$ and $\dot{v}$, we have $\dot{c} = \frac{r\dot{x}}{y}$, and $\dot{C} = \frac{r\dot{v}}{z}$; and consequently, $\dot{c} : \dot{C} :: \frac{r}{y} : \frac{r}{z} :: z : y$; that is, the Fluxions of the Curve are reciprocally as the Ordinates.

FLUXUS *Chylosus*, the same with *Celiaca passio*.

FLUXUS *Hepaticus*, is a kind of Dysentery, wherein black shining Blood, and much over-heated and torrified, as it were, is driven out of the Guts by the Fundament: It is sometimes taken for a Dysentery, wherein serous sharp Blood is evacuated. *Blanchard*.

FLY: See *Flie*.

FLYING-CAMP, is a small Body of an Army, consisting of 4, 5, or 6000 Men, and sometimes of a greater Number, as well Foot as Horse, which continually keeps the Field, making divers Motions to prevent the Incursions of the Enemies, or to frustrate their Enterprizes; to hinder Convoys, to harass the adjacent Country, and to throw it self, as occasion serves, into any Besiged Place.

FLYING-PINION, is a Part of a Clock, having a Fly or Fan, thereby to gather Air, and so to bridle the Rapidity of the Clock's Motion, when the Weight descends in the Striking Part.

FOCILE *Majus*, is the greater Bone of the Cubit called *Ulna*; or the lesser Bone of the Leg, called *Fibula*.

FOCILE *Minus*, is the lesser Bone of the Cubit, called *Radius*; or the lesser Bone of the Leg, called *Tibia*.

FOCUS, is with some a Place in the Mesentery, or other Parts, whence they formerly deduced the Original of Fevers.

FOCUS of an *Ellipsis*, is a Point towards each End of the longer Axis; from whence two Right Lines being drawn to any Point in the Circumference, shall be together equal to that longer Axis: See *Ellipsis*.

FOCUS of a *Parabola*, is a Point in the Axis within the Figure, and distant from the Vertex by a fourth Part of the *Parameter* or *Latus Rectum*. To find it, see *Parabola*, *Consectary* 5.

It is called the *Focus*, because it is the Point where the Sun's Rays will be united, when reflected from a *Parabolick Concave*, and consequently will there burn Bodies, and hence by some it is called the *Burning Point*. See more under *Parabola*.

FOCUS, in *Opticks*, or the *Focus* of a Glass, is the Point of Convergence or Concourse, where the Rays meet and cross the Axis after their Refraction by the Glass.

How to find this Point or Focus, Mr. *Molyneux*, in his Excellent *Dioptrica Nova*, gives several demonstrative Ways, *Pag.* 10, 11, 12, &c. As,

1. If there be a Body of Glass whose Surface is Convex, or the Segment of a Sphere, the Focus will be distant from the Pole or Vertex of the Glass almost a Diameter and half of the Convexity.

2. In a Plano-Convex Glass, the parallel Rays are united with the Axis, or its Focus is from the Pole of the Glass at the Distance of a Diameter of the Convexity, if the Segment be but of 30 Degrees.

In a Plano-Convex Glass, As 107 : 193 :: So is the Radius of the Convexity: To the Refracted Ray taken in its Concourse with the Axis, which in Glasses of large Spheres, is almost equal to the Distance of the Focus taken in the Axis.

3. In double Convex Glasses of the same Sphere, the Focus is distant from the Pole of the Glass about the Radius of the Convexity, if the Segment be but 30 Degrees.

But if the Convexities are unequal, or if the two Sides are Segments of different Spheres;

Then the Rule is,

As the Sum of the Radij of both Convexities:
To the Radius of either Convexity alone ::
So is the double Radius of the other Convexity:
To the Diſtance of the Focus.

N. B. The Rays which fall nearer the Axis of any Glaſs, are not united with it ſo ſoon as thoſe which are farther off: Nor will the Focal Diſtance be ſo great in a Plano-Convex Glaſs, when the Convex Side is towards the Object, as on the contrary. Wherefore that Learned Gentleman concludes truly, That in viewing any Object by a Plano-Convex Glaſs, the Convex Side ſhould be turned outward: As alſo in burning by ſuch a Glaſs, *P.* 25.

FOCUS *Virtual:* See *Virtual Focus.*

1. In Concave Glaſſes, when a Ray falls from Air parallel to the Axis, the *Virtual Focus*, by its firſt Refraction, is at the Diſtance of a Diameter and a Half of the Concavity.

2. In Plano-Concave Glaſſes, when the Rays fall parallel to the Axis, the *Virtual Focus* is diſtant from the Glaſs the Diameter of the Concavity.

3. In Plano-Concave Glaſſes, As 107: 193::
So the Radius of the Concavity:
To the Diſtance of the *Virtual Focus.*

4. In Double Concaves of the ſame Sphere, Parallel Rays have their *Virtual Focus* at the Diſtance of the Radius of the Concavity.

But whether the Concavities be equal or unequal, the *Virtual Focus*, or *Point of Divergency* of the parallel Rays is determined by this Rule:

As the Sum of the Radii of both Concavities:
Is to the Radius of either Concavity ::
So is the Double Radius of t'other Concavity:
To the Diſtance of the *Virtual Focus.*

5. In Concave Glaſſes, if the Point to which the incident Ray Converges, be diſtant from the Glaſs farther than the *Virtual Focus* of parallel Rays; The Rule for finding the *Virtual Focus* of this Ray is this;

As the Difference between the Diſtance of this Point from the Glaſs, and the Diſtance of the *Virtual Focus* from the Glaſs:
Is to the Diſtance of the *Virtual Focus* ::
So the Diſtance of this Point of Convergence from the Glaſs:
To the Diſtance of the *Virtual Focus* of this Converging Ray.

6. In Concave Glaſſes, if the Point to which the Incident Ray Converges, be nigher to the Glaſs than the Virtual Focus of parallel Rays; the Rule to find where it croſſes the Axis is this:

As the Exceſs of the *Virtual Focus* more than this Point of Convergency: Is to the Virtual Focus ::
So the Diſtance of this Point of Convergency from the Glaſs:
To the Diſtance of the Point where this Ray croſſes the Axis.

7. To find the Focus of a Meniſcus Glaſs; ſee under the Word *Meniſcus.*

Practical Rules for finding the Foci *of Glaſſes.*

For Convex *Spherick Glaſſes.*

1. For Glaſſes of ſmall Spheres, (that is, of deep Convexities) apply them to the End of a Scale of Inches and Decimal Parts, and expoſe them before the Sun; and upon the Scale we ſhall find the bright Interſection of the Rays exactly meaſured out; or expoſe them in the Hole of a dark Chamber, and where a White Paper receives the diſtinct Repreſentation of diſtant Objects, there is the Focus of this Glaſs. This is an univerſal and certain way for all Convexes.

For a Glaſs of a pretty long Focus, obſerve ſome diſtant Objects through it, and recede from the Glaſs till the Eye perceives all in *Confuſion*, or till the Objects begin to appear *Inverted*; here the Eye is in the Focus.

If it be a *Plano-Convex Glaſs*, make it reflect the Sun againſt a Wall; we ſhall on the Wall perceive two Sorts of Light; one more *bright*, within another more *obſcure*; withdraw the Glaſſes from the Wall till the *bright* Image is at its ſmalleſt, the Glaſs is then diſtant from the Wall about the fourth Part of its Focal Length.

If it be a *Double Convex*, expoſe each Side to the Sun in like manner, and obſerve both the Diſtances of the Glaſs from the Wall. The firſt Diſtance is about half the Radius of the Convexity turned from the Sun; and the ſecond Diſtance is about half the Radius of t'other Convexity likewiſe: Thus we have the Radii of the two Convexities; whence the Focus is found by this Rule;

As the Sum of the Radii of both Convexity:
To the Radius of either Convexity ::
So is the Double Radius of the other Convexity
To the Diſtance of the Focus.

The *Foci* of Concaves are obtain'd by Reflection; for as a *Concave Mirror*, or *Speculum*, burns at the Diſtance of about half the Radius of the Concavity; ſo a *Concave Glaſs*, being ſuppoſed a *Reflecting Speculum*, ſhall unite the Rays of the Sun at the Diſtance of about half the Radius of the Concavity.

Mr. *Halley*'s Doctrine of the Foci of Spherical Glaſſes of all Sorts, expoſed either to Diverging, Converging, or Parallel Rays, is as follows: See Appendix to *Molyneux*'s Dioptricks.

PROPOSITION.

To find the Focus of any Parcel of Rays Diverging from, *or* Converging to *a given Point in the* Axis *of a* Spherical Lens, *and inclined thereto under the ſame Angle, the* Ratio *of the Sines in Refraction being known.*

Let *G L* be the *Lens.*
P any Point in its Surface.
V the Pole thereof.
C the Center of the Sphere whereof it is a Segment.
O the *Object* or Point in the Axis, to or from which the Rays do proceed.
O P a given Ray.
Let the *Ratio* of Refraction be as *r* to *s*: Make *C R* to *C O*, as *s* to *r*, for the *Immerſion* of a Ray; or

or as r to s for the *Emerſion*; (that is, as the Sines of the Angles in the Medium which the Ray enters, to their correſponding Sines in the Medium out of which it comes.)

And laying CR from C towards O, the Point R ſhall be the ſame for all the Rays of the Point O.

Then draw the Radius PC, if need be, continued; and with the Center R, and Diſtance OP, ſweep a touch of an Arch interſecting PC in Q: The Line QR being drawn, ſhall be parallel to the Refracted Ray; and PF being made parallel thereto, ſhall interſect the Axis in the Point F, which is the Focus ſought.

Or make it, As $CQ : CP :: CR : CF$, and CF ſhall be the Diſtance of the Focus from the Center of the Sphere.

Demonſtration.

Let fall the Perpendiculars Px on the Axis, Cy on the given Ray, and Cz on the refracted Ray.

Then PF and QR are parallel by Conſtruction, whence the Triangles QRC and PFC are ſimilar.

And $CR : QR :: CF : PF$;
That is, $CR : OP :: CF : PF$.
Now $CF : PF :: Cz : Px$ *ob ſim. Tri.*]
Whence $CR : OP :: Cz : Px$
And $CR : Cz :: OP : Px$

Again, $CR : CO ::$ As the Sines of Refraction, by Conſtruction; that is, as s to r, or r to s; and

as $CR : Cz :: CO = \frac{r}{s}$, or $\frac{s}{r} CR : \frac{r}{s}$ or $\frac{s}{r} Cz$,
$:: PO : Px$.
But $PO : Px :: CO : Cy$,

Therefore $Cy = \frac{r}{s}$ or $\frac{s}{r} Cz$;

That is, $Cy : Cz ::$ As the Sines of Refraction.
But $\left\{\begin{matrix} Cy \\ Cz \end{matrix}\right\}$ is the Sine of the $\left\{\begin{matrix} \text{Angle of Incidence.} \\ \text{Refracted Angle.} \end{matrix}\right.$
Q. E. D.

The ſeveral Caſes of Rays Diverging or Converging, as they enter the Curve Surface of a *Convex* or *Concave Lens*, are for the Reader's Eaſe delineated in *Fig.* 1, 2, 3, 4: And the like Caſes of *Emerging Rays* in *Fig.* 5, 6, 7, 8.

Fig. 1

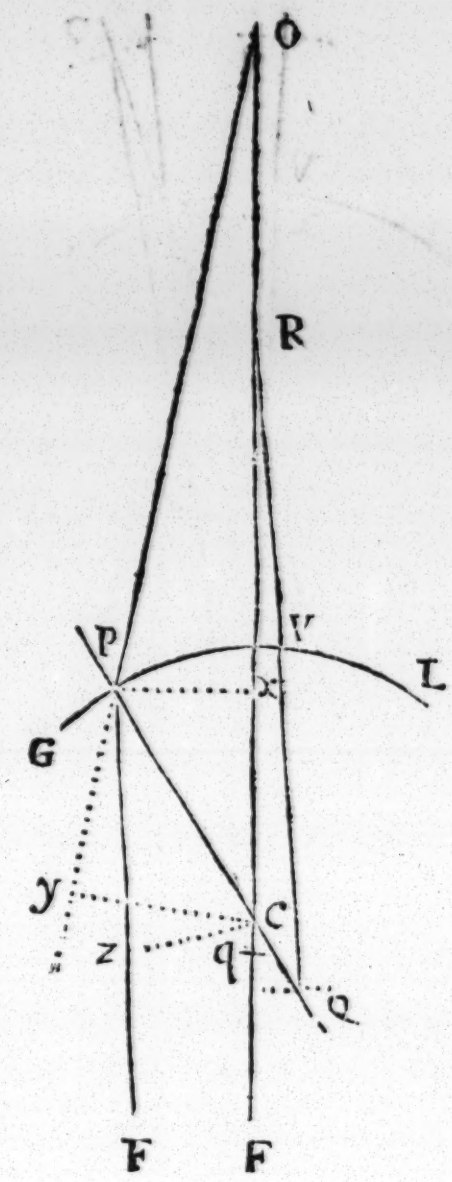


Fig. 2.

Fig. 3.

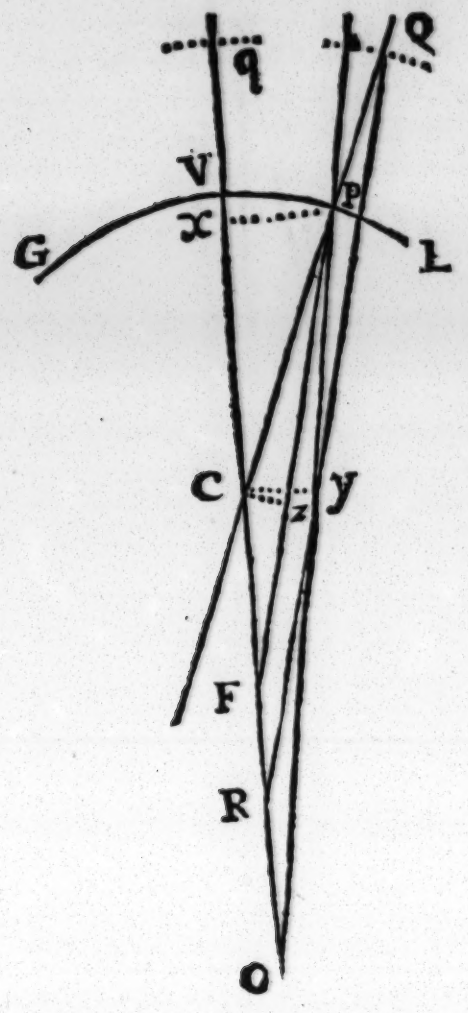

Fig. 4.

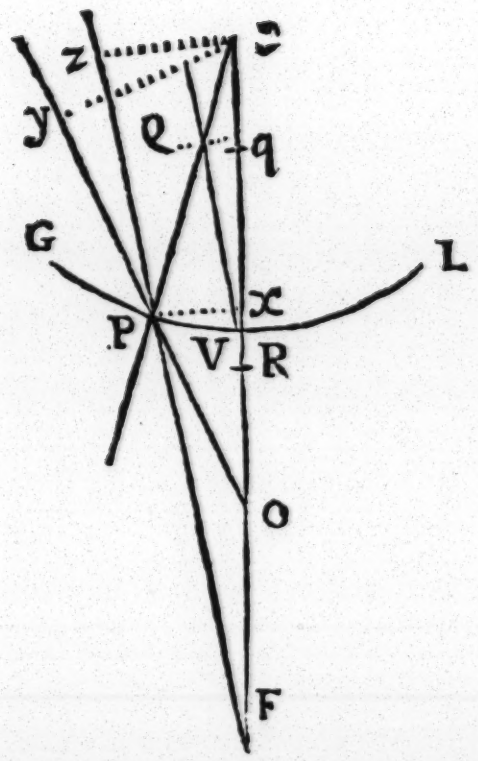

Fig. 5.

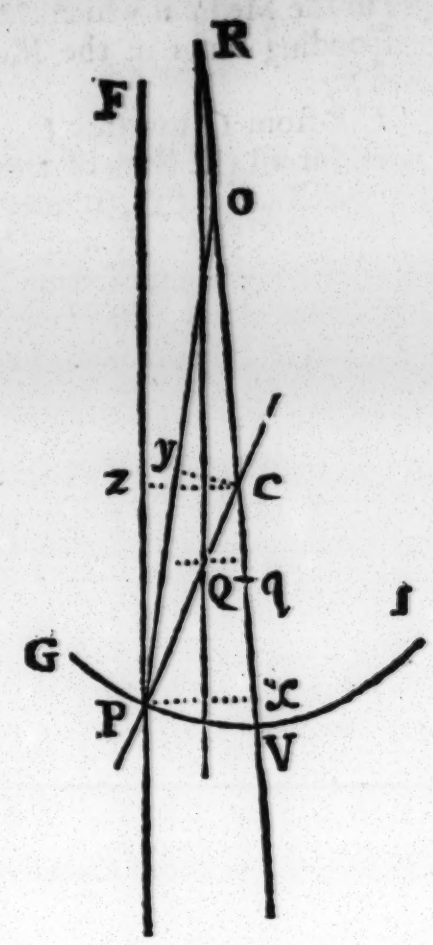

Fig. 6.

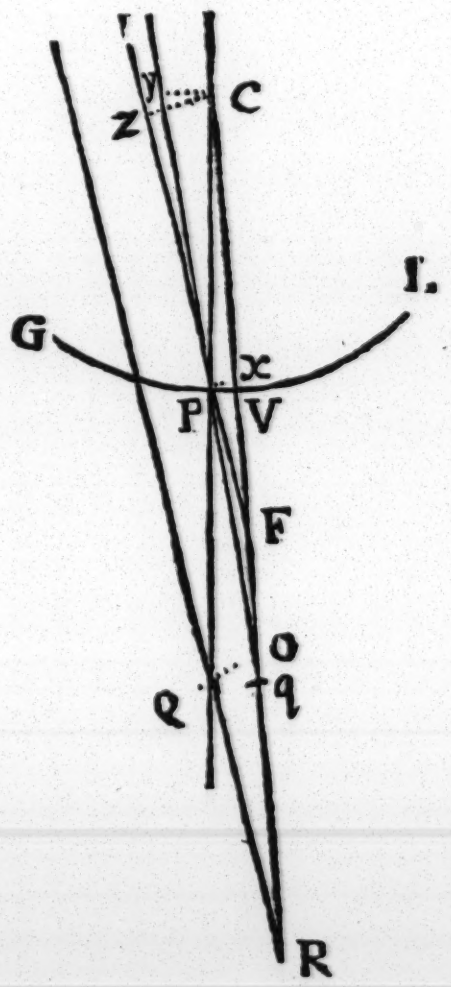

Fig.

Fig. 7.

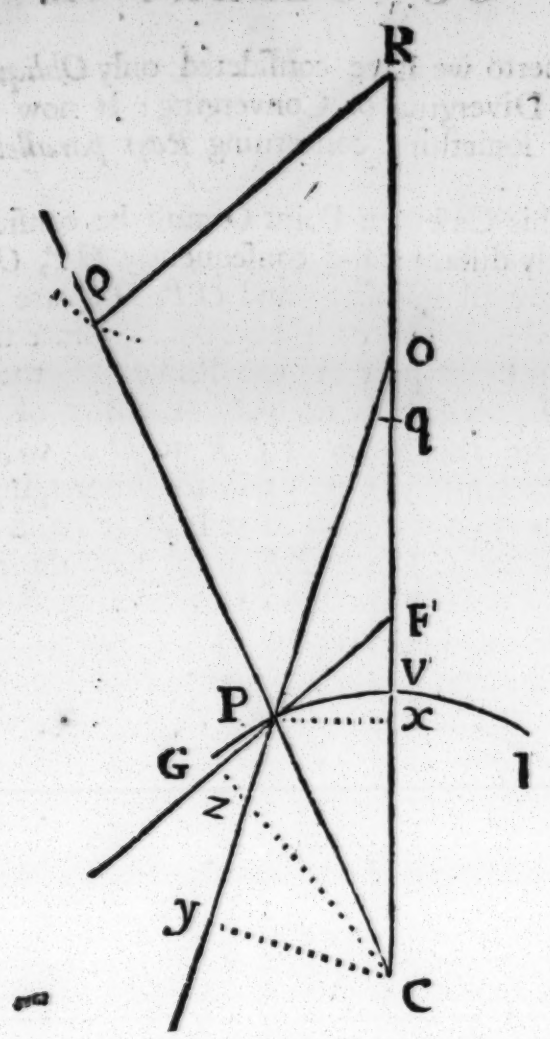

Fig. 8.

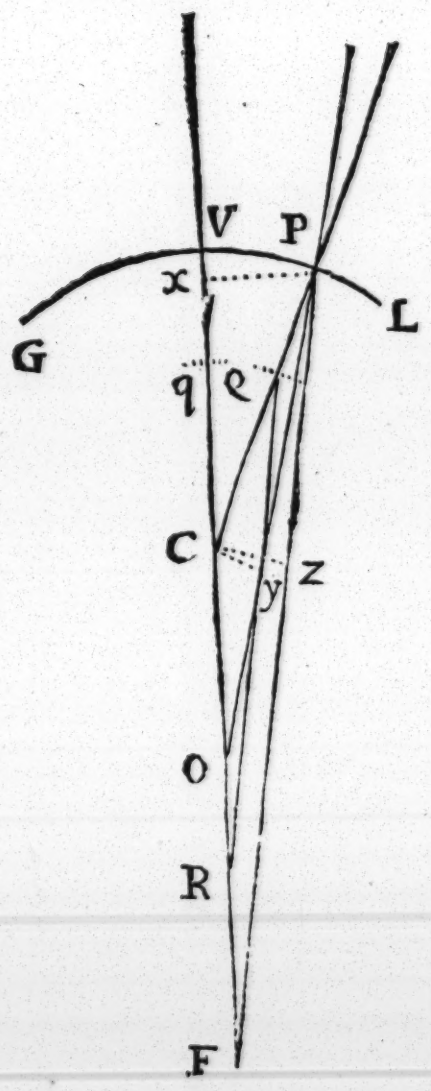


All which are drawn with the ſame Letters to their reſpective Points; only in ſome the Point *F* falling far diſtant, is to be underſtood in the Interſection of the Line *P F* with the Axis.

This thus demonſtrated, in the moſt difficult Caſes will give all the Rules for the Foci of Rays parallel to the Axis, as likewiſe for the principal Focus, where the Rays neareſt the Axis do unite: All which Rules are collected in theſe following *Corollaries*.

COROLLARY I.

If *O P* be equal to *C R*, then the Points *Q* and *C* are coincident, and the Rays *O P*, after Refraction, run on parallel to the Axis.

COROLLARY II.

If the Point *Q* fall on the ſame Side of the Axis, as is the Point *P*, then the Beams after Refraction do tend on, either Diverging or Converging, as before: But if *Q* fall on the other Side the Axis, as in *Fig.* 1. the Diverging Rays are made to Converge by a *Convex*, or the Converging to Diverge by a *Concave Glaſs*.

COROLLARY III.

If *O P* do exceed *C R*, the Focus is in all Caſes on the ſame Side of the Glaſs as is the Center of the Sphere *C*.

But contrariwiſe, if *O P* be leſs than *C R*, the Focus falls on the other Side of the Glaſs beyond the Vertex *V*.

COROLLARY IV.

An Object may be ſo placed, that the Rays next the Axis of a *Convex Glaſs* ſhall have an Imaginary Focus tranſmitting Diverging Rays, when the more remote Parts thereof ſhall make them Converge to a real Focus.

COROLLARY V.

If *O V* the Diſtance of the Object from the Pole or Vertex of the Glaſs, be taken inſtead of *O P*, then will *C Q* be the Difference of *O V* and *C R*; and as that Difference is to *C R*, ſo is the Radius *C V*, to *C F*, the Diſtance of the principal Focus from the Center of the Sphere, whereof the Glaſs is a Segment.

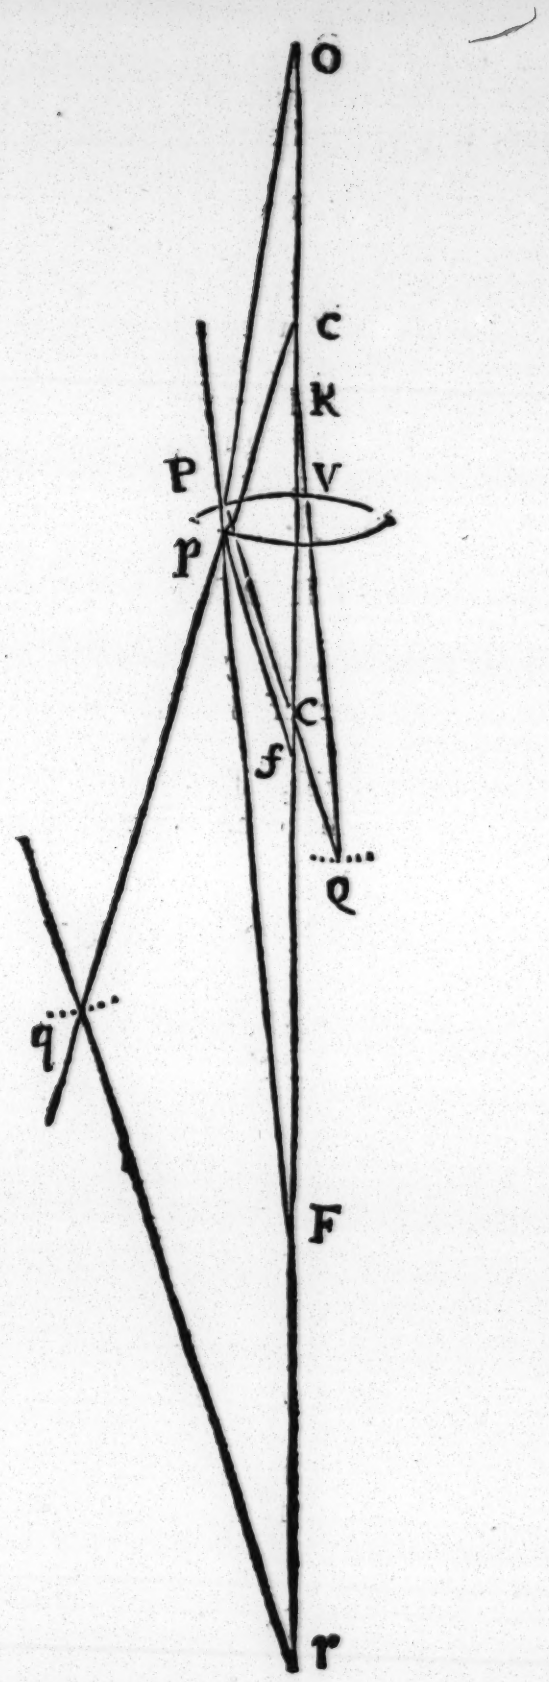
Or elſe, As *C Q*: To *O P* or *R Q* :: So *P C*: To *V F*, the Focal Diſtance from the Pole of the Glaſs.

Whence follows a General Rule for the Foci of all Glaſſes, only according to *Cor.* 3. if *O V* do exceed *C R*, the Focus is on the ſame Side of the Glaſs, as the Center of the Sphere: But if *C R* be greater, then the Focus is on the oppoſite Side of the Glaſs; whence it will be determined, whether the Focus be real or Imaginary.

COROLLARY VI.

What has been ſaid of one Surface of a *Lens*, is eaſily applicable to the other; taking *F*, the Focus of the firſt Surface, as an Object, and uſing it as *O* in the Figures for Emerging Rays; whereby the Focus of both Surfaces will be determined, as in *Fig.* 9.

Fig. 1.



COROLLARY VII.

Hitherto we have conſidered only *Oblique Rays*, either Diverging or Converging: It now remains to add ſomething concerning *Rays parallel* to the *Axis*.

In this Caſe the Point *O* muſt be conſidered as infinitely diſtant; and conſequently *OP*, *OC*, and *CR*, are all infinite; and *OP*, *OC* are in this Caſe to be accounted always equal, (ſince they differ but by a part of the Radius of the Sphere *GPVL*, which is no part of either of them;) wherefore the *Ratio* of *CR* to *OP* will be always the ſame, *viz.* as *s* to *r* for Immerging Rays, and as *r* to *s* for thoſe that Emerge; and by this Propoſition, *CF* is to *PF* in the ſame *Ratio*.

This Problem has been very fully conſidered by the celebrated Dr. *Wallis*, in his *Treatiſe of Algebra*, *Pag.* 258, but the Conſtruction thereof muſt be repeated here: See *Fig.* 1. preceding, and this following one.

Fig. 2.

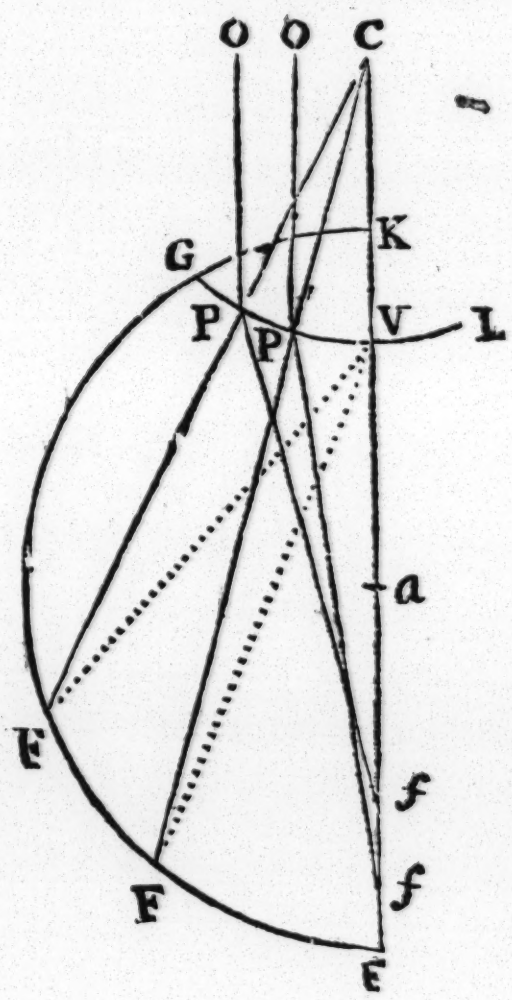


Fig. 2.

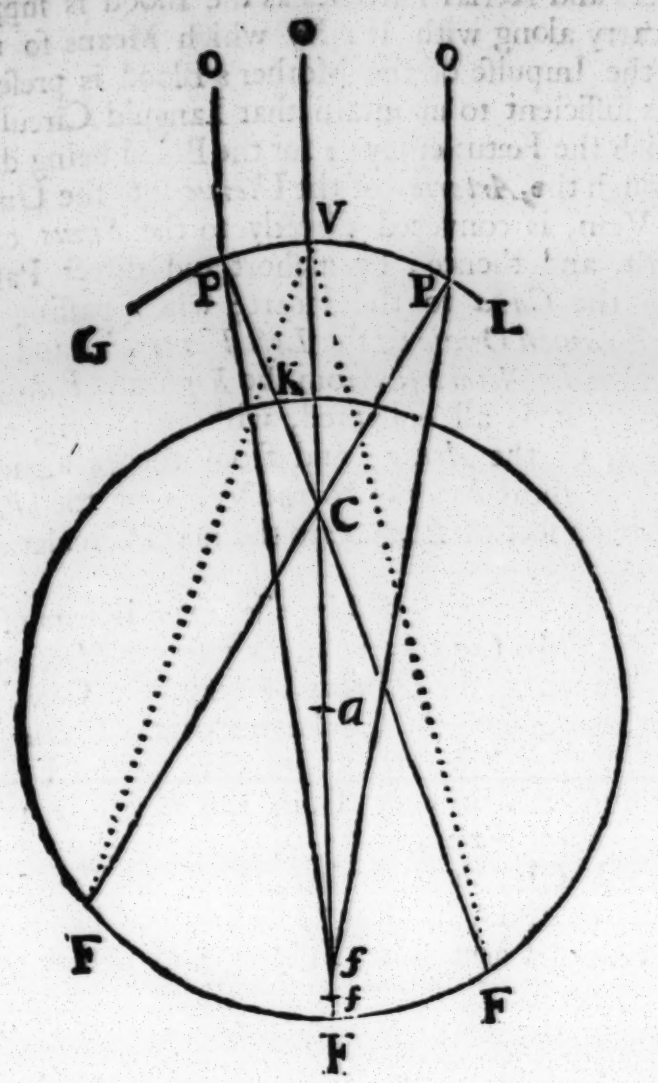


Let *GPVL* be a *Lens*, *VC* or *PC* the Radius of its Sphere; and let it be required to find all the Points *f*, *f*, ſo as *Cf*, may be to *Pf*, in the given Ratio as *s* to *r* for Immerging Rays, or as *r* to *s* for the Emerging.

Divide *CV* in *K*, and continue *CV* to *F*, that *CK* may be to *VK*, as *CF* to *VF* in the propoſed Ratio: Then divide *KF* equally in the Point *a*; and with that Center ſweep the Circle *FKF*; this Circle being drawn, gives readily all the Foci of the parallel Rays *OP*, *OP*: For having continued *CP* till it interſect the Circle in *F*, *PF* ſhall be always equal to *Vf*, the Diſtance of the Focus of each reſpective Parcel of Rays *OP*, from the Vertex or Pole of the *Lens*.

Demonſtration.

Draw the prick'd Line *VF*, and by what is delivered by Dr. *Wallis* in the afore-cited Place, *VF* and *CF* will be always in the ſame propoſed Ratio.

Again, *Vf* being made equal to *PF*, *CF* and *Cf* will be likewiſe equal, as are *GP* and *VC*; and the Angles *PCf*, *VCF* being *ad verticem*, are alſo equal: Wherefore *Pf* will be equal to *VF*, and conſequently *Cf* to *Pf* in the ſame Ratio as *CF* to *Vf*; whence, and by what foregoes, the Points *f*, *f*, are the ſeveral reſpective Foci of the ſeveral Parcel of Rays *OP*, *OP*. Q. E. D.

That *CF* is to *PF* in the Ratio of the Refraction in the Caſe of parallel Rays, will yet be more evident, if it be conſidered, that the Angle at *C* is equal to the Angle of Incidence, and the Angle at *P* to the Refracted Angle; wherefore *PF* the Side oppoſite to the Angle at *C*, is as the Sine of the Angle of Incidence; and *CF* oppoſite to the Angle at *P*, is as the Sine of the reſpective refracted Angle. Whence in all Caſes of parallel Rays, *CF* is to *PF* in the ſame conſtant Ratio of Refraction.

If it ſhall be deſired to effect in Numbers what we have here done by Lines, it will be moſt eaſy to adapt a Calculus to the foregoing Geometrical Conſtruction.

For if in the Triangle *POC*, there be given the Radius *CP* equal to Unity, *CO* the Diſtance of the Object from the Center of the Sphere, and the Perpendicular *Px*, equal to the Sine of the Angle *PCO*, the Side $PO = QR$ will be equal to $\sqrt{CO^2 + CP^2 + 2CO}$ in $\sqrt{CP^2 - Px^2}$.

Then, As *QR* or *PO*: To *Px* :: So *CR*: To the Sine of the Angle *CQR*, and the Complement to 180 Degrees of the Sum of the Angles *CPO* and *CQR*, is the Angle *CRQ* equal to *CFP*; and as *Px*: To *PO* :: So is the Sine of the Angle *CRQ*: To *CQ*; and as *CQ*: To *CP* :: So *CR*: To *CF*, which is the Diſtance of the reſpective Focus of all the Rays *PO*, from the Center of the Sphere *C*.

But the Foci of Rays parallel to the Axis may be computed more readily, following the Footſteps of the Conſtruction; for thereby it will appear, that the Radius of the Circle *KF*, *viz. a F*, is equal to $\frac{rs}{rr - ss} CP$, and $Ca = \frac{rr}{rr - ss} CP$, for Emerging Rays, as in *Fig.* 1. but for Immerging Rays, as *Fig* 2. *C a* will be found to be $\frac{ss}{rr - ss} CP$: And ſuppoſing the Diſtance of the Rays from the Axis $= Px$ in the Caſe of parallel Rays Emerging, the Diſtance of the Focus will be found,

$$PF = \frac{rr}{rr - ss} \sqrt{CP^2 - Px^2} + \sqrt{\frac{rs}{rr - ss} CP^2 - \frac{rr}{rr - ss} Px^2} - CP:$$

That is, *r* to *s* being as 3 to 2.

$$PF = \tfrac{9}{5} \sqrt{CP^2 - Px^2} + \sqrt{\tfrac{6}{5} CP^2 - \tfrac{9}{5} Px^2} - CP.$$

And for Immerging Rays, the Focal Diſtance is found by a like Rule:

$$PF = \frac{ss}{rr - ss} \sqrt{CP^2 - Px^2} + \sqrt{\frac{rs}{rr - ss} CP^2 - \frac{ss}{rr - ss} Px^2} + CP.$$

That is, *r* and *s* being as 3 to 2, as before.

$$PF = \tfrac{4}{5} \sqrt{CP^2 - Px^2} + \sqrt{\tfrac{6}{5} CP^2 - \tfrac{4}{5} Px^2} + CP.$$

Theſe Canons are ſo eaſily deduced from the Conſtructions, that there is no need to trouble the Reader with their Demonſtrations, only you have here added two Tables computed from them, with little more Work than a continual Addition; which may, by way of Example, ſerve to inſtruct and exerciſe the young Student in this Part of the Mathematicks.

Suppoſe *CP* the Radius of the Sphere of Glaſs 2 Inches, and the Ratio of Refraction as 3 to 2; at each Tenth of an Inch diſtance from the Axis the Foci are as follows.

For Emerging Rays.

Px	P F
0	√12.9600+√5.7600+2
1	√12.9276+√5.7276—2
2	√12.8304+√5.6304—2
3	√12.6684+√5.4684—2
4	√12.4416+√5.2416—2
5	√12.1500+√4.9500—2
6	√11.7936+√4.5936—2
7	√11.3724+√4.1724—2
8	√10.8864+√3.6864—2
9	√10.3356+√3.1356—2
10	√ 9.7200+√2.5200—2

For Immerging Rays.

Px	P F
0	√2.5600+√5.7600+2
1	√2.5536+√5.7536+2
2	√2.5344+√5.7344+2
3	√2.5024+√5.7024+2
4	√2.4576+√5.6576+2
5	√2.4000+√5.6000+2
6	√2.3296+√5.5296+2
7	√2.2464+√5.4464+2
8	√2.1504+√5.3504+2
9	√2.0416+√5.2416+2
10	√1.9200+√5.1100+2

But it is to be noted, That these *Foci* for Immerging Rays must not be taken for the *Foci* of a Plano-Convex, when the Convex-side is towards the Object; for the Plane-side, by its Refraction, does contract the Focal Length by about a Semidiameter of the Sphere; these suppose the Body of Glass continued.

The same Ingenious Author, as an Instance of the Excellence of the *Modern Algebra*, gives also in *Philos. Transf. N.* 205. a Way to find the Foci of all Optick Glasses universally; and shews of what great Use his and such Theorems are: But having enlarged so much already, I can only refer the *Algebraical Reader* thither, where he will find sufficient Satisfaction.

FODINA, is the Labyrinth in the Bone of the Ears.

FÆCULA, signifies a Powder which subsides to the Bottom in certain Strainings of Vegetables; for it is prepared of some green, washed, and pared Roots beat together with a little Water, then strained, that there may subside a white sort of Powder, which is to be dried lightly.

FOETUS, is the Young of all kind of Creatures, more especially Human: immediately after the Conception it is called an *Embryo*, but when its Formation in the Womb is perfectly finished, it is properly termed the *Fœtus*.

Dr. *Drake*, in *Phil. Transf. N.* 281. ingeniously tells us, That the Nourishment of the *Fœtus* in the Womb (which he makes to have a little more than Vegetative Life, and to be a Graft, as it were, upon the Stock of the Mother) is by Transfusion of the Blood from the Hysterick Arteries, immediately to the Umbilical Vein, together with such Nutritious Juices and Aerial Particles as the Blood is supposed to carry along with it: By which Means so much of the Impulse of the Mother's Blood is preserved, as is sufficient to maintain that Languid Circulation which the Fœtus enjoys; for the Blood being driven through the *Arteries* of the *Uterus* into the Umbilical Vein, is conveyed directly to the *Sinus* of the *Porta*, and thence, by a short and direct Passage, thro' the *Cava* to the Heart; where passing thro' the *Foramen Ovale* to the *Left Ventricle*, and thro' the *Canalis Arteriosus* from the *Right* and *Pulmonary Artery*, it is all delivered, without coming at the Lungs, to the *Aorta*; and from thence again, by the Umbilical Arteries to the Veins of the *Uterus*, making a sort of *Epicycle* to the main Circulation in the Mother.

And this is confirmed by the Experiments of the Accurate Mr. *Cowper*, who, by pouring *Mercury* into a Branch of the *Uterine Artery* of a Cow, that went into one of the *Cotyledones* of the *Uterus*, filled with that Metal those Branches of the Umbilical Veins, which went from the *Cotyledon* to the Navel of the *Fœtus*.

FOLIAGE, the branched Work in Tapestry or Painting; also a kind of Ornament used in Cornices, Frizes, Capitals of Pillars, and other Members of Architecture; some of which represent the Leaves of the Herb *Brank-Ursine* or *Bear's-Foot*; and others those of divers sorts of Trees, as the *Oak*, *Laurel*, *Olive*, *Vine*, &c.

FOLIATE; to *foliate* Looking-Glasses, is to spread a Composition of something which will firmly adhere to the Back of the Glass, and there reflect the Image. This is called the *Foile*, and is usually made with Quicksilver mix'd with some other Ingredients.

FOLIATION, according to Dr. *Grew*, is one of the Parts of a Flower of a Plant, being the Collection of those Fugacious Coloured Leaves (in *Latin Petala*) which constitute the Compass of the Flower; and also, sometimes to secure and guard the Fruit which succeeds the *Foliation*, as in Apples, Pears, &c. and sometimes stands within it, as in Cherries, Abricots, &c. for these being of a very tender and pulpous Body, and coming forth in the colder Part of the Spring, would be often injured by the Extremities of Weather, if they were not thus protected and lodged up within their Flowers.

The *Foliation* also is serviceable to the Growth of the Fruit in its Infancy or Embryo-State, being always proportionable to the Nature of the Fruit, and to the Plenty of the Sap by which the Fruit is fed or supplied. *Anat. of Plants, P.* 37.

The Doctor observes, That the Flowers of all Plants are perfectly formed or finished in all their Parts long before they appear in Sight, usually 2 or 3 Months, and sometimes Half a Year or more: And though usually the Flower appear before the Seed, yet is the Seed first formed, and then the Flower.

FOLLICULUS, a Term in Botany, signifying the Seed-Vessel, *Capsula Seminalis*, the Case, Husk, Coat, or Cover, which some Fruits and Seeds have over them; as that of the *Alkekengi*, the *Pedicularis*, &c.

FOLLICULUS *Fellis*, or *Vesica Bilaria*, is a little Bladder fastned to the Concave Part of the Liver, and receives the Bile, which in Process of Time empties

empties it ſelf into the Gut *Duodenum*, by a Ductus or Paſſage called *Choledochus ductus*.

FOMAHANT, a Star of the firſt Magnitude in *Aquarius*, whoſe Longitude is 329 Degrees 17 Minutes, Latitude 21 Degrees 3 Minutes.

FOMENTATION, is the bathing of any Part of the Body with a convenient Liquor; which is uſually a Decoction of Herbs in Water, Wine, or Milk: Alſo applying of Bags ſtuffed with Herbs and other Ingredients, which is commonly called a *Dry Fomentation*.

FONTANELLÆ, or *Iſſues*, are little Ulcers which Surgeons make in ſound Parts of the Body, to evacuate Humours, cure Diſeaſes, or prevent them. *Iſſues* are made either with an actual or a potential Searing-Iron, with a Lancet, and a Pair of Sciſſers, &c. You muſt always obſerve to make *Iſſues* betwixt two Muſcles. *Blanchard*.

FORAMEN *Lacrymale*: See *Lacrymale Punctum*.

FORCE, in Common Law, ſignifies an Offence, by which Violence is uſed to Perſons or Things; and is either *Simple* or *Compound*.

Simple Force, is that which is ſo committed, that it hath no other Crime adjoined to it: As if one by *force* do enter into another Man's Poſſeſſion without doing any other unlawful Act.

Mixt or *Compound Force*, is that Violence which is committed with ſuch a Fact, as of it ſelf only is Criminal; as if any by *force* enter into another Man's Poſſeſſion, and to kill a Man, or raviſh a Woman there, &c.

Force is alſo divided into true *Force*, and *Force* after a ſort, with ſeveral other Branches; as *forcible* Entries, *forcible* Detaining, unlawful Aſſembly, Routs, Riots, Rebellions, &c.

FORCEPS, is an Inſtrument wherewith dead and corrupt Parts (alſo things beſides or againſt Nature) are ſeized, cut off, or pulled out; they are of ſeveral Shapes, as long, crooked with Teeth, with Beaks, in faſhion of an Half-Moon, ſuch as will open the Mouth or the Womb, and by which you may ſee into either of them; which, according to the Difference of their Shape, are of different uſe. *Blanchard*.

FORCIBLE *detaining or holding of Poſſeſſion*, is a violent Act of Reſiſtance by ſtrong Hand of Men weapon'd with Harneſs, or other Action of Fear in the ſame Place, or elſewhere, whereby the lawful Entry of Juſtices or others is barr'd or hinder'd.

FORCIBLE *Entry*, is a violent actual Entry into a Houſe or Land, &c. or taking a Diſtreſs of any Perſon weapon'd, whether he offer Violence, or Hurt to any there, or furiouſly drive any out of the Poſſeſſion thereof.

FORE-CASTLE *of a Ship*, is that Part where the Fore-Maſt ſtands, and 'tis divided from the reſt of the Floor by a Bulk Head; that Part of the *Fore-Caſtle* which is aloft, and not in the Hold, is called the *Prow*.

FOREFOOT, a Sea Term for one Ship's lying or ſailing croſs anothers way; as if two Ships being under Sail, and in ken of one another, one of them lies in a Courſe, with her Stem ſo much a Weather the other, that if they both hold on their Courſe, the Windward Ship will run or go out a-head of the other; and then they ſay ſuch a Ship lies with the others *Fore-foot*, tho' as ſoon as ſhe has paſſed her, or gone out before her a-head, they do not ſay, ſhe paſſed by her Forefoot, but that ſhe is *gone out a-head*.

FOREJUDGED *the Court*, is when an Officer of any Court is expelled the ſame for ſome Offence, or for not appearing to an Action by Bill filed againſt him; and in the latter he is not to be re-admitted till he ſhall appear, but ſhall loſe his Office, and be *Forejudged the Court*.

FOREJUDGER, in Law, ſignifies a Judgment, whereby a Man is deprived, or put by the thing in queſtion.

FORELAND, a Term in Fortification, the ſame with *Berme*.

FORELOCKS, in a Ship, are little flat Wedges like pieces of Iron, uſed at the ends of Bolts, to keep the Bolts from flying out of the Holes. They are uſed alſo to keep faſt down the Cap-ſquares of the Carriages for the Guns; theſe are alſo called *Forelockeys*.

FORE-MAST of a Ship, is a round large piece of Timber, ſeated in her fore-part or Fore-caſtle, on which is born the Fore-ſail and Foretop-ſail-Yards. Its Length is uſually $\frac{8}{9}$ of the *Main-maſt*; the Foretop-maſt is half the Length of the Fore-maſt, and the Foretop-gallant-Maſt is half the Length of the Foretop maſt.

FORE-REACH; the Seamen ſay one Ship *forereaches* upon another, when both Sailing together, ſhe ſails better or out-goeth the other.

FORE-STAFF: See *Croſs-ſtaff*, being an Inſtrument uſed at Sea, for taking the Altitude of the Sun, Moon, or Stars, with ones Face towards the Object.

FOREIGN, is in Law uſed adjectively, being joyned with divers Subſtantives in ſeveral Senſes: As,

FOREIGN *Anſwer*, is ſuch an Anſwer as is not triable in the County where it is made.

FOREIGN *Attachment*, is an Attachment of Foreigners Goods found within a Liberty or City, in the Hands of a third Perſon, for the Satisfaction of ſome Citizen, to whom the ſaid Foreigner oweth Money.

FOREIGN *Matter*; that is, Matter triable in another County.

FOREIGN *Oppoſer*, or *Appoſer*, is an Officer in the *Exchequer*, to whom all Sheriffs and Bayliffs do repair to be appoſed by him of their Green Wax, after they are appoſed of their Sums out of the Pipe-Office; and from thence draws down a Charge upon one of them to the Clerk of the Pipe: His Buſineſs is to examine the Sheriffs Eſtreats with the Record, and to ask the Sheriff, what he ſays to every particular Sum therein.

FOREIGN *Plea*, is a Refuſal of the Judge as Incompetent, becauſe the Matter in Hand was not within his Precinct.

FOREIGN *Service*, is ſuch Service whereby a mean Lord holdeth over of another, without the Compaſs of his own Fee; or elſe that which a Tenant performeth either to his own Lord, or to the Lord Paramount out of his own Fee.

FOREST, is a large Wood priviledged to hold the King's Game of all kind.

The Properties of a Foreſt are theſe;

Firſt, A Foreſt, as it it is truly and ſtrictly taken, cannot be in the Hands of any but the King, for none hath Power to grant Commiſſion to be a Juſtice in *Eyre*, or the Foreſt, but the King.

The ſecond Property conſiſts in the Courts, as the *Juſtice-Seat* every three Years, the *Swain-mote* thrice every Year, and the *Attachment* once every forty Days.

The Third Property, are the Officers belonging to it, for the Preſervation of the Vert and Veniſon; as the Juſtices of the Foreſt, the Warden or Keeper, Verderers, Foreſters, Agiſtors, Regarders, Bayliffs, Beadles, and ſuch like.

FORESTER, is a Sworn Officer of the Foreſt, appointed by the King's Letters-Patent to walk the Foreſt both early and late, watching both the Vert and Veniſon, attaching and preſenting all Treſpaſſes againſt them within their own Balywick or Walk: And tho' theſe Letters-Patents be ordinarily granted but *quam diu ſe bene geſſerint*, yet ſome have it to them and their Heirs, and thereby are called *Foreſters in Fee.*

FORFEITURE, in our Language, ſignifies rather the Effect of tranſgreſſing a Penal Law, than the Tranſgreſſion it ſelf, as Forfeiture of Eſcheats.

FORFEITURE *of Marriage*, is a Writ lying againſt him, who holding by Knights Service, and being under Age, and Unmarried, refuſes her whom the Lord offers him with his Diſparagement, and Marrieth another.

FORFEX, is an Inſtrument to pull out Teeth with.

FORGERY: See the next following, *viz.*

FORGER *of Falſe Deeds*, in Law, ſignifies either him that fraudulently maketh and publiſheth *Falſe Writings*, to the Prejudice of any Man's Right; or elſe the Writ that lieth againſt him that committeth this Offence, which by ſome is called, *The Writ of Deceit.*

FORELORN-HOPE, or the *Enfans Perdue* in an Army.

FORM of any Natural Body, is the Eſſential, Specifical, or diſtinguiſhing Modification of the Matter of which it is compoſed, ſo as thereby to give it ſuch a peculiar manner of Exiſtence: And this is an Aggregate or Convention of as many particular Qualities, as ſerve to denominate the Body of ſuch a Nature, and to give it ſuch a Name, and which diſtinguiſhes it from other Bodies. Thus the Qualities of greateſt Specifick Gravity, Fixity in the Fire, Ductility under the Hammer, Paucity and yet Largeneſs of Pores, Diſſolubility in *Aqua Regia* and not in *Aqua fortis*, and Yellowneſs of Colour, make up the Form of that Metal which we call Gold. So that 'tis not any kind of ſubſtantial Soul or Subſtance diſtinct from Matter, but only ſuch a proper and agreeable Convention of Accidents, as by common conſent are reputed ſufficient to make a Portion of Univerſal Matter, belong to this or that Determinate Genus or Species of Natural Bodies. But yet ſome are of Opinion, That the Human Soul may properly enough be called, a *Subſtantial Form.*

FORMED *Stones*, are with the Writers of Natural Hiſtory, ſuch Bodies as being either pure Stone, Flint, or Sparr, are found in the Earth ſo formed, as that they bear a near Reſemblance to the external Figure and Shape of Muſcles, Cockles, Perewinkles, and other Shells. There hath been a great Diſpute amongſt the Naturaliſts, how theſe Bodies came thus formed, and a great many have been very fond of (what appears to me as a very abſurd Opinion) *viz.* That theſe are only a *Luſus Naturæ*, only the Sports and Diverſions of Nature, to make her ſelf Merry in the dark Regions of the Earth. But Dr. *Woodward*, in his Natural Hiſtory of the Earth, advances a very fair Solution of this Difficulty, and proves, that theſe formed Stones, by the Diſſolution of the Earth at the Deluge, were then made by being caſt into the Cavities of thoſe Shells which they repreſent, the Shells ſerving as Moulds to give them their proper form.

FORMEDON, is a Writ that lies for him that hath Right to any Lands or Tenements, by Vertue of an *Entail:* It lieth in three ſorts;

1. *Formedon in the Deſcender*, which lieth for the Recovery of Lands, &c. given to one and the Heirs of his Body, or to a Man and his Wife, and the Heirs of their Bodies, or to a Man and his Wife being Couſin to the Donor in *Frank-Marriage*, and afterwards alienated by the Donee; for after his Deceaſe, his Heirs ſhall have this Writ againſt the Tenant or Alliance.

2. *Formedon in the Reverter*, lieth for the Donor or his Heirs, where Land entail'd to certain and their Iſſue, with condition for want of ſuch Iſſue, to revert to the Donor and his Heirs, againſt him to whom the Donee alienateth, after the Iſſue extinct to which it was entail'd.

3. *Formedon in the Remainder*, lieth where a Man giveth Lands in Tail, the Remainder to another in Tail; and afterwards the former Tenant in Tail dieth without Iſſue of his Body, and a Stranger abateth, then he in the Remainder ſhall have this Writ.

FORMEE, the Term ſometimes uſed for the *Croſs Patee* in Heraldry: See *Patee.*

FORMER, is the Name of a piece of Wood turn'd round and fitted to the Bore of a Piece of Ordnance, on which are founded the Cartridges which hold the due Charge of Powder for the Gun.

FORMULÆ, is the Word uſed for the Phyſician's Preſcriptions. *Blanchard.*

FORNIX, is the Callous Subſtance of the Brain, ſo called, becauſe it ſeems to ſuſtain the Cavities of the Ventricles, and the Bulk of the impending Brain, like an Arch or Vault.

FORESTAL, is to be quit of Amerciaments and Cattle arreſted within your Land, and the Amerciaments thereof coming.

FORESTALLING, ſignifies the Buying or Bargaining for any Victuals or Wares coming to be ſold towards any Fair or Market, or from beyond the Seas towards any City, Port, Haven, Creek, or Road of this Realm, and before the ſame be there, to the intent to ſell the ſame again at a higher and dearer price.

FORT, is a Caſtle, or a place of ſmall extent, fortified either by Art or Nature.

FORT-ROYAL, is that which hath 26 Fathoms for the Line of Defence.

FORT-STAR, is a Redoubt, conſtituted by Reentring and Salient Angles, which commonly have from 5 to 8 Points: See more under the Word *Sconces.*

FORTIFICATION, or *Military Architecture*, is an Art ſhewing how to fortifie a place with *Ramparts*, *Parapets*, *Moats*, and other *Bulwarks*, to the end, that a ſmall number of Men within may be able to defend themſelves for a conſiderable time againſt the Aſſaults of a numerous Army without; ſo that the Enemy in attacking them muſt of neceſſity ſuffer great loſs.

Fortification is either *Regular* or *Irregular*, and with reſpect to Time, may be diſtinguiſh'd into *Durable* and *Temporary.*

Regular Fortification, is that which is built on a *Regular Polygon*, the Sides and Angles whereof are all equal; being commonly about a Musket-ſhot one from another.

Irregular Fortification, is that where the Sides and Angles are not at all uniform, equi-diſtant, nor equal one to another.

Durable Fortification, is that which is raiſed to continue a long while.

Temporary Fortification, is that which is erected upon an emergent occaſion for a little time; ſuch are all ſorts of Works caſt up for the ſeizing or maintaining

taining of a Poſt or Paſſage, as alſo *Circumvallations*, *Contravallations*, *Redoubts*, *Trenches*, *Batteries*, &c.

The principal Maxims of Fortification, *are theſe:*

1. Every Place within the *Fortification* ought to be flank'd; that is, ſeen ſidewiſe, or defenſible from the other Parts, ſo that there may be no Place in which an Enemy can lodge himſelf undiſcovered by thoſe that are within, and that both from the Front, the Sides, even from Behind if poſſible.

2. The Fortreſs ought to command all Places round about; and therefore all the Out-works muſt be lower than the Body of the Place.

3. The Works that are moſt remote from the Center of the Place, ought always to be open to thoſe that are more near.

4. The *Angle Flanquant*, or the Point of the *Baſtion*, ought to be at leaſt of 75 Degrees, or as ſome ſay (Mr. *Vauban*) not more than 100, or leſs than 60.

5. The *Angle of the Courtine* ought never to be leſs than 90, or greater than 100 Degrees, becauſe if it be larger, 'tis too much ſubject to the View of the Enemy.

6. The greater the *Flank* and *Demigorge* is in Proportion to other Things, the better; becauſe there is both more Room to retrench in, and alſo becauſe there may be made retiring Flanks, which add very much to the Strength of a Place.

7. The *Line of Defence* ought never to exceed Point-blank Muſket ſhot, which is about 120 or 125 Fathoms.

8. The *Baſtions* that are not too little, nor yet too exceſſively big, are to be preferred before others; and the Angle of a Baſtion ſhould not exceed 100, nor be leſs than 60 Degrees.

9. The greater the *Angle* that is made by the *outward Polygon* and the Face ſhall be, the greater is the Defence of the Face.

10. Whatſoever incloſes a durable Fortification, muſt be either Flank, Face, or Curtain; and built ſo well, that the firſt Diſcharge of the Cannon may not be able to pierce through it.

11. 'Tis impoſſible to fortify a Triangle after the common Way, becauſe the Angle of the Gorge is always leſs than 90 Degrees.

12. The Acuter the Angle at the Center is, the Place is by ſo much the ſtronger, becauſe it will have the more Sides.

13. In a *Regular Fortification* the Face muſt never be leſs than half the Curtain; and the Faces of the Baſtion ought to be defended by the Small Shot of the oppoſite Flanks.

14. *Dry Trenches* are preferable to thoſe filled with Water, eſpecially in great Places, where Sallies, Retreats, and Succours are frequently neceſſary; but in ſmall Fortreſſes, *Water Trenches* that cannot be drained are beſt, becauſe there is no need of Sallies, Succours, &c.

FORTINS, or *Field-Forts*, are Sconces or little Fortreſſes, whoſe *Flank'd Angles* are generally diſtant one from another 120 Fathom, but their Extent and Figure are different, according to the Situation or Nature of the Ground; ſome of them having whole Baſtions, and others only Demi-Baſtions. They are made uſe of only for a Time, either to defend the Lines of *Circumvallation*, or to guard ſome Paſſage or dangerous Poſt.

FOSSILS; all Bodies whatever that are dug out of the Earth, are by Naturaliſts commonly treated of under this general Title of *Foſſils:* But theſe may be diſtinguiſhed into two Claſſes.

Firſt, Such as are Natives of the *Earth*: Or,

Secondly, Such as are *Adventitious*, and repoſited in the Earth by the *Univerſal Deluge*, or by ſome other means.

Of which latter Sort are the *Exuvia* of *Sea* and *Land Animals*; the *Foſſil-Shells*, *Bones*, *Teeth*, &c. which are plentifully found in the Earth, and by ſome *Writers* have been erroneouſly thought a ſort of Stones that are peculiar, and as they ſpeak, *ſui Generis*.

The following *Table* of ſuch *Foſſils* are as *Natives* of the *Earth*, conſiſts only of the *Heads* and *Titles* extracted out of a *Natural Hiſtory* of theſe *Bodies*, compoſed by Dr. *Woodward*, and founded wholly upon *Experiments* and *Obſervations* made upon them.

In this *Table* they are rank'd and diſtributed according to their *Natural Properties*, and their *Relations* to each other.

Chap. 1. EARTHS.

The *Engliſh*, *Bohemian*, and the *Armenian* Boles.
Umbre. Ochre, yellow and red.
Tripela. Terra Militenſis.
Chalk. Steinomarga, or Lac Lunæ.
The common black Vegetable Earth.
Loam. Marle. Clay.
Terra Lemnia. Tobacco-pipe Clay.
Argilla, or Potter's Earth. Porcellana.
Steatites, or Soap-Earth. Fuller's-Earth.

Chap. 2. STONES.

Sect. 1. *Thoſe that are found in larger Maſſes.*

Lapis Molaris, or Milſtone. Grind-ſtone.
Sand-ſtone, or Saxum arenarium. Free-ſtone.
Saxum calcarium, or Lime-ſtone. Whetſtone.
Ragſtone.
Lapis fiſſilis, or Slate.
Hone. Oilſtone. Touchſtone.
Alabaſter. Marble.
Ophites. Porphyrites.

Sect. 2. *Stones found in leſſer Maſſes.*

Art. 1. *Thoſe that do not exceed Marble in Hardneſs.*

§. 1. *Thoſe that are of an indeterminate Figure and Texture.*

The coarſer or gritty Pebbles.
Lapis Violaceo Odore.

§. 2. *Thoſe that are of an indeterminate Figure, but of a regular Texture.*

Gypſum Striatum, *Engliſh* Talck.
Amianthus ſive Aſteſtos. Alumen plumoſum.
Talck.

§. 3. *Thoſe that are commonly of determinate Figures.*

Selenites. Lapis Spicularis, or *Muſcovy* Glaſs.
Ludus Helmontij, or the Waxen Vein.
Lapides Tubulis referti, or the Piped Waxen Vein.
Belemnites, or the Thunder-ſtone
The Foſſil Coralloid Bodies, ſimple and branched, and the Stones related to them, *e.gr.*
Stelechites. Mycetites. Porpites.
Aſtroites. The Honey-comb-ſtone.

Fluor or Spar, Stalactites, Stalagmites.
Osteocolla.

Art. 2. *Stones found in leſſer Maſſes, that do exceed Marble in Hardneſs.*

Thoſe comprehended under this Second Article, are uſually called *Gemms* or *Precious Stones*. The whole Tribe of theſe are exhibited here; and indeed none but them, excepting Pebbles and Flints, which are rank'd of courſe along with the Agate-kind, to which they really belong.

§. 1. *Thoſe that are Opaque.*

Subdiviſion 1. *Of one Colour.*

The Turcois. The Nephritick Stone. The Malachite. The two laſt are ſometimes a little variegated.

Subdiviſion 2. *Of different Colours mix'd in the ſame Body.*

Lapis Lazuli. Heliotropium, or Blood-ſtone.
The Jaſper.

§. 2. *Semi-pellucid Stones.*

Subdiviſion 1. *With Colours changeable, according to the different Poſition of the Stone to the Light.*

Oculus Cati. The Opal.

Subdiviſion 2. *With Colours permanent.*

The finer Pebbles and Flints, Agates. The Chalcedony.
Mocho-ſtones. The Oculus Beli. Onyx, and Sardonyx.
The white Cornelion. The red Cornelion, and the Beryl.

§. 3. *Stones Diaphanous, with Colours.*

§§. 1. *Yellow, or partaking of it.*
The Topaz. The Jacinth.
§§. 2. *Red, or partaking of it.*
The Granate. The ſeveral Sorts of Rubies.
The Amethyſt.
§§. 3. *Blue, or partaking of it.*
The Saphire. The Water Saphire.
The Aquemarine.
§§. 4. *Green, or partaking of it.*
The Emerald. The Chryſolite.

§. 5. *Stones Diaphanous, and without Colours.*

Cryſtal. The Pſeudo adamantes.
The white Saphire. The Diamond.

Chap. 3. SALTS.

Foſſil or Rock Salt. Sal Gemmeum.
The Tincal of *Perſia*. The Natron of *Egypt*.
Nitre, or Salt Petre.
Alum. Vitriol.

Chap. 4. BITUMINA.

§. 1. *Liquid.*

Naptha. Petroleum. Oleum terræ Barbadenſis.

§. 2. *Solid.*

Succinum, or Amber. Bitumen. Piſſaſphalton.
Gagates, or Jet. Kanal. Coal.

Chap. 5. METALLICK MINERALS.

Mercury. Cinnabar, the Mineral out of which 'tis drawn. Arſenick.
Sulphur. Pyrites, Marcaſita. Cobalt.
Lapis Calaminaris. Antimony.
Biſmuth, or Tin-Glaſs. Speltre, or Zink.
Nigrica fabrilis Merreti, or Black Lead.

Chap. 6. METALS.

Tin. Lead. Silver. Gold.
Copper. The Lapis Armenius is a Copper-Ore.
Iron. The Hæmatites is an Iron-Ore. There is alſo a little Iron in the Loadſtone. Manganeſe, Emery, the Ætites ferruginoſa, the Mineral Bezoar, the Geodes, and the Enhydros.

FOTUS, the ſame with *Fomentum*.

FOVEA *Cordis*, the ſame with *Anticardium*.

FOUGATE, or *Fongaſs*, is a ſmall Mine dug in form of a Well, in a Place ready to be gained by the Enemy, ſo that when they have made themſelves Maſters thereof, it is ſprung like a Mine by the Means of a Saucidge.

They are alſo prepar'd under a Work which is to be blown up, and are charged with Barrels or Sacks of Powder cover'd with Earth.

FOULE, a Word uſed at Sea in two Senſes, when a Ship has been long untrimmed, ſo that Graſs, Weeds Barnacles, or Periwincles, ſtick or grow to her Sides under Water, ſhe is then ſaid to be foule. They ſay alſo a Rope is foule, when it is either tangled in it ſelf, or hindred by another, ſo that it cannot run or be haled.

FOULE-WATER: A Ship is ſaid to make *foule Water*, when being under Sail, ſhe comes into ſuch Shole or ſhallow Water, that though her Keel do not touch the Ground, yet ſhe comes ſo near it, that the Motion of the Water under her raiſeth the Mud from the Bottom, and ſo polluteth or fouleth the Water.

FOUNDER: A Ship is ſaid to *founder* at Sea, when by any extraordinary Leak, or by a great Sea breaking in upon her, ſhe is ſo filled with Water, that ſhe cannot be freed of it, nor is ſhe able to ſwim under it, but ſinks with the Weight thereof.

FOURCH, in Law, ſignifies a Delay, putting off or prolonging of an Action.

FOURTH, a Term in Muſick; the ſame with *Diateſſaron*: Which ſee.

FRACTION, is a broken Number, ſignifying one or more Parts proportionally of any thing divided. It conſiſts of two Parts, which are two Numbers ſet one over another, as $\frac{5}{8}$: Of which two Numbers, that below the Line is called the *Denominator*, becauſe it denominates or ſhews the Nature or Kind of the Parts any Whole is divided into; and the Number above the Line is called the *Numerator*, becauſe it numbers or tells us how many of thoſe Parts the *Fraction* doth conſiſt of. Thus $\frac{5}{8}$ ſuppoſes ſome Whole to be divided into 8 equal Parts, and then that you take 5 of them, or 5 ſuch Parts.

In all *Fractions*, As the *Numerator*: Is to the *Denominator* :: So is the *Fraction* it ſelf: To that Whole of which it is a Fraction. Thus, ſuppoſe $\frac{3}{4}$ of

of a Pound be equal to 15 *s.* then 'tis plain, 3 : 4 :: 15 *s.* : 20 *s.*

From which general Axiom will follow these Corollaries.

1. That there may be infinite Fractions of the same Value one with another; for there may be infinite Numbers found, which shall have the Proportion one to another as 3 has to 4.

2. When the Numerator is less than the Denominator, the Fraction is less than the Whole, and consequently is what they call a *Proper Fraction.*

3. But when the Numerator is either equal to, or greater than the *Denominator*, the Fraction is called *Improper*, because 'tis equal to, or greater than the whole. Thus $\frac{4}{4}$ is equal to 1, and $\frac{5}{4}$ is equal to 1 and $\frac{1}{4}$.

Fractions are either *Single* or *Compound.*

Single Fractions are such as have but one *Numerator* and one *Denominator*, as $\frac{3}{4}$, $\frac{5}{9}$, $\frac{11}{22}$.

Compound Fractions, or Fractions of Fractions, are such as consist of more than one *Numerator* and one *Denominator*, as $\frac{1}{2}$ of $\frac{3}{4}$ of $\frac{5}{8}$, and are always connected by the Word *Of.*

Reduction of Fractions.

I. *To reduce Fractions to their least Terms.*

Rule 1. If both Numerators and Denominators are even Numbers, divide each by 2 as long as you can, till an odd Quotient ariseth, and then have recourse to the 4th *Rule*, which is General.

Thus, this Fraction $\frac{884}{1248}$ will by Bissection be reduced to $\frac{221}{312}$, and $\frac{8}{48}$ will be reduced to $\frac{1}{6}$.

Rule 2. If both end in Cyphers, cut off an equal Number of them from both, and then proceed by the other *Rules.*

Thus, $\frac{2400}{10000}$ will become $\frac{12}{50}$.

3. If both Numerator and Denominator end in 5, or one in 5, and the other in 0, they may be always reduced into lesser Terms, by dividing each by 5.

Thus, 5) $\frac{475}{8975}$ (= $\frac{95}{1795}$, and 5) $\frac{265}{480}$ (= $\frac{75}{96}$.

4. When by none of the former *Rules* you can reduce them wholly, try this Method, which is General; that is, find the greatest Number that will divide both *Numerator* and *Denominator* without any Remainder; and then dividing both Parts of the Fraction by that Number, take the Quotients for a new Fraction, which shall be of the same Value and in its least Terms.

The *Greatest Common Divisor* to any two Numbers is thus found:

Divide the Greater by the Lesser, and then divide the last Divisor by the Remainder, and so continually till nothing remain; and then take the last Divisor for the *Greatest Common Measure* sought.

If after all Trials still there remains Unity, then the Fraction cannot be reduced farther.

Thus, in reducing $\frac{91}{117}$ into its least Terms, 'twill be found to be $\frac{7}{9}$, the *Greatest Common Divisor* being 13.

91) 117 (1
91
26) 91 (3
78
13) 26 (2
26
00

But this *Rule* may also be very much abridg'd by this Method, *viz. When you find any Remainder to be more than half the last Divisor*, substract it from the Divisor, and divide that Divisor by the *new Remainder* found by such Substraction: As suppose you were to find the *Greatest Common Divisor* in this Fraction $\frac{744}{899}$.

744) 899 (1
744
155) 744 (4
620
124
155
124
31) 155 (5
155
0

Which last Remainder 124 being more than half 155, I substract it from it, and there remains 31; which dividing 155 without Remainder, I find to be the *Greatest Common Divisor* to those two Numbers.

II. *To find the Value of any* Fraction *in the known Parts of its Integer.*

As suppose it was requir'd to know what is $\frac{9}{16}$ of a Pound.

Multiply (9) the Numerator by (20) the Number of known Parts of the next inferior Denomination, and divide the Product by (16) the Denominator of the given Fraction; the Quotient will be 11 *s.* and the Remainder (4) being multiplied by (12) the Number of known Parts in the next inferior Denomination; and dividing the Product (48) by (16) as before, the Quotient will be 3 *d.* So that you find that $\frac{9}{16}$ of a Pound is 11 *s.* and 3 *d.*

20
9
16) 180 (11 *s.*
20
12
16) 48 (3 *d.*
00

III. *To*

III. *To reduce a mix'd Number (as* $4\frac{11}{12}$*) into an Improper Fraction of the ſame Value.*

Multiply (4) the Integer Part, by (12) the Denominator of the Fraction; to the Product (48) add the Numerator; the Sum (59) ſet over the former Denominator (12.) Thus $\frac{59}{12}$ will be an *Improper Fraction* of the ſame Value with the mix'd Number given; for 12 now divides that Product which before it help'd to produce, and therefore the Value muſt be the ſame as before.

IV. *To reduce a whole Number into an Improper Fraction.*

1. If no Denominator be aſſign'd, draw a Line under it, and ſet Unity beneath that Line, and 'tis done. Thus, if 8 were given to be reduc'd, write it in this Manner, $\frac{8}{1}$.

2. But if there be a Denominator (as ſuppoſe 3) given, multiply (8) the given Number by (3) the aſſign'd Denominator, and ſet the Product over (3) and 'tis done, and ſtands thus, $\frac{24}{3}$; for the Number 8 is multiplied by 3, and then that Product divided by 3, which makes it of the ſame Value now as before.

V. *To reduce an Improper Fraction into its equivalent mix'd Number, as ſuppoſe* $\frac{59}{12}$.

Divide (59) the Numerator by (12) the Denominator; the Quotient ($4\frac{11}{12}$) will be the mix'd Number ſought.

VI. *To reduce a Compound Fraction into a Single one.*

Multiply all the Numerators continually for a new Numerator, and all the Denominators for a new Denominator.

Thus, $\frac{1}{2}$ of $\frac{3}{4}$ of $\frac{5}{8}$ reduced, will be $\frac{15}{64}$.

VII. *To reduce Fractions of different Denominations to others of the ſame Value, having the ſame common Denominator.*

1. Reduce them always to their leaſt Terms.

2. Then multiply all the Denominators for a common Denominator; and multiply continually the Numerator of each Fraction into all the Denominators except its own, and that will give new Numerators to be ſet over the common Denominator.

Thus, if it was requir'd to reduce $\frac{2}{3}$, and $\frac{4}{7}$, and $\frac{5}{6}$ into one common Denominator:

I ſay, 3 into 7, into 6, produces 126 for a common Denominator.

Then $2 \times 7 \times 6 = 84$, therefore $\frac{2}{3} = \frac{84}{126}$.
And $3 \times 4 \times 6 = 72$, therefore $\frac{4}{7} = \frac{72}{126}$.
Alſo $5 \times 7 \times 3 = 105$, therefore $\frac{5}{6} = \frac{105}{126}$.

Addition in Vulgar Fractions.

1. *If the Fractions propoſed have equal Denominators*, only add the Numerators, and ſet the Sum over the common Denominator.

Thus, $\frac{5}{12} + \frac{9}{12} = \frac{14}{12}$.

2. But if they have not a common Denominator, they muſt be reduced to others of the ſame Value, that have a common Denominator; then add as in the firſt *Rule*.

3. If Compound Fractions are given to be added, they muſt firſt be reduced to ſingle ones of the ſame Value, and then they will fall under theſe two *Rules* foregoing.

4. When Fractions of different Denominations are given to be added, they muſt be reduced into Fractions of the ſame Denomination, (or which have the ſame common Integer) by the *Rule* for reducing Compound Fractions.

Thus, if $\frac{5}{8}$ of a Pound, $\frac{2}{3}$ of a Shilling, and $\frac{4}{7}$ of a Penny, were propoſed to be added together, they muſt all be brought into the Denomination of Pounds.

Thus, $\frac{2}{3}$ of a Shilling is $\frac{2}{3}$ of $\frac{1}{20}$ of a Pound, (which reduced, is $\frac{2}{60}$ of a Pound:) So $\frac{4}{7}$ of a Penny is $\frac{4}{7}$ of $\frac{1}{12}$ of $\frac{1}{20}$ of a Pound (which being reduced, is $\frac{4}{1680}$) then thoſe two Fractions $\frac{2}{60}$ and $\frac{4}{1680}$ may be added by the ſecond *Rule*.

5. *To add mix'd Numbers.*

1. Add the Integers in both Numbers together, then add the Fractional Parts, and if their Sum be a proper Fraction, only annex it to the Sum of the Integers.

2. But if it be an Improper Fraction, reduce it to its equivalent mix'd Number; and adding the Integral Part to the firſt Sum of the Integers, ſet the remaining Fractional Part after the Integers, and 'tis done.

Thus, $5\frac{2}{3} + 4\frac{1}{2} = 10\frac{1}{6}$.

Subſtraction of Vulgar Fractions.

1. If they have a common Denominator, ſubſtract the leſſer Numerator from the greater, and ſet the Remainder over the common Denominator.

Thus, from $\frac{8}{18}$ take $\frac{5}{18}$, and there remains $\frac{4}{18}$.

2. If they have not a common Denominator, they muſt be reduced to Fractions of the ſame Value, having a common Denominator; and then as in the 1ſt Rule.

Thus, $\frac{6}{7} - \frac{2}{5} = \frac{30}{35} - \frac{14}{35} = \frac{16}{35}$.

3. To ſubſtract a whole Number from a mix'd Number, or one mix'd Number from another.

Reduce the whole or mix'd Numbers to Improper Fractions, then proceed as in the 1ſt or 2d *Rule*.

N. B. This *Rule* is General; yet there are particular *Rules*, which in ſome Caſes are more Expeditious; as follows.

Particular Rules.

1. *To ſubſtract a whole Number from a mix'd.*

Subſtract the whole Number from the Integral Part of the mix'd Number; then to the Remainder annex the Fractional Part of the mix'd Number.

Thus, 3 from $5\frac{2}{7}$, leaves $2\frac{2}{7}$.

2. *To ſubſtract a Fraction from* 1 *or Unity.*

Subſtract the Numerator from the Denominator, and 'tis done.

Thus, $\frac{1}{4}$ from 1, leaves $\frac{3}{4}$.

3. To subſtract a Fraction from any whole Number greater than Unity.

Subſtract the Fraction from Unity (by 2d) then from the whole Number given ſubſtract that Unity, and place the remaining Integer before, and the Fractional Part (firſt found) after it, ſo ſhall that mix'd Number be the Remainder ſought.

Thus, $\frac{2}{5}$ from 7, leaves $6\frac{3}{5}$.

4. To ſubſtract a mix'd Number from a whole Number.

Firſt ſubſtract the Fractional Part from Unity, borrowed from the whole Number given, and ſet down the Remainder; then adding the Integer borrowed, to the Integers of the mix'd Number, ſubſtract the ſaid Sum from the whole Number, and to the Remainder annex the Fractional Part firſt found, and 'tis done.

Thus, $3\frac{1}{4}$ from 9, leaves $5\frac{3}{4}$.

5. To ſubſtract a Fraction from a mix'd Number.

1. If the Fraction given, be leſs than the Fractional Part of the mix'd Number, only ſubſtract the Fraction from the Fractional Part, and annex the Remainders to the integer Part of the mix'd, and 'tis done.

Thus, $\frac{1}{4}$ from $6\frac{3}{4}$, leaves $6\frac{2}{4}$.

2. But when the Fraction given is greater than the Fractional Part of the mix'd Number;

Subſtract the Fraction from Unity, and add the Remainder to the Fractional Part of the mix'd Number; then leſſening the Integral Part of the mix'd Number by Unity, annex the Fractional Part (laſt found) to it:

Thus, $\frac{7}{9}$ from $6\frac{3}{9}$, leaves $5\frac{5}{9}$.

CASE I.

6. To ſubſtract one mix'd Number from another.

When the Integral Part, and Fractional Part, of the mix'd Number to be ſubſtracted, are both leſſer than the Integers and Fractional Parts of the other mix'd Numbers; only ſubſtract the leſſer Integer from the greater, and the leſſer Fraction from the greater, and to the Remainder of the Integers annex the Remainder of the Fraction, and 'tis done.

Thus, $2\frac{7}{12}$ from $5\frac{9}{12}$ leaves $3\frac{2}{12}$, or $3\frac{1}{6}$.

CASE II.

When the Fractional Part of the mix'd Number (to be ſubſtracted) is greater than the Fractional Part of the other mix'd Number:

Firſt, Subſtract the greater Fraction from Unity, and add the Remainder to the Fractional Part of the other mix'd Number; which Sum, as the Fractional Part of the Remainder ſought, is to be kept.

Then add Unity to the leſſer Integral Part, and ſubſtract the Sum from the greater Integral Part, and to the Remainders annex the Fractional Part before reſerved, and 'tis done.

Thus, $2\frac{3}{4}$ from $7\frac{2}{5}$, reſts $4\frac{13}{20}$.

Multiplication of Vulgar Fractions.

1. When the Fractions propoſed are both ſingle Fractions, only multiply the Numerators one by another for a new Numerator, and the Denominators for a new Denominator.

Thus, $\frac{5}{8}$ into $\frac{9}{13}$, produces $\frac{45}{104}$.

2. If one be a mix'd or Whole Number, it muſt be reduced to an *Improper Fraction*, and then proceed as in the laſt Rule.

Thus, $\frac{2}{8}$ into $5\frac{2}{13}$, gives $\frac{67}{104}$; and $\frac{4}{9}$ into $\frac{10}{1} = 40$.

N. B. In *Multiplication of Fractions* the Product is leſs in Value than either Multiplicand or Multiplicator; becauſe in all Multiplications, As Unity: Is to the Multiplicator :: So is the Multiplicand: To the Product; or, As Unity: Is to either Factor :: So is the other Factor: To the Product. But Unity is bigger than either Factor (if the Fractions are proper) and therefore either of them muſt be greater than the Product.

Thus in Whole Numbers, if 5 be multiplied by 8, 'twill be, As 1 : 5 :: 8 : 40; or, 1 : 8 :: 5 : 40. Wherefore in Fractions alſo, As $1 : \frac{3}{4} :: \frac{5}{8} : \frac{15}{32}$; or, As $1 : \frac{5}{8} :: \frac{3}{4} : \frac{15}{32}$.

But 1 is greater than either $\frac{3}{4}$ or $\frac{5}{8}$: Wherefore either of them muſt be bigger than $\frac{15}{32}$.

Diviſion in Fractions.

1. When the Fractions propoſed are both ſingle, multiply the Denominator of the Diviſor by the Numerator of the Dividend; the Product is the Numerator of the Quote.

Then multiply the Numerator of the Diviſor, by the Denominator of the Dividend; the Product is the Denominator of the Quotient.

Thus, $\frac{3}{5}) \frac{4}{9} (\frac{20}{27}$.

2. If either Dividend, Diviſor, or both, be Whole or Mix'd Numbers, reduce them to improper Fractions; and if they be Compound Fractions, reduce them to Simple ones, and proceed as in the firſt Rule.

N. B. That in Diviſion of Fractions, the Quotient is always greater than the Dividend; becauſe in all Diviſion, As the Diviſor: Is to Unity :: So is the Dividend: To the Quotient; as if 3 divide 12, 'twill be, As 3 : 1 :: 12 : 4. Now 3 is greater than 1, wherefore 12 muſt be bigger than 4: But in Fractions, As $\frac{3}{5} : 1 :: \frac{4}{9} : \frac{20}{27}$; where $\frac{3}{5}$ is leſs than 1; wherefore $\frac{4}{9}$ muſt alſo be leſs than $\frac{20}{27}$.

FRACTURA *Oſſis*, the breaking of a Bone, is a Solution of the *Continuum* in the hard or bony Parts of the Body.

FRÆNULUM, is a membranous Ligament under the Tongue, which being extended too far towards the Tip of the Tongue, hinders Children in ſucking, whence they are ſaid to be Tongue-ty'd.

FRÆNUM, is that Ligament whereby the Prepuce is tied to the lower Part of the Glans of the *Penis*.

FRAISES, in Fortification, are pointed Stakes fixed in Bulwarks made of Earth, on the one ſide of the Rampart a little below the Parapet. Theſe Stakes being from 7 to 8 Foot long, are driven in almoſt half way into the Earth, and preſent their Points ſomewhat ſloping toward the Field. They ſerve to prevent Scalades and Deſertion.

FRAME, is the Out-work of a Clock or Watch, conſiſting of the Plates and Pillars, and which contains in it the Wheels and the reſt of the Work.

FRANCHISE, in Law, is taken to be a Privilege or Exemption from ordinary Jurisdiction, and ſometimes an Immunity from Tribute: It is either Perſonal or Real; that is, belonging to a Perſon immediately, or elſe by means of this or that Place, or Court of Immunity, whereof he is either Chief, or a Member.

FRANCHISE *Royal*, is where the King granteth to one and his Heirs, that they ſhall be quit of Toll.

FRANK-ALMOIN, in Law, ſignifies a Tenure or Title of Lands or Tenements beſtow'd upon God; that is, given to ſuch People as beſtow themſelves to the Service of God, for pure and perpetual Alms.

FRANK-BANK: See *Free-bench*.

FRANK-CHASE, is a Liberty of Free-Chaſe, whereby all Men (having Ground within that compaſs) are prohibited to cut down Wood, &c. without the View of the Foreſter, tho' it be in his own Demeſnes.

FRANK-FEE, in Law, is that which is in the Hands of the King or Lord of the Mannor, being ancient Demeſne of the Crown; whereas that which is in the Hands of the Tenant, is ancient Demeſne only.

FRANK-FORM, is a Land or Tenement, wherein the Nature of the Fee is charged by Feoffment out of Knight's-Service for ſeveral Yearly Services; and whence neither Homage, Worſhip, Marriage, nor Relief may be demanded, nor any other Service not contain'd in the Feoffment.

FRANK-FOLD, is where a Lord hath Benefit of Folding his Sheep within his Mannor for the Manuring of his Land.

FRANK-LAW, is taken for the free Enjoyment of all thoſe Privileges which the Law permits to a Man not found guilty of any heinous Offence. And he that loſeth his *Frank-Law*, is ſaid to fall into theſe Inconveniencies:

Firſt, That he may never be impannelled upon any Jury or Aſſize, or otherwiſe uſed in teſtifying any Truth.

Secondly, If he have any thing to do in the King's Court, he muſt not approach thither in Perſon, but appoint his Attorney.

Thirdly, His Lands, and Goods, and Chattels muſt be ſeized into the King's Hands; and his Lands muſt be eſtreated, his Trees rooted up, and his Body committed to Priſon.

FRANK-MARRIAGE, is a Tenure in Land Special, whereby a Man hath Land with a Woman to him and the Heirs of his Body, without doing any Service, but Fealty to the Donor.

FRANK-PLEDGE, in Law, a certain Pledge or Surety for Freemen.

FRANK-TENEMENT: See *Free-hold*.

FREE; the Seamen ſay, The Pump *frees* the Ship, when it throws out more Water than leaks into her; but on the contrary, when it cannot throw out the Water as faſt as it leaks in, they ſay, The Pump cannot *free* her: Alſo bailing or lading out Water out of a Boat, is called, *Freeing the Boat*.

FREE-BENCH, *Frank-Bank*, in Law, ſignifies that Eſtate in Copy-hold Lands that the Wife, being eſpouſed a Virgin, hath after the Deceaſe of her Huſband, for her Dower.

FREEHOLD, or *Frank-Tenement*, is that Land or Tenement which a Man holdeth in Fee, Fee-tail, or at the leaſt for Term of Life; and 'tis either *Freehold in Deed*, or *Freehold in Law*.

Freehold in Deed, is the Real Poſſeſſion of Lands or Tenements in Fee, Fee-tail, or for Life.

Freehold in Law, is the Right that a Man hath to ſuch Lands or Tenements before his Entry or Seiſure.

FREESE, a Term in Architecture: See *Frize*.

FREESING: The *Carteſians* explicate Freezing by the Receſs, or going out of the Ætherial Matter from the Pores of the Water or other Liquor; which being once done, the finer Parts are too ſmall and flexible to keep the long, ſlender, and Eel-like Particles of Water fluent, or in the form of a Liquor.

But the *Corpuſcularians* aſcribe the freezing of Water more probably, to the Ingreſs of Multitudes of cold or frigorifick Particles, as they call them, which entring the Liquor in Swarms, and diſperſing themſelves every way thro' it, do crowd into the Pores of the Water, and hinder the wonted agitation of its Parts, and wedge it up as it were into the hard or conſiſtent Body of Ice.

Freezing Mixture, is what is mix'd together in order to *freeze* other Bodies. Mr. *Boyle* in his Hiſtory of Cold ſhews, That not only all Sorts of Salts, whether *Alkalizate* or *Acid*, but even *Ardent Spirits*, ſuch as that of Wine; alſo Sugar and *Saccharum Saturni*, mix'd with Snow, are capable of freezing other Bodies; and the ſame Effect was alſo very eminently produced by the Mixture of Oil of *Vitriol*, or Spirit of *Nitre* with Snow, &c.

That Ice is ſpecifically lighter than the Water out of which it is by freezing made, is certain by its ſwimming in it; and that this Levity of Ice proceeds from theſe numerous Bubbles, which are produced in it by its Congelation, is equally plain; but how thoſe Bubbles come to be generated in freezing, and what Subſtance they contain in them (if they are not quite empty) is an Enquiry of great Importance, and perhaps if diſcovered, may help us much to underſtand the Nature of Cold.

Mr. *Hobbs* aſſerts, That they are occaſioned by the common Air, which intrudes into Water in its Coagulation, and ſo expands it.

But Firſt, No ſuch Ingreſs of Air into Water appears in its Coagulation; and that it doth not get into frozen Oil is plain, becauſe that Body is condenſed by being frozen.

Secondly, Mr. *Boyle* ſhews by undoubted Experiments, That Water frozen in Glaſſes ſealed hermetically, and in Braſs Bodies or Veſſels cloſely ſtopt, hath yet been turn'd into Ice abounding with theſe Bubbles.

Thirdly, He proves alſo by Experiment, That Water kept a while in the exhauſted Receiver, till all its Bubbles were emerged and gone, being afterwards turn'd into Ice by a freezing Mixture, that Ice had ſcarce any Bubbles at all in it. Whence 'tis plain theſe Bubbles are filled with ſome Matter which is within the Water, if they are filled with any thing: But he proves alſo by plain Experiments, that they have none, or at leaſt exceeding little true Elaſtick Air contain'd in them. *See* Vol. II.

FREEZLAND-HORSE, the ſame with *Chevaux de Freeze*.

FRESCO, in Architecture, to *Paint in Freſco*, is a ſort of Painting which is made upon the Plaiſtring of an Edifice before it be dry.

FRESH-DISSEISIN, in Law, ſignifies ſuch a *Diſſeiſin*, as a Man may ſeek to defeat of himſelf, and by his own Power, without the help of the King or Judges.

FRESH-FINE, is that which is levied within a Year paſt.

FRESH-FORCE, is a Force done within forty Days: For if a Man be diſſeiſed of any Lands or Tenements within any City or Boroughs, or *deforced* from them after the Death of his Anceſtor, to whom he is Heir, or after the Death of his Tenant for Life, or in Taile, he may within forty Days after his

his Title accrued, have a Bill out of the Chancery to the Mayor, *&c.*

FRESH-SHOT, in the Sea Phraſe, ſignifies the falling down of any great River into the Sea, ſo that the Sea has freſh Water a good Way from the Mouth of that River, which ſometimes by Accident is by the Deſcent of Land-Waters on a ſudden; and as this is more or leſs, they call it a great or ſmall *Freſh-Shot*.

FRESH-SUIT, in common-Law, is ſuch a preſent and earneſt Purſuit of an Offender, as never ceaſeth from the Time of the Offence committed or diſcovered, until he be apprehended: And the Effect of this in the Purſuit of a Felon is, that the Party purſuing ſhall have his Goods again; whereas otherwiſe they are the King's.

FRETT, a Bearing in Heraldry of this Figure.

Diamond, a *Frett Topaz*: The Coat Armour formerly of *Henry* Lord *Maltrevers*, and now quatered by the Duke of *Norfolk*.

Here is but one Frett, but ſometimes the Frett is of eight Pieces, and then 'tis ſpecified to be ſo; but if it conſiſt of more, 'tis called *Frette*.

FRIABLE, a Word uſed in reference to ſuch Bodies as will eaſily on rubbing break, crumble, or divide into ſmall Parts.

FRIGID *Zones*, See *Zones*.

FRIGORIFICK *Particles*, are ſmall Particles of Matter, actually and eſſentially Cold, which entring and penetrating other Bodies, do (according to the Opinion of *Gaſſendus* and others) produce in them that Quality which we call Cold: See *Cold*.

FRISE, or *Freeſe*, in Architecture, is that round Part of the Entablature which is between the *Architrave* and *Cornice*. This the *French* call the *Gorgerin* or *Collier*.

FRODMORTEL, or rather *Freemortoll*, in Law, is an Immunity or Freedom granted for Murder or Man-ſlaughter. *Cowel.*

FROENULUM, or *Frœnum Penis*, is a Membrane which ties the *Præputium* to the Glands of the *Penis*.

FRONT, in Perſpective, is the Orthographical Projection of an Object upon a Parallel Plane.

FRONT, in Fortification, is what the *French* call *Tenaille de Place*, and the Face of a Place. It is that which is comprehended between the Points of any two neighbouring Baſtions, *viz.* the Courtine, the two Flanks which are raiſed upon the Courtine, and the two Faces of the Baſtions which look towards one another.

FRONT-LINE, in Perſpective: See *Line of the Front*.

FRONTALE, or *Frontlet*, is an external Medicine, frequently applied to the Forehead for a Pain or Heat in the Head: It is made for the moſt Part of Herbs, Flowers, Seeds, Meal moiſtned with Vinegar of Roſes. *Blanchard.*

FRONTALIS, is a Muſcle which ariſes thin, broad, and fleſhy from the upper Part of the *Os Frontis*, near the *Sutura Coronalis*, and deſcending by the Poſterior and Forepart of the *Temporalis*, meets with its Partner near their Inſertions to the Skin of the Eye-brows; theſe draw up and wrinkle the Skin of the Forehead.

FRONTATUM, is a Term uſed by Mr. *Ray*, and other Botaniſts, to expreſs that the Leaf of a Flower (*Petalum*) grows broader and broader, and at laſt perhaps is terminated by a Right Line; and 'tis uſed in oppoſition to *Cuſpidatum*, which expreſſes that the Leaves of a Flower end in a Point.

Thus Marygolds, *Petala habent Frontata*,
But *Flos Solis*, *cuſpidata*.

FRONTIS *Os*, or *Coronale*, is a Bone of the *Cranium*, in form almoſt round; it joins the Bones of the *Sinciput* and Temples, by the Coronal Suture, and the Bones of the upper Jaw by the *Sutura Tranſverſalis*, and the *Os Sphænoides* by the *Sutura Sphænoidalis*. It forms the upper Part of the Orbit, and it has four *Apophyſes*, which are at the four Angles of the two Orbits. It has two Holes above the Orbits, through which paſs the Vein, Artery, and ſome Twigs of the firſt Branch of the fifth pair of Nerves. It has alſo one in each Orbit, a little above the *Os Planum*, through which a Twig of the Ophthalmick Branch of the fifth pair of Nerves paſſes to the Noſe, it is the Orbiter *Internus*. It has two *Sinus*'s above the Eye-brows, between its two Tables; they are lined with a thin Membrane, in which there are ſeveral Blood-Veſſels and Glands, which ſeparate a Mucous Seroſity, which falls into the Noſtrils. The Inſide of this Bone has ſeveral Inequalities, made by the Veſſels of the *Dura Mater*. It has two large Dimples, made by the anterior Lobes of the Brain. Above the *Criſta Galli* it has a ſmall blind Hole, into which the End of the *Sinus Longitudinalis* is inſerted. From this Hole it has a pretty large Spine which runs up along its Middle; inſtead of this Spine there is ſometimes a *Sinus*, in which lies the *Sinus Longitudinalis*, which ought to be obſerved carefully by Surgeons in Wounds of this Place. This Bone is thicker than the *Sinciput* Bones, but thinner than the *Os Occipitis*: In Children it is always divided into its Middle by a true Suture.

FRONTON, is a Part or Member in Architecture, which ſerves to compoſe an Ornament raiſed over Doors, Croſs-works, Nitches, *&c.* ſometimes making a Triangle, and ſometimes Part of a Circle. It is alſo called *Faſtigium* by *Vitruvius*, and *Pediſment* by the *French*.

FROZEN *Zones*: See *Zones*.

FRUCTIFEROUS, is that which produces Fruit; and is a Word uſed by my Lord *Bacon* and others, for ſuch Experiments in Natural Philoſophy, which are advantageous to the Experimenter in Point of Gain or Profit

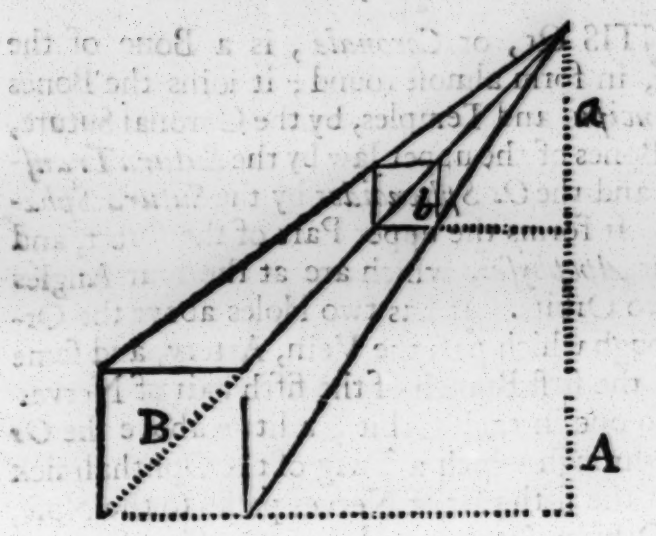
FRUMENTA and *Frumentaceous Plants*, are by the Botaniſts reckon'd all ſuch as have their Culm (or Stalk) pointed, and their Leaves like Reeds; and which bear their Seed (which is fit to make Bread, or be ground into Flower) in *Ears*, like common Corn; for they reckon two Kinds of *Fruges*, *Frumenta* and *Legumina*: See *Gramineous* and *Culmiferous Herbs*.

FRUSTUM, in Mathematicks, ſignifies a Piece cut off, or ſeparated from any Body; as the *Fruſtum* of a Pyramid or Cone, is a Part or Piece thereof cut off (uſually) by a Plane parallel to the Baſe.

All Round and Square Timber that is tapering may be conceiv'd as the *Fruſtum* of a *Cone* or a *Pyramid*. To find which, take the following Theorem, which in the main is Mr. *Oughtred*'s, who at *Pag.* 99. of his admirable *Clavis*, gives this and two others for the ſame Purpoſe.

Given
B, the Side of the greater Baſe,
b, the leſſer Baſe's Side,
A, the Height of the *Fruſtum*,
} Tho' below I ſuppoſe B and *b* to repreſent the Areas of the two Baſes.

Whole Height $a + A = H$.



First, To find a, ſay, As $B - b : b :: A : \frac{b\,A}{B - b}$ or $\frac{b\,A}{X}$. Now $B\,H = 3$ times the whole Pyramid, becauſe any Priſm is 3 times a Pyramid of the ſame Baſe and Height with it, by 7 *e* 10 *Euclid*, and $b\,a = 3$ times the upper Pyramid. Wherefore $\frac{B\,H - b\,a}{3}$ equal to the *Fruſtum* of the Pyramid required; Which Theorem in Words is this:

Multiply the lower Baſe by the whole Height, and from the Product ſubſtract the upper Baſe multiply'd by the Height of the Top-piece wanting; and then one third of the Remainder ſhall give the Fruſtum.

And the ſame way you may proceed for the *Fruſtum* of a Cone; only 'twill be more difficult to find the Circular Baſes.

FUGA *Vacui*; it is a Notion of the Peripateticks, and ſome other Ancient Philoſophers, that there is an *Abhorrence in Nature of a Vacuum*; and this in *Latin* they call *Fuga Vacui*, or Nature's endeavour to avoid a *Vacuum*.

FUGILE, an Impoſthume in the Ears. *Blanchard.*

FUGITIVES *Goods*, are the proper Goods of him that flieth upon Felony, which after the Flight lawfully found, do belong to the King or Lord of the Mannor.

FUGUE, in Muſick, is ſome Point conſiſting of 4, 5, 6, or any other Number of Notes begun by ſome one ſingle Part, and then ſeconded by a third, fourth, fifth and ſixth Part (if the Compoſition conſiſts of ſo many) repeating the ſame or ſuch like Notes, ſo that the ſeveral Parts follow, or come in one after another in the ſame manner, the leading Parts ſtill flying before thoſe that follow.

FUGUE-DOUBLE, is when two or more different Points move together in a *Fugue*, and are alternately interchanged by ſeveral Parts.

FULIGINOUS *Vapours*, according to ſome, are thick, impure, and ſooty *Vapours*.

FULMINATING *Powder*: See *Aurum Fulminans*, and *Pulvis Fulminans*.

FULMINATION, the ſame with *Detonation*; which ſee.

FUMIGATIO *Chymica*, is an Eroſion of Metal by Smoak or Vapour.

FUMIGATION, is making one Body receive the Smoak of another, in order to impregnate it with the more Volatile Parts of the Body burnt.

FUNCTION, the (ſame that Action) is, in reference to any Operation of the Organical Parts of an Animal Body, an effective Motion produced in the Part by the proper Aptitude, or Fitneſs of ſuch Part for the Uſes the Author of Nature deſigned it.

FUNDUS *Plantæ*, the Botaniſts call that the Bottom of a Plant, where the Stalk and Root juſt meet and join.

FUNGUS, is a ſoft ſpungy Fleſh which grows upon Wounds.

FUNICULAR *Hypotheſis*, was advanced by *Franciſcus Linus*, againſt the Notion of the Spring and Weight of the Air; and he ſuppoſes, That the Suſpenſion of the Mercury in the Torricellian Experiment, is not cauſed by the Weight of the Atmoſphere preſſing on the Mercury in the Baſin, but by a kind of *Funiculus* of ſome very fine and thin Subſtance; which being exceedingly rarified by a forcible Diſtenſion, is continually contracting it ſelf up, or becoming more diſtended according to the different Temperament of the external Air, and by this Means occaſions the riſing and falling of the Quickſilver in the Barometer.

But 'tis ſtrange that this little Rope or String at the Top would be able to ſuſtain all the Mercury requiſite to form a Column of 30 Inches in length; and that as Part will run out of the Tube when there is more Mercury in it, ſo none at all ſhould run out after it is come to its due length: Since Mercury is a Fluid Body, how comes the *Funiculus* to turn it into a ſolid one? And by its little Strings hold it ſo altogether, that none can run out?

FUNICULUS, *Inteſtinum*, *Laqueus*, or *Ductus Umbilicalis*, the Navel-ſtring, is a Membranous Channel or Conduit in the *Fœtus*, which reaches from the Navel to the *Placenta* in the Womb; it contains two Arteries, one Vein, and the Urinary Paſſage in the *Fœtus*, ſaith *Blanchard*. Indeed the Umbilical Veſſels between the Navel and the *Placenta* are wrapt up in a Production of the *Chorion* and the *Ammion*, which is generally about a Foot and an half long, that the Motion of the *Fœtus* may not pull the *Placenta* from the Womb: The Uſe of this Navel-ſtring is to carry the Mother's Blood by the Veins to the *Fœtus*, for its Nouriſhment; and that which is unfit for this Purpoſe, is carried back by the Arteries to the *Placenta*, while the *Fœtus* is ſtill ſupplied with more from the Vein; ſo that there is a continual Circulation of Blood between the Mother and the *Fœtus*.

FURCALE *Os*, the ſame with *Furcula*.

FURCELLA, the ſame with *Furcula*.

FURCHE, ſo the Heralds call the Form of this kind of *Croſs* in a Coat of Arms.

FURCULA *Superior*, is the upper Bone of the *Sternum* or Breaſt-bone; others call it *Jugulum*. *Blanchard.*

FURFURATION, or *Furfures*, is when Dandriffs fall from the Head in Combing; it comes for the moſt part from that Skin which is under the Hair; alſo from the Beard and Eye-brows. *Blanchard.*

FURFURES, the Scales that fall from the Head, and ſometimes from Skin of the other Parts of the Body, occaſion'd by the Separation of the *Cuticula* or Scarf-ſkin from the *Cutis*, or true Skin. *Blanchard.*

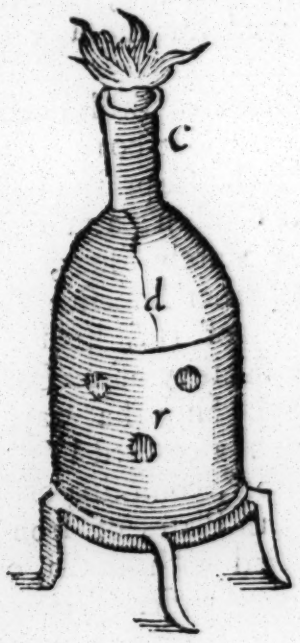
FURLE,

FURLE, the Sea Word for wrapping up and binding any Sail close to the Yard, which is done first by haling up the Braces, and then wrapping the Sail close together, and so binding it fast to the Yard with the Caskets, and Furling-lines. This was formerly written *Farthel*, because the Sail is thus made up in a Bundle or Farthel; but 'tis now every where corrupted into the Word *Furle*.

FURLING-LINES, are small Lines made fast to the Top-sails, Top-gallant-sails, and to the Misen-yard-Arms, to furle up those Sails. Indeed the Misen hath but one Furling-Line, but all the rest have two, one at each end.

FURNACE, the Chymists have several sorts of Furnaces, as the *Reverberatory*; which see under that Word: A *Wind Furnace*, or *Furnace for Fusions*, which is so called, because the Wind comes forcibly to blow the Coals, in order to *Melt* or *Fuse* the Matter in the *Crucible* or *Coppel*. This Furnace for *Fusions*, is in form just like the Reverberatory, only less, and there is no need of laying the two Cross Bars there mention'd. They frequently also use *Moveable Furnaces*, whose make is like that of the Reverberatory, and they are made of a Paste consisting of three parts of Powders of broken Pots, and two parts of Clay well temper'd together with Water.

Lemery gives the following Figure of a small moveable Furnace for *Fusions*.



c The Chimney.

d The Dome, consisting of two pieces.

r Three Registers or Holes, to let in the Air to come to the Fire.

FURNITURE *of a Dial*, are such Lines as are drawn thereon for Ornament; as the *Parallels of Declination*, *Length of the Day*, *Azimuths*, *Points of the Compass*, *Babylonish and Jewish Hours*, &c.

FURRING *of a Ship*, is laying on double Planks on her Sides; this is done after the Ship is built, and is by the Sailors called *Plank upon Plank*: But there is another way of *Furring* which is more properly so called; and that is, when a Ship's Planks are ripped, and new Timbers are put on the former Timbers, and on them other Planks; which is done sometimes to make a Ship bear her Sails the better.

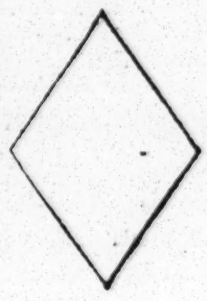
FURRS, in Heraldry, are used in the Doublings of the Mantles pertaining to a Coat of Arms, and sometimes to the Coat it self: They are usually of two Colours; as *Ermins* and *Ermines*, which are black and white: *Erminois* and *Pean*, which are black and yellow: *Vairy*, which is white and blue: *Verry*, which is yellow and red, or the like colours.

FURUNCULUS, a Boyl, is an acute Swelling as big as a Pigeon's Egg, attended with an Inflammation and Pain, especially when it begins to corrupt and putrifie; when it is open'd, and the Matter let out, part of the Flesh underneath is turned into Corruption of a whitish and reddish colour, which some call the Ventricle of the *Furunculus*; there is no danger in it, tho' you apply no Remedy to it; for it ripens of it self, and bursts; but the Pain makes it more eligible to apply a Remedy, because that frees the Patient sooner from his Trouble. *Blanchard.*

FUSAROLE, is a small round Member in Architecture, cut in form of a Collar, with somewhat long Beads under the *Echinus*, or Quarter Round of Pillars of the *Dorick*, *Ionick*, and *Composite Orders*.

FUSE or *Fusel* of a Bomb, or Granado-shell, is that which makes the whole Powder, or Composition in the Shell take Fire, to do the designed Execution; 'tis usually a Wooden Pipe or Tap filled with Wild-fire, or some such Composition, and is design'd to burn so long, and no longer, as is the Time of the Motion of the Bomb from the Mouth of the Mortar to the Place where it is to fall; which Time Mr. *Anderson* makes to be about 27 Seconds; so that the Fuse must be contrived either from the Nature of the Wild-fire, or the length of the Pipe which contains it, to burn just that Time.

FUSIL, in Heraldry is a Rhomboidical Figure; more slender then a Lozenge. Thus,



And sometimes thus;

The latter of which seems to be the true Figure, for the Fusil was anciently a kind of Spindle used in Spinning.

The Word Fusil also signifies a Fire-lock; whence comes our Word *Fusileers*, *i. e.* Soldiers carrying only Fire-Arms, and without Pikes.

FUSILIERS, are (in an Army) the same with Musqueteers, and are so called from the Word *Fusil*, which signifies sometimes a Musket.

FUSILLY, in Blazon, is when the Field of an Escutcheon is divided throughout into *Fusils*, as thus:

He beareth *Fusil Sable and Ermin.*

The like is to be understood of *Lozengy*, or *Fretty*, respect being had to the Figure.

FUSION, in Chymistry, is the same as *Melting*; so that their Furnace for melting of Metals is called the Furnace for *Fusions*. The *Cause of Fusion*, or the Reason of melting Metals, &c. is this, That by the Force of the Heat or Fire, the Cohesion of the Parts is dissolved, and the Metalline Particles being disjoined, and having a Figure proper to slide over one another's Surfaces, are moved with a most rapid Motion, and so put on the Form or Appearance of a Fluid.

FUSY, is that Part of a Watch about which the Chain or String is wrapped, and is that which the Spring draweth, being in Form commonly taper. In larger Works going with Weights it is Cylindrical, and is called the Barrel.

To find what Number of Turns the *Fuſy* will have, uſe this Proportion:

As the Beats of the Balance in one Turn of the Great-Wheel or *Fuſy*, (ſuppoſe 26928) : Is to the Beats of the Balance in one Hour (20196) :: So the Continuance of the Watches going in Hours (ſuppoſe 16) : To the Number of the Turns of the *Fuſy* (12).

That is, 26928 : 20196 :: 16 : 12.

FUTTOCKS, are the Compaſſing Timbers in a Ship; which make her Breadth; thoſe below next the Keel are called her *Ground Futtocks*; the other the *Upper Futtocks*.

GAL GAN

GABEL, according to ſome of our Ancient Records, Statutes, Charters, &c. ſignifies a Rent, Cuſtom, or Duty yielded or done to the King, or any other Lord, not by Contract or Bargain, but impoſed by the Will of the Lord. Both the Word and Thing it ſelf is grown quite out of Faſhion in *England*, where no Duty can be impoſed upon the Subject but by Act of Parliament; but in *France* it is ſtill practiſed, where it ſignifies an Exciſe upon Salt, and is a very heavy one.

GABIONS, a Term in Fortification, ſignifying Baskets made of Oſier-Twigs, equally wide at the Top and Bottom, about four Foot in Diameter, and from five to ſix high; which being filled with Earth, are ſometimes uſed as Merlons for the Batteries, and ſometimes as a Parapet for the Lines of Approach, when it is requiſite to carry on the Attacks through a Stony or Rocky Ground, and to advance them with extraordinary Vigour. They ſerve alſo to make Lodgments in ſome Poſts, and to ſecure other Places from the Shot of the Enemies, who nevertheleſs endeavour to ſet the Gabions on Fire with Pitch'd Faggots, to render them uſeleſs.

GAGE, when one Ship is to Windward of another, ſhe is ſaid to have the *Weather-gage* of her: The Seamen call alſo trying how much Water a Ship draws, *Gaging*, or rather *Gauging of her*; and it is thus done; They drive a Nail into a Pike near the End, and then put down this Pike by the Rudder till the Nail ketch hold under it, for then as many Feet as the Pike is under Water, is the *Ship's Gage*, or the Depth of Water ſhe draws.

GAGE, in Common Law, ſignifies a Pawn or Surety: See more in *Wage*.

GAGE-POINT: See *Gauge-Point*.

GALAXY, or *Via Lactea*: See *Milky-Way*.

GALE, the Sea Word for the blowing of the Wind at Sea: When the Wind blows not ſo hard but that a Ship can carry her Top-ſails a Trip, (that is, hoiſed up to the higheſt) then they ſay it is a *Loom Gale*; when it blows very ſtrong, they ſay it is a *ſtiff*, or *ſtrong*, or at leaſt, a *freſh Gale*; but when it blows ſo hard and violently that a Ship cannot bear any Sail, they ſay it blows a *Storm*. When two Ships are near one another at Sea, and there being but little Wind blowing, one of them finds more of it than the other, they ſay that the Ship *Gales* away from the other.

GALEA, is a Pain in the whole Head, ſo called from the Likeneſs of the Place, becauſe it takes in, or encompaſſes the whole Head like an Helmet; in *Latin Galea*. *Blanchard*.

GALEA is likewiſe uſed when the Head of the *Fœtus* is clothed with Part of the Membrane called *Amnion*, as it comes into the World; they ſay then it hath a *Galea*. *Blanchard*.

GALENICK-MEDICINE, is that Phyſick which is built upon the Principles of *Galen*, and therefore they are *Galeniſts* who embrace the Foundations of that Art, which are fetched from *Galen* and his Principles; though 'tis now frequently oppoſed to the Chymical Method of Practice, which, they ſay, is much ſhorter. *Blanchard*.

GALL: See *Bile*.

GALL-BLADDER, the ſame with *Folliculus Fellis*.

GALLACTOPHORI, are *Ductus*'s which carry Milk, and convey the Chyle (as ſome Modern Authors have fancied) a ſtrait way from the Guts to the Glandules of the Breaſts; yet the Arteries are more properly ſo called, becauſe they carry the Chyle along with the Blood to the Breaſts, wherein the Milk is ſeparated and reſerved for the Uſe of the *Fœtus*.

GALLERY, in a Ship, is that Beautiful Frame which is made upon the Stern without-board, into which there is a Paſſage out of the Captain's Cabbin, which is called the Great Cabbin; and theſe Galleries are indeed rather for Stately Shew, and the Captain's Pleaſure, than any other Benefit; for in Ships of War all open Galleries of this kind are to be avoided, in regard of the Facility of an Enemy's Entrance, and boarding of the Ship that way.

GALLERY, in Fortification, is a covered Walk, the Sides whereof are Musket-proof, conſiſting of a Double Row of Planks lined with Plates of Iron; the Top being ſometimes covered with Earth or Turf, to hinder the Effect of the Artificial Fire of the Beſieged. Theſe Galleries are frequently made uſe of in the Moat already filled with Faggots and Bavins, to the end that the Miner may approach ſafe to the Face of the Baſtion, when the Artillery of the oppoſite Flank is diſmounted.

GALREDA, a thick viſcous Juice that is extracted by boiling from the Griſtly Parts of Animals, and is uſually called a *Gelly*.

GANG: To Man the Boat, in the Sea Phraſe, is to put a Gang of Men (which is a Company) into her: They are commonly called the Coxſwain's Gang who hath the Charge of her.

GANGWAY, ſignifies all the ſeveral Entrances, Ways, or Paſſages from one Part of the Ship to the other; and whatſoever is put in any one of theſe Paſſages, are ſaid to be laid or put in the *Gangway*.

GANGLION, is an Humour in the Tendinous and Nervous Parts, proceeding from a Fall, Stroke, or otherwiſe: It reſiſts if ſtirred; if preſſed upon the Side, is not diverted, nor can be turned round. *Blanchard*.

GANGRENE, is a Cadaverous Corruption of a Part, attended with a beginning of Stink, Blackneſs, and Mortification. *Blanchard*.

GARB, the Term in Heraldry for a Wheat-Sheaf.

GARBOARD-PLANK, the first Plank of a Ship Fastened on her Keel; as

GARBOARD-STRAKE, is the first Seam in a Ship next to the Keel.

GARD DU-CORD, or *Gard-du-Gut*: See *Gardecaut*.

GARDECAUT, or *Gard-du-cord*, is that which stops the *Fusy* of a Watch when wound up, and for that end is driven up by the String; some call it *Guard-Cock*, others *Gard-du-Gut*.

GARDEYNE DEL EGLISE, or *Church-Wardens*, are Officers chosen in every Parish to have the Care and Custody of the Church Goods; and they may have an Action for the Goods of the Church, and divers other things they may do for the Benefit of the Church: They are to join with the Overseers for the making of Rates, and other Provision for the Poor of the Parish.

GARDIAN, or *Guardian*, signifies generally him that hath the Custody or Charge of any Person or thing; but most commonly him that hath the Education or Protection of such People as are not of sufficient Discretion to guide themselves and their Affairs, being indeed as largely extended as *Tutor* and *Curator* among the *Civilians*; for whereas *Tutor* is he that hath the Government of a Youth until he come to fourteen Years of Age; and *Curator*, he that hath the imposition and ordering his Estate afterwards, until he attain to the Age of five and twenty Years; or that hath the Charge of a Frantick Person during his Lunacy; both these with us are called *Guardians*.

A *Tutor* is either *Testamentarius*, or *à Prætore datus ex Lege Atilia*; or lastly, *Legitimus*: So we have three sorts of *Guardians* in *England*, one ordained by the Father in his last Will, another appointed by the Judge, the third cast upon the Minor by the Law and Custom of the Land.

As to the first of these, a Man having Goods or Chattels, may appoint a *Guardian* to the Body or Person of his Child, by his Last Will and Testament, until he come to the Age of fourteen Years, and to the disposing and ordering of his Estate so long as he thinks meet, which is commonly to one and twenty Years of Age. The same he may do of Lands not holden *in Capite*, or by Knight's-Service; but the ancient Law in this Case is very much altered, and in all Cases gives the Father Power to appoint a *Guardian* for his Child; but if the Father order no *Guardian* to his Child, the Ordinary may appoint one to manage his Goods and Chattels till the Age of fourteen Years; at which time he may chuse him another *Guardian*, as by the Civil Law he may his *Curator*; for this Rule holds, that is, *Invito Curator non datur*. And for his Lands the next a-kin on that Side, by which the Land cometh not, shall be *Guardian*, who was formerly called *Guardian in Soccage*.

GARDIAN, or *Guardian of the Spiritualties*, is he to whom the *Spiritual Jurisdiction* of any Diocese is committed during the Vacancy of the See. And the *Guardians* of the *Spiritualties* may either be *Guardian* in Law, or *Jure Magistratus*, as the Archbishop of any Diocese within his Province; or *Guardians* by Delegation, as he to whom the Archbishop or Vicar-General doth for the time depute.

GARDIAN, or rather *Warden of the Cinque Ports*, is a principal Magistrate that hath the Jurisdiction of those Havens in the South-East part of *England*, which are commonly called, *The Cinque Ports*; that is, the five *Ports* or *Havens*; who there hath all that Jurisdiction that the Lord High Admiral of *England* hath in Places not exempt.

GARGAREON, the same with the Epiglottis, or Cover of the Wind-pipe; which see.

GARGARISM, is a Liquid Medicine which is used to cleanse the Mouth and the adjacent Parts, by gargling or moving it up and down in the Throat without swallowing; and it is either a Decoction, wherein convenient Syrups are dissolved, or distilled Waters mixed with Syrups, and sometimes with Mineral Spirits. *Blanchard*

GARLAND, in a Ship, is that Collar of Rope which is wound about the Head of the Main-mast, to keep the Shrouds from galling.

GARNET, is a Tackle in a Ship, having a Pendant coming from the Head of the Main-mast, with a Block strongly seized to the Main-stay just over the Hatch-way; in which Block is reeved the Runner, which hath an Hook at one End, in which is hitched the Slings; and at the other End is a Double Block, in which the Fall of the Runner is reeved, that so by it any Goods or Casks that are not overheavy, may be haled and hoised into, or out of the Ship; when this *Garnet* is not used, it's fastened along by the Stay at the Bottom of it.

GARNISHEE, is taken for the Party in whose Hands Money is attached within the Liberties of the City of *London*, so used in the Sheriff of *London*'s Court, because he has had *Garnishment* or Warning, not to pay the Money, but to appear and answer to the Plaintiff's Creditor's Suit.

GARNISHMENT, in Law, is a Warning given to one for his Appearance, for the better furnishing of the Cause and Court; as if one is sued for the Detinue of certain Evidences and Charters, and saith, That the Evidences were delivered to him, not only by the Plaintiff, but another also; therefore prayeth that that other may be warned to plead with the Plaintiff, Whether the said Conditions be performed or no? And in this Petition he is said to pray *Garnishment*: *New Book of Entries*, Fol. 211. Col. 3.

GARRISON, is a certain number of Officers and Soldiers that defend a Place.

GARTER, a Term in Heraldry, signifying the Moiety or half of a *Bend*: See *Bend*.

GAS, a Word used by *Van Helmont*, and seems designed to signify in general a Spirit not capable of being coagulated: But he uses it loosely in many Senses; as he calls the Vital Principle in Man, *Gas Vitale*; that Sulphureous or Arsenical, or any other way noxious Damp which is found in some Mines, he calls *Gas Pingue Sulphureum*: Nay, sometimes he calls the Air its *Gas Ventosum*, as he doth Water *Gas Salium*: and in short, speaks very unintelligibly and inconsistently about it, as the Chymist's Manner is in other things.

GASTEROCNEMIUM, is the Calf of the Leg, whence its Muscles are called *Gasterocnemii*, from their swelling like a Belly: Therefore two of these Muscles are called *Gasterocnemii*.

GASTEROCNEMIUS *Externus*, also *Gemellus*, is a Muscle of the *Tarsus*, so called, (because with the *Soleus* or *Internus* of that Name) it composes the Calf of the Leg: It is also called *Gemellus*, from its being as it were double. It has two distinct Fleshy Originations, from the superior and hindmost Parts of each Tubercle of the lower Appendage of the Thigh Bone, which in their Descent are each dilated into two large Fleshy Bellies, the innermost of which is thickest and largest, having each a differing Series of Fleshy Fibres, and join to each other near where they make a broad strong Tendon,

don, which narrowing it self, joins with the great Tendon of the *Gasterocnemius Internus*, four Fingers breadth above its Insertion to the *Os Calcis*. When this Muscle acts, the Foot is said to be extended or pulled backwards, which Motion of it is very necessary in Walking, Running, Leaping, and Standing on Tiptoe, &c. Hence it is, those that walk much, that carry heavy Burthens, Chairs, &c. and who wear low-heel'd Shooes, have these Muscles larger than others.

GASTEROCNEMIUS *Internus*, is a Muscle of the Foot, which is placed under the *Gasterocnemius Externus* and *Plantaris*. It is also called *Soleus* from its Figure, resembling a Sole-Fish. It's externally fleshy Part is covered with a Transparent Tendinous Expansion, which makes it appear of a livid Colour. Its Beginning is partly Tendinous, but chiefly Fleshy from the hindermost Part of the upper Appendix of the *Fibula*, and Back-part of the *Tibia*, that is below the Insertion of the *Subpoplitæus*, and increasing to a large Fleshy Belly composed of various Orders of Fleshy Fibres, some of them underneath aptly expressing the Figure of the Top of a Feather, whose *Stamina* here being Tendinous, join with the great Tendon, which is about a Finger's Breadth in Length, and inserted to the superior and hindmost Part of the *Os Calcis*. The Foot, together with the Toes, being as it were a Leaver to the whole Body, ought therefore to be attended with Muscles of great Strength to extend it; wherefore we find these Muscles so much to exceed the *Antagonist*, the *Tibæus Anticus*, as well in the advantageous Construction of their differing Series of Fleshy Fibres, as their Magnitude and Insertion at the Extremity of the *Os Calcis*, whereby they are not only rendred serviceable in Walking, Running, Leaping, &c. but do also support the *Tibia* in Standing, lest the superincumbent Pressure of the Weight of the Body should make them incline forwards at their Articulations with the *Talus*.

GASTROEPIPLOICA, is the Vein and Artery which goes to the Ventricle and Cawl.

GASTRORHAPHIA, is a Connexion or a Suture in the Wounds of the Abdomen.

GASTROTOMY, the cutting of the Abdomen: See *Cæsarean Section*.

GATE *of the Sea*, or a *Sea-Gate*, is when two Ships lie aboard one another in a Wave or Billow, and by that Means sometimes become Rib-broken.

GAVEL, in Law, signifies Tribute, Toll, Custom, Yearly Rent, Payment, or Revenue, of which there are several Kinds, as *Gavel-Corn*, *Gavel-Malt*, *Out-Gavel*, *Gavel-Fodder*, &c.

GAVELET, is a special and ancient kind of *Cessavit* used in *Kent*, where the Custom of *Gavel-kind* continueth, whereby the Tenant shall forfeit his Lands and Tenements to the Lord of whom he holdeth, if he withdraw from him his due Rents and Services. Mr. *S.* in his *History of Gavel-kind* says, That this *Gavelet* was not a Rent or Service, but signified a Rent or Service withheld, denied, or detained, causing the Forfeiture of the Tenement to the Lord; with which the Lord *Coke* agrees, where he says, That *Gaveletum* is as much as to say, to cease, or to let to pay the Rent. And it seems this Writ lay in *London* as well as *Kent*.

GAVEL-KIND, signifies, in Law, a Custom, whereby the Land of the Father is equally divided at his Death among all his Sons, or the Land of the Brother at his Death equally divided among all his Brethren, if he have no Issue of his own. This Custom is still in force in divers Places of *England*, especially in *Kent*, *Urchenfield* in *Herefordshire*, and elsewhere, though with some Difference: And all *Gavel-kind* Land in *Wales* are made descendable to the Heirs, according to the Course of the Common Law. In *Gavel-kind*, tho' the Father be hanged, the Son shall inherit; for their Custom is,

The Father to the Bough, the Son to the Plough.

GAUGE-POINT, of a Solid Measure, is the Diameter of a Circle, whose Superficial Content is equal to the Solid Content of the same Measure: Thus, the Solid Content of a Wine Gallon being 231 Cubick Inches, if you conceive a Circle to contain so many Inches, you may easily find the Diameter of it, which shall be the *Gauge-Point* for *Wine Measure*: After the like Manner the *Gauge-Point* for *Ale Measure*, &c. is found. Vid. Windgate's *Rule of Proportion*, *Ch.* 10.

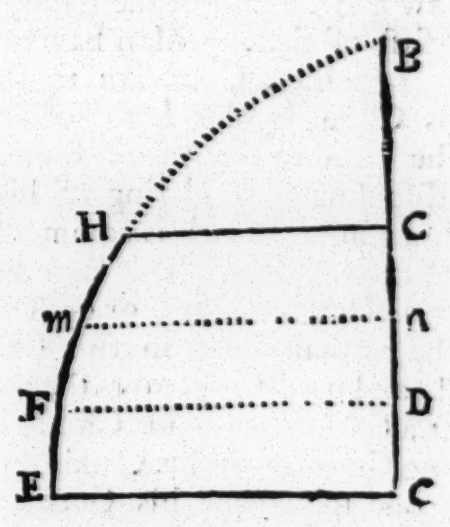
GAUGING, is the finding the Capacities or Contents of all sorts of Vessels which hold *Liquids*, *Powders*, *Meal*, *Corn*, &c.

If these are of a Square form like hollow Cubes or Parallelopipids, &c. such as many sorts of *Backs*, *Coolers*, *Fats*, &c. their Content is easily found, by multiplying the Area of the Base by the perpendicular Altitude, as you find the Solidity of Parallelopipids and Prisms.

If they are of a Cylindrical Figure, as Bushels, Gallons, &c. you must, as near as you can, find the Area of the Circular Base, and multiply that by the perpendicular Altitude as before.

If they are *Casks* of the usual Form of our Hogsheads, Barrels, &c. Mr. *Oughtred* considers them as Segments of a *Spheroid*, cut off by two Planes perpendicular to the Axis.

And then Mr. *Caswell* thus easily deduces his Theorem for measuring Wine and Ale Casks:



Suppose CEB a Quadrant of an Ellipsis, whose Semi-Axes are CB and CE; and let the Ratio of the Semi-Parameter to CB, be as l to t: And let EC, ED, mn, HG, be considered as the Radii of Circles, which when turned round the Axis, BC shall form a *Spheroid*: Therefore the Elemental Circle

$$\left.\begin{array}{rl} DF & = l \\ \odot\, nM & = \frac{l}{t} \times \\ \odot\, GH & = t \end{array}\right\} \begin{array}{l} \odot\, CB - \odot\, CD \\ \odot\, CB - Cn \\ \odot\, CB - CG \end{array}$$

Wherefore the Frustum of the Spheroid is $= \frac{l}{t}\, p \times CB - \frac{1}{2} \odot CG : = \frac{1}{3}\, p \times \frac{l}{t} \odot CB - \frac{l}{t} \odot CG =$

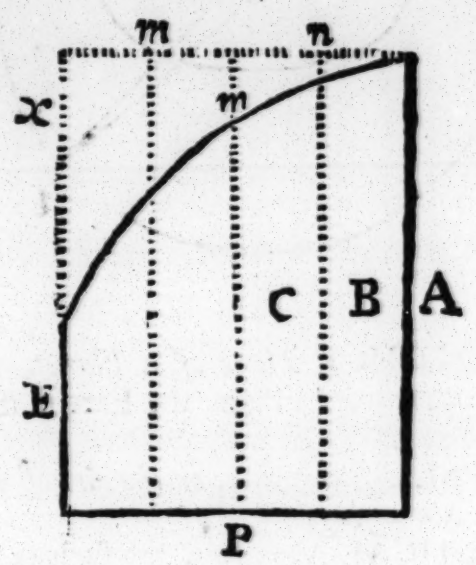
$$\overline{\left|\tfrac{1}{3}\, p \times 2 \odot CE + \odot HG\right|}$$

Which

Which laſt is Mr. *Oughtred*'s Theorem; in Words thus:

Add twice the Area of the Circle at the Bung, to the Area of the Circle of the Head; and then multiply that Sum by one Third of the Length of the Cask, (which p *ſtands for here, as being a Perpendicular to the Planes of theſe Circles) the Product is the Content of the Veſſel in Cubick Inches.*

But perhaps, ſaith Mr. *Caſwell*, moſt of our Casks had better be conſidered as *Fruſta* of a *Parabolick Spindle*; and then the Ground of their Menſuration he thus deduces.



Suppoſe *A* the Axis of a Parabola, and *P* an Ordinate to that Axis, divided into innumerable Parts by *B*, *C*, &c. drawn parallel to the Axis, whoſe Differences from *A*, ſuppoſe *n*, *m*, &c.

$$\text{That is, } \begin{cases} B = A - n \\ C = A - m \\ E = A - x \end{cases}$$

$$\text{Therefore } \begin{cases} B^2 = A^2 - 2An + nn \\ C^2 = A^2 - 2Am + mm \\ E^2 = A^2 - 2Ax + xx \end{cases}$$

But A^2, A^2, &c. is a Series of *Equals*, therefore $= p\,A^2$, and $2An$, $2Am$, &c. (by the Nature of the Parabola) is a Series of *Secundans*, therefore $= p \times \frac{2}{3} Ax$. And nn, mm, xx, is a Series of *Quartans*, therefore $= \frac{1}{3} p\,xx$.

Therefore the Fruſtum of a *Pyramidoid*, made of A^2, B^2, C^2, &c. is $= P \times A^2 - \frac{2}{3} Ax + \frac{1}{3} xx = \frac{1}{3} P\,x : \frac{1}{3} xx + 2A^2 + (A^2 - 2Ax =) E^2 - xx = \frac{1}{3} P \times : 2A^2 + E^2 - \frac{2}{3} xx$.

Therefore if a Segment of a *Parabola*, cut off by a Line parallel to the Axis, be turn'd about its ordinately Applicate *P*; the Fruſtum of the Acute *Parabolick Conoid*, ſo generated, or as ſome call it, a *Parabolick Spindle*, is $= \frac{1}{3} P \times : 2 \odot A + \odot E - \frac{2}{3} \odot x$.

So that the Fruſtum of a *Parabolick Spindle*, is leſs than the Fruſtum of the *Spheroid* of the ſame Baſe and Height by $\frac{7}{3} \odot x \times \frac{1}{3} P$; and for the moſt Part gives the Capacity of Casks nearer the Truth than the Theorem of *Oughtred*, who ſuppoſes Casks to be Fruſta of *Spheroids*; or than that of others, *by multiplying the Circles at the Bung and Head into half the Length of the Cask*, which ſuppoſes it to be a *Parabolick Conoid*: Or laſtly, than with others, to ſuppoſe them for Fruſta of *Cones*; which is fartheſt of all from the Truth.

The Common Rule for all Ale or Wine Casks, is to take the Diameters at the Bung and at the Head; by which you muſt find the Areas of the Circle there; then you muſt take $\frac{2}{3}$ of the Area of the Circle at the Bung, and $\frac{1}{3}$ of the Area of the Circle at the Head, and add them together into one Sum, which Sum multiplied by the internal Length of the Cask, gives the Content in Solid Inches: Which you may turn into Gallons, by dividing by 282 for Ale, and 231 for Wine Gallons.

But certainly 'tis eaſier and ſhorter to uſe the Theorem, as Mr. *Oughtred* expreſſes it, as aboveſaid, *viz*, $\frac{1}{3} p \times 2 \odot CE + HG$, than to make Fractions of the Areas of thoſe Circles, as in the common way.

GAYNAGE, in our Law, ſignifies moſt properly the Profit that comes by the Tillage of the Land held by the baſer kind of Soke-men.

GAZONS, in Fortification, are Pieces of freſh Earth covered with Graſs cut in Form of a Wedge, about a Foot long, and half a Foot thick, to line Parapets and the Tranſverſes of Galleries.

GEMELLES, the Term in Heraldry for the bearing of Bars by Pairs or Couples in a Coat of Arms: As,

He beareth *Gules on a Chevron Argent, three Bars Gemelles Sable*, by the Name of *Throgmorton*.

GEMELLUS, is a Muſcle of the Cubit, ſo called from its double Origine; it ariſeth firſt Tendinous from the ſuperior Part of the inferior *Coſta* of the *Scapula* internally, and as it paſſeth between the two round Muſcles, it grows Fleſhy, and in its Deſcent joineth with its other Beginning, which ariſes broad and Fleſhy from the upper and back-part of the *Os Humeri*, under the Deltoid Muſcle; and being Tendinous on the outſide, and Fleſhy within, is ſo inſerted to the ſuperior and external Part of the *Ulna*, called *Olecranum* and *Ancon*, or the Elbow. Its Uſe is to extend the *Cubit*: If we examine the two Beginnings of this Muſcle, we ſhall find them interwoven with various Orders of Fibres, whereby it is rendred capable of performing the Extenſion of the *Cubit* with a greater Strength; which appears in Tumblers when they are walking on their Hands, who by an immediate Extenſion of their *Cubits*, can return to their Feet.

GEMINI, a Muſcle ſerving to move the Thigh outwards.

GEMINI, one of the 12 Signs of the *Zodiack*, being the Third in Order; alſo a Conſtellation of that Name.

GEMINOUS *Arteries*, ſo ſome call the two ſmall Arteries which deſcend to the Joint of the Knee, between the Proceſſes of the Thigh-bones.

GEMMA, among the Botaniſts, is the Turgid Bud of any Tree when it is beginning to bear. 'Tis called alſo *Oculus*.

GENA *Mala*, is the Part of the Face from the Noſe to the Ears: Alſo the Chin and the Jaw-bone is ſometimes ſo called, which is either upper or lower. *Blanchard*.

GENERATING *Line or Figure*, in Geometry, is that which by its Motion or Revolution produces any other Figure Plane or Solid. Thus a Right Line moved any way parallel to it ſelf, *generates* a Parallelogram: if round a Point in the ſame Plane, with one End faſtened in that Point, it *generates* a Circle.

One entire Revolution of a Circle in the ſame Plane, *generates* the Cycloid; the Revolution of a Semicircle round its Diameter, *generates* a Sphere, &c. Sir *Iſaac Newton* uſes the Word

GENERATED, or *Genited Quantity*, in a very large Senſe, for whatever is produced either in Arithmetick by the Multiplication, Diviſion, or Extraction of Roots; or in Geometry by the Invention of the Contents, Areas, and Sides; or of Extream and Mean Proportionals, without Addition and Subſtraction.

GENERATION, is the Production of any thing in a Natural Way, which before was not in Being: For when in any Parcel of Matter there is produced ſuch a Concurrence of all thoſe Accidents which ('tis agreed) are neceſſary and ſufficient to conſtitute a *determinate Species* of things Corporeal; we then ſay a Body belonging to that Species is generated. So that here, properly ſpeaking, no *New Subſtance*, but only a new *Eſſential Denomination*, *Modification*, or *Manner of Exiſtence* is produced or generated: And when that Union of Accidents which denominates a Body generated, is deſtroyed and diſſolved, that Body loſing its Eſſential Modification is ſaid to be Corrupted.

GENEROSA, a Law Term for a Gentlewoman; if ſhe be really ſo, and named *Spinſter* in any Original Writ, Appeal, or Indictment, ſhe may abate and quaſh the ſame; for ſhe hath as good Right to that Addition, as a Baroneſs or Dutcheſs have to theirs: The ſame may be ſaid of *Generoſus*, a Gentleman. 2 *Inſt.* 668.

GENESIS, in Geometry, is the Formation of any Plane or Solid Figure by the Motion of ſome Line or Surface, which Line or Surface is always called the *Deſcribent*; and that Line according to which the Motion is made, is called the *Dirigent*.

GENICULUM, in Botany, is the Knot or Joint in the Stalk of any Plant.

GENIOGLOSSUM, is a Pair of Muſcles proceeding inwardly from the Fore-part of the Lower Jaw, under another Pair called *Geniohoydes*, and enlarging themſelves, are faſtened into the Baſis of the Tongue: Theſe ſerve to pull the Tongue forward, and to thruſt it out of the Mouth.

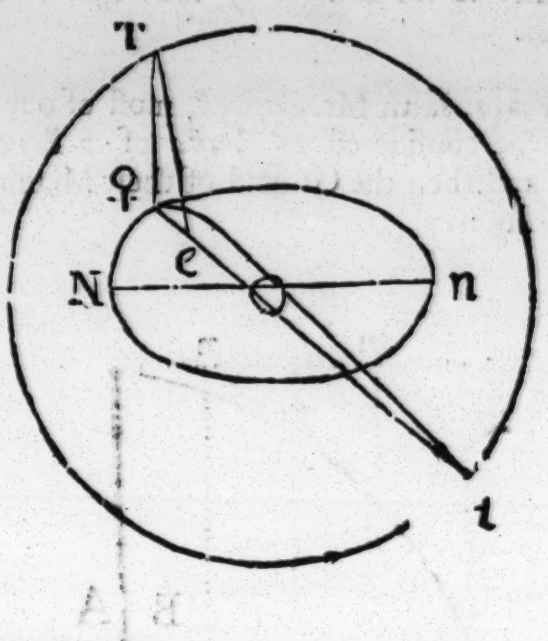
GENIOHYOIDEUS, is a Muſcle of the *Os Hyoides*, which, with its Partner, is ſhort, thick, and fleſhy, ariſing from the internal Parts of the Lower Jaw-bone called the Chin, and dilating themſelves, are ſoon leſſened again, and inſerted to the ſuperior Part of the Fore-bone of the *Os Hyoides*. Theſe acting, pull the *Os Hyoides*, &c. both upwards and forwards, and aſſiſt the *Glanioglossa* in thruſting the Tongue out of the Mouth.

GENUS, in Logick, is an Idea ſo common and univerſal, that it extends it ſelf alſo to other *Univerſal Ideas*. Thus a Right-lined Figure of four Sides, is a *Genus*, in reſpect of a *Parallelogram* or a *Trapezium*. And in like manner Subſtance is the ſame in reſpect of *Subſtance extended*, which is a Body; and *Thinking Subſtance*, which is a Spirit. The Logicians divide *Genus* into *Summum* or the higheſt *Genus*, which hath nothing above it to be a *Species* of: And *Subalternate*, which is ſometimes, or in ſome reſpects, a *Genus*, and in others a *Species*.

GEOCENTRICK, ſignifies any Planet or Orb that has the Earth for its Center, or the ſame Center with the Earth.

GEOCENTRICK *Latitude* of a Planet, is its Latitude ſeen from the Earth; or the Inclination of a Line connecting the Planet and the Earth, to the Plane of the Earth's (or true) Ecliptick: Otherwiſe 'tis the Angle which the aforeſaid Line (connecting the Planet and the Earth) makes with the Line, which is drawn perpendicular to the Plane of the Ecliptick.

Thus in the Figure annexed, the Angle ♀ ♈ *e* is the Meaſure of the Planet ♀, her Geocentrick Latitude when the Earth is in ♈, and the Angle *et* ♀, the Meaſure of it when the Earth is in *t*.



GEOCENTRICK *Place of a Planet*, is ſuch as it would appear to us from the Earth, if our Eye were there fixed.

GEODÆSIA, *Surveying, or the Art of meaſuring Land*: See *Surveying*.

GEODÆTICAL *Numbers*, are ſuch as are conſidered according to thoſe Vulgar Names or Denominations, by which Money, Weights, Meaſures, &c. are generally known, or particularly divided by the Laws and Cuſtoms of ſeveral Nations.

GEOGRAPHICAL *Mile*, is the *Sea Mile*, or *Minute*, being one 60th Part of a Degree of a great Circle on the Earth's Surface.

GEOGRAPHY, is a Deſcription of the whole Globe of the Earth, or known Habitable World; together with all its Parts, Limits, Situations, and other remarkable things relating thereto.

GEOMETRICAL, or *Algebraical Curves*, are ſuch, as that when their Nature or Property comes to be expreſſed by an Equation, the two variable Quantities in that Equation (as *x* and *y*, the *Abſciſſa* and *Ordinate*, are called in the Doctrine of Fluxions) are both, or do both denote ſtreight Lines, then that is truly a Geometrical or Algebraical Curve.

But when one of the Variable or Flowing Quantities in ſuch an Equation denotes a *Curve-Line*, then that Curve is called a *Tranſcendent Curve*.

GEOMETRICAL-PLANE: See *Plane*.

GEOMETRICAL *Progreſſion or Proportion*: See *Progreſſion*.

GEOMETRICAL *Solution of a Problem*, is when the Thing is ſolved according to the Rules of Geometry, and by ſuch Lines as are truly Geometrical and agreeable to the Nature of the Problem.

Thus *Des Cartes*'s Way of finding two Mean Proportionals is a *Geometrical Solution*, becauſe done according to the Nature of the Problem, which is a Solid one; and alſo becauſe performed by the *Periphery of a Circle* and the *Parabola*, which are truly Geometrical Curves, and agreeable to the Nature of the propoſed Problem: But then the Solution of it by *Diocles* is not *Geometrical*, becauſe both the *Ciſſoid* (by which he performs it) is no true Geometrical Curve, and alſo being a Line of the *Second Gender* (as they call it) it is proper only to a *Surſolid Problem*.

GEOME-

GEOMETRICK *Places:* See *Places Geometrical.*

GEOMETRY, originally ſignifies the Art of meaſuring the Earth, or any Diſtances or Dimenſions on or within it; but 'tis now uſed for the *Science of Quantity, Extenſion, or Magnitude, abſtractedly conſidered, without any regard to Matter.*

Geometry, very probably, had its firſt Riſe in *Egypt*, where the *Nile* annually overflowing the Country, and covering it with Mud, obliged Men to diſtinguiſh their Lands one from another, by the Conſideration of their Figure; and to be able alſo to meaſure the Quantity of it, and to know how to plot it and lay it out again in its juſt Dimenſions, Figure, and Proportion: After which 'tis likely a farther Contemplation of thoſe Draughts and Figures, help'd them to diſcover many excellent and wonderful Properties belonging to them, which Speculation continually was improving, and is ſtill to this very Day.

GEOMETRY is uſually divided into *Speculative* and *Practical:* The former of which contemplates and treats of the Properties of continued Quantity abſtractedly: And the latter applies theſe Speculations and Theorems to Uſe and Practice, and ro the Benefit and Advantage of Mankind. See Vol. II.

GERMINATION, is the growing or ſprouting out of Vegetables, or of any Parts of them.

GIBBOUS, is a Term uſed in reference to the enlightened Parts of the Moon, while ſhe is moving from Full to the Firſt Quarter, and from the laſt Quarter to Full again; for all that Time the dark Part appears horned and *falcated*, and the light one bunched out, Convex, or *Gibbous.*

GIFT-ROPE, is the Boat-Rope, which is faſtened to the Boat when ſhe is *ſwifted*, in order to her being towed at the Stern of a Ship.

GILD, or *Guild*, in Law, ſignifies a Tribute, or ſometimes an Amerciament; and ſometimes alſo a Fraternity or Company combined together, with Orders and Laws made among themſelves by the Prince's Licenſe.

GILLA *Vitrioli*, is only a Purification of White Vitriol, by diſſolving it in the Phlegm of Vitriol, and then filtrating the Solution, and either cryſtallizing it, or evaporating *ad ſiccitatem*, to gain the Salt or *Gilla*, which accordingly will be in the Form either of Cryſtals, or a dry Salt at the Bottom.

GINGLIMUS, is an Articulation of a Bone when it both receives and is received: Of this Articulation there are three ſorts.

The Firſt is when the End of a Bone has two Protuberances and one Cavity, and the End of the Bone which is articulated with it has two Cavities and one Protuberance, as the *Humerus* and the *Ulna*; or when a Bone at one Extremity receives another Bone, and at its other Extremity it is received by the ſame Bone, as the *Radius* and *Ulna.*

The Second Sort is when a Bone at one End receives another Bone, and at the other End is received by a third Bone, as the *Vertebræ* do.

The Third is when a Bone has a Cavity which receives the long Proceſs of another Bone, which Proceſs turns in the Cavity like the Axle-tree in a Wheel, as the ſecond *Vertebræ* of the Neck is articulated with the firſt; but this is no true *Ginglimus.*

GIRDING-GIRT: The Seamen ſay a Ship is *Girt*, or hath a *Girding-Girt*, when her Cable is ſo tight, or ſtrained, that upon the running of the Tide, ſhe cannot go over it with her *Stern part*, but will lie a-croſs the Tides.

GIVEN, is a Word often uſed in Mathematicks, and ſignifies ſomething which is ſuppoſed to be known: Thus, if a Magnitude be known, or that we can find another equal to it, they ſay, 'Tis a *given Magnitude*, or that ſuch a thing is *given in Magnitude.* If the Poſition of any thing be ſuppoſed as known, they ſay, *Given in Poſitions:* Thus, if a Circle be actually deſcribed upon any Plane, they ſay, its Center is *given in Poſition*; its Circumference is *given* in Magnitude; and the Circle both in *Poſition* and *Magnitude.* But a Circle may be *given in Magnitude only*; as when only its Diameter is given, but the Circle not actually deſcribed. If the Kind or Species of any Figure be given, they ſay, *Given in Specie.* If the Ratio between any two Quantities is known, they are ſaid to be *given in Proportion.* See *Barrow*'s Definitions and Propoſitions of *Euclid*'s *Data*, at the End of the Elements put forth by that Great Geometrician, *Anno* 1678.

GLACIALIS *Humor:* See *Humores Oculi.*

GLACIATION, the turning of Water, or any other Liquor, into Ice: See *Freezing.*

GLACIS, a ſloaping Bank in Fortification: It ſignifies a very gentle Steepneſs, but is more eſpecially taken for that which rangeth from the Parapet of the *Cover'd-way* to the Level on the Side of the Field.

GLAND: See *Glandula.*

GLANDULA: A *Glandule* is a Subſtance of a peculiar Nature, Fleſhy, White, or Gray; and it is two-fold: *Adventitious*, as thoſe Kernels which are ſometimes under the Arm-holes, and in the Neck, as the *King's-Evil*; a Swelling in the *Larynx* and middle of the Wind-pipe, *&c.* Or *Perpetual* and *Natural*, as the *Thymus*, *Pancreas*, *Glandula Pinealis*, *&c.* The *Perpetual* is again two-fold, either *Conglobated* in one entire Piece, which ſends the ſeparated Humour into the Veins, as the Pituitary Glandule, the *Pinealis*, the Glandules of the Meſentery, of the Groins, *&c.* Or *Conglomerated* in a Cluſter, which convey the Juice by their own Channels into ſome notable Cavities of the Body; as the *Pancreas*, the *Glandules of the Breaſt*, the *Salival Glandules*, *&c.*

There are alſo diſcovered by Dr. *Havers* a ſort of *Glands*, which he calls *Mucilaginous Glands*; which ſee under *Mucilaginous.*

GLANDULA *Guidonis*, is a Tumor like a *Glandula*, ſoft, ſingle, moveable, without Roots, and ſeparated from the adjacent Parts.

GLANDULA *Pinealis:* See *Conarium.*

GLANDULA *Pituitaria*, is a little Body in the *Sella Equina*, a Place in the Brain ſo called, cover'd over with the *Rete Mirabile* in many Brutes, but not in Men: It receives the Serous Humour from the *Infundibulum* and the *Rete Mirabile*, which it ſends into the Jugular Veins and the Lymphatick Veſſels.

GLANDULÆ *Lumbares*, are three Glands deſcribed by *Bartholin*, and by him ſo named, by reaſon of their lying upon the Loins: He thus deſcribes them, *Pag.* 191. of his *Anat. Edit.* 1674.

The two largeſt lie one upon another betwixt the deſcending *Cava* and *Aorta*, in that Angle which the Emulgents make with the *Cava:* The third being ſmaller ſtands over theſe, under the Appendices of the Diaphragm. They have Communication, or are knit to one another by ſmall Lacteal Branches, eſpecially the two larger.

He once thought them to ſupply the Place of the common Receptacle in Man; that not being ſo plain in him as in ſeveral Brutes: But ſince a Receptacle is acknowledg'd as well in Men as Brutes, Dr. *Wharton*'s Opinion concerning their Uſe ſeems more probable, *viz.*

That they ſupply the Place of thoſe larger Glands that are found in the Meſenteries of Brutes, but are not Natural to Men: And for this Reaſon he preſumes, That all ſuch Animals as want thoſe greater Glands in the Meſentery, have theſe *Lumbares* as well as Men.

GLANDULÆ *Odoriferæ* are certain ſmall Glandules diſcovered by that Accurate Anatomiſt Dr. *Tyſon*, in that Part of the *Penis* where the *Præputium* is contiguous to the *Balanus*; and he gives them this Name from the great Scent which their ſeparated Liquor emits: In ſuch Perſons as have the Prepuce longer than ordinary, theſe Glands are not only more, but larger, and ſeparate a greater Quantity of their Juice, which lodging there, often grows Acid, and corrodes the Glands: Theſe are very conſpicuous in moſt Quadrupeds, eſpecially in Dogs and Boars.

GLANDULÆ *Renales, ſeu Capſulæ Atrabilares*, are Glands which lie between the *Aorta* and the Kidneys, a little above the Emulgent Veſſels: They are two in Number, one on each Side, wrap'd up in Fat: They ſometimes change their Situation, and their Figure is alſo various; for in ſome they are Round, in others Oval, Square, Triangular, of a Trapezial or Irregular Figure; the Right is ordinarily bigger than the Left, and each about the Bigneſs of a *Nux Vomica*. Their Uſe is not certainly known; they ſeem to ſeparate a Liquor from the Arterial Blood before it goes to the Kidneys, for the liquifying the Blood which is thick after it comes from them.

GLANS, in Botany, is that which being contained within a ſmooth but hard Bark, and containing but one Seed, hath its Hinder-Part (which adheres to the Tree) covered with a kind of Cup, while the Fore-part is bare; as Acorns, &c. but properly *Glans* is the Fruit without the Cup.

GLANS, the ſame with *Balanus* and *Suppoſitorium*.

GLANDULUM *Corpus*, the ſame with *Proſtata*.

GLANDULOSA *Tunica Inteſtinorum*: See *Papillæ Inteſtinorum*.

GLASS *of Antimony*: See *Regulus of Antimony*.

GLASSY *Humour of the Eye*: See *Vitreous Humour*.

GLASSY *Tunicle*: See *Vitreous Tunicle*.

GLAUCOMA, is a Fault in the Eye, or a Tranſmutation of the Cryſtalline Humour into a Gray or Sky Colour.

GLAUCOSIS, the ſame with *Glaucoma*.

GLEBE-LAND, *Church-Land*, is moſt commonly taken for Land belonging to a Pariſh-Church beſide the Tythe.

GLENE, the ſame with *Pupilla*; alſo the Cavity of a Bone which receives another within it.

GLENOIDES, are two Cavities in the lower Part of the firſt Vertebre of the Neck.

GLOBE or *Sphere*, is a round ſolid Body, every Part of whoſe Surface is equally diſtant from a Point within it, called its Center: and it may be conceived to be formed by the Revolution of a Semicircle round its Diameter.

When ſuch a Body as this hath all the Parts of the Earth and Sea drawn or delineated on its Surface, like as in a Map, and placed in their Natural Order and Situation, it is called the *Terreſtrial Globe*.

But if on its Surface it hath the fixed Stars and the Images of the Conſtellations drawn, together with the Circles of the Sphere below deſcribed, 'tis then called the *Celeſtial Globe*.

And when the following Circles are ſuppoſed to be deſcribed on the Convex Surface of a Sphere, which is hollow within, and after this you imagine all Parts of the Sphere's Surface to be cut away, except thoſe Parts on which ſuch Circles are deſcribed, then that Sphere is called an *Armillary Sphere*, becauſe it appears in the Form of ſeveral Circular Rings or Bracelets put together in a due Poſition.

There are Ten Eminent Circles upon the Globe or of the Sphere; Six of which are called *Greater*, and the Four other *Leſſer Circles*.

A *Great Circle* of the Sphere is that whoſe Plane paſſeth through the Center of the Sphere, and divides it into two equal Parts or Hemiſpheres.

A *Leſſer Circle* is that which is parallel to a *Greater*, as the *Tropicks* and the *Polar Circles* are to the *Equator*, and as the *Circles of Altitude* are to the *Horizon*.

Or *Leſſer Circles* are ſuch as do not divide the Globe into two equal Parts.

The Greater Circles are,

I. The *Horizon*, which is a broad wooden Circle encompaſſing the Globe round about, having two Notches, the one in the North, the other in the South Part of it, for the Brazen *Meridian* to ſtand in.

There are uſually accounted two *Horizons*:

Firſt, The *Viſible*, or *Senſible*, which you may conceive to be made by ſome great Plain, or the Surface of the Sea; and which divides the Heavens into two *Hemiſpheres*, the one above, the other (apparently) below the Level of the Earth.

This Circle determines the Riſing and Setting of the Sun, Moon, or Stars, in any particular Latitude; for when any one of them comes juſt to the Eaſtern Edge of the *Horizon*, then we ſay it Riſeth; and when it doth ſo at the Weſtern Edge, we ſay it Setteth. And from hence alſo the Altitude of the Sun and Stars is accounted, which is their Height in Degrees above the Horizon.

II. The other *Horizon* is called the *Real* or *Rational*, and is a Circle which encompaſſes the Earth exactly in the Middle, and whoſe Poles are the *Zenith* and *Nadir*; that is, two Points in its Axis, each 90 Degrees diſtant from its Plain (as the Poles of all Circles are) and the one exactly over our Heads, and the other directly under our Feet. This is the Circle which the Wooden Horizon on the Globe repreſents.

On which *Broad Horizon* ſeveral Circles are drawn, the innermoſt of which is the Number of Degrees of the *Twelve Signs* of the *Zodiack*, *viz.* 30 to each Sign: For the Ancient Aſtronomers obſerved the Sun in his (apparent) Annual Motion, to deſcribe always one and the ſame Line in Heaven, and never to deviate from this Track or Path to the North or South, as all the other Planets did more or leſs; and becauſe they found the Sun alſo to ſhift, as it were backward, through all the parts of this Circle or Path, ſo that in his whole Year's Courſe he would *Riſe*, *Culminate*, and *Set* with every Point of it; they diſtinguiſhed the fixed Stars that appeared in or near this Circle into *Twelve Conſtellations* or Diviſions, which they called *Signs*; and becauſe they were moſt of them uſually drawn in the Form of Animals, they called this Circle by the Name of the *Zodiack*, and the very middle Line of it the *Ecliptick*: And ſince every Circle was divided into 360 Parts or Degrees, a

twelfth

twelfth Part of that Number muſt be 30, the Degrees in each Sign.

Next to this you have the Names of thoſe Signs; next to this the Days of the Month, according to the *Julian Account*, or *Old Stile*, *with the Calendar*; and then another *Calendar* according to the *Foreign Account*, called the *New Stile*.

And without theſe is a Circle divided into Thirty two equal Parts, which make the Thirty two Rhombs or Points of the Mariner's Compaſs, with the firſt Letters of the Names annexed; and ſince a Thirty ſecond Part of 360 Degrees is 11 Degrees 15 Minutes, they account that each ſingle Point of the Compaſs is 11 Degrees 15 Minutes.

The Uſes of this Circle in the Globe are,

1. To determine the Riſing and Setting of the Sun, Moon, or Stars, and to ſhew the Time of it by the help of the Hour-Circle and Index; as ſhall be ſhewed hereafter.

2. To limit the Increaſe and Decreaſe of the Day and Night: For when the Sun riſes due Eaſt, and ſets Weſt, the Days are equal.

But when he Riſeth and Setteth to the North of the Eaſt and Weſt, the Days are longer than the Nights; as on the contrary, the Nights are longer than the Days, when the Sun Riſeth and Setteth to the Southward of the Eaſt and Weſt Points of the Horizon.

3. To ſhew the Amplitude of the Sun, or of any Star; and alſo, on what Point of the Compaſs it Riſeth and Setteth.

II. The next *Great Circle* is the *Meridian*, which is repreſented by the Brazen Frame or Circle in which the Globe hangs and turns: This is divided into four Nineties, or 360 Degrees, beginning at the *Equinoctial*. 'Tis called the *Meridian*, becauſe when the Sun comes to the South Part of this Circle, 'tis then *Meridies*, *Mid-Day*, or *High-Noon*, and then the Sun hath its greateſt Altitude for that Day, which therefore is called the *Meridian Altitude*. The Plane of this Circle is perpendicular to the *Horizon*, and paſſeth through the South and North Points thereof through the *Zenith* and *Nadir*, and through the Poles of the World. In it, each way from the *Equinoctial* on the *Celeſtial Globe*, is accounted the North or South Declination of the Sun or Stars; and on the *Terreſtrial*, the Latitude of a Place North or South; which is all one Quantity with the Elevation or the Height of the Pole above the Horizon: Becauſe the Diſtance from the *Zenith* to the *Horizon*, being the ſame as that between the *Equinoctial* and the *Poles*, if from each you imagine the Diſtance from the *Pole* to the *Zenith* to be taken away, the Latitude muſt remain equal to the *Pole's Height*.

There are Two Points of this Circle, each 90 Degrees from the *Equinoctial*, which are called the *Poles of the World*; and a Diameter from thence continued through the Center of either Globe, is called the *Axis of the Earth* or *Heavens*, on which they are ſuppoſed to turn round.

Theſe *Meridians* are various, and change according to the Longitude of Places; for as ſoon as ever a Man moves but one Degree, or but a Point to the Eaſt or Weſt, he is under a new Meridian: But there is (or ſhould be) one fix'd, which is called the *Firſt Meridian*.

And this on ſome Globes paſſes through *Gratioſa*, one of the *Azores* Iſlands; but the *French* place the firſt Meridian at *Fero*, one of the *Canary* Iſlands.

The Poles of the Meridian are the Eaſt and Weſt Points of the Horizon.

On the *Terreſtrial Globe* there are uſually drawn Twenty four Meridians, one through every 15 Degrees of the Equator, or through every 15 Degrees of Longitude.

The Uſes of this Circle are,

Firſt, To ſet the Globe to any particular Latitude, by a proper Elevation of the Pole above the Horizon of that Place: And,

Secondly, To ſhew the Sun or Stars Declination, right Aſcenſion, and greateſt Altitude; of which more below.

III. The next *Great Circle* is the *Equinoctial*, as it is called on the Celeſtial, and *Equator* on the Terreſtrial Globe. This is a great Circle, whoſe Poles are the Poles of the World: It divides the Globe into two equal Parts or Hemiſpheres, as to North and South; and it paſſes through the Eaſt and Weſt Points of the Horizon, and at the Meridian is always as much raiſed above the Horizon, as is the Complement of the Latitude of any particular Place. Whenever the Sun cometh to this Circle, it makes equal Days and Nights all round the Globe, becauſe it always Riſeth then due Eaſt, and Sets due Weſt, which it doth at no other Time of the Year. All Stars alſo which are under this Circle, or which have no Declination, do always Riſe due Eaſt, and Set full Weſt.

All People living under this Circle (which in Geography, or rather by Navigators, is called the *Line*) have the Days and Nights conſtantly equal; and when the Sun is in the Equinoctial, he will be at Noon in their Zenith, or directly over their Heads, and ſo their erect Bodies can caſt no Shadow.

From this Circle, both ways, the Sun or Star's Declination on the Celeſtial, or Latitude of all Places on the *Terreſtrial Globe*, is accounted on the Meridian: And ſuch leſſer Circles as run through each Degree of Latitude or Declination parallel to the Equinoctial, are called Parallels of Latitude, or Parallels of Declination.

Through every 15 Degrees of this Equinoctial the Hour-Circles are drawn at Right Angles to it on the *Celeſtial Globe*, and all paſs through the Poles of the World, dividing the Equinoctial into 24 equal Parts.

And the *Equator* on the *Terreſtrial Globe* is divided by the Meridian into 36 equal Parts; which Meridians are equivalent to the Hour-Circles on the other Globe.

IV. The *Zodiack* is another *Great Circle* of the *Sphere*, dividing the Globe into two equal Parts: When the Points of *Aries* and *Libra* are brought to the Horizon, it will cut *that* and the Equinoctial obliquely, making with the former an Angle equal to the Sun's greateſt Meridian Altitude in any Latitude; and with the Equinoctial, an Angle equal to 23 Degrees and 30 Minutes, which is the Sun's greateſt Declination. This Circle by Aſtronomers is accounted as a kind of broad one, and is like a Belt or Girdle round the Globe: Through the Middle of it is drawn a Line called the *Ecliptick*, or *Via Solis*, the *Way of the Sun*; becauſe the Sun never deviates from it in its Annual Motion, as the Planets do all more or leſs, whence it hath its Breadth.

This Circle is mark'd with the Characters of the *Twelve Signs*, and on it is found out the Sun's Place, which

which is under what Star or Degree of any of the *Twelve Zodiacal Conſtellations* he appears to be at Noon. By this are determined the Four Quarters of the Year, according as the Ecliptick is divided into four equal Parts; and according as the Sun goes on here, he hath more or leſs Declination.

Alſo from this Circle the Latitude of the Planets and fixed Stars are accounted from the Ecliptick towards its Poles.

The Poles of this Circle are 23 Degrees 30 Minutes diſtant from the Poles of the World, or of the Equinoctial, and by their Motion round the Poles of the World, are the Polar Circles deſcribed.

In theſe Poles of the Ecliptick all the Circles of Longitude which are drawn through the Zodiack do determinate, as the *Meridians* and *Hour-Circles* do in the Poles of the World, and as the *Azimuth* or *Vertical Circles* do in the *Zenith* and *Nadir*.

V. If you imagine two *Great Circles* paſſing both through the Poles of the World, and alſo one of them through the *Equinoctial Points*, *Aries* and *Libra*, and the other through the *Solſtitial Points*, *Cancer* and *Capricorn:*

Theſe are called the two *Colures*, the one the *Equinoctial*, the other the *Solſtitial Colure*. Theſe will divide the Ecliptick into four equal Parts or Quarters, which are denominated according to the Points where theſe paſs through, called the four Cardinal Points, and are the firſt Points of *Aries*, *Libra*, *Cancer*, and *Capricorn*.

Theſe are all the Great Circles.

VI. If you ſuppoſe Two Circles drawn parallel to the Equinoctial, at 23 Degrees 30 Minutes diſtant from it, one towards the North, the other towards the South, theſe are called the *Tropicks*, becauſe the Sun appears, when in them, to turn backward from his former Courſe; the one the Tropick of *Cancer*, and the other, the Tropick of *Capricorn*, becauſe they are under theſe Signs.

VII. If two other Circles are ſuppos'd to be drawn through 23 Degrees 30 Minutes, reckoned on the Meridian from the Polar Points, theſe are called the *Polar Circles:* The Northern is the Artick, and the Southern the Antartick Circles, becauſe oppoſite to the former:

Theſe are the Four Leſſer Circles.

And theſe on the *Terreſtrial Globe* the Ancients ſuppoſed to divide the Earth into five *Zones*, viz. two *Frigid*, two *Temperate*, and the *Torrid Zone*.

Beſides theſe Ten Circles lately deſcribed, which are always drawn on the Globe it ſelf, there are ſome other neceſſary Circles to be known, which are barely imaginary, and ſuppoſed only to be drawn upon the Globe.

1. *Meridians*, or *Hour-Circles*, which are great Circles meeting all in the Poles of the World, and croſſing the Equinoctial at Right Angles; theſe are ſupplied by the Meridian, Hour-Circle, and Index.

2. *Azimuths*, or *Vertical Circles*, which likewiſe are *Great Circles of the Sphere*, and meet in the *Zenith* and *Nadir*, as the Meridians and Hour-Circles do in the Poles: Theſe cut the Horizon at Right Angles, and on theſe is reckoned the Sun's Altitude when he is not in the Meridian. They are repreſented by the Quadrant of Altitude, which being fix'd at the Zenith, is moveable about round the Globe through all the Points of the Compaſs.

3. There are alſo *Circles of Longitude* of the Stars and Planets, which are Great Circles paſſing through the Pole of the Ecliptick, and in that Line determining the Stars or Planets Place or Longitude reckoned from the firſt Point of *Aries*.

4. *Almacanters*, or *Parallels of Altitude*, are Circles having their Poles in the Zenith, and are always drawn parallel to the Horizon. Theſe are *Leſſer Circles of the Sphere*, diminiſhing gradually as they go farther and farther from the Horizon.

In reſpect of the Stars there are alſo ſuppoſed to be *Parallels of Latitude*, which are parallel to the Ecliptick, and have their Poles the ſame with thoſe of that Circle.

5. *Parallels of Declination* of the Sun or Stars, which are leſſer Circles, whoſe Poles are the Poles of the World, and are all drawn parallel to the Equinoctial, either North or South; and theſe (when drawn on the *Terreſtrial Globe*) are called *Parallels of Latitude*.

DEFINITIONS.

1. *Latitude of any Place*, is an Arch of the Meridian of that Place, intercepted between its Zenith and the Equator; and this is the ſame with an Arch of the Meridian, intercepted between the Pole and the Horizon; and therefore it is often expreſſed by the Poles Height, or Elevation of the Pole: The Reaſon of which is, That from the Equator to the Pole, there always being the Diſtance of 90 Degrees, and from the Zenith to the Horizon the ſame Number, and each of theſe 90 Degrees containing within it the Diſtance between the Zenith and the Pole; that Diſtance therefore being taken away from both, muſt leave the Diſtance from the Zenith to the Equator, equal to the Diſtance between the Pole and the Horizon, or to the Elevation of the Pole above the Horizon.

2. *Latitude of a Star or Planet*, is an Arch of a Great Circle reckoned on the Quadrant of Altitude, laid through the Star and Pole of the Ecliptick, from the Ecliptick towards its Pole.

3. *Longitude of a Place*, is an Arch of the Equator intercepted between the Meridian of the Place and the firſt Meridian: Or it is more properly the Difference, either Eaſt or Weſt, between the Meridians of any two Places, accounted on the Equator.

4. *Longitude of a Star*, is an Arch of the Ecliptick, accounted from the beginning of *Aries* to the Place where the Stars Circle of Longitude croſſeth the Ecliptick; ſo that it is much the ſame as the Stars Place in the Ecliptick, accounted from the beginning of *Aries*.

5. *Amplitude of the Sun*, or of a *Star*, is an Arch of the Horizon intercepted between the true Eaſt or Weſt Points of it, and that Point upon which the Sun or Star riſes or ſets.

6. *Right Aſcenſion of the Sun*, or of a *Star*, is that part of the Equinoctial reckoned from the beginning of *Aries*, which riſeth or ſetteth with the Sun or Star in a Right Sphere: But in an Oblique Sphere it is that Part or Degree of the Equinoctial which comes to the *Meridian* with it, (as before) reckoned from the beginning of *Aries*.

1. *A Right or Direct Sphere*, is when the Poles are in the Horizon, and the Equator in the Zenith. The Conſequence of being under ſuch a Poſition of the Heavens as this (which is the Caſe of thoſe who live directly under the Line) is, That the Inhabitants have no Latitude nor Elevation of the Pole: They can nearly ſee both the Poles of the World: All the

Stars

Stars in the Heavens do once in 24 Hours Riſe, Culminate, and Set with them; the Sun always Riſes and Deſcends at Right Angles with the Horizon, which is the Reaſon they have always equal Day and Night, becauſe the Horizon doth exactly biſect the Circle of the Sun's Diurnal Revolution.

2. *A Parallel Sphere*, is where the Poles are in the Zenith and Nadir, and the *Equinoctial* in the Horizon; which is the Caſe of ſuch Perſons, if any ſuch there be, who live directly under the North or South Poles.

And the Conſequences of ſuch a Poſition are, That the Parallels of the Sun's Declination will alſo be Parallels of his Altitude, or Almacanters to them. The Inhabitants can ſee only ſuch Stars as are on their Side the Equinoctial; and they muſt have 6 Months Day, and 6 Months continual Night every Year; and the Sun can never be higher with them than 23 Degrees 30 Minutes, (which is not ſo high as it is with us on *February* 10th.)

3. An *Oblique Sphere*, is where the Pole is elevated to any Number of Degrees leſs than 90: And conſequently the Axis of the Globe can never be at Right Angles to, nor in the Horizon; and the Equator, and Parallels of Declination, will all cut the *Horizon* Obliquely, from whence it takes its Name.

Oblique Aſcenſion of the Sun, or Stars, is that Part or Degree of the Equinoctial reckoned from the beginning of *Aries*, which Riſes and Sets with them in an Oblique Sphere.

Aſcenſional Difference, is the Difference between the *Right* and *Oblique Aſcenſion*, when the Leſſer is ſubſtracted from the Greater.

On the Terreſtrial Globe.

1. A Space upon the Surface of the Earth, reckoned between two Parallels to the Equator, wherein the Increaſe of the longeſt Day is a Quarter of an Hour, is by ſome Writers called a *Parallel*.

2. And the Space contained between two ſuch Parallels, is called a *Climate*: Theſe *Climates* begin at the *Equator*; and when we go thence North or South, till the Day become half an Hour longer than it was before, they ſay, we are come into the *Firſt Climate*; when the Days are an Hour longer, than they are under the *Equator*, we are come to the *Second Climate*, &c. Theſe Climates are accounted in Number 24, reckoned each way towards the Poles.

The Inhabitants of the Earth are divided into three Sorts, as to the falling of their Shadows.

1. *Amphiſcii*, who are thoſe which inhabit the *Torrid Zone*, or live between the Equator and Tropicks, and conſequently have the Sun twice a Year in their Zenith; at which time they are *Aſcii*, i. e. have no Shadows, the Sun being Vertical to them. Theſe have their Shadows caſt to the Southward, when the Sun is in the Northern Signs; and to the Northward, when the Sun is in the Southern Signs, reckoned in reſpect of them.

2. *Heteroſcii*, who are thoſe whoſe Shadows fall but one way; as is the Caſe of all ſuch as live between the Tropick and Polar Circles: For their Shadows at Noon are always to the Northward in North Latitude, and to the Southward in South Latitude.

3. *Periſcii*, are ſuch Perſons that inhabit thoſe Places of the Earth that lie between the Polar Circles and the Poles, and therefore have their Shadows falling all manner of ways, becauſe the Sun at ſome times of the Year goes clear round about them.

The Inhabitants of the Earth, in reſpect of one another, are alſo divided into three Sorts.

1. *Periœci*, who are ſuch as inhabiting the ſame Parallel (not a *Great Circle*) are yet directly oppoſite to one another, the one being Eaſt or Weſt from the other exactly 180 Degrees, which is their Difference of Longitude: Now theſe have the ſame Latitude and Length of Days and Nights, but exactly at contrary Times; for when the Sun Riſeth to one, it Sets to the other.

2. *Antœci*, who are Inhabitants of ſuch Places, as being under a Semicircle of the ſame *Meridian*, do lie at equal Diſtances from the *Equator*, one towards the North, and the other towards the South.

Now theſe have the ſame Degree of Latitude, but towards contrary Parts, the one North, and the other South; and therefore muſt have the Seaſons of the Year directly at contrary Times one to the other.

3. *Antipodes*, who are ſuch as dwell under the ſame Meridian, but in two oppoſite and equi-diſtant Parallels, and in the two oppoſite Points of thoſe two Parallels; ſo that they go Feet againſt Feet, and are diſtant from each other an entire Diameter of the Earth, or 180 Degrees of a Great Circle.

Theſe have the ſame Degree of Latitude, but the one South, the other North, and accounted from the *Equator* a quite contrary way; and therefore theſe will have all Things, as Day and Night, Summer and Winter, directly contrary to one another.

PROBLEMS.

I. *To find the Latitude of any Place.*

Bring the Place to the Braſs Meridian, and the Degrees of that Circle, intercepted between the Place and the Equinoctial, are the Latitude of that Place either North or South.

Then to fit the Globe ſo that the *Wooden Horizon* ſhall repreſent the Horizon of that Place, elevate the Pole as many Degrees above the *Wooden Horizon*, as are the Latitude of that Place, and it is done; for then will that Place be in the Zenith.

If after this you rectify the Globe to any particular Time, you may by the Index know the Time of Sun-riſing and Setting with the Inhabitants of that Place, and conſequently the preſent Length of their Day and Night, &c.

PROBLEM II.

To find the Longitude of Places.

Bring the Places ſeverally to the Braſs Meridian and then the Number of Degrees of the *Equinoctial*, which are between the Meridians of each Place, are their *Difference of Longitude* either Eaſt or Weſt.

But if you reckon it from any Place where a *Firſt Meridian* is ſuppoſed to be placed, you muſt bring that *Firſt Meridian* to the Brazen one on the Globe; and then turning the Globe about, till the other Place come thither alſo, reckon the Number of Degrees of the *Equinoctial*, intercepted between that *Firſt Meridian*, and the proper one of the Place, and that is the Longitude of that Place, either Eaſt or Weſt.

PROBLEM III.

For the Diſtances of Places on the Terreſtrial Globe.

See the *Problem* on the Celeſtial Globe, *For finding the Diſtance between two Stars.*

PROBLEM IV.

To find what Places of the Earth the Sun is Vertical to at any time aſſigned.

Bring the Sun's Place, found in the Ecliptick on the Terreſtrial Globe, to the Brazen Meridian, and note what Degree of the Meridian it cuts; then by turning the Globe round about, you will ſee what Places of the Earth are in that Parallel of Declination, (for they will all come ſucceſſively to that Degree of the Brazen Meridian) and thoſe are the Places or Parts of the Earth to which the Sun will be Vertical that Day; whoſe Inhabitants will then be *Aſcii*; that is, their erect Bodies at Noon will caſt no Shadow.

Problems on the Celeſtial Globe.

Suppoſe *May* the 10th, 1701, the Sun's Place to be juſt at the Entrance into the firſt Degree of *Gemini*.

PROBLEM I.

To rectify the Globe: Or, To render it in the General fit to reſolve any Problem; which Rectification *therefore is always ſuppoſed to be the firſt thing done: To do which,*

Bring the Sun's Place, found in the Ecliptick on the Globe, to the *Meridian*, and the Hour-Index to 12 at Noon.

PROBLEM II.

For the Sun's Declination.

Bring the Sun's Place for that Day, (which here and below is ſuppoſed to be given) to the *Meridian* as before, and then the Degrees of the *Meridian*, reckoned from the Equinoctial either North or South, are the *Sun's Declination* at Noon, either North or South, according to the Time of the Year, *viz.* from *March* the 10th to *September* the 12th, North; and thence to *March* again South: And the *Declination* for *May* the 10th will be 20 Degrees and about 12 Minutes North.

PROBLEM III.

For his Amplitude either Riſing or Setting.

Bring the Sun's Place to the *Horizon*, either on the Eaſt or Weſt Side, and the Degrees of the Horizon, accounted from the Eaſt Point, either North or South, are the *Amplitude* required; *viz. May* the 10th, the Sun's *Amplitude* will be 34 Degrees to the North of the Eaſt.

And at the ſame Time you have in the outer Circle of Rhombs the Point which the Sun Riſes or Sets upon, N. E. by E. or N. W. by W.

PROBLEM IV.

For his Right Aſcenſion.

Bring the Sun's Place to the *Meridian*, and the Number of Degrees intercepted between the beginning of *Aries*, and that Degree of the Equinoctial, which comes to the *Meridian* with the Sun, is the *Right Aſcenſion.*

If you would have it in Time, account every 15 Degrees to be an Hour, and every Degree to be 4 Minutes.

N. B. The Reaſon of bringing the Sun's Place to the *Meridian* in this Problem, is to ſave the Trouble of putting the Globe into the Poſition of a *Right Sphere*: For properly Right Aſcenſion is that Degree of the Equinoctial which Riſes with the Sun in a *Right Sphere*. But ſince the Equator is always at Right Angles to the *Meridian*, if you bring the Sun's Place thither, it muſt in the Equinoctial cut his Right Aſcenſion: Thus in the Inſtance of *May* the 10th, the Sun's Right Aſcenſion will be 59 Degrees, or 4 Hours wanting 4 Minutes.

PROBLEM V.

For the Oblique Aſcenſion.

Bring the Sun's Place to the *Horizon* on the Eaſt-ſide, and the Number of Degrees intercepted between that Degree of the Equinoctial which is now come to the *Horizon*, and the beginning or firſt Point of *Aries* is the *Oblique Aſcenſion*. Thus, *May* the 10th, the Sun's *Oblique Aſcenſion* is 30 Degrees 15 Minutes.

Of thoſe two *Aſcenſions* take the Leſſer from the Greater, the Remainder will be,

PROBLEM VI.

The Aſcenſional Difference.

Which therefore is the Difference in Degrees between the Right or Oblique Aſcenſion, or the Space between the Sun's Riſing and Setting, and the Hour of Six: Wherefore his Aſcenſional Difference turned into Time, will give the Time of the Sun's Riſing or Setting before or after Six. Thus, from 59 Degrees take 30 Degrees 15 Minutes, there will remain 28 Degrees 45 Minutes, the *Aſcenſional Difference* in Degrees, and in Time 1 Hour 55 Minutes; and ſo much doth the Sun Riſe before Six, and Set after it.

PROBLEM VII.

For the Sun's Riſing or Setting.

Bring his Place to the Horizon, either Eaſt or Weſt, and the Hour-Index ſhall ſhew the Time either of his Riſing or Setting accordingly; which, *May* 10th, is 5 Minutes after 4 in the Morning, and and 5 Minutes before 8 at Night.

The Time of the Sun's Setting doubled, gives the Length of the Day, which then will be 15 Hours 50 Minutes; and the Time of this Riſing doubled, gives the Length of the Night, which, *May* 10th, is 8 Hours 10 Minutes.

PROBLEM VIII.

For the Sun's Meridian Altitude, or Depreſſion at Midnight.

Bring his Place to the *Meridian*, above the *Horizon*, for his Noon Altitude, which will ſhew the Degrees of it accounted there from the *Horizon*; which, *May* the 10th, will be 58 Degrees 42 Minutes. For his Midnight Depreſſion, below the North Point of the *Horizon*, you muſt bring the Point in the Ecliptick, oppoſite to the Sun's preſent Place, to the South Part of the Meridian above the Horizon; and the Degrees there intercepted between that Point and the Horizon, are his Midnight Depreſſion:

Depreſſion; which, *May* the 10th, will be 18 Degrees 42 Minutes.

PROBLEM IX.

For the Sun's Altitude at any Time of the Day given.

Rectify the Globe, and *fit the Quadrant of Altitude*; that is, ſcrew the Braſs Quadrant of Altitude to the Zenith; or in our Latitude, ſcrew it ſo that the graduated Edge cut 51 Degrees 30 Minutes on the Meridian, reckoned from the Equinoctial.

Then turn about the Globe till the Index ſhew the Time propoſed, and ſtay the Globe there; after which bring the Quadrant of Altitude to cut the Sun's Place in the Ecliptick, and then that Place or Degree of the Ecliptick ſhall ſhew the Sun's Altitude on the Quadrant.

Thus, *May* the 10th, the Sun's Altitude at Nine a Clock in the Morning will be 43 Degrees 30 Minutes.

PROBLEM X.

To find the Sun's Hour or Altitude when he is due Eaſt or Weſt above the Horizon.

Rectify the Globe, and *fit the Quadrant of the Altitude*; then bring the Quadrant to cut the true Eaſt Point, and next turn the Globe about till the Sun's Place in the Ecliptick cut the graduated Edge of the Quadrant; for then that Place will ſhew the Altitude and the Index of the Hour.

Thus, *May* the 10th, the Sun will be Eaſt at 5 Minutes paſt Seven in the Morning, and his Altitude then is 26 Degrees.

PROBLEM XI.

To find the Sun's Altitude or Time of the Day on any Azimuth given: Or, When the Sun is on any given Point of the Compaſs.

Set the Quadrant of Altitude to the Azimuth given, then turn the Globe till his Place in the Ecliptick touch the graduated Edge of the Quadrant; ſo ſhall that Place give the Altitude on the Quadrant, and the Hour-Index the Time of the Day.

Example.

May the 10th, the Azimuth being 60 Degrees from the South toward the Eaſt, or the Point of the Compaſs which the Sun is then on, being S. E. by E. and near half a Point more Eaſterly; his Altitude will be (nearly) 46 Degrees, and the Hour of the Day a little more than a Quarter paſt Nine in the Morning.

PROBLEM XII.

To find the Declination and Right Aſcenſion of any Star.

Bring the Star to the *Meridian*, and then the Degrees intercepted between the Equinoctial and the Point of the Meridian cut by the Star, are its Declination; and the Meridian cuts and ſhews its *Right Aſcenſion* on the Equinoctial, accounting it from the beginning of *Aries*.

PROBLEM XIII.

To find the Longitude and Latitude of any Star.

Bring the Solſtitial Colure to the Braſs Meridian, and there fix the Globe; then will the Pole of the Ecliptick be juſt under 23 Degrees 30 Minutes, accounted from the Pole above the North Point of the Horizon, and upon the ſame Meridian; there ſcrew the Quadrant of Altitude, and then bring its graduated Edge to the Star aſſigned, and there ſtay it; ſo will the Star cut its proper *Latitude* on the *Quadrant*, reckoned from the Ecliptick; and the Quadrant will cut the Ecliptick in the Star's *Longitude*, or its Diſtance from the firſt Point of *Aries*.

PROBLEM XIV.

To find the Time of any Star's Riſing, Setting, or Culminating, i. e. being on the Meridian.

Rectify the Globe and *Hour Index*, and bring the Star to the Eaſt or Weſt Part of the Horizon, or to the Brazen Meridian, and the Index will ſhew accordingly the Time of the Star's *Riſing*, *Setting*, or *Culminating*, or of its being on the Meridian.

Thus, *May* the 10th, *Arcturus* will be on the Meridian at about $\frac{1}{4}$ of an Hour after 10 at Night; *Cor Leonis* will be *Setting* about one in the Morning; and the firſt Star in the Head of *Aries* will be *Riſing* about an Hour after.

PROBLEM XV.

To know, at any Time aſſigned, what Stars are Riſing or Setting; what are on the Meridian, and how high they are above the Horizon; and on what Azimuth or Point of the Compaſs they are; by which means the real Stars in the Heaven may eaſily be known by their proper Names, and rightly diſtinguiſhed one from another.

Rectify the Globe, and *fit the Quadrant of Altitude*, and ſet the Globe, by the Means of the Compaſs, due North and South; then turn the Globe and Hour-Index to the Hour of the Night aſſigned; ſo will the Globe, thus fix'd, repreſent the Face or Appearance of the Heavens for that Time.

Whereby you may readily ſee what Stars are in or near the Horizon; what are on or near the Meridian; which are to the North, or which to the South, &c. And the Quadrant of Altitude being laid over any particular Star, will ſhew its *Altitude* and *Azimuth*, and on what Point of the Compaſs it is; whereby any Star may eaſily be known, eſpecially if you have a Quadrant, or any ſuch Inſtrument, to take the Altitude of any real Star ſuppoſed to be known by the Globe, to ſee whether it agree with that Star which is its Repreſentative on the Globe or not.

PROBLEM XVI.

Given the Sun's Place, and any Star's Altitude, to find the Hour of the Night.

Rectify the Globe and *fit the Quadrant*, then move the Globe to and fro till the Quadrant cut the Star in its given Altitude, for then the Hour-Index will ſhew the Hour of the Night: And thus may

the Hour of the Night be known by a Star's Azimuth, or its Azimuth from its Altitude.

Example.

May the 10th, the Sun being in the firſt Degree of *Gemini*, I take the Altitude of *Lucida Lyra*, which I find to be 51 Degrees, or I find its *Azimuth* to be two Degrees to the Northward of the Eaſt; then bringing the Quadrant of the Altitude to cut that Star in 51 Degrees of *Altitude*, I find the Hour-Index points at Eleven a Clock at Night; as it would alſo have done had the Star been brought to the Azimuth on the Globe.

PROBLEM XVII.

To find the Diſtance between any Two Stars.

If the Stars lie both under the ſame Meridian, bring them to the Brazen Meridian, and the Degrees between them there reckoned are their true Diſtance.

Thus *Capella*, or the Star in the Left Shoulder of *Auriga*, and *Rigel*, which is in *Orion*'s Left Thigh, are nearly under the ſame Meridian; and being both brought to the Brazen Meridian of the Globe, their Diſtance there will be found to be 54 Degrees.

If they are both in the Equinoctial, or have both the ſame Declination, *i. e.* are both in the ſame Parallel, then bring them one after another to the Brazen Meridian, and the Degrees of the Equinoctial intercepted between them, when thus brought to the Meridian ſeverally, are their Diſtance.

If the Stars are neither under the ſame Meridian, nor parallel, then either lay the Quadrant of Altitude from one to the other, (if it will reach) and that will ſhew the Diſtance between them in Degrees; or elſe take the Diſtance with Compaſſes, and apply that to the Equinoctial, or to the Meridian.

Which Method of Proceeding alſo will ſhew the Diſtance of any Two Places on the Terreſtrial Globe in Degrees; and by Multiplication by 70, you will have it in Miles. Wherefore to find how far any Place on the Globe is from another, you need only take the Diſtance between them on the Globe with a pair of Compaſſes; and applying the Compaſſes to the Equator at the beginning of *Aries*, or at the firſt Meridian, you will there find the Degrees; which multiply by 70, and that will turn it into Miles.

Thus the Diſtance between *London* and *Jamaica* being on the Globe 69 Degrees, I multiply that by 70, and it gives me 4830 Miles; and ſo far is *Jamaica* diſtant *directly* from *London*, or in an Arch of a Great Circle.

GLOBULUS *Naſi*, is the lower cartilaginous moveable Part of the Noſe.

GLOSSOCOMIUM, is a Chyrurgeon's Inſtrument for broken Limbs; ſo called from the Shape of a Merchant's little Caſket, which was formerly carried upon the Back. *Blanchard.*

GLOTTIS, is the Chink of the *Larynx*, which is covered by the *Epiglottis*.

GLUTÆI, are Six Muſcles which move the Buttocks, on each Side three.

GLUTÆUS *Major*, a Muſcle of the Thigh, ſo called from its being the largeſt Muſcle of thoſe which compoſe the Buttocks: It has a large Semi-circular Beginning, forwards meerly Tendinous from near two Thirds of the External Parts of the Spine of the *Os Ilium*; backwards its Origination is thick and fleſhy from the poſterior Part of the Spine, and hindermoſt part of the *Sacrum* laterally, and the whole *Os Coccygis*; as alſo from a broad Ligament that's extended between the two laſt named Bones and the Tubercle of the *Os Iſchium*; its Fleſhy Fibres deſcending diſgregately, in an almoſt Semi-circular manner, become Tendinous as they approach the great *Trochanter*, where it's united with its firſt deſcribed Tendinous Beginning, deſcending over the External Part of the great *Trochanter*, and after being joined with the Tendon of the *Membranoſus*, proceeds to cover and ſtrictly embrace all the External Muſcles of the *Tibia*, like as the External Tendon doth of the *Biceps* of thoſe of the *Cubit*: But the other part of it proceeding from the Fleſhy Body of this Muſcle, is largely inſerted to the *Linea Aſpera*, on the back Part of the *Os Femoris*, near four Finger's Breadth below the great *Trochanter*.

The firſt deſcribed Tendinous Beginning of this Muſcle doth not only ſerve to ſupport its Fleſhy Body, but its Fibres interſecting thoſe of the *Membranoſus*, as they cover all the Muſcles of the *Tibia*, do more adequately include them, whereby they are corroborated in their Action: When this Muſcle acts, it pulls the Thigh directly backwards.

GLUTÆUS *Medius*, a Muſcle of the Thigh, which lies chiefly under the Tendinous Beginning of the *Glutæus Major*, and ariſing Fleſhy from almoſt the whole External Part of the *Os Ilium*, in its deſcent becomes thicker and fleſhy, and is inſerted by a ſhort ſtrong Tendon to the Superior and External Part of the great *Trochanter* in a Semi-circular Manner. Mr. *Cowper* thinks this Muſcle is employed to turn the Thigh inwards, though others ſay it ſerves to extend it.

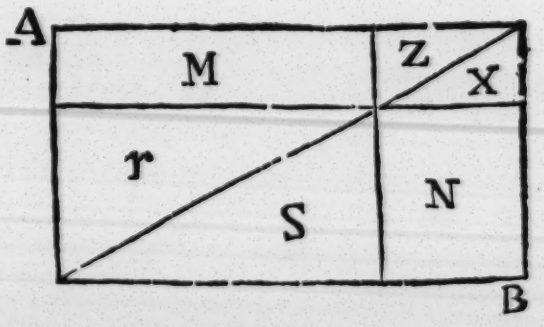
GLUTÆUS *Minor*, is a Muſcle of the Thigh, which lies totally under the *Glutæus Medius*, it being ſo much leſs than that, as that is than the *Glutæus Major*. It ariſeth Semi-circular, Broad, and Fleſhy from the *Dorſus Ilij*; from hence its Fleſhy Fibres deſcend to their partly Tendinous and partly Fleſhy Inſertion, like the *Medius*, at the Superior Part of the Root of the great *Trochanter*.

The Fibres of this running Parallel with thoſe of the *Medius*, aſſiſt it in all its Actions: They alſo aſſiſt in ſtrengthening the Articulation of the Thigh-bone, with the *Coxa*, more ſtable in ſtanding erect.

GLUTIA, are Two Prominences of the Brain, called *Nates*.

GLUTOS is the greater *Rotator* (an *Apophyſis*) in the upper Part of the Thigh-bone, named *Trochanter*. *Blanchard.*

GNOMON, in a Parallelogram, is a Figure made of the two Complements, together with either of the Parallelograms about the Diagonal.



Thus here, in the Parallelogram *AB*, the *Gnomon* is $M+z+x+N$, or $M+r+s+N$.

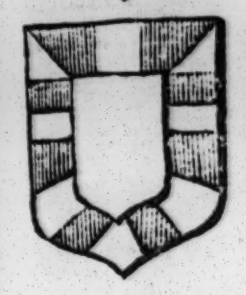
GNOMON, in *Dialling*, ſignifies the *Style*, *Pin*, or *Cock* of a Dial, the Shadow whereof pointeth out the Hours.

The

The *Gnomon* of every *Dial* is ſuppoſed to repreſent the *Axis of the World*; and therefore the two Ends or Extremities thereof muſt directly anſwer to the *North* and *South Pole*.

GNOMONICKS, the ſame with *Dialling*.

GOARING; the Seamen ſay a Sail is cut *Goaring*, when 'tis cut ſloping by degrees, and is broader at the *Clew* than at the *Earing*, as all *Top-ſails* and *Top-gallant Sails* are.



GOBONATED, a Term in Heraldry for a Bordure of this Form; which is neither *Checky*, nor *Counter-componed*, but of a different Diviſion from both.

GOLDEN-NUMBER: See *Cycle of the Moon*.

To find the Golden-Number.

To the Year add 1, and divide the Sum by 19, the Remainder is the *Golden-Number*.

Example.

To 1701 add 1, the Sum 1702 divide by 19, the Remainder 11 is the *Golden-Number* for that Year.

GOLDEN-RULE: See *Rule of Three*.

GOLDEN *Sulphur of Antimony*, is made by boiling the Droſs, ariſing in the making of *Regulus of Antimony*, in a little more than its Weight of common Water, in an Earthen Pot for about half an Hour, and then ſtraining the Liquor, there is Vinegar poured upon it, on which a Reddiſh or Gold-colour Powder will precipitate: It muſt be gathered by Filtration and dried; 'tis an Emetick; the Doſe from 2 to 6 Grains.

GOMPHOS, is when the Pupil of the Eye, going beyond a little Skin of the *Tunica Uvea*, is like that Swelling of hard Fleſh in the Corner of the Eye called *Clavus*. *Blanchard*.

GOMPHOSIS, or *Conclavatio*, is when one Bone is faſtened into another like a Nail, as may be ſeen in the Teeth. *Blanchard*.

GONARGA, the Gout in the Knee..

GOOD-A-BEARING, or *Good-behaviour*, in Common Law, ſignifies an exact Carriage or Behaviour of a Subject to the King and his Liege-people, whereunto Men upon their evil Courſe of Life, or looſe Demeanor, are ſometimes bound: He that is bound to this, is more ſtrictly bound than to the Peace; for the Peace is not broken without an Affray, but this Surety, *de bono geſtu*, may be forfeited by the Number of a Man's Company, or by his or their Weapons or Harneſs.

GOOSE-WING: When a Ship ſails before a Wind, or with a Quarter Wind, and in a freſh Gale, the Seamen ſometimes, to make the more haſte, do *unparal* the Miſſen-yard, and then they launch out both Sail and Yard over the Quarter on the Lee-ſide, fitting Guyes at the further End, to keep the Yards ſteddy with a *Boom*, and this booms out the Miſſen-ſheet, and all this they do to give the Ship the more way, which otherwiſe, with theſe Winds, the Miſſen-ſail could not do, and this Sail ſo fitted is called a *Gooſe-wing*, and ſometimes a ſtudding Sail.

GORGE, *Gulla*, or *Neck*, in Architecture, is the narroweſt part of the *Tuſcan* or *Dorick* Capitals, lying between the *Aſtragal* above the Shaft of the Pillar and the Annulets. It is alſo a kind of Concave Moulding, larger, but not ſo deep as a *Scotia*, which ſerves for Compartments, Chambrances, &c.

GORGE, in Fortification, is the Entrance of the Platform of any Work.

GORGE, in all other Out-Works, is the Interval betwixt their Wings on the Side of the great Ditch: But it ought to be obſerved, that all the *Gorges* are deſtitute of *Parapets*, becauſe if there were any, the Beſiegers having taken Poſſeſſion of a Work, might make uſe thereof, to defend themſelves from the Shot of the Place; ſo that they are only fortified with *Palliſadoes* to prevent a Surprize.

GORGE *of a Baſtion*, is nothing elſe but the prolonging of the *Curtains* from their Angle with *Flank* to the Center of the *Baſtion* where they meet: But when the Baſtion is flat, its *Gorge* is a right Line which terminates the Diſtance comprehended between two Flanks.

GORGE *of the Ravelin*, or of a *Half-Moon*, is the Space contained between the Extremities of the two Faces on the Side of the Place.

GORGED, the Herald's Term for the Bearing of Crown, Coronet, or ſuch like thing about the Neck of a Lion or a Swan, &c. for then they ſay the Lion or Cygnet is *Gorged* with a Ducal Coronet, &c.

GOTHICK, in Architecture, is an Order ſo far different from the Ancient Proportions and Ornaments, that its Columns are either too maſſy in a Form of vaſt Pillars, or as ſlender as Poles, having Capitals without any certain Dimenſions, carved with the Leaves of *Brank-Urſin*, *Thiſtles*, *Coleworts*, &c.

GRACILIS, is one of the Muſcles of the Legs, ſo called from being the moſt ſlender of them: It ariſeth ſomewhat broad, partly Tendinous and partly Fleſhy from the *Os Pubis* internally, between the firſt and ſecond deſcribed Heads of the *Triceps*, and in its ſtreight Deſcent in the Inſide of the Thigh grows narrow, and becomes Tendinous a little above the *Sartorius*, and is ſo inſerted (immediately beneath it) to the *Tibia*. It aſſiſteth in bending the Thigh and Leg inwards.

GRAMINEOUS *Herbs*, amongſt the Botaniſts, are ſuch as have a long narrow Leaf, and no Foot-ſtalk.

Theſe Biſhop *Wilkins* (in his Real Character) ranges into ſuch as are either,

1. *Frumentaceous*, *i. e.* whoſe Seed is uſed by Men for Food, either Bread, Drink, or Broth; ſuch as Wheat, Rye, Barley, &c. Or,

2. Not *Frumentaceous*, more properly called Graſſes, which have an hollow-jointed Stalk not branched, and a Stamineous Flower: See *Gramina* and *Graſſes*. The *Frumentaceous Herbs* are ſometimes called *Cercoles*.

GRAMMAR, is the Art of Speaking and Writing any Language truly. It takes its Name from the Greek Word *Gramma*, which ſignifies a Letter, becauſe it treateth primarily of the Formation of Articulate Sounds, which are repreſented by Letters.

GRANADO, is a little hollow Globe or Ball of Iron, or other Metal, about two Inches and a half in Diameter, which being filled with fine Powder, is ſet on fire by the means of a ſmall Fuſee faſtened to the Touch-hole; as ſoon as it is kindled, the Caſe flies into many Shatters, much to the Damage of all

that ſtand near. Theſe *Granadoes* ſerve to fire cloſe and narrow Paſſages, and are often thrown with the Hand among the Soldiers to diſorder their Ranks, more eſpecially in thoſe Poſts where they ſtand thickeſt; as in *Trenches*, *Redoubts*, *Lodgments*, &c.

GRAND-ASSIZE: See *Aſſize*.

GRAND-CAPE: See *Cape* and *Attachment*.

GRAND-CLIMACTERICKS: See *Climacterical Year*.

GRAND-DISTRESS, is ſo called, becauſe of the Quality and Extent thereof; for thereby the Sheriff is commanded, *Quod diſtringat tenentem, ita quod nec ipſe nec aliquis per ipſum ad eam anum apnat, donec habuerit aliud præceptum, & quod de exitibus eorundem nobis reſpondeat, & quod habeat corpus ejus*, &c.

This Writ lies in two Caſes, either when the Tenant or Defendant is Attached, and ſo return'd, and appears not, but makes Default; then a *Grand-Diſtreſs* is to be awarded: Or elſe when the Tenant or Defendant hath once appeared, and after makes Default, then this Writ lies by the Common Law in lieu of a *Petit-Cape*.

GRANIVOROUS, are thoſe Animals that feed upon Corn and other Seed.

GRANT, in Law, ſignifies a Gift in Writing of ſuch a thing as cannot aptly be paſſed or conveyed by Word only, as Rents, Reverſions, Services, Advowſons in Groſs, Common in Groſs, Tythes, &c. Or made by ſuch Perſons as cannot give but by Deed, as the King and all Bodies Politick: Which Difference is often in Speech neglected, and then it is taken generally for every Gift whatſoever, made of any thing by any Perſon; and he that *granteth* is named *Grantor*, and he to whom it is made, the *Grantee*. A thing is ſaid to lie in *Grant*, which cannot be aſſigned without Deed, 3 *Rep.* 63.

GRANULATION, in Chymiſtry, ſignifies pouring a melted Metal Drop by Drop into cold Water, that ſo it may *granulate* or congeal into ſmall Grains. The beſt way is to pour the Metal through an Iron-Cullender, or through a new Birchen Broom.

GRAPHOIDES, a long, ſharp, and ſlender Appendix of the Temple-Bones, ſomewhat bow'd like a Cock's-Spur: Alſo the Muſcle called *Digaſtricus*.

GRAPHOIDES, is a Proceſs like the Pen for a Table-book; about the Baſis of the Brain it inclines backward.

GRAPNEL, is a kind of Anchor for Boats or Gallies to ride by: They differ from other Anchors, in that they have four Flukes and no Snack, though there are ſome with three Flukes, with which they uſe to *ſweep* for Hawſars or ſmall Cables: In Men of War alſo theſe Grapnels, or at leaſt a lighter kind of them, are uſed to be thrown into an Enemy's Ship, in order to catch hold of ſome of her Gratings, Rails, Gunwales, &c. this is done in order to boarding of her.

GRATINGS, in a Ship, are ſmall Ledges of ſawed Plank framed one into another like a Lattice or Priſon-grate, lying on the Upper-Deck between the Main-maſt and Fore-maſt, ſerving for a Defence in a cloſe Fight; and alſo for the Coolneſs, Light and Contrivance of the Ship's Company.

There is alſo another Grating in the Head of a Ship, where the Neceſſary-Houſe ſtands.

GRAVE-ACCENT, in Grammar, ſhews when the Voice is to be depreſs'd, and is expreſs'd thus, (`).

GRAVEDO, the ſame with *Corryza*.

GRAVELLED-ASHES, are the Lees of Wine dried and burn'd to Aſhes: So that they are a kind of Calcined Tartar.

GRAVING *of a Ship*, is bringing her firſt aground, and then burning off (with Reeds, Broom, &c.) all the Filth and Foulneſs that ſticks to her Sides without-board, in order to *pay* her anew.

GRAVITAS *Acceleratrix*: See *Vis Centripeta*.

GRAVITY, or as it may be called, the *Vis Centripeta*, is that Quality by which all Heavy Bodies tend towards the Center of the Earth, accelerating the Motion as they come nearer towards it. And this Admirable and Univerſal Law of Nature is that which (generally ſpeaking) keeps all Bodies in thoſe Places and Stations which they are deſigned for.

About the Cauſe of this great and Catholick Affection of Matter, there have been various Sentiments.

1. *Ariſtotle* will have all Earthy Bodies, by a Natural Inclination, to tend towards the Center of the Earth, as to their proper Place, *Sub Concava Lunæ*: But it hath been proved over and over, that there is no ſuch thing as *Poſitive* or *Abſolute Gravity* or *Levity*.

2. *Copernicus* aſſerts Gravity to be an Innate Principle in all the Parts of Matter, when they are by any Means ſeparated from their Wholes, to reduce themſelves thither again the neareſt way, or in Right Lines. But this is not to aſſign any Phyſical Cauſe of this great Effect, but only to ſay Bodies deſcend, becauſe they are heavy, or becauſe they deſcend.

They alſo that explain Gravity by *Univerſal Attraction*, do only give us another Word, but no Idea of the Cauſe of Gravity.

3. *Gaſſendus* and *Kepler*, and many others, define Gravity to be a Motion impreſſed on all Bodies by a certain Magnetick Attraction of the Earth or Globe, to which any Body deſcends.

Theſe will have the Earth to be one great *Magnet* or *Loadſtone*, continually ſending out Magnetical Effluvia, which lay hold on all Bodies, and draw them towards the Earth: See *Gilbert* and *Kircher de Magnete*.

4. *Des Cartes* ſuppoſes the Particles of his Celeſtial Matter, by being reflected from the Surface of the Earth, and conſequently aſcending up again, from thence to drive down into their Places the Terreſtrial Bodies which they find above them, *Sect.* 20, 21, 22, 23. of his *Principia Philoſoph.*

But 'tis very difficult to conceive, and, I think, implies a kind of Contradiction, that Bodies ſhould be forced downwards by a continual Impulſe of other Matter tending upwards, and acting upon all Parts uniformly and equally.

The Ingenious Mathematician Mr. *Keil* of *Baliol-College*, *Oxon*, hath alſo ſufficiently overthrown this Hypotheſis in the Preface to his *Introductio ad Veram Phyſicam*.

5. *Voſſius*, and ſome others, will needs have the Diurnal Motion of the Earth round its Axis to be the Cauſe of the Deſcent of heavy Bodies: Whereas 'tis demonſtrable, from Experiment and the Doctrine of the Laws of Motion, That the Reverſe of Gravity would thence enſue: For all Bodies moving circularly, do always endeavour to recede *ab Axe Motus*; and all looſe Bodies would then be caſt off from the Earth in a Tangent to the Parallel Latitude of any Place.

6. Others

6. Others miſtaking the Effect for the Cauſe, will have the Preſſure of the Atmoſphere to occaſion Gravity, or the Deſcent of heavy Bodies: But 'tis plain by Experiments made *in Vacuo*, That the Atmoſphere, like all other Fluids, doth hinder the Deſcent of heavy Bodies, rather than further them or cauſe them; for a Feather *in Vacuo* will deſcend as faſt as a Bullet or Stone in the open Air.

7. The Learned Dr. *Hook*, in his *Micrographia*, *P.* 22. ſeems to think, that by ſuppoſing our Globe of Earth, Air, and Water, environ'd round with a Fluid very ſubtle and heterogeneous to them all, and which can freely pervade the Pores, not only of Glaſs, but even of the cloſeſt Metals; the Endeavour of this Fluid to detrude all Earthly Bodies from it, may, by that and ſome other Properties, make all Bodies move towards the Center of the Earth: And he ſaith he can prove, by many Experiments, that there is ſuch a Fluid. But this Opinion appears to be Defective on the ſame Account that the *Carteſian* is; which ſee.

8. The Learned Mathematician Capt. *Edmund Halley*, owns Gravity to be an Effect unſolvable by any Philoſophical Hypotheſis; and Modeſtly and *Religiouſly* reſolves it into the immediate Will of our All-wiſe Creator, who by appointing this Law throughout all the Material World, keeps all Bodies in their proper Places and Stations, which, without it, would ſoon fall to Pieces and be utterly deſtroyed. *Philoſoph. Tranſact. N.* 197.

Sir *Iſaac Newton*, *Book* 2. *Prop.* 19. *Corol.* 5. obſerves very well, That of all Bodies conſidered within the Confines of any Fluid, there is a twofold *Gravity*, the one *True* and *Abſolute*, the other *Apparent*, and *Vulgar*, and *Comparative*.

Abſolute Gravity, is the *whole Force* by which any Body tends downwards; but the *Relative* or *Vulgar* is the Exceſs of Gravity in any Body above the Specifick Gravity of the Fluid, whereby it tends downwards more than the Ambient Fluid doth.

In reference to *Abſolute Gravity*, the Parts of all Fluids and all Bodies do really gravitate in their proper Places, and therefore by their joint Weights do make the Weight of the Whole: For every heavy Whole is an Heavy Body, as we find by Experience in Veſſels filled with all Kinds of Liquors; and the Weight of any Whole is equal to, becauſe compounded of, the Weight of all its Parts.

The latter Kind of Gravity is ſuch, that in reference to it, Bodies do not gravitate in their Places, or rather do not, when compared one with another, *pre-gravitate*; but by hindring one another in their mutual Endeavour to deſcend, do remain in their proper Places all one as if they were not heavy at all. Thoſe Things which do not pre-gravitate in the Air, Water, &c. the Vulgar take to have no Gravity; and only judge thoſe to be heavy Bodies which they ſee pre-gravitate or deſcend, becauſe they cannot be ſupported by the ordinary Gravitation of the Fluid, or by its Preſſure all manner of ways.

So that the Notion of Weight among the Vulgar, is only the Exceſs of any Bodies Weight above that of Air: And conſequently they account thoſe things to be *Light*, which being leſs heavy than Air, are ſupported by it, or buoyed up in it.

Whereas theſe *Comparatively* light Bodies are not ſo *really*, ſince in *Vacuo* it hath been found by Experiment, that they deſcend as faſt as other heavy Bodies do in the Air, (Vid. *Mr.* Boyle's *Experiments of his Air Pump.*)

The Properties of Gravity are very well enumerated by Capt. Halley, *in* Numb. 179. *of* Philoſophical Tranſactions.

1. That by it all Bodies deſcend towards a Point, which either is, or is very near to the Center of Magnitude of the Earth and Sea; about which the Sea forms it ſelf into a Spherical Surface, and the Prominences of the Land, conſidering the Bulk of the Whole, differ but inſenſibly therefrom.

2. That this Point or Center is fixed within the Earth, or at leaſt hath been ſo ever ſince we have any Authentick Hiſtory: For a Conſequence of its Shifting, though never ſo little, would be the overflowing of the Low-Lands on that Side the Globe towards which it approached.

And this he thinks would well account for the Univerſal Deluge, To have the Center of Gravitation to be removed for a Time towards the Middle of the then inhabited World.

And he ſaith, That a Change of its Place but the 2000th Part of the Radius of our Earth, would be ſufficient to lay the Tops of the higheſt Hills under Water.

3. That in all Places equi-diſtant from the Center of the Earth, the Force of Gravity is nearly equal.

But indeed all Places on the Earth's Surface are not at equal Diſtances from the Center; becauſe, as Sir *Iſaac Newton* hath proved, the Equatorial Parts are ſomething higher than the Polar Parts; the Difference between the Earth's Diameter and Axis being about 34 *Engliſh* Miles, which hath been confirmed by the Neceſſity of making a Pendulum ſhorter (in thoſe Places) before they will ſwing Seconds.

4. Gravity equally affects all Bodies, without regard either to their *Bulk*, *Figure*, or *Matter*: So that abſtracting from the Reſiſtence of the Medium, the moſt *Compact* and *Looſe*, the *Greateſt* and *Smalleſt* Bodies would deſcend equal Spaces in equal Times, as appears from the quick Deſcent of very light Bodies in the exhauſted Receiver. Whence a very great Difference may be obſerved betwixt Gravity and Magnetiſm; the latter affecting only Iron, and that towards its Poles; the former all Bodies alike in every Part.

Hence alſo may be concluded there is no ſuch Thing as poſitive Levity, thoſe Things which appear light being only comparatively ſo. And whereas ſeveral Things riſe and ſwim in Fluids, 'tis only becauſe they are not, bulk for bulk, ſo heavy as thoſe Fluids: Nor is there any Reaſon why *Cork* for Inſtance, ſhould be ſaid to be light, becauſe it ſwims on *Water*, any more than *Iron*, becauſe it will ſwim on *Mercury*.

5. That this Power increaſes as you deſcend, and decreaſes as you aſcend from the Center of the Earth; and that in Proportion of the Squares of the Diſtances therefrom reciprocally: So, as for Inſtance, at a double Diſtance to have but a Quarter of the Force, &c. which is highly agreeable to Reaſon,

n, becauſe the gravitating or attracting Power muſt needs be exerted more vigorouſly in a ſmall Sphere, and more feebly in a greater, in Proportion, as it is contracted or expanded. Wherefore ſeeing the Surfaces of Spheres are to one another, as the Squares of their Radij, their Power at ſeveral Diſtances will be as the Squares of thoſe Diſtances reciprocally; and then its whole Action upon each Spherical Surface, be it great or ſmall, will be always equal.

Mr. *Hugens*, in the laſt Propoſition of his Fourth Part of his Book *De Horologio Oſcillatorio*, ſhews by Experiments moſt accurately made, That *Gravity* is that Force by which a Body, placed any where near the Surface of the Earth, is impelled towards the Center after the Rate of $15\frac{1}{12}$ of *Paris* Feet in a Second of Time.

The very Learned and Ingenious Capt. *Halley*, in his Diſcourſe about the Cauſe of Springs in *Philoſ. Tranſact. N.* 192. ſeems to think, That there may be ſome Matter which may have a *Conatus* directly contrary to that of Gravity; as is, ſaith he, the Caſe in Vegetation, where the Sprouts tend directly upwards, or againſt the Perpendicular.

GRAVITY *of Bodies*, is either *Specifick* or *Abſolute*: See *Specifick Gravity*.

GREAT-BEAR: See *Urſa Major*.

GREAT *Circles of the Globe or Sphere*, are thoſe whoſe Plane paſſing thro' the Center of the Sphere, divides it into two equal Parts or Hemiſpheres; of which there are Six drawn on the Globe, *viz.* the *Meridian*, *Horizon*, *Equator*, *Ecliptick*, and the two *Colures*: which ſee.

GREEN-CLOTH, or *Counting-Houſe of the King's Houſhold*, is ſo called, becauſe the Table ſtands always covered with a *Green-Cloth*: Here ſit the Lord-Steward, Treaſurer of the King's Houſe, Comptroller, Maſter of the Houſhold, Cofferer, two Clerks of the *Green-Cloth*, and two Clerks Comptrollers, for Daily taking the Accounts of all Expences of the Houſhold, making Proviſions and ordering Payment for the ſame, for the good Government of the King's Servants, and paying the Wages of thoſe below Stairs.

GREEN-WAX, in Law, ſignifies the Eſtreats of Fines, Iſſues, and Amerciaments in the Exchequer, under the Seal of that Court made in *Green-Wax*, to be levy'd in the County: See *Foreign Apposer*.

GREGORIAN-YEAR, *The New Account*, or, *New Stile*, inſtituted upon the Reformation of the Calendar by Pope *Gregory* XIII. (from whom it takes the Name) in the Year 1582; whereby Ten Days being taken out of the Month of *October*, the Days of their Months go always Ten Days before ours: As for Inſtance, their Eleventh is our Firſt Day: Which *New Stile*, or *Account* is uſed in moſt Parts beyond the Seas; and is called from Pope *Gregory*, the *Gregorian Account*.

GRENADO: See *Grenado-Shell*.

GRIPE *of a Ship*, is the *Compaſs* or *Sharpneſs* of her *Stem* under Water, and chiefly towards the Bottom of the *Stem*: And the Deſign of ſhaping her ſo, is to make her Gripe the more, or keep a good Wind; for which end ſometimes a Falſe Stem is put on upon the true one.

GRIPE alſo is the Sea Phraſe for a Ship's being apt to run her Head or Noſe too much into the Wind, for then they ſay *She Gripes*. And there are two Cauſes of this Effect; either over-loading a Ship a-head, the Weight of which preſſes her Head ſo down, that it is not apt to fall off from the Wind; or elſe the *Staying* or *Setting* her Maſts too much aft, which will always be Fault in a ſhort Ship that draws much Water, and will cauſe her to be continually running into the Wind: But in *Floaty Ships*, if the Maſts be not ſtayed very far aft, they will never keep a good Wind.

GROMETS, in a Ship, are ſmall Rings faſtened to the upper Side of the Yard of a Ship, by Staples, to tie unto it, or to faſten the *Laskets*.

GROUND-TACKLE, is the Sea Term for a Ship's Anchor, Cables, *&c.* in general; or whatever is neceſſary to make her ride ſafe at Anchor in proper Ground.

GROUND-TIMBERS, in a Ship, are thoſe Timbers which lie on her Keel, and are faſtened to it with Bolts through the Keelſon. They are ſo called, becauſe the Ship lies at reſt upon them when ſhe is a-Ground.

GROUNDING *of a Ship*, is bringing of her on Ground to be trimmed, made clean, ſcrubbed, or have ſome Leak ſtopp'd in her.

GRY, according to Mr. *Lock*, is a Meaſure containing $\frac{1}{10}$ of a Line: A Line is $\frac{1}{10}$ of an Inch, an Inch $\frac{1}{10}$ of a Philoſophical Foot, and a Philoſophical Foot is $\frac{1}{2}$ of a Pendulum, whoſe *Diadromes* or *Vibrations*, in the Latitude of 45 Degrees, are each equal to one Second of Time, or $\frac{1}{60}$ of a Minute.

GRYPHUS, a ſort of crooked Pincers uſed by Surgeons.

GUARDANT, the Term in Heraldry for a Lion born in a Coat of Arms, when his Face is turned towards the Spectator, and he appears in a Poſture of Guard or Defence (as it were) of himſelf.

GUARD-COCK: See *Gardecaut*.

GUDGIONS, in a Ship, are the Eyes drove into the Stern Poſt, into which the Pintles of the Rudder go, to hang her on.

GUEST-ROPE, is that Rope by which the Boat is kept from *Steeving*, or going too much in and out, as ſhe lies in the Tow of a Ship.

GULA or *Gullet*: See *Oeſophagus*.

GULBE, in Architecture, the ſame with *Gorge*.

GULES, ſo the Heralds call the Red Colour in the Arms of Gentlemen; but in thoſe of the Nobility they call it *Ruby*; and in Sovereign Princes Coats *Mars*. 'Tis expreſſed in Engraving by perpendicular Strokes or Hatches, thus,

GULF, in Geography, is a Part of the Ocean or Great Sea, which runs up into the Land thro' narrow Paſſages, which are called *Streights*; as the *Gulf* of *Florida* in *America*, the *Arabian Gulf* or *Red-Sea* in *Africa*, the *Perſian Gulf* in *Aſia*, and the *Gulf* of *Venice*, or the *Adriatick Sea* in *Europe*.

GUMMA *Gallicum*, is by ſome the Term for the eating out of a Bone in the *French Pox*.

GUNTER'S-LINE, is the common Line of *Numbers*, invented firſt by Mr. *Gunter*, and ſo commonly known that there is no need of a Deſcription of it here; it being not only done by the Inventor in his Book of the Sector, but alſo by *Everard*, *Brown*, *Partridge*, in their Sliding Rules, and almoſt every one that hath written of Practical Mathematicks. *See* Vol. II.

GUNTER'S-QUADRANT, is an Inſtrument made in Wood or Braſs, curiouſly contrived to find the Hour of the Day and Azimuth, with moſt Propoſitions of the Globe; as alſo Heights and Diſtances.

You have a full Deſcription of it in Mr. *Gunter*'s Book of the Sector; but 'tis by no means ſo good to find the Hour of the Day as Mr. *Collins*'s Quadrant: See *Quadrant*.

GUNTER'S-SCALE, called by the Common Seamen uſually, *The Gunter*, is a large plain Scale, with the Lines of Artificial Sines and Tangents fitted ſo to a Line of Numbers, that they can by the Compaſſes work all Queſtions in plain Dialling, *&c.* with tolerable Exactneſs, if the Scale be large and good. It hath its Name for being the Invention of the above-named Mr. *Gunter*, and is now commonly put on all our Scales, and on our Sectors, where they are uſually called, *The Artificial Lines*.

GUNWALE, or *Gunnel* of a Ship, is that Piece of Timber which reaches on either ſide of the Ship from the Half-Deck to the Fore-caſtle, being the uppermoſt *Bend* which finiſheth the upper Works of the Hull in that Part, and wherein they put the Stanchions which ſupport the Waſte-Trees; and this is called the *Gunwale*, whether there be Guns in the Ship or no: And the lower Part of any *Port*, where any Ordnance are, is alſo termed the *Gunwale*.

GURGULIO, the ſame with *Cion*, or the *Epiglottis*; which ſee.

GUTTA *Roſacea*, is a Redneſs with Pimples, wherewith the Cheeks, Noſe, and whole Face is deformed, as if it were ſprinkled with red Drops: Theſe Pimples or Wheals often increaſe to that degree, that they render the Face rough and horrid, and the Noſe monſtrouſly big.

GUTTA-SERENA, or *Amauroſis*, is a Dimneſs, or even total Loſs of the Sight, cauſed by a Watery Humour flowing down from the Brain upon the Optick Nerves.

GUTTÆ, or *Drops*, in Architecture are certain Parts in Form of little Bells, which, to the Number of Six, are put below every *Triglyph* in the *Architrave* of the *Dorick* Order. They are ſo called by Architects from their Shape, repreſenting the *Drops* of Water, which having run along the *Triglyphs*, ſtill hang under the Cloſure between the Pillars.

GUTTAL-CARTILAGE, in Anatomy, is that which includes the third and fourth Griſtle of the *Larynx*, which ſeem to be but one, by reaſon of the common Membrane with which they are covered.

GUTTE *de l' Eau*, Drops of Water; theſe in Heraldry they paint Argent or White.

GUTTE *de Larmes*, when they are Drops of Tears, and theſe in Heraldry are painted Blue or Azure.

GUTTE *de Or*, Drops of melted Gold; all which kinds are ſometimes born in Eſcutcheons.

GUTTE *de Sang*, the Term in Heraldry for Drops of Blood born any how in a Coat of Arms; if the Drops are of any other Subſtance, they are called accordingly.

GUTTORIS *Os*, the ſame that is called *Hyoides Os*.

GUVE *de Ronde*, a Term in Fortification, ſignifying the ſame as a ſimple or a *ſingle Tenaille*: See *Tenaille*.

GUY; a *Guy* in a Ship, is any Rope uſed to keep off things from bearing or falling againſt the Ship Side when they are to be hoiſted in: Thus, if any thing is to be haled in over the Gunwale, it is gently eaſed in by a *Guy-Rope* faſtened uſually to the Stanchions of the Waſte-Trees.

That Rope alſo which is made faſt to the Foremaſt at one End, and is reeved thro' a ſingle Block ſeized to the Pendant of the Winding-Tackle, and then again reeved through another ſeized to the Foremaſt, and whoſe Uſe is to hale forward the Pendant of the Winding-Tackle, is alſo called a *Guy*.

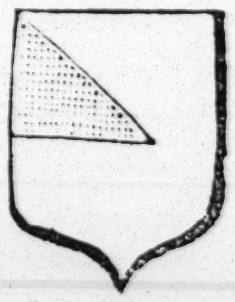
GYMNASTICKS, that Part of Phyſick which treats of the Rules that are to be obſerved in all ſorts of Exerciſes, in order to the Preſervation of Health. This is ſaid to be invented by one *Herodicus*, born at *Selymbra* a City of *Thrace*, or, as ſome ſay, at *Leutini* in *Sicily*; He was Brother to *Georgius* the Famous Rhetorician and Philoſopher.

This *Herodicus* was at firſt Maſter of an Academy, where young Gentlemen came to learn Warlike and Manly Exerciſes; and whom he obſerving to be very Healthful on *that Account*, he made *Exerciſe* become an Art, in reference to the Recovery of Men out of Diſeaſes, as well as preſerving them from them, and called it *Gymnaſtick*, which he made a great Part of his Practice of Phyſick: But *Hippocrates*, who was his Scholar, blames him ſometimes for his *Exceſſes* in this kind of Phyſick, and his want of Judgment in preſcribing this Method of Cure in Fevers, *&c.* And *Plato*, in his *Phædr.* exclaims againſt him with great warmth on this Account, and ſaith, he uſed to enjoin his Patients to walk from *Athens* to *Megara*, (which is about 25 Miles) and to come home again on Foot as they went, as ſoon as ever they had once but touch'd the Walls of the City.

GYNÆCIA, in general, are the Accidents incident to Women; but *Hippocrates* takes them more ſtrictly for the Courſes. *Blanchard*.

GYNÆCOMASTUM, is the growing of the Breaſts. *Blanchard*.

GYRON, an Ordinary in Heraldry, conſiſting of two ſtreight Lines iſſuing from divers Parts of the Eſcutcheon, and meeting in the Feſſe Point; thus,



He beareth: *Sanguine a Gyron iſſuing from the Dexter Point Or.*

HABEAS *Corpora*, is a Writ that lies for the bringing in a Jury, or ſo many of them as refuſe to come upon the *Venire facias*, for the Trial of a Cauſe brought to iſſue.

HABEAS *Corpus*, is a Writ which a Man Indicted for a Treſpaſs before Juſtices of Peace, or in a Court of any Franchiſe, and being apprehended and impriſoned for the ſame, may have out of the King's-Bench, to remove himſelf thither at his own Coſts, and to anſwer the Cauſe there.

And the Order of this Caſe is, firſt to procure a *Certiorari* out of the *Chancery*, directed to the ſaid Juſtices for the removing of the Indictment into the King's Bench; and upon that, to procure this Writ to the Sheriff, for the cauſing of his Body to be brought at a Day.

HABENDUM, is a Word of Form in a Deed or Conveyance, every of which muſt have two Parts, *viz.* the *Premiſes*, and the *Habendum*.

The Office of the *Premiſes* is to expreſs the Names of the Grantor, Grantee, and the Thing granted.

The Office of the *Habendum* is to limit the Eſtate ſo, that the general Implication of the Eſtate, which (by Conſtruction of Law) paſſeth into the *Premiſes*, is by the *Habendum* controlled and qualified.

HABERE *facias Seiſinam*, is a Writ Judicial, which lieth where a Man hath recovered Lands in the King's-Court, directed to the Sheriff, and commanding him to give *Seiſin* of the Land recovered. This Writ is ſometimes iſſuing out of the Records of a Fine, executory, directed to the Sheriff of the County where the Land lieth, and commanding him to give the Cogniſee, or his Heirs, *Seiſin* of the Land whereof the Fine is levied, which Writ lieth within the Year after the Fine or Judgment, upon a *Scire facias*, and may be made in divers Forms.

There is alſo a Writ called *Habere facias Seiſinam, ubi Rex habuit annum, diem, & vaſtum*; which lies for the Delivery of Land to the Lord of the Fee, after the King has taken his Due of Lands of him that was convicted of Felony.

HABERE *facias viſum*, is a Writ that lies in divers Caſes, where view is to be taken of the Lands or Tenements in queſtion.

HABITUDE, is a Diſpoſition of the Mind or Body, acquir'd by reiterated or repeated Acts; as Skill and Knowledge in the Sciences, Virtue, Vice, Excellence in Painting, Writing, Dancing, *&c.*

HÆLOSIS, according to ſome, is a reflected Inverſion of the Eye-lid.

HÆMALOPS, the Extravaſation of Blood about the Eye, occaſion'd by a Blow or Contuſion, commonly called a *Blue Eye:* Alſo the Redneſs of the Eyes proceeding from an Inflammation, or the Diſtenſion of the Blood-Veſſels in the Eye, or that which we call a *Blood-ſhotten Eye*.

HÆMATOSIS, the ſame with *Sanguification*; it is performed in all the Parts of the Body, and not in any peculiar Part, as the Heart, Liver, Spleen, as ſome formerly imagined: See *Blood*.

HÆMODIA, a painful Numneſs of the Teeth, proceeding from the Irritation of the Membranes that ſurround their Roots, or of the Nerves that are diſperſed through their Subſtance. 'Tis uſually occaſioned by the eating of Acid Fruits, or the Vomiting of Acid Humours: We commonly ſay in *Engliſh*, that the Teeth are ſet on Edge.

HÆMOPTYSIS, is the ſpitting of Blood from the Lungs, which proceeds either from a ſweating out at the Glandules of the *Larynx*, with which its *Tunick* is cloathed within; to wit, when the Openings of the Arteries are too much relaxed; or from ſome great Veſſels that are broke, or out of the little Bladders of the Lungs themſelves. *Blanchard.*

HÆMORHAGIA, is a Flux of Blood at the Noſtrils, Mouth, or Eyes, *&c.*

HÆMORRHOIDES, are Swelling Inflammations in the *Rectum*, or about the Fundament, red and painful, which ſometimes ſend forth Blood or Matter. *Blanchard.*

HEMORRHOIDICAL-VEINS, are either *Internal* or *External*.

The *Internal* are Branches of the third and laſt Diviſion of the *Vena Meſenterica*, which is it ſelf the right Branch of the *Porta:* This is ſpread thro' the Middle of the *Meſenterium*, and goes to that Part of the *Colon* which lies on the Left Side to the *Rectum*, and thence down to the *Anus*.

The *External Hemorrhoidal-Veins* ariſe from the *Vena Hypogaſtrica*, and ſometimes from a double Branch of it ſpreading about the *Sphincter* of the *Anus*; and this Hypogaſtrick-Vein is, in it ſelf, Part of the Internal Branch of the *Vena Iliaca*.

HÆREDE *Abducto*, is a Writ that lieth for a Lord, who having the Wardſhip of his Tenant under Age, by Right cannot come by his Body, for that he is conveyed away by another.

HÆREDE *deliberando alii qui habet cuſtodiam terræ*, is a Writ directed to the Sheriff, willing him to command one, having the Body of him that is Ward to another, to deliver him to him, whoſe Ward he was by reaſon of his Lord.

HÆRETARE, in Law, ſignifies to give a Right of Inheritance, or make the Donation Hereditary to the Grantee and his Heirs.

HÆRETICO *Comburendo*, is a Writ that lies againſt him that is a Heretick; *viz.* that having once been convicted of *Hereſy* by his Biſhop, and having abjured it, afterwards falling into it again, or into ſome other, is thereupon committed to the Secular Power. Sir *Edward Coke*, in his 12th *Report*, *Fol.* 93. is of Opinion, that this Writ lies not at this Day.

HAILE; to *haile* a Ship, is either to call to her to know from whence ſhe is, and whither ſhe is bound; or elſe to ſalute her, and wiſh her Health.

HALE; to *hale* a Ship, is the ſame thing as what we call *pulling a-ſhore*.

HALF-MOON, in Fortification, is an Outwork that hath only two Faces, forming together a Saliant-Angle, which is flanked by ſome Part of the Place, and of the other Baſtions.

Theſe *Half Moons* are ſometimes raiſed before the Curtain, when the Ditch is a little wider than it ought to be; in which Senſe 'tis much the ſame with a Ravelin, only the Gorge of an *Half-Moon* is

is made bending in like a Bow or Crescent, and is most times used to cover the Point of a Bastion, whereas Ravelins are placed before the Curtain; but they are Defective, as being ill Flanked.

HALLIARDS, in a Ship, are those Ropes by which they hoise up all her Yards. The Cross-Jack and the Sprit-sail Yard indeed have no *Halliards*, because they are always slung; tho' in small Craft, or Vessels, they have *Halliards* to the Sprit-sail Yard.

HALO, or *Halos*, is a certain Meteor in Form of a bright Circle or Ring that surrounds the Sun, Moon, or Star, but more especially the Moon.

These *Halo's* or Crowns do sometimes appear colour'd like the Rainbow: And our Incomparable Sir *Isaac Newton* gives a Hint of the Solution of this Phænomenon in his Opticks, *Pag.* 111. shewing that it arises from the Sun or Moon's shining thro' a thin Cloud, consisting of Globules of Hail or Water all of the same Size. And he gives you two Observations of his own, of the actual Appearance of colour'd *Halo's*; one about the Sun, *June* 1692; the other round the Moon, *Febr.* 19. 1694, at Night.

HALO, is a reddish Spot or Circle of Flesh which surrounds each Nipple in the Breasts of Women.

HANDSPIKE, is a Wooden Leaver, with which, at Sea, they *Traverse* the Ordnance, or heave withal in a *Windlass* to weigh up the Anchor.

HARIOT, or *Heriot*, in Law, is taken for the best Cattle that a Tenant hath at the Hour of his Death, due to the Lord by Custom. And there is *Hariot Service* and *Hariot Custom*. *Hariot Service* is after the Death of a Tenant in Fee-simple; and *Hariot Custom* is after the Death of a Tenant for Life. Also *Hariot Service* is often express'd in the Grant of a Man, that he holds by such Service to pay *Hariot* at the Time of his Death, that holdeth in Fee-simple. *Hariot Custom* is when *Hariots* have been paid Time out of Mind by Custom, and this may be after the Death of a Tenant for Life: And for this the Lord may distrain and seize; but of right, neither the Lord nor Officer should take *Hariot*, before it be presented at the next Court holden after the Tenant is dead, that such a Beast is due for a *Hariot*. If the Lord purchase Part of the Tenancy, *Hariot Service* is extinguish'd; but it is not so in *Hariot Custom*. And if the Lord ought to have a *Hariot* when his Tenant dieth, and the Tenant deviseth away all the Goods, yet the Lord shall have the *Hariot*, for the Law preferreth the Custom before the Devise.

HARMONIÆ, is, in some Authors, an Anatomical Term, and signifies the same with *Mendosa Sutura*, *viz.* a jointing together the Bones of the Head, particularly those of the Nose and Palate, by a streight Line.

HARMONICAL *Proportion*, or *Musical*, is when, of four Numbers, As the First: Is to the Fourth :: So is the Difference of the First and Second : To the Difference of the Third and Fourth.

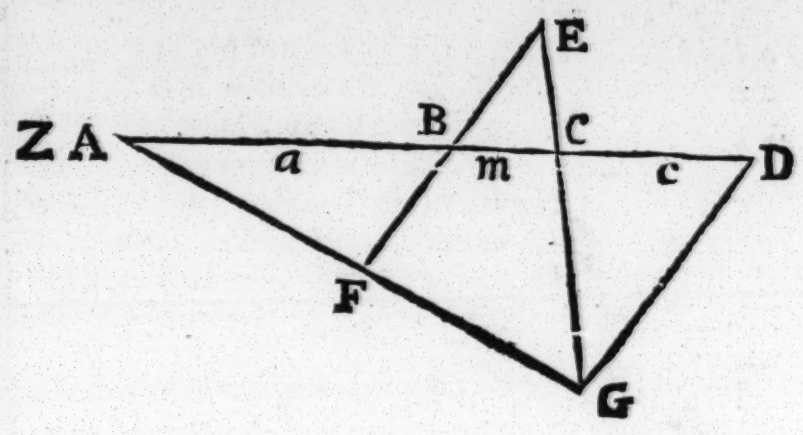
As 5 : 8 : 12 : 30, are *Musical Proportionals*, because 5 : 30 :: 8 — 5 : 30 — 12 :: 3 : 18.

Suppose in *Species* the four Terms A, M, N, E, let it be, $A : E :: M - A : E - N$.

Wherefore $AE - AN = ME - AE$. These Terms being rightly ordered, 'twill be $\frac{AN}{2A - M} = E$; and $\frac{EM}{2E - N} = A$.

In Words thus:

If the Rectangle, contained under the first and third Terms, be divided by the Excess of twice the first above the second; the Quotient will be the fourth Term in *Harmonical* or *Musical Proportion*: Wherefore it is necessary the Terms should be so given, that the double of the first may exceed the second.



A Right Line, as AD, is said to be divided *Harmonically*, if being cut into 3 Parts, AB, BC, and CD, the Case be so, that as the Whole AD (or Z:) is to either Extream a or c :: so shall the other Extream be : to the indeterminate Part m: That is,

$Z : a :: c : m$
$Z : c :: a : m$ } Wherefore $Zm = ac$.

And to divide any given Right Line thus *harmonically*, as suppose AD;

From either End of it draw a Right Line, as DG, making an Angle with it, and of any Length: Connect the End of this Line with the other End A, by drawing AG; and then taking any Point, as B, at pleasure, in the given Line there draw EF parallel to DG, and in it take BE equal to BF; then draw EG, and that shall find the Point C required; and then calling, as above, the whole Line $Z : AB = a : BC = m$, and $CD = C$: I say $Z : a :: c : m$.

For the Triangles ADG, ABF, and BEC are all similar; and consequently $AD : AB :: DG : BF$:: or as DG: to $BF = BE$; but as $DG : BE :: CD : BC$; (by working about the equal Angles D and EBC:) Wherefore, by Equality, $AD : AB :: CD : CB$; that is, $Z : a :: c : m$. *Q.E.D.*

And from hence 'tis plain, That the Ratio of the whole Line AD to the Segment B, may be taken at pleasure: But that the intermediate Part BC, must be less than either AB or CD.

HARMONY, is an agreeable or pleasing Union between two or more Sounds, continuing together at the same time.

Harmony is naturally produced by *Consonances*, but Art has discover'd the way to make it yet more agreeable, by the Mixture of *Dissonances*.

HARPINGS, in a Ship, is properly her Breadth at the Bow; tho' some call the Ends of the *Bends*, which are fastened into the Stem, by the same Name.

HATCHES of a Ship, are the Doors in the Midship, or between the Main-mast and Fore-mast, by which any Goods of Bulk are let down into the Hold. Hence the

HATCH-WAY, is that Place which is directly over the Hatches; so that to lay a thing into the *Hatch-way*, is to put it so that the Hatches cannot be come at, or opened.

HAURIANT, the Term in Heraldry proper to blazon Fiſhes, when they are born in any Eſcutcheon in an erect or perpendicular Poſture, as if they were putting up their Heads above the Water to breath.

HAWSER, (or *Halſer*) is a Rope conſiſting of three Strands, being a kind of a little Cable, ſerving for many Uſes on board a Ship, as to faſten the Main and Fore-ſhrouds, to warp a Ship over a Bar, *&c.*

HAWSES, of a Ship, are two round Holes under her Head or Beak, through which the Cables paſs when ſhe is at Anchor. They ſay a Ship hath a *Bold Hawſe*, when the Holes are high above Water. A *Freſh Hawſe*, is when there is a Suſpicion that the Cables are fretted in the Holes. To *Fresk the Hawſe*, is to lay new Pieces upon the Cable in the *Hawſe*. They call it *burning in the Hawſe*, when the Cable endures an extraordinary Streſs. *Clearing the Hawſe*, is untwiſting the Cables, which, by reaſon of the Ship's winding, are intangled one with another.

HEAD-ANGLES: See *Angles*.

HEAD-LINES, in a Ship, are the Ropes of all Sails which are next to the Yards, and by which the Sails are made faſt to the Yards.

HEAD-SAILS, are thoſe Sails in a Ship which belong to the Fore-maſt and Bolt-ſprit, becauſe they govern the Head of the Ship, and do make it fall off and keep out of the Wind; theſe, in Quarter Winds, are the chief drawing Sails.

HEAD-SEA, is when a great Wave, or Billow of the Sea comes right a-head of a Ship as ſhe is in her Courſe.

HEART: See an Anatomical Deſcription of it under the Word *Cor*.

HEAT, one of the Four Primary Qualities, and ſeems to conſiſt only, or at leaſt *chiefly*, in the local Motion of the ſmall Parts of a Body Mechanically modified by certain Conditions, of which the Principal is the vehement and various Agitations of thoſe ſmall inſenſible Parts.

In which Deſcription it appears, there are theſe Three Conditions neceſſary to produce *Heat*;

1. That the ſmall Parts be vehemently and rapidly agitated, or moved, in a much greater Degree than is neceſſary to produce the Quality we call *Fluidity*.

2. That the *Determinations* of the inſenſible Corpuſcles thus vehemently agitated, be alſo *very various*, ſome moving up, ſome down, ſome to the Right Hand, others to the Left, *&c.* And hence, though Air and Water are, we find often, very vehemently moved, as in Tempeſts and Cataracts; yet there is no reaſon to expect that they ſhould grow hot upon this Motion, becauſe the *Vehemency* belongs to the Progreſſive Motion of the whole Body; and notwithſtanding that, yet the Parts it conſiſts of may not any thing near be ſo much quickned in their Motions, made according to other various Determinations, as to grow ſenſibly hot; but in Bodies very hot or enkindled, the rapid Motion of the inſenſible Parts ſeems to have all manner of Directions, and to be darted round, in a kind of burning Sphere, all manner of ways.

3. Tis requiſite alſo, to the Production of Heat, That the thus variouſly and vehemently agitated Particles be alſo ſo ſmall as, generally ſpeaking, to be ſingly inſenſible: For unleſs they are exceeding fine and ſubtle, they cannot penetrate readily into the Pores of Contiguous Bodies, and ſo warm or burn them.

As to the Operation of Heat upon our Senſes, the Reſult of which we often call *Heat*, it is uſually eſtimated by its Relation to the Organs of our Feeling; for we don't eſteem any Body to be hot, unleſs the Motion of its ſmall Parts be violent or brisk enough to increaſe or ſurpaſs that of the Particles of the Object: For if it be more languid in the Object than in the Sentient, we pronounce the Body to be cold; but if it be more violent in the Object than in the Sentient, we ſay the Body is hot; as any one may Experiment by putting his Hand, when cold, into warm Water; for then the Water will appear warm to him; whereas, had his Hand been hot, it would have felt cold.

The Intenſeneſs of *Heat* (as alſo of Light) always is as the Denſity of the Rays or Particles of Fire which occaſion it; and that Denſity is as the Diſtance from the Radiating Point *reciprocally*. See *Quality*.

The Learned and Curious Dr. *Slare*, in *Philoſoph. Tranſact. N.* 213. hath publiſhed ſeveral ſtrange Experiments about the Productions of Flame and Fire, from the bare Mixture of two Liquors *actually cold*; which two Liquors are a Vegetable Oil (the Kinds of which, proper for this Purpoſe, he there gives you in a Table) and a Compound Spirit of Nitre; which Spirit is made by Diſtillation (in a Retort) of equal Parts of Salt Petre and Oil of Vitriol, in a Sand Furnace with a great Fire.

And one thing is very remarkable as to his two Liquors, That tho' Gunpowder cannot be made by firing to give any Exploſion in the Exhauſted Receiver, yet theſe did ſo in a very rapid manner, blowing up the Receiver, and breaking out in a great Flame.

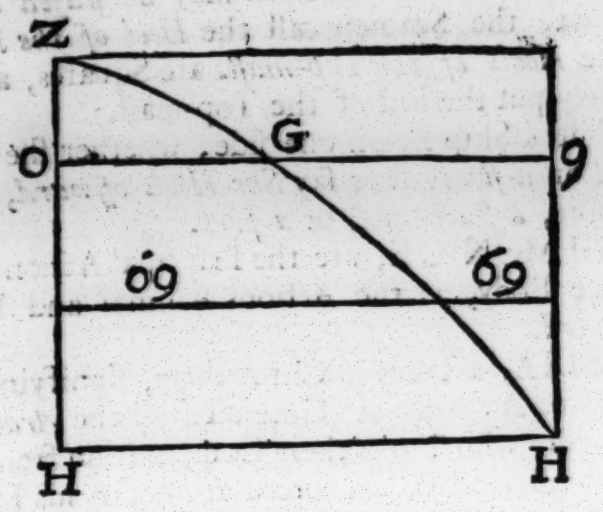
The Learned and Ingenious Captain *Halley* hath a Diſcourſe in *Philoſ. Tranſact. N.* 203. about the proportional *Heat* of the Sun in all Latitudes, and of a Method for collecting the ſame: Where he ſhews, That the Simple Action of the Sun is, as all other Impulſes or Strokes, more or leſs forcible, according to the Sines of the Angle of Incidence, or to the Perpendicular let fall on the Plane, whence the Vertical Ray (being that of the greateſt Heat) being put for *Radius*, the Force of the Sun, on the Horizontal Surface of the Earth, will be to that, as the Sine of the Sun's Altitude at any other Time.

This being allowed for true, it will then follow, That the Time of the Continuance of the Sun's ſhining being taken for a Baſis, and the Sines of the Sun's Altitudes erected thereon, as Perpendiculars, and a Curve drawn through the Extremities of thoſe Perpendiculars, the *Area* comprehended ſhall be proportionate to the Collection of the Heat of all the Beams of the Sun in that ſpace of Time.

Hence it will follow, That under the Pole the Collection of all the Heat of a Tropical Day, is proportionate to a Rectangle of the Sine of 23 Degrees and a Half into 24 Hours, or the Circumference of a Circle; that is, the Sine of 23 Degrees and a Half, being nearly $\frac{4}{7}$ of Radius, as $\frac{8}{10}$ into 12 Hours. Or the Polar *Heat* is equal to that of the Sun continuing 12 Hours above the *Horizon* at 53 De-

53 Degrees height, than which the Sun is not 5 Hours more elevated under the Equinoctial.

But that this may be the better understood, he explains it by the following Figure.



Wherein the Area ZGHH, is equal to the Area of all Sines of the Sun's Altitude under the Equinoctial, erected on the respective Hours from Sunrise to the Zenith; and the Area ♋ HH ♋ is in the same Proportion to the Heat for the same 6 Hours under the Pole on the Tropical Day; and ⊙ H H Q, is proportional to the collected Heat of 12 Hours, or half a Day under the Pole, which space ⊙ H H Q is visibly greater than the other Area HZGH, by as much as the Area HGQ is greater than the Area Z G ⊙; which that it is so, is visible to sight, by a great excess; and so much in Proportion does the Heat of 24 Hours Sun-shine under the Pole, exceed that of 12 Hours under the Equinoctial; whence, *Cæteris paribus*, it is reasonable to conclude, That were the Sun perpetually under the Tropick, the Pole would be at least as warm, as it is now under the Line it self.

But whereas the Nature of Heat is to remain in the Subject, after the Cause that heated it is removed, and particularly in the Air; under the Equinoctial, the 12 Hours absence of the Sun does very little still the Motion impress'd by the past Action of his Rays, wherein Heat consists, before he arises again; but under the Pole, the long absence of the Sun for 6 Months, wherein the Extremity of Cold does obtain, has so chill'd the Air, that it is, as it were Frozen, and cannot (before the Sun has got far towards it) be any ways sensible of his Presence, his Beams being obstructed by thick Clouds, and perpetual Fogs and Mists, and by that *Atmosphere* of *Cold*, as the Honourable Mr. *Boyle* was pleased to term it, proceeding from the everlasting Ice, which in immense Quantities does chill the neighbouring Air, and which the too soon retreat of the Sun does leave unthaw'd, to increase again, during the long Winter, that follows this short Interval of Summer.

But the differing Degrees of Heat and Cold in differing Places, depend in a great measure upon the Accidents of the neighbourhood of high Mountains, whose Height exceedingly chills the Air brought by the Winds over them; and of the Nature of the Soil, which variously retains the Heat, particularly the Sands, which in *Africa*, *Arabia*, and generally where such Sandy Desarts are found, do make the Heat of the Summer incredible to those that have not felt it.

In prosecution of his former Thought, he computed the following Table for every tenth Degree of Latitude, to the Equinoctial and Tropical Sun, by which an Estimate may be made of the intermediate Degrees.

Lat.	Sun in ♈. ♎.	Sun in ♋	Sun in ♑
0	20000	18341	18341
11	19696	20290	15834
20	18797	21737	13166
30	17321	22651	10124
40	15321	23048	6944
50	12855	22991	3798
60	10000	22773	1075
70	6840	23543	000
80	3473	24673	000
90	0000	25055	000

Then he gives the following *Corollaries*, very well worth Note.

COROLLARY I.

That the Equinoctial Heat, when the Sun becomes Vertical, is as twice the Square of the Radius; which may be proposed as a Standard to compare with, in all other Cases.

COROLLARY II.

That under the Equinoctial, the Heat is as the Sine of the Sun's Declination.

COROLLARY III.

That in the Frigid Zones, when the Sun Sets not, the Heat is as the Circumference of a Circle into the Sine of the Altitude at 6. And consequently, that in the same Latitude these Aggregates of Warmth, are as the Sines of the Sun's Declination; and at the same Declination of the Sun, they are as the Sines of the Latitudes, and generally they are as the Sines of the Latitudes into the Sines of the Declination.

COROLLARY IV.

That the Equinoctial Day's Heat, is every where as the Co-sine of the Latitude.

COROLLARY V.

In all Places where the Sun Sets, the Difference between the Summer and Winter Heats, when the Declinations are contrary, is equal to a Circle into the Sine of the Altitude at 6, in the Summer parallel, and consequently, those Differences are as the Sines of Latitude into, or multiplied by the Sines of Declination.

COR. VI.

From the foregoing Table it appears, That the Tropical Sun under the Equinoctial, has of all others the least Force: Under the Pole, it is greater than any other Day's Heat whatsoever, being to that of the Equinoctial, as 5 to 4.

From the Table, and these Corallaries, a general Idea may be conceiv'd of the Sum of all the Actions of the Sun in the whole Year, and that part of Heat that arises simply from the Presence of the Sun, be brought to a *Geometrical Certainty*.

The Heat of the Sun for any ſmall Portion of Time, is always as a Rectangle, contain'd under the Sine of the Angle of Incidence of the Ray producing Heat at that Time.

The Excellent Sir *Iſaac Newton*, at the End of his Opticks, juſt now publiſh'd, renders it probable, tho' he propoſes it but as a Query; That Flame is a Fume, Vapour, or Exhalation heated red hot; that is, ſo hot as to ſhine: Becauſe Bodies don't flame without emitting a copious Fume, and this Fume burns in the Flame.

The *Ignis Fatuus*, is a Vapour ſhining without Heat, and there ſeems to be the ſame difference between the Vapour and Flame, as between rotten Wood ſhining without Heat, and burning Coals of Fire. In diſtilling hot or ardent Spirits, if the Head of the Still be taken off, the aſcending Vapour will take Fire at the Flame of a Candle, and be turn'd into Flame; and the Flame will run along the Vapour from the Candle to the Still.
